ADVERTISEMENT.

This work (Bulletin No. 47) is one of a series of papers intended to illustrate the collections belonging to the United States, and constituting the National Museum, of which the Smithsonian Institution was placed in charge by the act of Congress of August 10, 1846.

The publications of the National Museum consist of two series—the Bulletins, of which this is No. 47, in continuous series, and the Proceedings, of which the eighteenth volume is now in press. A small edition of each paper in the Proceedings is distributed in pamphlet form to specialists, in advance of the publication of the bound volume.

The Bulletins of the National Museum, the publication of which was commenced in 1875, consist of elaborate papers based upon the collections of the Museum, reports of expeditions, etc., while the Proceedings facilitate the prompt publication of freshly-acquired facts relating to biology, anthropology, and geology, descriptions of restricted groups of animals and plants, the discussion of particular questions relative to the synonymy of species, and the diaries of minor expeditions.

Other papers, of more general popular interest, are printed in the Appendix to the Annual Report.

Full lists of the publications of the Museum may be found in the current catalogues of the publications of the Smithsonian Institution.

Papers intended for publication in the Proceedings and Bulletins of the National Museum are referred to the Committee on Publications, composed as follows: FREDERICK W. TRUE (chairman), R. EDWARD EARLL (editor), J. E. BENEDICT, OTIS T. MASON, LEONHARD STEJNEGER, and LESTER F. WARD.

S. P. LANGLEY,
Secretary of the Smithsonian Institution.

* Circa.

PREFACE.

In this work the writers have endeavored to give concise descriptions of all the species of fishes known to inhabit the waters of North and Middle America. In scope the work includes, therefore, all the species known to exist in North America, Central America, the West Indies, the Caribbean Sea, the Galapagos Archipelago, with the offshore banks and continental slopes of both oceans included, as well as the waters of the Gulf Stream. All marine species known to occur north of the Equator, and all fresh-water species north of the Isthmus of Panama are included. The fact that over a hundred species have been added to the list within the time taken for printing the present volume, shows that this catalogue is still far from complete.

The classification and sequence of groups adopted by us is essentially that of Dr. Theodore Gill, freely modified to suit our present purposes. This system in many of its details is purely tentative, to be confirmed or changed when the anatomy of the various forms is better known. This fact has been strongly emphasized by Dr. Gill and needs no further discussion here. In the arrangement of the families and genera we have endeavored to avoid unnatural associations and incoherent groups, even at the risk of what may seem an excessive subdivision. In general, however, no correct idea of the relation of large groups can be formed until the component parts are separated and defined.

The rules of nomenclature recently formulated by the American Ornithologists' Union, and now adopted by nearly all American naturalists, have been followed in this work. The only exceptions are those arising from the operation of two minor regulations which seem to be impracticable or unnecessary.*

---

*The first of these exceptions concerns Canon XVII, 2, which gives to specific names applied to males, precedence over names used for females, when the two occur on the same page. In such cases of synchronous names, we have awarded priority to the name standing first on the page, regardless of other considerations. The other exception is in the rule abandoning a name (as *Scaphirhynchus*; *Xiphidion*; *Canthidermis*) when a prior generic name is of like etymology and of nearly the same spelling (as *Scaphorhynchus*, *Xiphidium*, or *Acanthoderma*). We regard all generic names as different unless originally spelled alike, and the original orthography (misprints aside) is in all cases retained.

The present work is, in a sense, a revision of the "Synopsis of the Fishes of North America," published in 1883 by Jordan & Gilbert, as Bulletin XVI of the United States National Museum. While the general character of the work is the same as in the Synopsis, the text in the present work has been entirely rewritten, and the geographical range greatly extended by the addition of the faunas of Mexico, Central America, and the West Indies. The number of species included has been thus more than doubled. An effort has been made to show in the sequence of forms, something of our knowledge of the line of evolution of the different groups of fishes.

Our recognition of indebtedness should include in greater or less degree most contemporary workers in systematic ichthyology, for it is not easy to separate the aid given to our individual studies from that given as direct assistance in the preparation of the present work.

Dr. Charles Henry Gilbert has turned over to the present junior author his share in Jordan & Gilbert's "Synopsis," and has also freely given help and advice, unpublished observations, descriptions of new forms, and other aids which increase the usefulness of the work. Most of the descriptions here published have been written in his laboratory or verified in the museum in his charge.

In ways similarly important, we are under the deepest obligations to Dr. Theodore Gill, who has looked over all our proof sheets, and who has given numberless valuable suggestions arising from his extensive knowledge of comparative anatomy and of the literature of zoölogy. Every part of the work has been made more valuable by the friendly interest of this master of taxonomy.

Still other aids of importance have come from Dr. G. Brown Goode, Assistant Secretary of the Smithsonian Institution in charge of the United States National Museum. The work of rewriting the Synopsis of 1883 was undertaken at his suggestion. Every help toward its completion has been freely extended, the most important being the use of the advance proof-sheets of the "Oceanic Ichthyology" of Goode & Bean.

To Timothy Hopkins, esq., of Menlo Park, Cal., a generous patron of biological research, we are indebted for the kind interest which made it possible for the junior author to associate himself with the present work.

Dr. George A. Boulenger, of the British Museum of Natural History, has examined many type specimens for us, and has most kindly furnished advance proof-sheets of the first volume of his Catalogue of Teleostean Fishes. Large use of these proof sheets has been made in our accounts of the *Percidæ* and *Serranidæ*.

Valued aids in the solution of doubtful questions have been received from Dr. Franz Steindachner of Vienna, Dr. Franz Hilgendorf of Berlin, Dr. Christian F. Lütken of Copenhagen, Dr. Robert Collett of Christiania, and from Dr. Léon Vaillant, M. F. Bocourt, and M. Alexandre Thominot, in Paris.

In our own country, we have especially to express our obligations for favors received from Dr. Tarleton H. Bean, of the New York Aquarium; from his brother, Mr. Barton A. Bean, and Mr. R. Edward Earll, of the United States National Museum; from Prof. Edward D. Cope, of Philadelphia, and Mr. Samuel Garman, of the Museum of Comparative Zoölogy; Dr. Hugh M. Smith and Mr. William C. Kendall, of the United States Fish Commission; Dr. Stephen A. Forbes, of the University of Illinois; Dr. Edwin J. Nolan, of the Academy of Natural Sciences of Philadelphia, and Prof. Simon H. Gage, of Cornell University. To the Hon. Marshall McDonald, United States Commissioner of Fish and Fisheries, and Mr. Richard Rathbun, chief of the Division of Scientific Inquiry of the United States Fish Commission, we are under especial obligations for assistance in many ways.

Our own students, present and past, especially Dr. Seth E. Meek, Dr. Wilbur W. Thoburn, Mr. Edwin C. Starks, Dr. Frank Cramer, Dr. Carl H. Eigenmann, Mr. Albert J. Woolman, Mr. Cloudsley Rutter, Mr. Keinosuke Otaki, Mr. Thomas M. Williams, Mr. George B. Culver, Mr. Norman B. Scofield, Miss Susie B. Bristol, Mrs. Flora Hartley Greene, and others, have rendered aid of various kinds. Dr. Meek has devoted a winter in Palo Alto to the preparation of the first draft of the account of the *Pomacentridæ*, *Gadidæ*, *Brotulidæ*, and other families. Mr. Cramer is the author of the account of the *Scorpænidæ* and *Agonidæ*, and to Dr. Thoburn we owe the outline of the *Cottidæ*. Mr. Starks has spent much time in the verification of descriptions. An especially important service has been rendered by Prof. Walter Miller of the chair of Archæology in Leland Stanford Junior University, and Mr. William Barnum, Editor of the United States Fish Commission publications, in reviewing and correcting the etymology of names of the genera and species. Prof. Augustus T. Murray, of the chair of Greek in the Leland Stanford Junior University, has also contributed valuable suggestions. To Mr. George A. Clark, President's Secretary of the Leland Stanford Junior University, we owe many favors in connection with the preparation of manuscript.

Under the head of each species, enough synonymy has been given to connect this work with other descriptive works, and no more. Reference is made to each original description of supposed new species or genera, to the descriptions in Dr. Günther's "Catalogue of the Fishes of the British Museum," to Jordan & Gilbert's "Synopsis of the Fishes of North America," and to other works in which special information is given. The limits of the present work prevent us from giving a bibliography of the works consulted. In general, we have tried to examine every paper which throws light on American Ichthyology.

In conclusion, we may say that no one can realize the imperfections of this work more keenly than we do. We offer no excuse for inaccuracies and errors, but it is fair to say that, throughout the four years in which this work was written, both its authors have found their energies crowded to the utmost by executive work to which systematic ichthyology bears no relation. Had it not been so, this book would have come somewhat nearer our own ideals, and especially would it be more exact and detailed on the side of Osteology, Embryology, and Palæontology. As it is, we trust that the work will be a useful representation of the present state of our knowledge of the fauna in question.

David Starr Jordan,
Barton Warren Evermann.

Leland Stanford Junior University,
Palo Alto, Santa Clara County, California.
March 15, 1895.

NOTE.

In our descriptions of species, we have attempted to bring the principal comparative measurements first. The expressions "head 4," or "depth 4" mean that the length of the head in the one case, or the greatest depth of the body in the other, is contained 4 times in the length of the fish measured from the tip of the snout to the end of the last caudal vertebra, the caudal fin being not included. The size of the eye and the length of snout and other head parts are compared with the length of the side of the head, unless otherwise stated; thus "eye 5" means that the horizontal diameter of the eye is $\frac{1}{5}$ the length of the head. "Scales 5–64–7" means that there are 5 rows of scales between the base of the dorsal fin and the lateral line (the scale in the lateral line excluded), 64 oblique transverse series crossing the lateral line, and 7 horizontal series between the lateral line and the base of [illegible] or the vent. When the number of pores in the lateral line is fewer than the number of scales in it, we have usually indicated the fact.

The fin formulæ are usually shortened as much as possible; thus "D. 10," "D. IV, 9," or "D. VIII–13," means that in the first case the fish has a single dorsal fin of 10 soft or articulated rays; in the second case, a single dorsal fin of 4 spines and 9 soft rays; and the last indicates a fish with 2 dorsal fins, the first composed of 8 spines and the second of 13 rays.

Spines are always indicated in Roman letters.

The abbreviations for the other fin formulæ are similarly explained.

The measurements given in the text are intended to apply to the average of mature fishes. Young fishes usually have the depth less, the head and eye larger, and the mouth smaller, than adult examples of the same species.

Descriptions not taken from specimens, or at least not verified by us, are credited to the author from whom they have been copied.

"Eu." after the account of any species indicates that it is found in Europe.

The names of the localities from which the types of the species were obtained, are printed in antique old style type in connection with the synonymy of each species.

When the type specimens are in the United States National Museum, we have given the numbers which they bear on the register of that institution.

An atlas, containing anatomical figures and illustrations of many of the more important species, is now in preparation and will appear upon the completion of the second volume of the present work.

Xystroperca, Jordan & Evermann	1181
Ocyanthias, Jordan & Evermann	1227

THE FISHES
OF
NORTH AND MIDDLE AMERICA.

BY DAVID STARR JORDAN AND BARTON WARREN EVERMANN.

Ichthyology (*ἰχθύς*, fish; *λόγος*, a discourse) is the study of fishes. A "fish," in the popular sense, is a member of any one of the three classes of aquatic or fish-like vertebrates, the groups here designated as *Leptocardii*, *Marsipobranchii*, and *Pisces*. The *Tunicata* and *Enteropneusta (Balanoglossus)*, now recognized as belonging to the CHORDATA and approximated to the VERTEBRATA, are excluded in this definition, as in their adult condition these creatures have undergone a retrograde metamorphosis and are by no means fish-like. For an opposite reason, the BATRACHIA, which develop jointed limbs in their adult condition, although closely allied to the true fishes, are not included in the popular idea of a fish.

Among the forms commonly called fishes we recognize three classes—*Leptocardii*, *Marsipobranchii*, and *Pisces*. We have preferred to leave the *Pisces* as a single class, including all fish-like vertebrates with paired fins, though there is much to be said in favor of regarding the Selachians and Dipnoans as each constituting a distinct class coördinate with the true fishes and the Batrachians. We see no warrant for separating the Ganoids as a class from the true fishes, still less for uniting the Ganoids and Selachians in one class, *Palæichthyes*, while the true fishes are placed in another.

ANALYSIS OF THE CLASSES OF FISH-LIKE VERTEBRATES.

a. Acraniata.—Anterior end of the central nervous axis not dilated into a brain and not surrounded by a protective capsule, or skull.

  b. Notochord perfect, persistent, extending throughout the body, included in a membranous sheath, as is the cord-like nervous axis above it; body elongate, lanceolate, not worm-like nor enveloped in a tunic; walls of the body with muscular myotomes; middle line of body with rudimentary fins; no proboscis; the mouth slit-like, fringed with cirri; heart a longitudinal tubular vessel which gives off branchial tubes which unite in an aorta; gill slits inclosed externally by a fold in the integument which incloses a chamber (atrium) which opens below; vent remote from mouth. LEPTOCARDII, I.

aa. Craniota.—Anterior end of the nervous axis dilated into a brain which is contained within a protective capsule, the skull; notochord not continued forward beyond the pituitary body; heart developed and divided at least into two parts.

  c. Skull imperfectly developed and without jaws; shoulder girdle and pelvis obsolete; no paired fins; a single median nostril; gills purse-shaped; skin naked; skeleton cartilaginous. MARSIPOBRANCHII, II.

  cc. Skull well developed, and with jaws; shoulder girdle and pelvis more or less developed; nostrils not median; gills not purse-shaped; limbs, if present, developed as rayed fins, never with fingers and toes like those of the higher vertebrates; gills persistent through life. PISCES, III.

Class I. LEPTOCARDII.

(The Lancelets.)

Skeleton membrano-cartilaginous. Notochord persistent and extending to the anterior end of the head, inclosed in a membranous sheath as is the cord-like nervous axis above it. Heart a longitudinal tubular vessel which gives off branchial vessels which unite in an aorta; end of the nervous axis not dilated into a brain and not surrounded by a protective capsule, or skull. Blood colorless. Respiratory cavity confluent with the cavity of the abdomen; gill slits in great number, the water being expelled through an abdominal pore in front of the vent. Jaws none; the mouth a longitudinal fissure, with cirri on each side. Body lanceolate in form, more or less fish-like, and not enveloped in a tunic. Dorsal fin present, low; anal fin usually more or less developed.

Small marine animals, highly interesting to the zoölogist as exhibiting the lowest degree of development of the vertebrate type. The class includes but the single order, Amphioxi or Cirrostomi. (*λεπτός*, thin; *καρδία*, heart.) (Subclass Leptocardii, Günther, Cat., viii, 513–514.)

Order A. AMPHIOXI.

(The Cirrostomes.)

This order is equivalent to the family Branchiostomidæ. (*ἀμφί*, both; *ὀξύς*, sharp: *Cirrostomi* is from *cirrus*, a lock of hair; *στόμα*, mouth.) (Cirrostomi, Günther, Cat., viii, 513–514.)

Family I. BRANCHIOSTOMIDÆ.*

(The Lancelets.)

Body elongate, lanceolate, compressed, naked, colorless; the fins represented by a low fold extending along the back, with usually a rudimentary fold below which passes by the vent to the abdominal pore. Mouth inferior, appearing as a longitudinal fissure, surrounded by conspicuous, rather stiff, cirri. Eye rudimentary. Liver reduced to a blind sac of the simple intestine. Small, translucent creatures found imbedded in the sand on warm coasts throughout the world. Eight species are now recognized, referable to 2 or 3 genera. They are all very similar in appearance and habits, and the numbers of the muscular impressions furnish the only characters thus far known by which the species can be distinguished.† (Cirrostomi, Günther, Cat., viii, 513–514.)

a. Gonads (reproductive structures) present on both sides of the median line; anal fin present, with traces of fin rays; no caudal process. Branchiostoma, 1.

aa. Gonads present on the right side only; anal fin without fin rays or successive fin-ray chambers; a long caudal process, or tail, about as long as the head. Asymmetron, 2.

---

[*] In the arrangement of the genera and species of this group we have been guided by the conclusions of Dr. E. A. Andrews, in his recent paper, "An undescribed Acraniate: *Asymmetron lucayanum*." (Studies Biol. Lab. Johns Hopkins University, v, No. 4, 213–247, 1893.)

[†] See Günther, Rept. Zoöl. Voyage H. M. S. Alert, 1884, where the value of this character is first fully recognized.

1. BRANCHIOSTOMA, Costa.

(LANCELETS.)

Branchiostoma, COSTA, Cenni Zoölogici Napol., 49, 1834, (*lubricum* = *lanceolatum*).
Amphioxus, YARRELL, British Fishes, 468, 1836, (*lanceolatus*).

Lancelets with the gonads or reproductive structure present on both sides of the median line. Anal fin present, with traces of rays. Vertebral column not produced backward into a caudal process. Six or 7 species recognized, found in the warm seas, usually buried in sand flats at no great depth. They are very tenacious of life, and will endure considerable mutilation. (*βράγχια*, gills; *στόμα*, mouth, the cirri about the mouth having been taken for gills by Costa).

a. Myocommata or muscular bands, 58 to 64.
  b. Myocommata behind vent, 11 to 13, the formula usually $35 + 14 + 12 = 61$. LANCEOLATUM, 1.
  bb. Myocommata behind vent, 7 to 10, the formula usually $35 + 14 + 9 = 58$. CARIBÆUM, 2.
aa. Myocommata or muscular bands, 65 to 70, the usual formula $44 + 16 + 9 = 69$; size larger than in other American species; the tail short. CALIFORNIENSE, 3.

1. BRANCHIOSTOMA LANCEOLATUM, (Pallas).

(EUROPEAN LANCELET; AMPHIOXUS.)

Muscular bands usually $35 + 14 + 12 = 61$. Usual length 1½ inches. The common European species, with the tail stoutish and rather long; abundant on the sandy shores of the Mediterranean, and known from Southern England and Scandinavia. The Lancelet of the Chesapeake Bay, according to Dr. Andrews, is referable to this species rather than to *B. caribæum*. (*lanceolatus*, lance-shaped.) (EU.)

Limax lanceolatus, PALLAS, Spicilegia Zoöl., X, 19, 1774, Cornwall.
Branchiostoma lubricum, COSTA, Cenni Zoöl. Napol., 49, 1834, Naples.
Amphioxus lanceolatus, YARRELL, British Fishes, 468, 1836, and of many writers on anatomy; GÜNTHER, Cat., VIII, 513, 1870; JORDAN & GILBERT, Synopsis, 867, 1883; GÜNTHER, Rept. Zoöl. H. M. S. Alert, 32, 1884; ANDREWS, Studies Biol. Lab. Johns Hopkins Univ., V, 238, 1893.

2. BRANCHIOSTOMA CARIBÆUM,* Sundevall.

(WEST INDIAN LANCELET.)

Muscular bands (myocommata) usually $35 + 14 + 9 = 58$; gonads 22 to 26 on each side; usual length 1¼ inches; tail short; extremities attenuate. In shallow waters, buried in the sand, from Beaufort, N. C., to the mouth of the La Plata; abundant off the Carolina coast and in localities in Florida (Port Tampa), Jamaica, Brazil, etc. (Name from the Caribbean sea.)

Branchiostoma caribæum, SUNDEVALL, Öfvers, Vet. Akad. Förhandl., 12, 1853, St. Thomas; Rio Janeiro; GÜNTHER, Voyage Alert, 32, 1884; JORDAN & GILBERT, Synopsis, 3; ANDREWS, *l. c.*, 240, 1893.

---

*This species is not very different from *B. lanceolatum*, and may vary into it.

3. BRANCHIOSTOMA CALIFORNIENSE,* Gill.

(CALIFORNIA LANCELET.)

Larger than the other American species, with the muscular bands in greater number, usually 44 + 16 + 9 = 69. Tail very short. Usual length 70 mm., or nearly 3 inches. Coast of California, from San Diego Bay southward, very abundant at the mouth of San Diego Bay, where it was first obtained by Dr. J. G. Cooper about 1868; lately taken in large numbers at San Diego and at San Luis Gonzales Bay, in the Gulf of California. In specimens from the last-named locality (Albatross Coll.) the usual formula is 45 + 14 + 9 = 68.

Branchiostoma, species, COOPER, Cronise, Nat. Wealth California, 489, 1868, San Diego.
Branchiostoma californiensis, GILL, MS., ANDREWS, *l. c.*, 241, 1893.

2. ASYMMETRON, Andrews.

? *Epigonichthys*,† PETERS, Berl. Monatsber., 327, 1876, (*cultellus*).
Asymmetron, ANDREWS, Studies Biol. Lab. Johns Hopkins Univ., v, 237, 1893, (*lucayanum*).

Gonads, or reproductive structures, developed on the right side only. Anal fin without fin rays or successive fin-ray chambers. A long caudal process. Otherwise as in *Branchiostoma*. One species. (ἀ-σύμμετρος, wanting symmetry.)

4. ASYMMETRON LUCAYANUM, Andrews.

(BAHAMA LANCELET.)

Right metapleuron continuous with the median ventral (anal) fin, which passes to the right of the anus. Preoral hood extensive, the cirri united by the membrane throughout the greater part of their length, and smooth, without sensory papillæ. Gonads on the right, 29, extending from the 15th to the 43d myotomes inclusive. Myotome formula 44 + 9 + 13 = 66. Length ½ inch. Adult and young swimming at the surface in the evening in June and July at Bemini and Nassau, Bahamas; also taken buried in calcareous sand. (*Andrews.*) (*Lucayas*, the islands discovered by Columbus in 1492, now the Bahamas.)

Asymmetron lucayanum, ANDREWS, *l. c.*, 237, 1893, Bemini, Bahamas.

Class II. MARSIPOBRANCHII.‡

(THE LAMPREYS.)

Skeleton cartilaginous; the skull imperfectly developed, not separate from the vertebral column. No true jaws, no limbs, no shoulder girdle, no pelvic elements, no ribs. Gills in the form of fixed sacs, without branchial arches, 6 or more in number on each side. Nostril single, median. Mouth subinferior, suctorial, more or less circular. Heart without arterial bulb. Alimentary canal straight, simple, without cæcal appendages, pancreas, or spleen. Generative outlet peritoneal. Vertical fins with feeble rays, usually continuous around the tail. Naked, eel-shaped animals, inhabiting cool waters, both fresh and salt. They undergo a metamorphosis, the young being often quite unlike the adult. (Subclass CYCLOSTOMI, Günther, Cat., VIII, 1870, 499–512.) (*μαρσίπιον*, pouch; *βράγχια*, gills.)

---

* Closely allied to this species is *B. elongatum*, Sundevall. Myocommata 49 + 18 + 12 = 79. Length 1⅖ to 2½ inches. Chinchas Islands, Peru, probably extending northward to Panama, but not yet recorded within our limits. (Sundevall, Öfers. Vet. Akad. Förh., 147, 1853, Chinchas Islands.)

† *Epigonichthys* is said to differ from *Branchiostoma* in the absence of the anal fin. Dr. Andrews states that Mr. Arthur Willey, who has examined its Australian type, *E. cultellus*, finds gonads on the right side only, as in *Asymmetron*. If *Asymmetron* is a valid genus, probably *Epigonichthys* is also valid. It is perhaps distinguishable from *Asymmetron* by the want of a caudal process.

‡ Prof. Cope makes the *Marsipobranchii* a subclass under a class *Agnatha*, characterized by the absence of jaws and shoulder girdle. This class is composed chiefly of extinct forms, most of them belonging to the subclass *Ostracodermi*, and provided with bony dermal plates and lateral limbs. See American Naturalist, October, 1889, 853. The group *Marsipobranchii* is also often known as *Cyclostomi*, as *Dermopteri*, and as *Myzontes*.

ORDERS OF MARSIPOBRANCHII.

a. Nasal tube duct-like, with cartilaginous rings, penetrating the palate; gill openings remote from the head, opening directly into the pharynx; no eyes. HYPEROTRETI, B.

aa. Nasal duct a blind sac, not penetrating the palate; gill openings close behind the head, communicating with a common branchial passage which opens directly into the pharynx; eyes well developed in the adult. HYPEROARTII, C.

Order B. HYPEROTRETI.*

(THE HAGFISHES.)

Nostril tube-like, with cartilaginous rings, penetrating the palate, its position at the extremity of the head, over the mouth; snout with 8 barbels; mouth without lips; 1 median tooth on the palate and 2 comb-like series of teeth on the tongue. Branchial apertures at a great distance from the head; a series of mucous sacs along each side of the abdomen. Intestine without spiral valve. Eggs large, with a horny case provided with threads for adhesion. Marine lamprey-like animals, burrowing into the flesh of fishes, on which they feed. They may be referred to 2 families, differing mainly in the structure of the gill openings. (*ὑπερῷα*, palate; *τρητός*, perforate).

a. Branchial apertures 6 to 14 on each side, each leading by a duct to a branchial sac. HEPTATREMIDÆ, II.

aa. Branchial apertures single on each side, from which diverge ducts to 6 branchial sacs. MYXINIDÆ, III.

Family II. HEPTATREMIDÆ.

(THE BORERS.)

This family differs from the *Myxinidæ* chiefly in the structure of the branchial apparatus, there being 6 to 14 sacs on each side which receive water directly from the œsophagus, as in *Myxine*, but the emptying ducts, instead of passing backward and downward to a common external opening, as in *Myxine*, pass directly through the wall of the body, so that there are as many external openings as there are gill sacs. Species about 5, referable to 2 genera, inhabiting the colder parts of the Pacific, their habits similar to those of *Myxine glutinosa*. They fasten themselves on the gills or eyes or isthmus of large fishes, whence they work their way very rapidly into the inside of the body. They there devour all the flesh without breaking the skin, so that the fish is left a mere hulk of head, skin, and bones. (*Myxinidæ*, genus *Bdellostoma*, Günther, Cat., VIII, 511. The generic name *Heptatrema*, Duméril, has priority over *Bdellostoma*.)

---

* For a general account of our species of *Hyperotreti*, see Putnam, Proc. Bost. Soc. Nat. Hist., 1873.

a. Gill openings 10 to 12 on each side; base of tongue opposite sixth or seventh pair of gills. POLISTOTREMA, 3.

3. POLISTOTREMA, Gill.

Polistotrema, GILL, Proc. U. S. Nat. Mus., 1880, 30, (*dombey*).*

This genus is distinguished from *Heptatrema (Bdellostoma)* by the presence of 10 to 14 gill openings, instead of 6 or 7, as in *Heptatrema*. Two or 3 species known, from the eastern Pacific. (A superlative of πολύς, many; τρῆμα aperture.)

5. POLISTOTREMA STOUTI, (Lockington).

(CALIFORNIA HAGFISH; LAMPERINA.)

Gills usually† 12 on each side, the number varying from 10 to 14. Teeth 10 in each series. Branchial artery dividing opposite sixth or seventh pair of gills. Snout 20 times in total length; head to first gill opening 4½; branchial region 8, tail 8. Plum color, paler below, the edge of the lower fold pale. Skin thin, very lax, and separable from the muscles, excessively slimy. L. 14 inches. Coast of California, and north to Cape Flattery, very abundant about Monterey, burrowing ‡ into the flesh of the larger flounders and *Sebastodes*. (Named for Dr. A. B. Stout, of San Francisco.)

Bdellostoma stouti, LOCKINGTON, Amer. Nat., 1878, 793, Eel River, California.
Bdellostoma dombey, JORDAN & GILBERT, Synopsis, 57, 1883, not of Cuvier.

---

* *Polistotrema dombey* (Cuvier) is a species distinct from *P. stouti*. It is thus characterized by Putnam (Proc. Bost. Soc. Nat. Hist., 1873, 160), from specimens from Chile: "Head about ⅕ of total length, and contained about 1⅓ times in the length of the abdomen. Tail 7 to 8 times in total length. Base of tongue between the 7th or 8th pair of gills. Gills, 10 on each side. Length from 13 to 22 inches. Coast of Chile." According to Putnam the branchial artery divides at its base into a right and a left trunk in this species.

Le Gastrobranche dombey, LACÉPÈDE, Hist. Nat. Poiss., I, 531, 1798, Chile, non-binomial.
Gastrobranchus dombey, CUVIER, Règne Animal, 121, 1817, after Lacépède.
Bdellostoma polytrema, GIRARD, Proc. Acad. Nat. Sci. Phila., 1854, 199, Valparaiso.
Bdellostoma polytrema, GÜNTHER, Cat., VIII, 512, 1870.

†According to Dr. Gilbert, in 54 specimens of *Polistotrema stouti*, 41 were found to have 12 gill openings on each side, 12 had 11 on each side, and 1 had 13. Occasional specimens may have either 10 or 14, but the normal number is 12.

‡ The hagfish fastens itself usually on the gills or isthmus of large fishes, sometimes on the eyes, whence it works its way very rapidly into the inside of the body. It then devours all the flesh of the body without breaking the skin, so that the fish is left a living hulk of head, skin, and bones. It is especially destructive to fishes taken in gill nets. In every gill net in summer, at Monterey, more or less of these empty shells of fishes are obtained. When these are taken from the water the hagfish scrambles out with great alacrity. It is thought that the hags enter the fishes after they are caught. A fish of 10 to 15 pounds weight will be devoured by them in a single night. Large fishes of even 30 pounds weight are often brought up without flesh and without viscera, and they certainly do not swim into a gill net in this condition.

The fishes chiefly infested are *Sebastodes pinniger*, *miniatus*, and *mystinus*, *Ophiodon elongatus*, *Paralichthys californicus*, and *Rhacochilus toxotes*.

Family III. MYXINIDÆ.

(The Hagfishes.)

Body eel-shaped, covered by a thin skin, which is easily detached. Along the lower side, for nearly the whole length of the animal, are 2 rows of mucous glands, each with an external opening, yielding an abundance of mucus which renders these animals excessively slimy. No eyes. Brain small, of the normal fish type. Skull little developed, cartilaginous; the flexible notochord inclosed in its sheath, and extending from the base of the skull to the end of the tail, representing the spinal column. Mouth round, suctorial, without lips, with a pair of barbels on each side. Nostril single, large, on the median line above, and at the very front of the head, provided with 2 pairs of barbels. Teeth strong, a single median one on the roof of the mouth, and 2 rows on each side of the tongue, which is a powerful organ, with a strong fibrous tendon moving in a muscular sheath. Alimentary canal a simple nearly straight tube, without spiral valve; gill sacs placed on each side of the œsophagus, lying directly against its outer walls. The water passes into them by a small pore opening directly from the œsophagus into each sac. It is then passed out by a duct, which continues backward along the outer walls of the sacs to the abdominal wall at the end of the last sac, where all the ducts from one side unite in one, and the water is emptied at the branchial opening on each side of the median line. In close connection with the branchial opening on the left side there is a third opening that leads by a very short duct to the œsophagus, and hence into the branchial sacs, at the times when the supply of water through the mouth is cut off by the head being buried in the flesh of the animal on which it feeds. Ovary single, on the right side. No oviducts; the mature eggs falling into the abdominal cavity and excluded through the peritoneal opening at the side of the vent. Eggs with a horny case, and threads for adhesion. Parasitic animals, burrowing into the bodies of fishes, and found in the cold seas.

Two species are usually recognized—*Myxine olivacea*, Lacépède (= *australis*, Jenyns), from the coasts of Patagonia, and *Myxine glutinosa*. (*Myxinidæ*, genus *Myxine*, Günther, VIII, 510-511.)

4. MYXINE, Linnæus.

Myxine, Linnæus, Systema Naturæ, Ed. x, 1758, 650, (*glutinosa*).
Gastrobranchus, Bloch, Ichth., XII, 51, tab. 413, 1797, (*cæcus*).
Muræenoblenna, Lacépède, Hist. Nat. Poiss., v, 647, 1803, (*olivacea*).
Anopsus, Rafinesque, Anal. de la Nature, 493, 1815, (*olivacea*).

Characters of the genus included above. (An old name, from *μύξα*, slime).

6. MYXINE GLUTINOSA,[*] Linnæus.

(Hagfish; Borer.)

Head 3½ to 4 in total length; tail 6½ to 10; lingual teeth 8 to 11 in each row. Bluish above, whitish below. North Atlantic on both coasts, south to Cape Cod. Not abundant in America. "Intrat et devorat Pisces; aquam in gluten mutat." (Linnæus). (EU.)

---

[*] "*Myxine* is generally or always in its young stage a male, while at a more advanced stage it becomes transformed into a female. It seems to be an animal which in sexual respects is in a transition stage, from what and to what it is hard to say. It seems to be seeking, without yet reaching that mode of reproduction which is most profitable for it in the struggle for existence." —*Fridtjof Nansen.*

Myxine glutinosa, LINNÆUS, Syst. Nat., Ed. x, 650, 1758, Atlantic Ocean; GÜNTHER, Cat., VIII, 510, 1870; PUTNAM, Proc. Bost. Soc. Nat. Hist., 1873, 135.

Myxine limosa, GIRARD, Proc. Ac. Nat. Sci. Phila., 1858, 223, Grand Menan, Bay of Fundy; JORDAN & GILBERT, Synopsis, 5, 1883.

Gastrobranchus cœcus, BLOCH, Ichth., XII, pl. 413, 66, 1795, Denmark, etc.

Order C. HYPEROARTII.*

(THE LAMPREYS.)

Nasal duct a blind sac, not penetrating the palate. This order is equivalent to the single family *Petromyzonidæ*. (*ὑπερῴα*, palate; *ἄρτιος*, complete; *i. e.*, entire.) (PETROMYZONTIDÆ, Günther, Cat., VIII, 499–509.)

Family IV. PETROMYZONIDÆ.

(THE LAMPREYS.)

Body eel-shaped, subcylindrical anteriorly, compressed behind; the mouth nearly circular, suctorial, usually armed with horny teeth, or tooth-like tubercles which are simple or multicuspid, resting on papillæ; those immediately above and those immediately below the œsophagus more or less specialized; eyes developed in the adult; gill openings 7, arranged in a row along the sides of the "chest;" nostril on top of the head just in front of the eyes; lips present, usually fringed; dorsal fin more or less deeply divided by a notch; the posterior part commonly continuous with the anal around the tail; intestines with a spiral valve; eggs small.

These animals undergo a metamorphosis; the young are usually toothless and have the eyes rudimentary. Separate generic names (*Ammocœtes*, *Scolecosoma*, *Chilopterus*) had been applied to these larval forms, before it was discovered that they were the normal young of the true lampreys.

Genera about 7; species about 15; of the rivers of temperate regions. They attach themselves to fishes and feed by scraping off the flesh with their rasp-like teeth. Most of them ascend rivers or brooks at the spawning season, after which very many of the individuals die. (PETROMYZONTIDÆ, Günther, Cat., VIII, 499–509.)

a. Second dorsal continuous with caudal.
  b. Supraoral lamina ("maxillary") and infraoral lamina ("mandible") destitute of teeth, "the armature of the lamprey type being obsolescent;" otherwise as in *Petromyzon;* sea lampreys. BATHYMYZON, 5.
  bb. Supraoral and infraoral laminæ with teeth or tooth-like tubercles.
    c. Supraoral lamina contracted, the armature consisting of 2 or 3 cusps placed close together; discal teeth numerous, in concentric series; anterior lingual teeth with a median depression or groove; buccal disk large in the adult, contracted in the young.
      Anterior lingual tooth with a deep median groove and terminating in an incurved point; dorsal fin divided. Large lampreys; anadromous. PETROMYZON, 6.

---

* For a detailed account of the North American Lampreys, see Jordan & Fordice, Ann. N. Y. Ac. Sci., 1886. For an excellent account of the life history of certain species see Gage, in Wilder Quarter-Century Book, 1893, pp. 420–479.

dd. Anterior lingual tooth divided by a median groove; dorsal fin continuous, with a broad notch. Small lampreys; fluviatile. ICHTHYOMYZON, 7.

cc. Supraoral lamina very large, expanded laterally, forming a crescent-shaped plate with a cusp at either end and sometimes a median cusp; anterior lingual teeth more or less serrate.

e. Supraoral lamina with a well-developed median cusp; anterior lingual tooth wedge-shaped, its edge finely serrate and nearly straight; dorsal fin divided; buccal disk moderate, some of its teeth bicuspid. Large lampreys; anadromous. ENTOSPHENUS, 8.

ee. Supraoral lamina with a very small median cusp or none; anterior lingual tooth little developed, its edge crescent-shaped and dentate; the middle denticle enlarged; buccal disk small, the teeth small and never tricuspid; dorsal fins separate or deeply divided; small lampreys; fluviatile. LAMPETRA, 9.

5. BATHYMYZON, Gill.

Bathymyzon, GILL, Proc. U. S. Nat. Mus., 1883, 254, (*bairdii*).

Supraoral lamina contracted, its two converging teeth almost completely fused, and only evident at the summit of the combined mass; infraoral lamina crescentiform and spout-like at the middle and with the denticles obsolete; discoperipheral teeth numerous and in obliquely arched series of 4 to 7, declining downward; innermost lateral teeth of the 4 rows diverging from mouth, in each side bicuspid, with the cusps approximated and diminishing downward rapidly; lingual teeth 3, pectinate, the anterior deeply impressed and sulcate backward at the middle, and the posterior correspondingly curved backward at their inner lateral angles; the anterior dorsal fin distinct from posterior. (*βαθύς*, deep; *μύζω*, to suck.)

7. BATHYMYZON BAIRDII, (Gill).

Head from snout to first branchial aperture about 7 times in total length; eye midway between snout and fifth branchial aperture; diameter of buccal disk equal to interval between eye and fifth branchial aperture, the margin regularly fringed; indications of 8 teeth on the infraoral lamina; tips of the two supraoral ones barely perceptible; pectinations of lingual teeth well marked. Chest about as long as snout. Fins moderate; anterior dorsal somewhat higher in front of middle than diameter of orbit, second dorsal about twice as high, or equal to the distance between eye and first branchial aperture. Color dark, belly grayish; second dorsal darker across middle in front and toward margin behind; caudal blackish throughout. (Gill.) Gulf stream, once taken. (Named for Spencer Fullerton Baird.)

Petromyzon (*Bathymyzon*) *bairdii*, GILL, *l. c.*, 254, 1883; lat. 49° N., 547 fathoms; GOODE & BEAN, Oceanic Ichthyology, 4, 1894. (Type, No. 33311.)

6. PETROMYZON, (Artedi), Linnæus.

(LAMPREYS.)

Petromyzon, (ARTEDI), LINNÆUS, Systema Naturæ, Ed. x, 1758, 230 (*marinus*).

Ammocœtes, (Duméril), CUVIER, Règne Animal, Ed. I, 119, 1817, (*branchialis*, larval form of any or all European species.)

Ammocœtus, BLAINVILLE, Faune Française, liv. XXIV, 3, 1828, (*branchialis*).

Lampreys with the supraoral lamina armed with 2 or 3 separate teeth, pointed, and close together, not forming a crescent-shaped plate; anterior lingual tooth with a median depression; buccal disk large, with numerous teeth arranged in concentric series; dorsal fins separate, the second joined to the caudal.

North Atlantic, ascending rivers; one species known, the largest of the lampreys. (*πέτρα*, stone; *μύζω*, to suck.)

8. PETROMYZON MARINUS, Linnæus.

(Great Sea Lamprey; Lamprey Eel.)

Head large, longer than the branchial area; buccal disk large, with numerous conical teeth, arranged in obliquely transverse series, 4 to 7 in each row; lateral teeth on each side of mouth bicuspid, the other teeth simple; dorsals low, well separated; the second dorsal with a depression on the tail; lips moderately fringed; males and often females, in spring, with an elevated fleshy ridge on back before dorsal fin; 64 muscular impressions between gill openings and vent. Color bluish brown, mottled with blackish confluent patches, rarely nearly plain; whitish below. Length 24 to 36 inches. Atlantic coasts of Europe and North America, southward to Chesapeake Bay, abundant northward, ascending streams in the spring to deposit its spawn. (Eu.)

Petromyzon marinus, Linnæus, Syst. Nat., Ed. x, 1758, 230, European Seas; (after Artedi); Günther, Cat., viii, 501; Jordan & Gilbert, Synopsis, 11, 1883; Jordan & Fordice, Ann. Ac. Sci. N. Y., 1886, 283.

Petromyzon americanus, Le Sueur, Trans. Am. Phil. Soc. Phila., i, 383, 1818, Coast of Massachusetts; Storer, Fish. Mass., 251, pl. 38, fig. 4, 1867.

Petromyzon nigricans, Le Sueur, *l. c.*, 385, 1818, Massachusetts.

Ammocœtes bicolor, Le Sueur, *l. c.*, 386, 1818, (larva), Northampton, Massachusetts.

Petromyzon appendix, De Kay, N. Y. Fauna: Fishes, 381, 1842, (young). Providence; Hudson River.

?*Petromyzon lamotteni*, Le Sueur, in De Kay, *l. c.*, 382, 1842, no locality.

Represented in fresh waters by

8a. PETROMYZON MARINUS UNICOLOR, (De Kay).

A dwarfish form similar to the common lamprey; darker and more uniform in color, the dorsal ridge larger, the fins closer together; found landlocked in the lakes of northern and central New York; abundant in Cayuga Lake.

Ammocœtes unicolor, De Kay, N. Y. Fauna: Fishes, 383, 1842, (larva), Lake Champlain.

Petromyzon marinus dorsatus, Wilder MS., Jordan & Gilbert, Synopsis, 869, 1883, Cayuga Lake. (Type, No. 31368); Gage, Wilder Quarter Century Book, 1893, 420.

Petromyzon marinus unicolor, Meek, Ann. Ac. Sci. N. Y., 1886, 284.

7. ICHTHYOMYZON, Girard.

(River Lampreys.)

Ichthyomyzon, Girard, Pac. R. R. Sur., x, 381, 1858, (*argenteus*).

Scolecosoma, Girard, *l. c.*, 385, 1858, (*concolor, larva*).

Allied to *Petromyzon*, but with the anterior lingual tooth divided by a median groove. Dorsal fin continuous, with a broad notch. Small lampreys; confined to fresh waters in eastern United States. (*ἰχθύς*, fish; *μύζω*, to suck.)

a. Head 7½ in length; infraoral lamina with 7 cusps. CONCOLOR, 9.
aa. Head 9 in length; infraoral lamina with 7 to 12 cusps. CASTANEUS, 10.

9. ICHTHYOMYZON CONCOLOR, (Kirtland).

(SILVERY LAMPREY.)

Body considerably compressed; head broad, with large buccal disk, which is moderately fringed; teeth strong and nearly uniform, the 2 supraoral teeth being similar to those on the rest of the disk; lateral teeth all simple; infraoral cusps connivent, 7 in number, the middle ones the longest; upper margin of dorsal scarcely depressed in front of the vent; origin of dorsal nearly midway between the tip of snout and end of tail; 51 muscular impressions between gill openings and vent. Head 7½; depth 12. Color, silvery, bluish above, sometimes with bluish spots; a small dusky spot above each gill opening, usually conspicuous even in the larva; larva with small toothless contracted mouth, as in *P. marinus*. It may be that this is the young of *Petromyzon marinus*. L. 12 inches. Great Lakes and upper Mississippi Valley; rather common; ascending small brooks in the spring. (*concolor*, uniformly colored.)

Petromyzon argenteus, KIRTLAND, Bost. Jour. Nat. Hist., III, 1840, 342, with plate (name preoccupied), Big Miami River.
Ammocœtes concolor, KIRTLAND, *l. c.*, 473, with plate (larva), Mahoning River; Scioto River.
? *Ammocœtes borealis*, AGASSIZ, Lake Superior, 252, 1850, Michipicoten River.
? *Ammocœtes æpypterus*, ABBOTT, Proc. Ac. Nat. Sci. Phila., 1860, 327 (larva), Ohio River.
Petromyzon bdellium, JORDAN, Cat. Fish. N. A., 4, 1885, after Kirtland.
Petromyzon concolor, JORDAN & FORDICE, Ann. N. Y. Ac. Sci., 1886, 282.
Ichthyomyzon argenteus, JORDAN & GILBERT, Synopsis, 10, 1883.

10. ICHTHYOMYZON CASTANEUS, Girard.

Supraoral lamina tricuspid; some of the lateral teeth bicuspid; infraoral lamina with 7 to 12 cusps; head 9 in length; otherwise as in *I. concolor*, the color more yellowish. L. 12 inches. Mississippi Valley, scarce.* (*castaneus*, chestnut color.)

Ichthyomyzon castaneus, GIRARD, Pac. R. R. Surv., 381, 1858, Galena, Minnesota.
Ichthyomyzon hirudo, GIRARD, *l. c.*, 382, Fort Smith, Arkansas. (Type, No. 980.)
Petromyzon castaneus, JORDAN & GILBERT, Synopsis, 868, 1883, and JORDAN & FORDICE, *l. c.*, 281, 1886; GÜNTHER, Cat., VIII, 507, 1870.
Ichthyomyzon hirudo, GÜNTHER, Cat., VIII, 507, 1870.

8. ENTOSPHENUS, Gill.

Entosphenus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 331, (*tridentatus*, name only); JORDAN & GILBERT, Synopsis, 7, 1883 (*tridentatus*).

Lampreys of large size, with the supraoral lamina forming a crescent-shaped plate on which are 3 cusps, the middle one little smaller than the others; anterior lingual tooth wedge-shaped, its edge almost straight and finely pectinate; lips fringed; buccal disk moderate, its teeth comparatively few; dorsal fins separate. One species, a large anadromous lamprey, found in the North Pacific, similar in habit to *Petromyzon marinus* of the North Atlantic. (*ἐντός*, within; *σφήν*, wedge; the lingual tooth being wedge-shaped.)

---

* Recorded from Galena, Minn. (Girard); Mill Creek, Shawnee Co., Kans. (Cragin); Fort Smith, Ark. (Girard); Forlorn Hope, La. (Bean); Manitoba (Evermann).

11. ENTOSPHENUS TRIDENTATUS, (Gairdner).

Lips thick, fringed with numerous papillæ, within which are small teeth. Infraoral lamina with 5 or 6 cusps; buccal teeth before mouth unicuspid, those on sides larger, the first and last bicuspid, the middle ones tricuspid; median supraoral cusp little more than ½ the length of the other 2; first dorsal fin distant about ⅖ of its own length from the second. Head 8 to 10 in length; 73 muscular impressions between gill openings and vent. Color, plain dark brown, rarely mottled. Pacific coast of America, Unalaska to Southern California; ascending streams to spawn, going as far as Walla Walla, in the Columbia, its range southward extends to Santa Ana River at Riverside, California. L. 18 inches or more. (*tridentatus*, three-toothed.)

Petromyzon tridentatus, (GAIRDNER MS.), RICHARDSON, Fauna Bor. Am., 293, 1836, Falls of the Walamet, now Willamette.

Petromyzon ciliatus, AYRES, Proc. Cal. Ac. Sci., 1855, 44, San Francisco.

Petromyzon lividus, GIRARD, Pac. R. R. Surv., 379, 1858, Wahlahmath River, Oregon (Willamette River.) (Type, No. 976.)

Petromyzon astori, GIRARD, *l. c.*, 380, 1858, Astoria, Oregon. (Type, No. 978.)

Ichthyomyzon tridentatus and *astori*, GÜNTHER, Cat., VIII, 506, 1870.

Entosphenus epihexodon, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 331, Fort Reading, California after Girard.

Lampetra tridentata, *astori*, and *epihexodon*, JORDAN & GILBERT, Synopsis, 7, 8, 1883.

Ammocœtes tridentatus, JORDAN & FORDICE, *l. c.*, 291, 1886.

9. LAMPETRA,* Gray.

(BROOK LAMPREYS.)

Lampetra, GRAY, Proc. Zoöl. Soc. London, 1851, 235, (*fluvialis*).

Lampreys of small size, with the dorsal fin emarginate or divided into two parts, the posterior portion continuous with the low anal fin around the tail; supraoral lamina broad, forming a crescentic plate, with a large bluntish cusp at each end, and rarely a very small median cusp; lingual teeth small, with a crescent-shaped dentate edge, the median denticle enlarged; buccal disk small, its teeth few and never tricuspid. Small lampreys, inhabiting the brooks of Europe and North America. Five or 6 species known, bearing much the same relation to *Entosphenus* that *Ichthyomyzon* bears to *Petromyzon*. (*lambere*, to suck; *petra*, stone.)

a. Dorsal fin divided into 2 parts which are separate, or joined at base only.

---

*The name *Ammocœtes* was originally applied to the larval forms of *Petromyzonids* which are in that stage specifically indistinguishable and which were supposed by Duméril and Cuvier to be generically distinct from the adult forms. After the identity of the two was discovered, the name *Ammocœtes* was used by many writers, following a suggestion of Milne-Edwards, as a general term to be applied to the blind or larval stage of all lampreys. *Lampetra* of Gray should therefore be used for this genus, for which it was originally proposed. Inasmuch as no European *Ammocœtes* can be referred to any determinate species of *Petromyzonid*, the nominal genus corresponds with *Petromyzon* as a whole and not to any subdivision.

b. Infraoral lamina with 7 cusps; dorsals wholly separate. AUREA, 12.
bb. Infraoral lamina with 8 or 9 cusps.
c. Lateral teeth usually 4 on each side, all bicuspid; dorsals separate. SPADICEA, 13.
cc. Lateral teeth usually 3 on each side of disk, the middle one tricuspid, the others bicuspid; dorsals slightly connected. CIBARIA, 14.
aa. Dorsal fins distinctly united, with a sharp notch; lateral teeth usually 3, bicuspid. WILDERI, 15.

12. LAMPETRA AUREA, (Bean).

Dorsal fins separate, the first ½ the height of the second, the interspace ⅔ the length of the first; infraoral lamina with 7 cusps, the outer largest; head shorter than thorax, 10½ in length. Plumbeous, golden below. (*Bean.*) Yukon River and streams of Alaska and Kamchatka. L. about a foot. Very close to the European *L. fluviatilis.* (*aureus*, golden.)

Ammocœtes aureus, BEAN, Proc. U. S. Nat. Mus., 1881, 159, Yukon River; (Type, No. 21524); JORDAN & GILBERT, Synopsis, 868, 1883.

Lampetra camtschatica, PALLAS, Zoogr. Rosso-Asiat., III, 67, 1811, Kamchatka. This was apparently not intended as a binomial name.

? *Petromyzon borealis*, GIRARD, Pac. R. R. Surv., 377, 1858, after *P. fluvialis*, Richardson, mentioned only as a small lamprey attached to an Inconnu in Great Slave Lake, "very like Bloch's figure" of *L. fluviatilis.*

13. LAMPETRA SPADICEA, Bean.

Dorsals separated, the interspace ½ the snout, insertion of first at middle of body; second dorsal little higher than first; infraoral lamina with 9 cusps, the outer largest; lingual teeth with about 20 pectinæ; 4 bicuspid teeth on each side of disk. Guanajuato, Mexico. (*Bean.*) (*spadiceus*, nut-brown.)

Lampetra spadicea, BEAN, Proc. U. S. Nat. Mus., 1887, 374, Guanajuato, Mexico. (Type, No. 38005.)

14. LAMPETRA CIBARIA, (Girard).

Lips fringed; infraoral lamina with 8 or 9 subequal cusps; about three teeth on each side of buccal disk, the middle one usually tricuspid, the others bicuspid; teeth on upper part of disk simple; dorsal fins slightly connected at base; second dorsal not much higher than first, much lower than in *L. wilderi;* insertion of dorsal a little behind middle of body; 63 muscular depressions between last gill opening and vent; head 10 in length. Color plumbeous, sides silvery. L. 8 inches. Pacific slope, from Fraser River to the Sacramento. Rather common in the rivers and brooks northward. (*cibarius*, pertaining to food.)

Petromyzon plumbeus, AYRES, Proc. Cal. Ac. Sci., 1854, 28, (name preoccupied), San Francisco.

Ammocœtes cibarius, GIRARD, Pac. R. R. Surv., 383, 1858, larva, Puget Sound; JORDAN & FORDICE, *l. c.*, 292, 1886. (Type, No. 6176.)

Petromyzon ayresi, GÜNTHER, Cat., VIII, 505, 1870, British Columbia.

Lampetra plumbea, JORDAN & GILBERT, Synopsis, 8, 1883.

15. LAMPETRA WILDERI, Gage, new species.

(SMALL BLACK LAMPREY.)

Head moderate, about as long as the thorax; mouth small; snout shorter and lips, less fringed than in *L. planeri;* dorsal fins connected only in breeding season, inserted behind middle of body, considerably depressed in front of the vent, but not divided into 2 fins; posterior lobe highest;

insertion of dorsal a little before middle of body; both dorsals high, the first 1¾ in height of second; anal tube conspicuous in the spring; eyes moderate; supraoral lamina with its cusps large, triangular, well separated; a small pointed median cusp sometimes present in the adult; in half-grown specimens the lamina forms a curved plate without distinct cusps; infraoral lamina curved, with 5 to 9 feeble, bluntish, subequal cusps; about 3 bicuspid teeth on each side of mouth; other buccal teeth simple. Head 8½; 67 muscular impressions between gill openings and vent. Bluish black above, silvery below. L. 6 to 10 inches. A small species ascending western streams in the spring in great numbers to deposit its spawn; abundant from Western New York (Cayuga Lake; Meek, Gage) to Iowa, both in tributaries of the Great Lakes and the Ohio and Mississippi. Our species seems to be distinct from *Lampetra planeri*, generally common in Northwestern Europe. (Named for Burt Green Wilder, the distinguished anatomist, the first to study the lampreys of Cayuga Lake. Specimens from that locality are taken as types of *L. wilderi.*)

Petromyzon nigrum, Rafinesque, Ich. Oh., 84, 1820, (name preoccupied), Falls of Ohio.
Petromyzon branchialis, Günther, Cat., viii, 504, 1870.
Ammocœtes niger, Jordan & Gilbert, Synopsis, 9, 1883.
Ammocœtes branchialis, Jordan & Fordice, *l. c.*, 293, 1886. Gage, in Wilder Quarter-Century Book, 436, 1893.

Class III. PISCES.

(The Fishes.)

The Pisces, or Fishes, may be defined as cold-blooded vertebrates adapted for life in the water, breathing by means of gills which are attached to bony or cartilaginous gill arches, the gills persistent throughout life; having the skull well developed and provided with a lower jaw; the limbs present and developed as fins, rarely wanting through atrophy; shoulder girdle present, furcula-shaped, curved forward below, rarely obsolete or represented by cartilage; pelvic bones present; exoskeleton developed as scales or bony plates or horny appendages or sometimes entirely wanting, and with the median line of the body provided with one or more fins composed of cartilaginous rays connected by membrane, the fins rarely atrophied.

All recent writers on fishes agree that the Lancelets and the Lampreys differ so widely in structure and development from the true fishes that they must be regarded as forming distinct classes. Many writers go still further, and remove from the class of fishes the Sharks, Skates, Chimæras and Dipnoans. A smaller number remove the Ganoids, also. It seems to us, however, preferable to regard these, with the True Fishes, or Teleosts, as members of the single class of Pisces.

The class Pisces may be conveniently divided into 5 subclasses—Selachii, Holocephali, Dipnoi, Crossopterygia, and Teleostomi. As there are no North American representatives of the Dipnoi (Ceratodus, Lepidosiren, Protopterus), or of the Crossopterygia (Polypterus), these singular groups may be passed by without further mention in this work.

SUBCLASSES OF PISCES.

a. Skull without system of membrane bones (opercles, etc.).

- *b.* Suspensorium of the mandible present. Gills not free, being attached by the outer margin to the skin; eggs few and large, impregnated and sometimes developed internally, covered with a thick leathery skin when developed externally; embryo with deciduous external gills; no membrane bones about the head; upper jaw formed of palatine and pterygoid elements without maxillary or premaxillary; skeleton cartilaginous; skull without sutures; tail heterocercal; ventral fins abdominal; male with large intromittent organs or claspers attached to the ventral fins, these complex in structure in existing species; shoulder girdle not attached to the skull; skin naked or covered with small rough scales, or spines, or bony bucklers; no air bladder; arterial bulb with 3 series of valves; optic nerves with a chiasma; cerebral hemispheres united; gill openings slit-like, 5 to 7 in number; jaws distinct from the skull, joined to it by suspensory bones; teeth distinct. (Sharks and Skates.) SELACHII.
- *bb.* Suspensorium of the mandible wanting; no maxillary arch; ventral fins with claspers; gill opening single, leading to 4 gill slits; jaws coalescent with the skull; teeth united in the form of bony plates. (Chimæras.) HOLOCEPHALI.

aa. Skull with a well-developed system of membrane bones (opercles, suborbital ring, etc.); gills free, attached to the gill arches by their bases only; gill opening single on each side; eggs comparatively small and numerous; no claspers; a maxillary arch; cerebral hemispheres not united. (True Fishes.) TELEOSTOMI.

Subclass SELACHII.*

(THE SHARKS AND SKATES.)

This group, sufficiently defined above, includes among recent fishes, the Sharks and the Rays, marine fishes mostly of large size, abounding in all seas. The group is commonly divided into 2 orders, which are widely different in appearance, so far as the extremes are concerned, but which pass into each other by insensible gradations.

We begin the group with the archaic type, the order or suborder *Diplospondyli*, proceeding thence from the more generalized sharks to the specialized skates. The true sharks form an almost perfect gradation into the skates, but there are no forms extant which connect the *Diplospondyli* with modern sharks. (*σέλαχος*, shark; the word originally meaning cartilage.)

ORDERS OF SELACHII.

a. Gill openings 6 or 7; dorsal fin single; vertebral column imperfectly segmented, each segment being equivalent to 2 vertebræ, and bearing 2 neural aches; anal fin present. DIPLOSPONDYLI, D.

aa. Gill openings 5; vertebral column well segmented, each segment forming a neural arch and 1 centrum.

- *b.* Vertebræ each with the internal calcareous lamellæ radiating from the central ring; anal fin present. ASTEROSPONDYLI, E.
- *bb.* Vertebræ with the internal calcareous lamellæ not radiating, but arranged in one or more concentric circles or series around the central ring; no anal fin; palatoquadrate arch not articulated to the skull.
  - *c.* Gill openings lateral; dorsal fins 2. CYCLOSPONDYLI, F.
  - *cc.* Gill openings ventral; dorsal fins small and posterior, or wanting; body and pectoral fins forming a depressed disk. BATOIDEI, G.

---

* Also frequently known as *Elasmobranchii*, *Plagiostomata*, *Chondropterygia*, or *Placoidei*. In Prof. Cope's system, the *Selachii* constitute one of the 2 orders in this subclass and all the existing sharks and skates are referred to it. In the *Selachii*, as thus understood, the claspers are complex, while in the extinct order of *Ichthyotomi* these organs are simple.

Order D. DIPLOSPONDYLI.

(The Notidanoid Sharks.)

Sharks with the palatoquadrate apparatus articulated or connected with the postorbital processes of the skull; branchial apertures in increased number, 6 or 7: only 1 dorsal fin. Vertebral column imperfectly segmented so that from each segment 2 neural arches and 2 vertebral bodies arise. Among existing sharks this group contains 2 families. Numerous genera represented by fossils seem allied to these, which are among the "oldest living vertebrates." (*διπλόος*, double; *σπόνδυλος*, vertebra; *Notidanus*, (*νωτιδανός*, dry back) is a Greek name of some shark, in Atheneus.)

a. Body greatly elongate, almost eel-shaped; dorsal, anal, and ventrals close together on posterior part of body; teeth in the 2 jaws alike; mouth anterior.
CHLAMYDOSELACHIDÆ, V.

aa. Body moderately elongate; teeth in the 2 jaws unlike; mouth inferior.
HEXANCHIDÆ, VI.

Family V. CHLAMYDOSELACHIDÆ.

(The Frilled Sharks.)

Body elongate, slender, suggesting the form of an eel. Head broad, depressed. Eyes lateral, without nictitating membrane. Nasal cavity separate from that of the mouth. Mouth anterior. Teeth with broad, backward-extended bases and slender cusps. Spiracles present. Gill openings 6. One dorsal fin, without spine; anal fin present. No pit at root of caudal. First gill membrane free across the isthmus. Intestine with a spiral valve. Anterior basibranchial cartilages present.

This family contains a single species, recently discovered by Mr. Garman, from whose papers this account is taken. It inhabits the open sea, and may not occur in American waters.

Chlamydoselachidæ, Garman, Bull. Essex Inst., 1884, 47, and elsewhere.

10. CHLAMYDOSELACHUS, Garman.

Chlamydoselachus, Garman, Bull. Essex Inst., Jan. 17, 1884, 47, (*anguineus*).

Opercular flap forming a broad frill over first gill opening. Teeth similar in both jaws, each with 3 slender, curved, subconical cusps, separated by a pair of rudimentary denticles, on a broad base; no median upper series of teeth in front; a series on the symphysis below. Mouth wide, without labial folds at the angles. Pupil horizontally elongate. Fins broad; caudal without a notch. Basihyal elongate. One species known, inhabiting waters of some depth in the open sea. An extinct species, *Chlamydoselachus lawleyi*, Davis, has been described from pliocene deposits in Tuscany. (*χλαμύς*, mantle or frill; *σέλαχος*, shark.)

16. CHLAMYDOSELACHUS ANGUINEUS, Garman.

Dorsal fin small, opposite the anal, which is more than twice its size; pectorals small, placed low; ventrals large, placed far back, opposite anal. Eye small. Gill openings large, curved, oblique, all of them before pectorals. Teeth $\frac{13\text{-}0\text{-}13}{12\text{-}1\text{-}12}$. Scales on upper edge of tail enlarged. Head $7\frac{1}{2}$ in length. Greatest depth of body about 15. Color, plain brown. L. 5 to 6 feet (*Garman*). Seas about Japan; also taken off Madeira, in deep water. Not certainly known from the American coast, but if fishermen's drawings can be trusted, this is found in the Western Atlantic and is probably the original of some of the recorded "sea serpents." (*anguineus*, from *anguis*, the slow worm, the word allied to *anguilla* = ἔγχελυς, eel.)

Chlamydoselachus anguineus, GARMAN, *l. c.*, and in Bull. Mus. Comp. Zoöl., 1885, XII, No. 1, with plates and account of anatomy, off Japan; GÜNTHER, Deep Sea Fishes, Challenger, 1884, with plates, Japan; COLLETT, Bull. Soc. Zoöl. France, 1890, 219; Funchal, Madeira.

Family VI. HEXANCHIDÆ.

(THE COW SHARKS.)

Body moderately elongate, somewhat depressed anteriorly, tapering toward the caudal fin. Head depressed, oblong, with the snout projecting. Eyes submedian or anterior, without nictitating membrane. Mouth subinferior, large, arched in front; no labial fold. Teeth in the 2 jaws unlike; in the upper jaw 1 or 2 pairs of awl-shaped teeth, the next 6 teeth broader and each provided with several cusps, one of which is much the strongest. Lower jaw with 6 large comb-like teeth on each side, besides the smaller posterior teeth. Spiracles small, on the side of the neck. Only 1 dorsal fin, without spine, opposite the anal, and similar to it. No pit at the root of the caudal. Gill openings wide, 6 or 7 in number. Viviparous sharks, sometimes reaching a very large size. Genera 3; species about 7; of the warm seas. (NOTIDANIDÆ, Günther, Cat., VIII, 397-399.)

a. Gill openings 7 on each side; median tooth of lower jaw with a small median cusp or none. NOTORHYNCHUS, 11.

aa. Gill openings 6 on each side; median tooth of lower jaw with a small median cusp or none. HEXANCHUS, 12.

II. NOTORHYNCHUS,* Ayres.

Notorhynchus, AYRES, Proc. Cal. Ac. Sci., 1856, I, 72, (*maculatus*).

Gill openings 7 on each side. Dentition in general much as in *Hexanchus*, the lower teeth uniform in size or decreasing toward corners of mouth; cusps on the cutting edge regularly graduated, while the ascending inner margin of each tooth is finely serrated; median tooth of lower jaw with the median cusp small or wanting. Two species known; spotted sharks of the Pacific. (νῶτος, back; ῥύγχος, snout; the allusion not clear.)

17. NOTORHYNCHUS MACULATUS, Ayres.

Snout broad, rounded, the nostrils near its tip; spiracles large, nearer the gill openings than the eye; a long furrow at the angle of the mouth. No median tooth in upper jaw; 2 small teeth near together in front, simple and pointed; 2 a little larger, behind and outside of these;

---

*In *Heptranchias cinereus*, the European type of *Heptranchias*, the lower median tooth has a strong central cusp.

then 2 others directly behind the first pair; next, on each side, a tooth much larger, pointed, with a conspicuous cusp on the outer side at base, and one or more denticulations beside; the other teeth larger, similar, but more serrated and more oblique, approaching the lower teeth in form; median tooth in lower jaw broad, with a small median cusp and 2 or 3 larger lateral cusps on each side; the other teeth, 6 on each side, much broader than high, with 4 to 6 sharp, outward-directed cusps, the first cusp longest and bearing a small tooth near its base; these teeth are quite similar and increase slightly in size outward. Tail long, 2¾ in total length, the caudal fin mostly below it; anal small, just behind the small dorsal. Sandy gray, with some round black spots, larger than the pupil, rather sparsely placed. Pacific coast, from Monterey northward to Washington; rather common northward, especially in Humboldt Bay. (*maculatus*, spotted.)

Notorhynchus maculatus, AYRES, Proc. Cal. Ac. Sci., 1856, 1, 72, San Francisco.
Notorhynchus maculatus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 495, and 1864, 149.
Notorhynchus borealis, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 150, Nisqually, Washington.
Heptranchias maculatus, JORDAN & GILBERT, Synopsis, 62, 1883.

12. HEXANCHUS, Rafinesque.

Hexanchus, RAFINESQUE, Caratteri, 1810, 14, (*griseus*).
Notidanus, CUVIER, Règne Animal, Ed. 1, 1817, 128, (*griseus*).
Monopterhinus, BLAINVILLE, Faune Française, 1828, 77, (*griseus*).

Two species known, distinguished from all other living sharks except the eel-shaped *Chlamydoselachus*, by the presence of 6 gill openings. (ἕξ, six; ἄγχος, bend or sinus.)

a. Median tooth of lower jaw with a slight median cusp and about 3 marginal cusps; first lateral tooth with about 6 cusps. CORINUS, 18.
aa. Median tooth of lower jaw without median cusp, but with 4 or 5 marginal cusps; first lateral tooth with 8 or 9 cusps. GRISEUS, 19.

18. HEXANCHUS CORINUS, Jordan & Gilbert.

(SHOVEL-NOSED SHARK.)

Head large, broad, depressed, and blunt. No median tooth in upper jaw; about 4 pointed teeth in front of upper jaw; all entire and without basal cusps; the next 3 teeth with a single strong cusp on the outer margin; others with more cusps, approaching form of lower teeth; median tooth of lower jaw very small, with a small cusp; lateral teeth with 6 cusps, the first the largest, the others regularly smaller, the median edge in the adult finely serrated. Tail long, twice as long as head, about 3⅕ in total length. Pectoral as long as lower jaw from gill opening. Scales on upper edge of tail enlarged. Color almost black, unspotted; a grayish lateral streak. Monterey Bay to Puget Sound, not common. (*corinus*, northwestern, from *corus* or *caurus*, the northwest wind.)

Hexanchus corinus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 352, Neah Bay; and Soquel and Bay of Monterey, California; Synopsis, 62, 1883. (Types, Nos. 37369, 27196.)

19. HEXANCHUS GRISEUS, (Gmelin).

(Cow Shark; Caña-Bota.)

Head large, depressed, blunt, the nostrils near tip of snout; no median upper tooth; 2 on each side entire, hooked outward; the next teeth with 6 or 7 cusps, the others similar; lower median tooth small, without cusp; lateral teeth each with 7 to 9 cusps, the number of denticles on most of the teeth being thus greater than in *H. corinus.* Tail not twice head, 3½ in length, its upper scales enlarged; pectoral shorter than lower jaw from gill opening. Color dark gray. (*Day*). L. 8 to 26 feet. A very large shark inhabiting deep water, in the Mediterranean, thence north to the west coasts of Scotland; also frequently taken in Cuba. (*Poey*). (*griseus*, gray.) (Eu.)

Squalus griseus, Gmelin, Syst. Nat., 1495, 1788, Mediterranean, after Broussonet.

Squalus griseus, Bonnaterre, Tabl. Encycl. Ichth., 9, 1788, Mediterranean, after Griset of Broussonet.

Notidanus griseus, Günther, Cat., VIII, 397, 1870.

Notidanus griseus, Day, British Fishes, 308, 1870.

Hexanchus griseus, Poey, Synopsis, 454, 1875.

Order E. ASTEROSPONDYLI.

(The Typical Sharks.)

The essential character of this order is in the structure of the vertebræ. The calcareous lamellæ within each vertebra radiate from the central ring. The group contains the great body of living sharks, including all of those with 5 gill openings, 2 dorsals, and an anal fin. (ἀστήρ, star; σπόνδυλος, vertebra.)

Suborders of Asterospondyli.

a. Palatoquadrate apparatus articulated to preorbital part of skull; dorsal fins with spines. Proarthri.

aa. Palatoquadrate apparatus not articulated with the skull; no dorsal spines. Galei.

Suborder PROARTHRI.

(The Cestraciont Sharks.)

This group is characterized by the articulation of the palatoquadrate apparatus by an extensive surface with the preorbital region of the skull. Vertebræ asterospondylous. It consists of a single family, the Heterodontidæ, which, like the preceding families, possesses much interest to palæontologists from its supposed relation to extinct forms. (πρό, before; ἄρθρον, joint; *Cestracion*, is an old name, from κέστρα, a pickax; the name probably originally applied to *Sphyrna.*)

Family VII. HETERODONTIDÆ.

(The Bullhead Sharks.)

Sharks with 2 dorsal fins, each provided with a strong spine; the first dorsal opposite the space between pectorals and ventrals; the second in advance of the anal. Body elongate, obtusely trihedral, gradually tapering backward; head high, with the forehead declivous, little prominent; nostrils confluent with mouth; mouth rather narrow, the upper lip divided into 7 lobes, the lower with a fold; spiracles small, below the lower part of the eye; no nictitating membrane; gill openings rather narrow; dentition similar in both jaws, small obtuse teeth in front, which in the young are pointed, and provided with 3 to 5 cusps; lateral teeth large, pad-like, twice as broad as long, arranged in oblique series, one series being formed by much larger teeth than those in other series; scales small, sometimes cruciform; caudal fin moderate, more or less bent upward, and usually notched at tip. Oviparous, the egg cases very large, subconical, without tentacles and spirally twisted. Species about 4, all inhabiting the Pacific Ocean, usually placed in one genus; 2 here recognized. Size small. (CESTRACIONTIDÆ, Günther, Cat., VIII, 417–418; but HETERODONTUS, Blainville, 1816, has priority over CESTRACION, Cuvier, 1817.)

13. GYROPLEURODUS, Gill.

Gyropleurodus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 489, (*francisci.*)
Tropidodus, GILL, *l. c.*, (*pantherinus*=*quoyi*).

Branches of the lower jaw widely separated, the interval rounded in front, growing wider behind. Molars in few rows; ridges above eye prominent. Characters of the genus otherwise included above. Eastern Pacific. (*γῦρος*, whorl; *πλεῦρον*, side, *ὀδούς*, tooth.)

a. Gill openings not very high, the length of the first slit being less than that of the branchial region; molars in 4 to 6 rows; ridges above eye very prominent.
  b. Molars convex, the larger ones not much if any carinated. FRANCISCI, 20.
  bb. Molars carinate along their middle. QUOYI, 21.

20. GYROPLEURODUS FRANCISCI, (Girard).

(BULLHEAD SHARK.)

Head short and high, broad, but with subvertical sides; the forehead very declivous from eyes, the snout wide and transverse, but prominent; 2 blunt, diverging ridges continued from each side of the snout, abruptly merging into the more conspicuous superciliary ridges, the interval between which is nearly plane; teeth in front digitated, with 3 or 4 cusps, quincuncially distributed in rows slightly converging toward the middle; in the upper jaw, on the sides, molars oblong and flattened, arranged in about 4 oblique whorls, uniform or increasing backward, except the last, which is smallest; on the sides of the lower jaw, also, are molars, oblong, with flattened crowns, and arranged in transversely oblique whorls, but decreasing backward. Branches of the lower jaw widely separated by an interval rounded in front and becoming wider behind, the sides themselves being curved outward; the acute teeth confined to the front, the molar teeth few and disposed in about 4 whorls, the first 3 of which slightly increase, while the fourth is almost rudimentary. Branchial area almost oblong. Dorsal fins considerably produced backward at their posterior angle; the compressed spine forming about ½ of the base of each fin; anal fin large, reaching the root of caudal; caudal fin about ¼ of the length, a notch at its tip, opposite last vertebra. Color brown, with small black spots scattered over the body and fins. L. 2 feet. Coast of California; abundant south of Point Concepcion. Its spirally twisted egg cases are very remarkable. (Name from San Francisco, but its range probably does not extend so far to the north.)

Cestracion francisci, Girard, Proc. Ac. Nat. Sci. Phila., 1854, 196, Monterey.
Cestracion francisci, Günther, Cat., viii, 416, 1870.
Gyropleurodus francisci, Gill, Proc. Ac. Nat. Sci. Phila., 1862, 492; Jordan & Gilbert, Synopsis, 31, 1883.

21. GYROPLEURODUS QUOYI, (Fréminville).

First dorsal inserted nearer ventrals than pectorals; anal fin low, not reaching base of caudal; body slender. Brown, with round dark spots about as large as eye. (*Valenciennes.*) Galapagos Islands. (To M. Quoy, a French naturalist.)

Cestracion quoyi, Fréminville, Mag. Zoöl., 1840, pl. 3, Galapagos.
Cestracion pantherinus, Valenciennes, Voyage de la Vénus, about 1850, 320, Galapagos.
Cestracion quoyi, Günther, Cat., viii, 416, 1870.

Suborder GALEI.

(The True Sharks.)

Asterospondylous sharks with the palatoquadrate apparatus not articulated with the skull; gill openings always 5 and always lateral. Dorsal fins 2, well developed, each without spines. This order contains most of the living sharks. (γαλεός, a shark.)

- *a.* First dorsal fin over or behind the ventrals; spiracle present; no nictitating membrane.
  - *b.* Tail not bent upward; nostrils not confluent with the mouth. Scylliorhinidæ, viii.
  - *bb.* Tail abruptly directed upward and backward from the base of the caudal fin; nostrils confluent with the mouth. Ginglymostomidæ, ix.
- *aa.* First dorsal fin inserted more or less in advance of the ventrals.
  - *c.* First dorsal fin long and low, highest posteriorly; spiracles developed; no pit at root of caudal; gill openings all in advance of pectoral. Pseudotriakidæ, x.
  - *cc.* First dorsal fin high, highest anteriorly, its base wholly in front of that of ventrals.
    - *d.* Caudal fin not lunate, its upper lobe two or more times the length of the lower, with a notch below toward its tip; side of tail not keeled.
      - *e.* Last gill opening above base of pectoral.
        - *f.* Tail moderately developed, forming less than ⅓ of the total length; eyes with nictitating membranes.
          - *g.* Head normally formed. Galeidæ, xi.
          - *gg.* Head hammer-shaped or kidney-shaped by the extension of its sides. Sphyrnidæ, xii.
        - *ff.* Tail exceedingly long, forming about ½ the total length; eyes without nictitating membrane. Alopiidæ, xiii.
      - *ee.* Last gill opening entirely in front of pectoral; spiracles pore-like; tail moderately developed. Carchariidæ, xiv.
    - *dd.* Caudal fin lunate; caudal peduncle with a keel on each side; size large.
      - *h.* Last gill opening entirely in front of pectorals.
        - *i.* Gill openings moderate; teeth large and sharp. Lamnidæ, xv.
        - *ii.* Gill openings very large, nearly meeting under the throat; teeth very small; size enormous. Cetorhinidæ, xvi.
      - *hh.* Last gill opening above the base of the pectorals. Rhinodontidæ, xvii.

Family VIII. SCYLLIORHINIDÆ.

(The Cat Sharks.)

Dorsal fins 2; both rather small, without spines, the first more or less behind the ventrals; anal fin present, usually before the second dorsal; caudal fin rather long, usually with a basal lobe; the tail not keeled, and not bent upward. Spiracles present; no nictitating membrane; gill openings small, the last one above the root of the pectorals. Mouth usually broad, with small teeth, several series being in function; teeth each with a median cusp and 1 to 4 small cusps on each side; nostrils near the mouth, sometimes confluent with it, sometimes provided with cirri. Mucous pores about head numerous, especially on lower side of snout. Egg cases large, quadrate, with prehensile tubes at the angles. (Scylliidæ, Günther, Cat., viii, 400–413.)

a. Scylliorhininæ. Spiracles close behind eye; gill openings nearly equidistant; teeth small, usually tricuspid.
  b. Nostrils not separated by an isthmus, the nasal valves confluent; tail not serrated. Scylliorhinus, 14.
  bb. Nostrils separated from each other by a broad isthmus.
    c. Scales on upper margin of the tail little if at all enlarged, usually similar to those on rest of body, or at any rate not forming a serrated edge. Catulus, 15.

14. SCYLLIORHINUS, Blainville.

(Roussettes.)

Scylliorhinus, Blainville, Journ. Phys. 1816, 263: (*canicula*, etc.).
Scyllium, Cuvier, Règne Animal, Ed. 1, 1817, 124, (*canicula*).
Scylliorhinus, Gill, Ann. Lyc. Nat. Hist. N. Y., 1861, 41, reprint, (restriction to *canicula*).

This genus includes those Scyllioid sharks in which the nasal valves are confluent, with their hinder border entire and free. Caudal moderate; gill openings equidistant; spiracles close behind eyes; tail not serrated. Species mostly of the old world. (*σκυλλίον*, a small shark; *σκύλλω*, to tear; *ῥίνη*, shark.)

22. SCYLLIORHINUS PROFUNDORUM, Goode & Bean.

Nasal valves confluent, with a short blunt cirrus on the posterior as well as on the anterior flap; length of nasal cavity about equal to horizontal diameter of the eye, the 2 cavities separated by a space equal to ½ interorbital area and ⅖ snout; distance of posterior angle of nasal cavity from root of teeth at nearest point ½ area between cavities; distance from symphysis to tip of snout equal to width between angles of mouth. A well-developed labial fold at angle of mouth, extending on lower jaw halfway from its angle to the symphysis, and on upper jaw nearly in direction of nasal cavity, disappearing at ½ the distance. Teeth moderate, with 2 small lateral cusps on each side of the longer middle cusp, in about 5 rows. Gill openings narrow, somewhat less than long diameter of eye; distance from first to last, which, like the fourth, is above angle of pectoral, equal to ½ snout. Ventral fins thick, short, leaf-shaped, their origin twice as far from nasal cavity as is last of gill openings; origin of anal under tip of first dorsal, its end under end of dorsal; its base equal to ½ length of head to first gill opening. Caudal continued in line of axis of body; lower lobe rounded, and in its greatest height not deeper than the height of the caudal extension of the body at the same point. Color, uniform grayish brown. One specimen (85646, U. S. N. M.), 20½ inches, obtained by the Fish Commission steamer *Albatross* at a depth of 816 fathoms, in latitude 39° 9′ N., longitude 72° 3′ 15″ W. (*Goode & Bean*). (*profundorum*, of the depths.)

Scylliorhinus profundorum, Goode & Bean, Oceanic Ichthyology, 17, 1894, Gulf Stream.

15. CATULUS, Smith.

Catulus, Andrew Smith, Proc. Zool. Soc. Lond., 1837, 85, (*stellaris*).
Poroderma, Smith, *l. c.*, (*africanus*).
Halælurus, Gill, Ann. Lyc. Nat. Hist. N. Y., 1861, 407, (*bürgeri*).
Cephaloscyllium, Gill, *l. c.*, (*laticeps*).

As here understood, this genus is very close to the European genus *Scylliorhinus*,* from which it is distinguished by the separate nasal valves. Gill has further divided the group into *Catulus*, having the nasal valves provided with lobes or grooves, *Halælurus* having the nasal valves simple, and *Cephaloscyllium*, which has a very broad head and the stomach inflatable. The latter group is perhaps generically distinct, but we lack the data for properly defining it. *Catulus* differs from *Pristiurus* in having the scales on the upper edge of the tail not much, if at all, enlarged and usually not differentiated from the others. The prickles on the body are usually much coarser in *Catulus* than in *Scylliorhinus* or *Pristiurus*. Species numerous, usually in rather deep water. (*Catulus*, diminutive of low Latin *catus*, cat.)

I. Catulus: Head not very broad; belly not capable of great inflation.
- *a.* Body plain brown, or marbled with whitish without black spots or markings; belly dusky.
  - *b.* Upper margin of tail with a broad band of enlarged closely appressed tricuspid scales (obsolete in the young).
    - *c.* Snout from mouth forward ½ width of mouth; anal much longer than second dorsal; belly pale. XANIURUS, 23.
  - *bb.* Upper margin of tail without enlarged scales; belly not pale.
    - *d.* Snout, from mouth, ⅞ width of mouth; anal 2½ times base of second dorsal. BRUNNEUS, 24.
    - *dd.* Snout, from mouth, scarcely ½ width of mouth; anal scarcely larger than second dorsal. CEPHALUS, 25.
- *aa.* Body not plain brown; spotted, or banded, or marbled with black; no enlarged scales on back.
  - *e.* Back of tail covered with narrow black lines which form a net work of polygonal meshes; belly yellowish; body moderately elongate, the stomach probably not inflatable. RETIFER, 26.

II. Cephaloscyllium, (κεφαλή, head; Scyllium, σκυλλίον). Head very broad and depressed Stomach capable of great inflation.
- *f.* Back with broad black crossbars; upper part with large round black spots. UTER, 27.

---

* *Scylliorhinus*, Blainville, 1816 = *Scyllium*, Cuvier, 1829, typo *Sq. canicula*, Linnaeus.

Subgenus CATULUS.

23. CATULUS XANIURUS, Gilbert.

Snout short, broadly rounded, its length from mouth, ½ greatest width of snout, which is equal to width of mouth; angle of mouth with folds, that on lower jaw twice as long as on upper, reaching about ¼ distance to symphysis; teeth small; snout and sides of head with numerous mucous pores; eyes large. Pectoral small, rounded; first dorsal over ventrals, its base 2 in the interspace between dorsals, shorter than that of anal; second dorsal slightly shorter and lower than first, its base 1⅗ in anal; caudal 4⅓ in length; upper edge of caudal in adult with a broad band of enlarged, broad, crowded, tricuspid scales, the band broader than in the European *Pristiurus melastomus,* and the scales less acute; scales of body much coarser than in *Pristiurus.* Color dark slaty brown, usually uniform above, sometimes with small whitish spots, the fins often edged with paler; belly pale. L. 2 feet. Pacific coast of Southern California, abundant in rather deep water; apparently a transitional form between *Catulus* and *Pristiurus* with the appearance of the former, but approaching the latter in the scaling of the tail. (*ξανίον*, scraper; *οὐρά*, tail.)

Catulus xaniurus, GILBERT, Proc. U. S. Nat. Mus., 1891, 540; off Southern and Lower California, in 184 to 684 fathoms.

24. CATULUS BRUNNEUS, Gilbert.

Body deeper, head narrower, snout longer and sharper than in *C. xaniurus.* Preoral part of snout ¾ greatest width of snout and ⅞ width of mouth. Angle of mouth with labial folds, the lower slightly shorter than upper and reaching halfway to symphysis. Eye 3 in snout. Pectorals more adnate to body than usual. First dorsal narrow and high, reaching little beyond ventrals, its base 1½ in interspace between dorsals; second dorsal slightly larger than first; anal very long, its base 2½ times that of either dorsal. Caudal 3⅔ in body, the scales along its upper edge like those on rest of body, not saw-like. Uniform warm brown above and below, the snout and edges of fins blackish. L. 20 inches. Gulf of California, in deep water; one specimen known, a female with mature eggs. (*brunneus*, brown.)

Catulus brunneus, GILBERT, Proc. U. S. Nat. Mus., 1891, 542, Gulf of California.

25. CATULUS CEPHALUS, Gilbert.

Allied to *C. xaniurus,* but the head wider, the snout shorter, the preoral portion less than ½ its greatest width; color darker, the belly dark brown like the back, the second dorsal larger, more posteriorly placed, the first dorsal larger, the anal smaller, scarcely larger than the second dorsal; pores on head large, in rows instead of patches. Tail without band of enlarged scales (these possibly developed in the adult). Teeth mostly tricuspid, the inner sometimes with 4 or even 5 cusps. Size very small, probably not over 15 inches when adult. Gulf of California and southward, in deep water; no full-grown examples known. (*κεφαλή*, head.)

Catulus cephalus, GILBERT, Proc. U. S. Nat. Mus., 1891, 541, deep water near the Revillagigedo Islands and in the Gulf of California, in 362 to 460 fathoms.

26. CATULUS RETIFER, (Garman).

Body moderately elongate, the vent in front of its middle. Head depressed, its width nearly equal to its length, from spiracles forward; length of snout from mouth less than distance between outer margins of nostrils; nasal valves broader than isthmus; length of arch of mouth a little more than $\frac{1}{2}$ its width; lower labial fold reaching $\frac{1}{4}$ distance to symphysis; teeth small, each with a central cusp and 2 small ones on each side. Pectorals short and broad. First dorsal inserted near middle of body; caudal not large. Light brownish, crossed at irregular intervals by groups of 2 to 4 narrow black lines, which are joined by other lines, forming a network of polygonal meshes; belly yellowish. (*Garman.*) Gulf Stream in deep water, a few specimens taken off the South Atlantic coast. (*rete*, net; *fero*, to bear.)

Scyllium retiferum, GARMAN, Bull. Mus. Comp. Zoöl., XI, 233, 1881, off coast of Virginia, in deep water.
Scylliorhinus retifer, JORDAN & GILBERT, Synopsis, 869, 1883.

Subgenus CEPHALOSCYLLIUM, Gill.

27. CATULUS UTER, Jordan & Gilbert, nom. new species.

(SWELL SHARK.)

Head very broad and depressed, broader than long, and not $\frac{1}{2}$ as deep as broad. Snout very blunt, projecting a little beyond the mouth. Mouth very broad, little arched, with only a trace of labial fold. Teeth similar in both jaws, small, tricuspid, in about 4 series, $\frac{60}{64}$ in number. First dorsal beginning over middle of ventrals; second dorsal beginning behind front of anal and ending before end of anal. Grayish, tinged below with yellowish; back with black crossbars; upper parts with large round black spots; sides with small whitish spots also. L. $2\frac{1}{2}$ feet. Monterey to San Diego; very abundant in Santa Barbara channel. A small voracious shark, often taken in lobster pots. When caught it inflates its stomach with air till its diameter is $\frac{1}{3}$ its whole length. It will then float belly upward on the water. (*uter*, an inflated bladder.)

? *Scyllium ventriosum*, GARMAN, Bull. Mus. Comp. Zoöl., VI, 167, 1880, Chile.
Scyllium ventriosum, JORDAN & GILBERT, Synopsis, 59, 1883. It is probable that the Californian species is distinct from the Chilean *ventriosus*. Both are close to the Australian *C. laticeps*, type of the genus or subgenus *Cephaloscyllium*, which differs from *Catulus* in the inflatable belly and the broad depressed head.

Family IX. GINGLYMOSTOMIDÆ.

(THE NURSE SHARKS.)

Large sharks with general characters of the SCYLLIORHINIDÆ, but with the tail very long and more or less abruptly bent upward at its base, as in the GALEIDÆ. First dorsal above or behind the ventrals, the second opposite or rather before anal; eyes very small, with small spiracles behind them; nostrils confluent with the mouth. Nasal valves on both sides forming a quadrangular flap in front of the mouth, each being provided with a free cylindrical cirrus; an upper and lower lip, the latter not extending across the symphysis; fourth and fifth gill openings close together. Genera 3, species about 5; large sharks of the warm seas. (SCYLLIIDÆ, part, Günther, Cat., VIII, 407–409.)

a. Tail moderate, about ⅓ total length; spiracles minute; snout rather blunt. Teeth in both jaws in many series, each with a strong median cusp, and 1 or 2 smaller cusps on each side; second dorsal nearly opposite anal. GINGLYMOSTOMA, 16.

16. GINGLYMOSTOMA, Müller & Henle.

Ginglymostoma, MÜLLER & HENLE, Wiegmann's Archiv., 22, 1837, (*cirratus*).

Characters of this genus given above. (*γίγγλυμος*, hinge; *στόμα*, mouth.)

28. GINGLYMOSTOMA CIRRATUM, (Gmelin).

(NURSE SHARK; GATA.)

Head obtuse, depressed; nasal cirrus reaching the lower lip; angles of the fins obtusely rounded; tail forming nearly ⅓ of the total length; skin very thick. Uniform brownish; young specimens with small, scattered, round black spots. L. 6 to 10 feet. A large shark of the warmer parts of the Western Hemisphere, abundant about coral reefs in the West Indies and on the west coast of Mexico, and occasionally on our South Atlantic coast. (*cirratus*, bearing cirri.)

Squalus cirratus, GMELIN, Syst. Nat., I, 1492, 1788; American Seas, after Broussonet.

Ginglymostoma cirratum, MÜLLER & HENLE, Plagiostomen, 23, 1838; GÜNTHER, Cat., VIII, 408, 1870.

Squalus cirratus, BONNATERRE, Tableau Encycloped. Ichthyol., 7, 1788; after Barbillon of Broussonet.

Squalus punctatus, BLOCH & SCHNEIDER, Syst. Ich., 134, 1801; Cuba, after Gata Hispanis of Parra.

Squalus punctulatus, BLOCH & SCHNEIDER, *l. c.*, 549; Cayenne, after *Squale pointillé* of Lacépède.

Squalus argus, BANCROFT, Zoöl. Jour., V, 82, 1832-1834, West Indies.

Ginglymostoma fulvum, POEY, Memorias, II, 342, 1861, Havana. This name was applied to unspotted specimens; these occur on both coasts of Mexico, and the absence of spots in the young is probably an individual variation. If not, *G. fulvum* may rank as a species or subspecies.

Ginglymostoma caboverdianus, CAPELLO, Jour. Sci. Phys. Lisb., 1867, 167, Cape Verde.

Family X. PSEUDOTRIAKIDÆ.

Body elongate; mouth wide, with a very short labial fold near the angle; snout depressed; nostrils inferior, not confluent with the mouth; eyes oblong, lateral, without nictitating membrane; spiracles well developed, behind the eye; gill openings moderate, in advance of pectoral; jaws with many rows of very small, tricuspid teeth; first dorsal fin long and low, highest posteriorly, inserted opposite the space between the pectorals and ventrals; second dorsal rather large, larger than anal; ventrals and pectorals well developed; no pit at root of caudal; caudal fin very low and long. Skin with minute asperities. One species known, a large shark of the North Atlantic, in most respects similar to the SCYLLIORHINIDÆ, but having the dorsal fin different in form and placed farther forward. The insertion of the first gill opening is also different. For these reasons we have placed the genus provisionally in a distinct family. (PSEUDOTRIACIS, Günther, Cat., VIII, 395.)

17. PSEUDOTRIAKIS, Capello.

Pseudotriakis, CAPELLO, Jour. Sci., Math., Phys., Nat., Lisbon, 1868, 321, (*microdon*).

Characters of the genus given above. (*ψευδής*, false; *Triakis.*)

29. PSEUDOTRIAKIS MICRODON, Capello.

Grayish brown, the fins, except the first dorsal, edged with dusky; base of first dorsal 7 times its height. Two specimens of this species are known—the type from Portugal; the second, 10 feet in length, taken at Amagansett, on Long Island. (*μικρός*, small; *ὀδούς*, tooth.) (EU.)

Pseudotriakis microdon, CAPELLO, Jour. Sci., Math., etc., Lisbon, 1868, 321, Portugal; GÜNTHER, Cat., VIII, 395, 1870; BEAN, Proc. U. S. Nat. Mus., 1883, 147.

Family XI. GALEIDÆ.

(THE REQUIEM SHARKS.)

Sharks with 2 dorsal fins, the first short and high, entirely before the ventrals, the second comparatively small, opposite the anal; no spines; gill openings moderate, the last above the base of the pectorals; tail more or less bent upward from the base of the caudal fin; sides of tail not keeled; eyes with nictitating membranes; head not hammer-shaped, the snout being longitudinally produced, as usual among sharks. Ovoviviparous. Spiracles small or obsolete.

A large family of 20 or more genera and about 60 species; found in all seas. The species are often closely related and difficult of determination. (CARCHARIIDÆ, part (CARCHARIINA and MUSTELINA), Günther, Cat., VIII, 357–380, and 383–388.)

a. GALEINÆ: Teeth flat and paved, without cusps or ridges; spiracles present; no pit at root of tail; labial folds well developed.
  b. Embryo not attached to the uterus by a placenta; teeth very blunt. MUSTELUS, 18.
  bb. Embryo attached to the uterus by a placenta; teeth more acute. GALEUS, 19.
aa. Teeth more or less compressed, with entire or serrate sharp edges. GALEORHININÆ:
  c. Spiracles present.
    d. Root of tail without pit.
      e. Teeth rather small, each with a medium cusp and 1 or 2 small lateral cusps on each side.
        f. Teeth small, close-set, approaching those of *Galeus* but with pointed cusps; snout slender; embryo attached to uterus by a placenta. (Coloration plain.) RHINOTRIACIS, 20.
        ff. Teeth larger, with sharp cusps; snout of moderate length; embryo not attached to uterus by a placenta. (Coloration variegated.) TRIAKIS, 21.
      ee. Teeth larger, with a single cusp, oblique, notched and coarsely serrated on the outer margin. GALEORHINUS, 22.
    dd. Root of tail without conspicuous pit above; teeth all coarsely serrate, alike in both jaws and all with a deep notch on outer margin; caudal fin with a double notch. GALEOCERDO, 23.

CARCHARHININÆ:

cc. Spiracles obsolete; lower teeth narrower than upper teeth.
  g. Angle of mouth without groove or with merely a slight depression, which does not extend along either jaw.
    h. First dorsal fin inserted posteriorly, nearer ventrals than pectorals; embryo not joined to the uterus by a placenta; slender sharks, with very strongly serrated teeth. PRIONACE, 24.
    hh. First dorsal inserted anteriorly, nearer pectorals than ventrals; embryo (so far as known) attached to the uterus by a placenta.
      i. Teeth all serrate more or less, often entire in the very young. CARCHARHINUS, 25.
      ii. Teeth of upper jaw serrate at base only; lower teeth entire, erect. HYPOPRION, 26.
      iii. Teeth all entire at all ages, and nearly all erect. APRIONODON, 27.
  gg. Angle of mouth provided with a more or less distinct groove which extends along one or both of the jaws; teeth entire, or very nearly so, more or less obliquely placed, their points turned away from the median line; embryo (so far as known) with a placenta. SCOLIODON, 28.

18. MUSTELUS, Cuvier.

(DOG SHARKS.)

Mustelus, CUVIER, Règne Animal, Ed. 1, 128, 1817, (*mustelus* and *canis*).

Mustelus, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 148, (restricted to *canis* and its relatives, the allies of *Mustelus* being called *Pleuracromylon*).

Body elongate, slender; snout comparatively long and flattened; mouth crescent-shaped, with well-developed labial folds; teeth small, many-rowed, flat and smooth, rhombic, arranged like pavement, alike in both jaws, and blunter than in any other sharks; eyes large, oblong; spiracles small, just behind the eyes; pectoral fins large; first dorsal large, not much behind pectorals; second dorsal somewhat smaller; anal opposite second dorsal and still smaller; ventrals well developed; basal lobe of caudal almost obsolete, the tail nearly straight; embryo not attached to the uterus by a placenta. Small sharks, among the smallest of the American species. (*mustelus*, a weasel or marten; the same word used for shark, as is the synonymous word *galeus*.)

a. Middle of first dorsal evidently nearer posterior root of pectoral than anterior root of ventral; snout long, its length from mouth more than width of mouth; teeth blunt. Embryo not examined, probably as in *M. canis*. LUNULATUS, 30.
aa. Middle of first dorsal about midway between pectorals and ventrals (as above measured). First dorsal higher than long, the tip of anterior lobe reaching, when depressed, beyond tip of posterior lobe, its free margin deeply incised, its base 2¾ times in interval between dorsals; teeth blunt. CANIS, 31.

30. MUSTELUS LUNULATUS, Jordan & Gilbert.

(GATO.)

Free margin of fins concave; first dorsal high, its narrow anterior lobe reaching tip of the slender posterior lobe when deflected, the fin about as high as long; interval between dorsals 2⅔ times base of first; lower lobe of caudal pointed; tail 5 in body, its terminal lobe more than ⅓ its length; pectoral rather sharp, its free margin incised, its tip about reaching middle of dorsal. Embryo unknown (probably without placenta). Very pale gray, fins all pale. L. 20 inches. West coast of Mexico, common in Gulf of California. (*lunulatus*, somewhat moon-shaped, from the concave margins of the fins).

Mustelus lunulatus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 108, Mazatlan, Mexico. (Type, No. 29211.)

31. MUSTELUS CANIS, (Mitchill).

(SMOOTH HOUND; DOG-SHARK; BOCA DULCE.)

Body slender, tapering backward from the dorsal fin to the long slender tail; snout depressed, moderately sharp: mouth small, the teeth all alike bluntish; a fold at the angle of the mouth; lower lobe of caudal blunt; tail more than $\frac{1}{5}$ body, its terminal lobe more than $\frac{1}{3}$ its length; pectorals rather obtuse, their free margins little incised, their tips reaching first third of dorsal; inner lobe of ventrals produced; embryo without placenta. Coloration light gray, nearly uniform, sometimes with pale spots. Length 2 to 3 feet. Cape Cod to Cuba and in Southern Europe; abundant on the Atlantic coasts of both continents, especially off New York and in the Mediterranean. (*canis*, dog.) (EU.)

Squalus canis, MITCHILL, Trans. Lit. Phil. Soc. N. Y., 1, 1815, 486, New York.
Mustelus asterias, CLOQUET, Dict., 407, 1820, Europe.
Mustelus vulgaris, MÜLLER & HENLE, Plagiostomen, 190, pl. 27, fig. 1, 1838, Europe.
Squalus hinnulus, BLAINVILLE, Faune Franc., 83, pl. 20, fig. 2, 1828, Mediterranean.
Mustellus stellatus, RISSO, Eur. Merid., III, 1826, 126, Nice.
Mustelus plebejus, BONAPARTE, Fauna Italica, part VIII, 43, plate 132, 1834, Italy.
Mustelus vulgaris, GÜNTHER, Cat., VIII, 386, 1870.
Mustelus canis, STORER, Fish. Mass., 227, 1867; JORDAN & GILBERT, Synopsis, 870, 1883.

19. GALEUS, Rafinesque.

Galeus, RAFINESQUE, Caratteri Alcuni Nuovi Generi, 13, 1810, (*mustelus*,* etc.; the intended type is apparently *Sq. galeus*, L., though that species is not mentioned by name).
Galeus,† LEACH, Obsérv. genus *Squalus*, 62, 1812, (*mustelus*).
Pleuracromylon, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 148, (*lævis*=*mustelus*).

---

* *Galeus mustelus* (Linnaeus), the Smooth Hound, of Europe, has been listed as American by Dr. Günther, who records a stuffed specimen from New York. No American collector has recognized it.

† The name *Galeus* was first used in binominal nomenclature by Rafinesque, for a genus thus defined:

"VIII. G. GALEUS. Due spiragli, due ale dorsali, un ala anale, cinque branchie da ogni lato, coda diseguale, obliqua.

"*Osservazione.* La maggior parti delli *Squali* degli autori si annoverano in questo genere, il quale si distingue dal vero genere *Squalus* della presenza di un ala anale."

Four species are mentioned, *vulpeculus*, *melastomus*, *catulus*, and *mustelus*. The species which the author had in mind was doubtless *Squalus galeus*, L.

This well-known species agrees with the above diagnosis, and although not explicitly included in the genus (for Rafinesque's paper treated only of new species and new genera), yet it would go with the others as one of the "maggior parti delli *Squali*." An important argument for this view rests in the fact that Rafinesque adopted many Linnæan specific names for his genera, and in most cases explicitly specified such Linnæan species as the types of his genera. There can be no doubt that *Squalus galeus*, L., was his type of his genus *Galeus*, and *Squalus carcharias*, L., his type of his *Carcharias*.

In 1812, Leach proposed a genus *Galeus*, to include sharks with the anal fin present and the caudal fin irregular (*i. e.*, not lunate). This genus thus defined, corresponds nearly to *Galeus* of Rafinesque. But one species, *Galeus mustelus*, is mentioned by Leach, the same species having been included in *Galeus*, Rafinesque. For this reason we have formerly adopted the name *Galeus* for *G. mustelus*. Still later, a subgenus, *Galeorhinus*, was proposed by Blainville for sharks distinguished from *Carcharinus*, Blainville, by the presence of spiracles. This group again corresponds to the *Galeus* of Rafinesque and Leach. In this group are included with others, *Squalus mustelus* and *Squalus galeus* of Linnæus, the latter species being obviously intended as the type. Still later (1817), the genera *Mustelus* and *Galeus* were defined by Cuvier, and with his definition

This genus is very close to *Mustelus*, with which it agrees in most external respects, the essential difference being in the presence of a placenta connecting the embryo with the uterus. The teeth are rather sharper than in *Mustelus.* The boundaries of this group and the preceding are not yet well defined, and it may be that the two should be reunited. (*γαλεός*, a kind of shark, like *γαλῆ*, the weasel.)

a. Middle of first dorsal about midway between posterior root of pectorals and anterior root of ventrals; first dorsal longer than high; its tip not reaching tip of posterior lobe, its free margin scarcely incised, its base about half the interval between dorsals; teeth sharpish. (Embryo not examined.) DORSALIS, 32.

aa. Middle of first dorsal much nearer root of ventrals than pectorals; snout rather short, its length from mouth a little less than distance between angles of mouth; teeth rather sharp. CALIFORNICUS, 33.

32. GALEUS DORSALIS, (Gill).

Lower lobe of caudal not acute; tail less than ⅕ total length, its terminal lobe less than ⅓ its length; pectorals obtuse, their free edges almost straight, their tips reaching first fourth of dorsal; inner lobe of ventrals not produced, the free edge of the fin straight. Embryo with placenta. Color dark gray, axils of pectorals and ventrals dusky. L. 3 to 4 feet. Panama and neighboring waters, north to the Gulf of California, the largest species of the group. (*dorsalis*, pertaining to the back.)

Mustelus dorsalis, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 149, Panama.
Mustelus dorsalis, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 110.

33. GALEUS CALIFORNICUS, (Gill).

First dorsal longer than high, its blunt tip when depressed not reaching tip of posterior lobe, its margin deeply incised, its base 2¼ times in the interval between dorsals; lower lobe of caudal blunt; terminal lobe of tail more than ⅓ its length, pectorals rather obtuse, their free margin little concave, their tips reaching little past front of dorsal; inner lobe of ventrals somewhat produced; embryo attached to uterus by a placenta. Dark grayish; axils of pectorals and ventrals dusky. L. 30 inches. California, north to San Francisco; rather common.

Mustelus californicus, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 148, San Francisco.
Mustelus californicus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 110.
Mustelus californicus, JORDAN & GILBERT, Synopsis, 870, 1883.

20. RHINOTRIACIS, Gill.

Rhinotriacis, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 486, (*henlei*).

General appearance of *Galeus*, but with the teeth distinctly tricuspid and not paved. Snout sharp. Embryo attached to the uterus by a placenta. Coloration plain. One species known. (*ῥίν*, snout; *Triacis*).

---

they have been accepted by nearly all later authors. It seems to us best in cases like this to follow the rules of nomenclature strictly. The strict letter of the law seems to require the use of *Galeus* in place of *Pleuracromylon.*

The name *Mustelus* was at first applied by Cuvier to the whole group of smooth-mouthed sharks. It has, however, been restricted by Gill to the subgenus typified by *M. canis*, and it should be retained for this subdivision, leaving *Pleuracromylon*, or *Galeus*, as the name of the other genus or subgenus.

34. RHINOTRIACIS HENLEI, Gill.

Snout produced, slender. L. 2½ feet. Color uniform reddish brown above, pale below, the pectoral, ventral, and anal fins margined with paler. Coast of California from Humboldt Bay to Monterey, a rather rare and imperfectly known species. (Named for Prof. J. Henle, the associate of Johannes Müller.)

Rhinotriacis henlei, Gill, Proc. Ac. Nat. Sci. Phila., 1862, 486, San Francisco.
Triacis henlei, Jordan & Gilbert, Synopsis, 20, 1883.

21. TRIAKIS, Müller & Henle.

Triakis, Müller & Henle, Magazine of Natural History, II, new series, 36, 1838, (*scyllium*). (*Triacis*, corrected spelling.)

Body compressed, elongate; mouth large, crescent-shaped, with well-developed long labial folds; teeth moderate, numerous, similar in both jaws, each with a longer median cusp, and 1 or 2 smaller ones on each side; eyes small, with nictitating membrane; spiracles small, behind the eyes; no pit at the root of the caudal; no lower lobe to the caudal; first dorsal fin opposite the space between the pectorals and ventrals. Embryo without placenta. Coloration variegated, black and gray. Pacific and Indian Oceans. (*τρεῖς*, three; *ἀκίς*, point.)

35. TRIAKIS SEMIFASCIATUM, Girard.

(Cat Shark; Leopard Shark.)

Snout moderately produced, rounded. Nostril with a broad anterior flap. First dorsal fin nearly midway between the pectorals and ventrals; the second dorsal not much smaller than the first, and partly in advance of the anal. Gray, the upper parts with well-defined black cross bands, narrower than the interspaces; a row of rounded black spots along the sides of the body, alternating with the interdorsal crossbars. L. 3 feet. Cape Mendocino to San Diego, common; a handsome shark, readily known by its variegated coloration. (*semifasciatus*, half banded.)

Triakis semifasciatum, Girard, Proc. Ac. Nat. Sci. Phila., 1854, 196, Presidio de San Francisco; Jordan & Gilbert, Synopsis, 20, 1883; Günther, Cat., VIII, 384, 1870.
Mustelus felis, Ayres, Proc. Cal. Ac. Sci., 1854, 17, San Francisco.

22. GALEORHINUS, Blainville.

(Topes.)

Galeus,[*] Rafinesque, Caratteri Alcuni Nuovi Generi, 13, 1810, in part, (*galeus*, etc., although that species is not explicitly mentioned).
Galeorhinus, Blainville, Bull. Sci. Philom., 1816, 121, (*galeus*).
Galeus, Cuvier, Règne Animal, Ed. I, 127, 1817, (*galeus*).
Eugaleus, Gill, Proc. Ac. Nat. Sci. Phila., 1864, 148, (*galeus*).

First dorsal opposite the space between the pectorals and ventrals; mouth crescent-shaped, with the teeth alike in both jaws, oblique, notched, and serrated; spiracles present, small; nictitating membrane present; no pit at the base of the caudal; caudal fin with a single notch. Tropical seas. (*γαλεός*, a kind of shark, like a weasel, *ῥίνη*, shark.)

---

[*] See note under *Galeus*.

36. GALEORHINUS ZYOPTERUS, Jordan & Gilbert.

(Oil Shark; Soup-fin Shark.)

Snout depressed, rather long, rounded at tip; nostrils nearer mouth than tip of snout; teeth about $\frac{32}{30}$, the 4 or 5 nearest the middle much smaller, the median tooth of each jaw smallest, subtriangular, without basal cusps; lateral teeth of both jaws similar, their points directed strongly outward; a sharp angle near middle of outer margin, below which are 2 to 5 sharp cusps or serrations; eye large; second dorsal scarcely $\frac{1}{4}$ size of first. Dusky grayish, most of pectoral, tip of caudal, and anterior portion of both dorsals black. L. 6 feet. Coast of Southern California from San Francisco to Cerros Island; very abundant. Valued for the oil in its liver, and for the fins, which are much prized by the Chinese; the gelatinous fin rays making a fine soup. Closely related to the European Tope (*G. galeus*, (L.)), from which it may prove to be indistinguishable. (*ζυόν*, soup; *πτερόν*, fin.)

Galeorhinus zyopterus, Jordan & Gilbert, Synopsis, 871, 1883, San Pedro, California. (Type, No. 26973.)

23. GALEOCERDO, Müller & Henle.

Galeocerdo, Müller & Henle, Plagiostomen, 59, 1838, (*tigrinus*).
Boreogaleus, Gill, Ann. Lyc. Nat. Hist. N. Y., VII, 411, 1861, (*arcticus*).

Mouth crescent-shaped; teeth alike in both jaws, large, oblique, coarsely serrated on both margins, with a deep notch on outer margin; spiracles present; caudal fin with a double notch; a pit on the tail above and below at the base of the caudal fin; first dorsal opposite the space between pectorals and ventrals. Large sharks, found in most seas. (*γαλεός*, a kind of shark, like *γαλῆ*, the weasel; *κερδώ*, a fox or weasel.)

37. GALEOCERDO TIGRINUS, Müller & Henle.

(Tiger Shark; Alecrin; Tigrone.)

Caudal fin forming about $\frac{1}{3}$ of the total length, much longer than the space between the dorsal fins; second dorsal somewhat in advance of the anal; a long labial fold along the upper jaw. Color brown, with numerous dark spots larger than the eye; adult nearly plain. Tropical seas, not rare, occasionally northward to Cape Cod and to San Diego. L. 15 to 30 feet. A very large and fierce shark, known by its variegated coloration, the most formidable of the West Indian species.[*] (*tigrinus*, tigerlike).

Galeocerdo tigrinus, Müller & Henle, Plagiostomen, 59, 1838; Günther, Cat., VIII, 378, 1870; Jordan & Gilbert, Synopsis, 21, 1883.
Galeus maculatus,[†] Ranzani, De Novis Speciebus Piscium, Dissert. Prima, 7, 1838, Brazil.
Galeocerdo maculatus, Poey, Synopsis, 455, 1868.

---

[*] "Le ha sacado del vientre del madre más de 60 felos prontos á nacer vivos y a poblar el abismo." *Poey.*

[†] We are unable to decide which of these two names of the same date, *tigrinus* and *maculatus*, is entitled to priority. Common usage has accorded precedence to the work of Müller & Henle.

24. PRIONACE, Cantor.

(BLUE SHARKS.)

Prionodon, MÜLLER & HENLE, Plagiostomen, 36, 1838, (*glaucus*, etc., name preoccupied).
Prionace, CANTOR, Malayan Fishes, 399, 1850, (substitute for *Prionodon*).
Cynocephalus, (KLEIN), GILL, Ann. Lyc. Nat. Hist. N. Y., 1861, 401, (*glaucus*).

Large sharks with the body and head slender; no spiracles; the teeth in both jaws strongly serrated in the adult, those in the upper jaw broad, those below narrower, straight, and claviform; first dorsal large, inserted midway between axils of pectorals and ventrals; second dorsal much smaller, usually not larger than anal; embryo not attached to the uterus by a placenta. Species rather few; large, slender, swift, voracious sharks of the warm seas. The groups here called *Prionace*, *Hypoprion*, *Aprionodon*, and *Scoliodon* are usually placed as subgenera under *Carcharhinus* or *Carcharias*, as the group has been commonly called. Their retention as distinct genera is apparently justified on the ground of convenience. (*πρίων*, saw; *ἀκίς*, point).

38. PRIONACE GLAUCA, (Linnæus).

(GREAT BLUE SHARK.)

Snout very long; nostrils rather nearer to the mouth than to the extremity of the snout; no labial fold except a groove at the angle of the mouth; teeth of the upper jaw oblique, scarcely constricted near the base; lower teeth slender, triangular in young examples, lanceolate, with a broad base, in old ones. Pectoral fin long, falciform, extending to the dorsal, which is nearer the ventrals than the root of the pectorals. Color light bluish gray above, paler below. A large shark of the warm seas, occasionally taken on our coasts (a few specimens from San Francisco and Monterey). More common in Europe. (EU.)

Squalus glaucus, LINNÆUS, Syst. Nat., Ed. x, 235, 1758, Seas of Europe.
Carcharias glaucus, GÜNTHER, Cat., VIII, 364, 1870.
Carcharhinus glaucus, JORDAN & GILBERT, Synopsis, 22, 1883.
Squalus cæruleus, BLAINVILLE, Faune Française, 91, 1828, Medeiterranean.
Squalus hirundinaceus, VALENCIENNES, in Müller & Henle, Plagiostomen, 37, 1838, Brazil.

25. CARCHARHINUS, Blainville.

Carcharias,* RAFINESQUE, Caratteri Alcuni Nuovi Generi, 10, 1810, (in part; *taurus*, the only species named).
Carcharhinus, BLAINVILLE, Journ. Phys., 1816, 264; (*commersoni*, a name based on Lacépède's figure of "*Squalus carcharias*"; it apparently represents *Carcharhinus lamia*).
Carcharias, CUVIER, Règne Animal, Ed. 1, 125, 1817, (*carcharias*, expressly identified with *Canis carcharias* of Bélon (de Aquatilibus, 1, 60), which is the species commonly called *Carcharias lamia*).
Eulamia, GILL, Ann. Lyc. Nat. Hist. N. Y., 1861, 401, (*lamia*).
Platypodon, GILL, *l. c.*, 401, (*menisorrah*).
Isogomphodon, GILL, *l. c.*, 401, (*oxyrhynchus*).
Lamiopsis, GILL, *l. c.*, 401, (*temmincki*).

---

* The name Carcharias as a generic term was first used by Rafinesque in 1810. It was thus defined:

"G. CARCHARIAS. Nessuno spiraglio, due ale dorsali, un ala anali, cinque aperture branchiali da ogni lato. Coda disiguale obbliqua. *Oss.*, Questo genero é il primo nell' ordine delli *Squalini*, e contiene le specie le piú enorme e le piú voraci; differisce notabilmente del genere *Galeus* dalla

Body rather robust, the head broad and depressed; mouth inferior, with the teeth in both jaws strongly serrated in the adult, less so or entire in the young; those in the upper jaw broad or narrow, those below narrow, straight, and nearly erect. No spiracles. First dorsal large, placed not far behind pectorals; pectorals falcate; second dorsal small. Embryos attached by placenta to the uterus, as in *Scoliodon*,* *Triakis*, and *Galeus*. Species very numerous and difficult of separation. Voracious sharks of the warm seas. (*καρχαρίας*, an old name of *C. lamia*, from *κάρχαρος*, jagged; *ῥίνη*, shark, the name first applied to *Squatina*, from its rasp-like skin; *ῥίνη*, a file.)

a. Teeth in both jaws distinctly serrate in the adult; the serræ on the lower teeth smaller; upper teeth rather broad, lower teeth narrower; snout not very acute.

PLATYPODON, (πλατύς, broad; ὕπο, under; ὀδούς, tooth):

  b. Upper teeth oblique, deeply notched on the outer margin; lower teeth narrow, scarcely or not notched.

    c. Pectorals very large, 3 times as long as broad, falciform, extending beyond base of first dorsal; color blue-gray. OBSCURUS, 39.

    cc. Pectorals shorter, not 3 times as long as broad, extending little if any beyond base of first dorsal.

      d. Length of snout from mouth, little if any greater than width of mouth.

        e. Distance from end of base of first dorsal to ventrals less than length of base of first dorsal.

          f. Nasal flap without sharp lobe.

            g. Second dorsal smaller than anal; snout depressed; first dorsal close behind pectorals. Light gray. PLATYRHYNCHUS, 40.

            gg. Second dorsal and anal nearly equal; color blue-gray. FALCIFORMIS, 41.

---

mancanza degli Spiragli." Under this group one new species is described, *Carcharias taurus*, a species of *Odontaspis*, as the genera have been understood.

No type is indicated by Rafinesque, but it is evident that he had the *Squalus carcharias* of Linnæus in mind as type, in accordance with his custom of raising Linnæan species to the rank of genera. In Rafinesque's Indice, published in the same year, 1810, a few months later, *Squalus carcharias*, L., appears as the type of *Carcharias* under the name of *Carcharias lamia*. The *Squalus carcharias* of Linnæus as understood by Rafinesque was *Carcharhinus lamia*. It was primarily based on *Carcharodon carcharias*, a species not known to most of the succeeding authors, who applied the name *Squalus carcharias* to *Carcharias lamia* instead of to *Carcharodon*. Cuvier distinctly makes *lamia* the type of his genus *Carcharias* as he refers to Bélon's figure of "*Canis carcharias*" as the only good representation of his species.

Bélon's figure plainly represents *Carcharias lamia*. It is also evident that Rafinesque has the *lamia* in mind in referring to his "*Squalus carcharias*" or "*Carcharias lamia*." The phrase "Coda disiguale, obbliqua," shows this, as also does the fact that the species was placed in the list of Sicilian fishes. *Carcharias lamia* is common in Sicily. *Carcharodon carcharias* is rare in the Mediterranean. In fact, few of the earlier writers in Italy or France knew the *Carcharodon*, and referred all accounts of it to the great shark known to them, *Carcharias lamia*. So far as intention of the author goes, *Carcharias* of Rafinesque should be strictly synonymous with *Carcharias* of Cuvier, and both based on the same type as the *Eulamia* of Gill. *Carcharhinus* of Blainville was originally based, according to Gill, on his *Squalus commersoni*, which seems to be *Carcharinus lamia*. In this connection we may note that Rafinesque, in 1810, seemed to have used but two general treatises on fishes, the Systema Naturæ of Linnæus, and the Historie Naturelle des Poissons of Lacépède. Rafinesque's genus *Carcharias* is Lacépède's "Premier sousgenre, une nageoiré de l' anus sans évents." His *Galeus* is the "Second sousgenre une nageoiré de l' anus et deux évents," while the name *Squalus* is retained by him for the "Troisième sousgenre, deux évents sans nageoire de l' anus." Rafinesque's remaining genera, *Dalatias*, *Tetroras*, *Isurus*, *Cerictius*, *Alopias*, etc., are based on species supposed by Rafinesque to be new.

If we should refer Rafinesque's genera to the groups of Lacépède, on which they were really based, *Carcharias* would be equivalent to *Carcharhinus* and *Galeus* to *Galeorhinus*. On the other hand, the strict rule of requiring the type of a genus to be taken from the species actually mentioned by its author makes the arrangement here adopted the necessary one. As in other disputed cases, we here follow the rules strictly.

* So far as known to us, the embryos in all our other viviparous sharks are without placentæ.

ff. Nasal flap with an acute lobe.

h. Snout not very short, its length from mouth not notably less than width of mouth. Color yellowish brown. ACRONOTUS, 42.

hh. Snout very short and blunt, its length from mouth but ⅔ width of mouth. PEREZI, 43.

ee. Distance from end of base of first dorsal to ventrals greater than length of first dorsal; snout moderate. REMOTUS, 44.

dd. Length of snout from mouth greater than width of mouth; first dorsal small. HENLEI, 45.

CARCHARHINUS:

bb. Upper teeth triangular, suberect, scarcely notched on the outer margin; lower teeth similar but much narrower.

i. Snout moderate, its length from mouth about equal to width of mouth.

j. Pectorals not falcate; fins not conspicuously darker at tips. Atlantic. MILBERTI, 46.

jj. Pectorals somewhat falcate; second dorsal rather smaller than anal; fins scarcely dusky at tip. Pacific. LAMIELLA, 47.

ii. Snout very short, its length from mouth less than width of mouth.

k. Pectoral long and falcate, reaching to posterior part of base of dorsal. Atlantic.

l. Anterior margin of first dorsal convex, the height of the fin about equal to depth of body. LAMIA, 48.

kk. Pectoral fin moderate, scarcely falcate, not reaching to end of base of dorsal.

m. Second dorsal not larger than anal; length of snout from mouth 1½ times in breadth of mouth; upper teeth very broad. Atlantic. PLATYODON, 49.

mm. Second dorsal larger than anal.

n. Length of snout from mouth but ½ breadth of mouth; upper teeth not very broad; head very broad above. Pacific. FRONTO, 50.

nn. Length of snout from mouth more than ½ breadth of mouth; fresh waters. NICARAGUENSIS, 51.

ISOGOMPHODON, (ἴσος, equal; γόμφος, nail; ὀδούς, tooth):

aa. Teeth slightly serrated, similar in form in the two jaws, narrow, claviform, constricted at base; snout rather sharp.

o. Snout moderate, its length from mouth not greater than the breadth of mouth; teeth moderate, about 30 in each jaw; fins edged with black.

p. Base of anal a little longer than that of second dorsal; pectoral reaching end of base of first dorsal. ÆTHALORUS, 52.

pp. Base of anal equal to that of second dorsal; pectoral reaching past base of first dorsal. LIMBATUS, 53.

oo. Snout very long and narrow, its length from mouth twice distance between nostrils; teeth small, about 48 in each jaw. OXYRHYNCHUS, 54.

Subgenus PLATYPODON, Gill.

39. CARCHARHINUS OBSCURUS, (Le Sueur).

(DUSKY SHARK.)

Head rather pointed, flattened above and below; first dorsal rather large; second dorsal smaller than the anal, and considerably produced behind; pectorals very large, falciform, extending beyond the end of the dorsal, their outer margin 4 times the inner. Dark clear blue above, white below. A large shark, reaching a length of 9 or 10 feet, inhabiting the Middle Atlantic and frequently taken on our coast. (*obscurus*, dusky.)

Squalus obscurus, LE SUEUR, Jour. Ac. Nat. Sci. Phila., 1818, I, 223, New York.
Carcharias obscurus, GÜNTHER, Cat., VIII, 366, 1670.
Carcharhinus obscurus, JORDAN & GILBERT, Synopsis, 22, 1883.
Carcharias falcipinnis, LOWE, Proc. Zoöl. Soc. Lond., 1839, 90, Madeira.
Prionodon obvelatus, VALENCIENNES, Poiss. Iles Canaries, 103, 1836, Canaries.

40. CARCHARHINUS PLATYRHYNCHUS, (Gilbert).

Snout moderate, not pointed, very flat, and broadly rounded; its length from mouth slightly greater than width of mouth, and less than width of snout opposite nostrils. No labial folds; nostril flap without acute lobe; upper teeth broadly triangular, coarsely serrate, the inner edge oblique, the outer more or less definitely notched; lower teeth narrow, erect; eye moderate. Pectorals little falcate, long, reaching beyond base of first dorsal, the fin about $\frac{1}{2}$ as broad as long; first dorsal inserted close behind pectoral, its distance from pectoral $\frac{2}{5}$ its base; its base $2\frac{1}{2}$ times in interspace between dorsals, and less than its height, which is less than depth of body; second dorsal inserted over anal, its base 3 in first dorsal, the fin smaller than anal; caudal $3\frac{1}{2}$ in total length. Light gray, the fins colored like the body. Magdalena Bay to Galapagos Islands; probably not rare. Resembles *C. lamiella*, from which it differs in dentition and in position of first dorsal. (*πλατύς*, flat; *ῥύγχος*, snout.)

Eulamia platyrhynchus, GILBERT, Proc. U. S. Nat. Mus., 1891, 544, Clarion Island, Socorro Island, Magdalena Bay.

41. CARCHARHINUS FALCIFORMIS, (Bibron).

(CAZON DE PLAYA.)

Snout moderately prolonged and acute; nostrils without lobe; first dorsal rather backward; second dorsal and anal opposite each other and of medium size; pectorals not twice as long as broad; upper teeth with a marked reëntrant angle on the outer border; 2 pores on the nape, well marked. Color, blue-black, deeper than in any other species. L. 10 feet. (Poey.) Cuba and neighboring waters. (*falx*, scythe; *forma*, form.)

Carcharias falciformis, BIBRON, in Müller & Henle's Plagiostomen, 47, 1838, Cuba.
Squalus tiburo, POEY, Memorias, II, 331, 1861, Havana.
Platypodon falciformis, POEY, Enumeratio, 191, 1875.

42. CARCHARHINUS ACRONOTUS, (Poey).

Close to *C. falciformis*, but with an acute lobe to the nostril; first dorsal farther forward; the second dorsal and anal larger; pectoral scarcely falciform; nuchal pores inconspicuous; color yellowish brown. (Poey). Cuba. (*ἀκρός*, sharp; *νῶτος*, back.)

Squalus acronotus, POEY, Memorias, II, 335, 1861, Havana.

43. CARCHARHINUS PEREZI, (Poey).

Snout rounded, its length from mouth $\frac{2}{3}$ width of mouth, and about equal to length of mouth (measured from the line connecting the angles); teeth oblique, with a deep notch on outer margin; lower teeth narrow; Nostril with a small, sharp lobe. Pectoral falciform, rather large. First dorsal acute, inserted near tip of pectoral; anal opposite second dorsal, which has a base nearly $\frac{1}{2}$ as long as that of first dorsal. Gray, tips of fins dusky. Cuba. (Named for Don Laureano Perez, of the University of Madrid.)

Platypodon perezi, POEY, Enumeratio, 195, 1875, Cuba.

44. CARCHARHINUS REMOTUS, (Valenciennes).

Muzzle rounded, the preocular length equal to the interorbital area; snout before mouth equal to width of mouth; upper teeth oblique with a reëntrant angle, the lower narrow; first dorsal a little higher than long, commencing close behind pectorals; second dorsal lower than anal, the interspace between dorsals nearly 3 times base of anal; distance from first dorsal to ventrals greater than length of first dorsal; pectorals 1⅔ times as long as broad, the posterior margin concave; the outer angle rounded; caudal 5⅕ in length. Color gray. Martinique. (Duméril.) (*remotus*, remote; the ventrals remote from the first dorsal.)

Carcharias remotus, VALENCIENNES, in Duméril's Hist. Nat. Poiss., I., 374, 1870, Martinique.

45. CARCHARHINUS HENLEI, (Valenciennes).

Snout produced, the distance between its extremity and the mouth being more than the width of the mouth, upper teeth oblique, notched on the outer margin; lower teeth narrow, nearly erect. Pectorals short, not reaching end of dorsal, their lower margin ⅖ length of upper. First dorsal very small and short, its base much shorter than that of anal. Uniform gray. (Günther.) Coast of Brazil and northward to Guiana. (Named for Dr. J. Henle.)

Carcharias henlei,* VALENCIENNES, in Müller & Henle, Plagiostomen, 46, 1838, Guiana.
Carcharias porosus,* RANZANI, Nov. Pisc. Diss. Prima., 70, 1838, Brazil.
Carcharias porosus, GÜNTHER, Cat., VIII, 365, 1870.

Subgenus CARCHARHINUS.

46. CARCHARHINUS MILBERTI, (Müller & Henle).

This species differs from *C. platyodon* chiefly in the following respects: Head longer, snout much less obtuse, its length from mouth equal to breadth of mouth; distance between nostrils ⅓ less than length of snout. Teeth and fins as in *C. platyodon*. Pectorals rather small, not falcate, 6½ in body; caudal 4 in body, rather narrow. Cape Cod to Florida; not rare, but very imperfectly described. (Named for M. Milbert, a French naturalist who collected in America.)

Carcharias (Prionodon) milberti, MÜLLER & HENLE, Plagiostomen, 38, 1838, New York.
Carcharias cæruleus, DE KAY, N. Y. Fauna: Fishes, 354, 1842, New York.
Carcharias cæruleus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 244.
Lamna caudata, DE KAY, *l. c.*, 351, 1842, Brenton Reef, Rhode Island.
Eulamia milberti, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 262.
Carcharhinus cæruleus, JORDAN & GILBERT, Synopsis, 872, 1883.

47. CARCHARHINUS LAMIELLA, (Jordan & Gilbert).

(BAY SHARK.)

Body robust, the back elevated. Head broad and flat; the snout long, but wide and rounded, its length from mouth a little more than width of mouth and greater than distance between nostrils, which are nearer snout than angle of the mouth. Eye moderate. Teeth $\frac{30}{30}$, their form as in *C. lamia*, the upper regularly triangular, without notch, narrow in the young, the lower narrowly triangular, erect, on a broad base; all the teeth distinctly and evenly serrated. First dorsal beginning at a distance $\frac{4}{5}$ its own base behind the pectorals and ending a little more than its base before the ventrals. Space between dorsals $2\frac{3}{5}$ times base of first dorsal, 7 times that of second. Height of first dorsal $\frac{2}{3}$ the depth of the body; pectoral reaching past first dorsal. Second dorsal very small, not $\frac{1}{6}$ the height of the first, smaller than anal and nearly opposite it. Pectorals long and broad, reaching past base of dorsal, $5\frac{2}{3}$ in body. Tail $3\frac{1}{2}$ in length. Color plain light gray. San Diego Bay and southward along the Mexican coast. Very close to *C. lamia*, but the dorsals and pectorals smaller and the first dorsal farther back. (Diminutive of *lamia*.)

---

* We do not know which of these two names has priority of date.

Carcharias lamiella, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 110, **San Diego**; JORDAN & GILBERT, Synopsis, 873, 1883. (Type, No. 27366.)

48. CARCHARHINUS LAMIA,* (Rafinesque).

(CUB-SHARK; REQUIN; REQUIEM; LAMIA.)

Head broad, depressed; snout short and rounded, nostrils midway between its tip and the front of the mouth; breadth of mouth $2\frac{1}{3}$ times length of preoral part of snout. First dorsal very large, inserted close behind the base of the pectoral, its height a little greater than the length of its base, its anterior margin convex, its upper angle rounded, its posterior border nearly straight, its lower angle pointed, its height about equal to greatest depth of body; second dorsal much smaller than first, about equal to anal; pectorals at least twice as long as broad, 5 times in body; upper lobe of caudal $\frac{1}{4}$ the total length, twice the inferior lobe. Grayish, fins rarely darker at tip. L. 10 feet. Tropical parts of the Atlantic; common northward to Florida Keys, abundant in the Caribbean Sea and in the Mediterranean; a man-eating shark, notorious in warm regions as a greedy scavenger about wharves. (*λαμία*, lamia, sea-monster, from *λαιμός*, devouring hunger.) (EU.)

Canis carcharias, *Lamia* or *Requin* of early writers.

Squalus carcharias of most early French and Italian writers, not of Linnæus.

Carcharias lamia, RAFINESQUE, Indice d'Ittiol. Sicil., 44, 1810, **Sicily**, (after Lacépède).

Carcharhinus commersoni, BLAINVILLE, Bull. Sci. Philom., 1816, 121, (based on Lacépède's figure of *Squalus carcharias*.)

Squalus carcharias, CUVIER, Règne Animal, based on *Canis carcharias* of Bellonius.

Carcharias lamia, RISSO, Hist. Nat. Europ. Merid., III, 119, 1826, **Nice**.

Squalus longimanus, POEY, Memorias, II, 338, 1861, **Cuba**.

Eulamia longimana, POEY, Synopsis, 48, 1868.

Eulamia lamia, POEY, Enumeratio, 188, 1875.

Carcharias lamia, GÜNTHER, Cat., VIII, 372, 1870; JORDAN, Proc. U. S. Nat. Mus., 1884, 104.

---

* *Carcharhinus leucos*, (Valenciennes): Pectorals rather long, but shorter than in *C. lamia*; first dorsal with pointed angles, its anterior border not convex, and its posterior border little excavated (Duméril); otherwise about as in *C. lamia*, with which it is probably identical. West Indies; Algiers. (λευκός, white.)

Carcharias leucos, Valenciennes, in Müller & Henle's Plagiostomen, 42, 1838, **Antilles**; Duméril Hist. Nat. Poiss., 358.

49. CARCHARHINUS PLATYODON, (Poey).

Body stout; head very short, broad, depressed, and bluntly rounded; mouth twice as broad as long, its breadth about ½ more than length of snout; upper teeth very broad, triangular, erect, coarsely serrate, not notched; lower teeth narrower, more finely serrate. First dorsal beginning close behind pectoral, a little higher than long, not falcate, its base 2⅓ in interspace between dorsals; second dorsal very small, its base 5 in interspace; caudal moderate, 2⅔ in body; anal a little longer than second dorsal, and placed a little farther back; pectorals rather small, not falcate, 6 in total length, reaching a little past front of dorsal; width of pectoral nearly ⅔ of its length. Slaty blue, white below; caudal blackish, other fins with dark tips. L. 10 to 15 feet. Cuba to Texas; abundant in the Gulf of Mexico; the specimen here described being from Galveston. (*πλατύς*, broad; *ὀδούς*, tooth.)

Squalus platyodon, Poey, Memorias, II, 331, 1861, Havana.
Squalus obtusus, Poey, *l. c.*, 337, Havana.
Carcharias platyodon, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 243; Synopsis, 872, 1883.

50. CARCHARHINUS FRONTO, (Jordan & Gilbert).

(Tiburon.)

Body short and stout; head very broad, depressed, broadly rounded anteriorly, the front of snout parallel with cleft of mouth; snout from mouth ½ the distance between angles of mouth; and about equal to distance from chin to the line connecting these angles; interorbital width twice length of snout to eyes. Teeth in both jaws narrowly triangular, twice as high as broad, all nearly erect and scarcely notched on outer margin. Free margins of fins concave; insertion of first dorsal nearer pectorals than ventrals; length of base of first dorsal more than its height, but less than interorbital width; interspace between dorsals 2¼ times base of first, 3⅕ times base of second; tail 4¼ in body; anal smaller than second dorsal; pectorals large, not acute, reaching a little past front of dorsal. Slaty gray, the edges of fins brownish. L. 10 feet. Pacific Coast of Mexico; a large voracious shark remarkable for its broad head. (*fronto*, having a wide forehead.)

Carcharias fronto, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 102, Mazatlan, Mexico. (Type, No. 28167.)

51. CARCHARHINUS NICARAGUENSIS, (Gill & Bransford).

(Tigrone.)

Snout short, obtusely rounded; distance from mouth to snout ⅘ distance between nostrils; teeth $\frac{26}{26}$; upper teeth triangular, scarcely notched on outer margin; first dorsal commencing just behind axil of pectoral, its height greater than length of its base; second dorsal larger than anal, its base 2½ in that of first dorsal; pectorals moderate, their length not twice height of dorsal. L. 7 feet. Lake Nicaragua and its outlet, Rio San Juan, abundant, confined so far as known to fresh waters, the only strictly fresh water shark recorded.

Eulamia nicaraguensis, Gill & Bransford, Proc. Ac. Nat. Sci. Phila., 1877, 190, Lake Nicaragua, Nicaragua.

Subgenus ISOGOMPHODON, Gill.

52. CARCHARHINUS ÆTHALORUS, (Jordan & Gilbert).

Body robust, the head rather long and pointed in profile, flattish above; snout from mouth equal to distance between angles of mouth, ½ greater than from chin to line connecting these angles; interorbital width slightly more than snout from eye; 3 short furrows from angle of mouth; teeth in both jaws narrowly triangular, nearly erect and scarcely notched on the outer margin, all finely serrate; pores not conspicuous; gill openings large. Free margins of all fins concave. Insertion of first dorsal close behind base of pectoral; length of base of first dorsal less than its height; interspace between dorsals 2 to 2⅓ times base of first dorsal and 4 times second, which is much smaller than first. Tail about ¼ total length; anal a little longer than second dorsal. Eyes very small. Pectorals somewhat falcate, reaching to opposite posterior part of base of dorsal, their tips pointed; pectoral, 6 in body. Slaty gray; upper edge of tail blackish; tips of all fins blackish. L. 6 feet or more. Mazatlan to Panama; common; very close to *C. limbatus.* (*αἰθαλή*, soot; *ὅρος*, margin.)

Carcharias æthalorus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 104, Mazatlan. (Type, Nos. 28202, 29549.)

53. CARCHARHINUS LIMBATUS, (Müller & Henle).

(CAÇONETTA.)

Snout somewhat pointed in front, rather produced, the distance between its extremity and the mouth somewhat less than width of mouth; nostrils nearly midway between the extremity of snout and mouth; teeth $\frac{25\text{-}29}{27\text{-}30}$, similar in form in both jaws, erect, constricted, on a broad base, the upper more distinctly serrated than the lower; gill openings wide, at least twice as wide as the eye, which is small. Pectorals falciform, extending beyond end of dorsal, the length of their upper margin being nearly 4 times that of lower. First dorsal commencing very close behind the axil of the pectoral; origins of second dorsal and anal opposite to each other, the bases being nearly equally long. Caudal fin long, its length equal to distance between the origins of the 2 dorsal fins. Color gray, lower side of the extremity of the pectoral, extremities of the second dorsal and anal and of the lower caudal lobe, black. (Günther.) Tropical seas, north to Florida; a stray specimen taken at Woods Holl, Mass.; common in Brazil; used as food by the very poor. (*limbatus*, edged.)

Carcharias (*Prionodon*) *limbatus*, MÜLLER & HENLE, Plagiostomen, 49, 1838, Martinique.
Carcharias limbatus, GÜNTHER, Cat., VIII, 373, 1870.
Isogomphodon limbatus, JORDAN & GILBERT, Synopsis, 23, 1883.
Isogomphodon maculipinnis, POEY, Repertorio, I, 191, 1867, Cuba.
Carcharias mülleri, STEINDACHNER, Sitzber. Akad. Wiss. Wien., 1867, 356, West Indies.
Carcharias microps, LOWE, Proc. Zoöl. Soc., 1840, 38, Madeira.
Prionodon cucuri, CASTELNAU, Anim. Amér. Sud. Poiss., 99, 1855, Bahia.

54. CARCHARHINUS OXYRHYNCHUS, (Müller & Henle).

Snout very much elongate, pointed, narrow; distance between mouth and tip of snout about twice distance between nostrils; a short labial fold on each jaw; teeth small, $\frac{46\text{-}49}{48\text{-}49}$, erect, rather slenderer in lower jaw; only the upper teeth show serration near the tip. Pectorals very large and broad, extending beyond dorsal, which begins above root of pectoral. Second dorsal and anal sub-equal, only ½ size of first dorsal. Eye small, gill openings moderate. (Günther.) Surinam. (*ὀξύς*, sharp; *ῥύγχος*, snout.)

Carcharias oxyrhynchus, MÜLLER & HENLE, Plagiostomen, 41, 1838, Surinam.
Carcharias oxyrhynchus, GÜNTHER, Cat., VIII, 375, 1870.

26. HYPOPRION, Müller & Henle.

Hypoprion, MÜLLER & HENLE, Plagiostomen, 34, 1838, (*macloti*).
Hypoprionodon, GILL, Ann. Lyc. Nat. Hist. N. Y., 1861, 401, (*hemiodon*) (teeth serrate on outer side only).

Characters essentially as in *Carcharhinus*, but with the lower teeth entire, the upper teeth coarsely serrated at base only, on one or both sides; lower teeth erect. (*ὑπό*, below; *πρίων*, saw; the upper teeth being serrated at base).

a. Snout obtuse; its length from mouth ½ interorbital width; upper teeth weakly serrate on both sides in adult; second dorsal very large, more than ½ base of first. BREVIROSTRIS, 55.
aa. Snout acute; its length from mouth 1⅙ times width of mouth; upper teeth strongly serrate on both sides; second dorsal small, about ½ as long as first. SIGNATUS, 56.

55. HYPOPRION BREVIROSTRIS, Poey.

Body robust; head flattened, the snout short, flat, broadly rounded; nostril midway between tip of snout and posterior edge of pupil; preoral part of snout half interorbital width; width of mouth equal to distance from tip of snout to posterior margin of orbit; fold at angle of mouth half orbit; upper teeth broadly triangular, the base finely serrate on outer edge only in young, on both sides in adult; lower teeth erect. Eye small. Second dorsal unusually large, similar to first and nearly as high. Interspace between dorsals 2¼ times base of first, 2⅓ times second; anal about ⅔ size of second dorsal; pectorals moderate, broad, nearly reaching middle of first dorsal. Gray, fins dusky in young, inside of mouth brilliant white. L. 7 feet. West Indies, north to Charleston, not rare at Key West, where it frequents the wharves with its more dangerous relative, *Carcharhinus lamia*. (*brevirostris*, short-nosed.)

Hypoprion brevirostris, POEY, Repertorio, II, 451, tab. 4, 1868, Cuba; JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 581; JORDAN, *l. c.*, 1884, 104.

56. HYPOPRION SIGNATUS,* Poey.

Snout long, acute, the preoral length 1⅙ times width of mouth; nostrils with a short, acute lobe; pectoral acute, not falciform; second dorsal opposite anal, neither ½ base of first dorsal; upper teeth strongly serrate at base, the claw sharp and nearly erect. Cuba. (Poey, description of *longirostris*.) (*signatus*, marked.)

Hypoprion signatus, POEY, Synopsis, 452, 1868, Cuba; POEY, Enumeratio, 199, 1875.
Hypoprion longirostris, POEY, Enumeratio, 199, 1875, Cuba.

---

*Poey has given names to 2 species of *Hypoprion* with the snout long, the 2 differing only in form of the teeth. These are *longirostris*, described as above, and *signatus*, known from the teeth only. The upper teeth of *signatus*, according to Poey, have the claw triangular and bluntish, the lower teeth bluntish, not flexuous, and somewhat oblique. Probably the 2 are not different species, and *signatus* is the older name.

27. APRIONODON, Gill.

Aprion, MÜLLER & HENLE, Plagiostomen, 32, 1838, preoccupied, (*isodon*).
Aprionodon, GILL, Ann. Lyc. Nat. Hist. N. Y., VII, 1861, 411, (*punctatus* = *isodon*).

Snout more or less produced and conic; teeth entire, without serræ, all of them narrowed, on a broad base, the lower erect, the upper erect or slightly oblique; dorsal more or less posterior, opposite the space between pectorals and ventrals. (*ἀ-*, privative; *πρίων*, saw; *ὀδούς*, tooth; the edges of the teeth being always entire.)

57. APRIONODON ISODON, (Müller & Henle).

Snout short, little pointed; distance from angle of mouth to nostril twice that from nostril to end of snout; pectorals reaching end of first dorsal, which is much longer and higher than second. Grayish. (Duméril.) Atlantic Ocean, recorded from New York, Virginia, and Cuba; probably rare. (*ἴσος*, equal; *ὀδούς*, tooth).

Carcharias isodon, MÜLLER & HENLE, Plagiostomen, 32, 1838, New York.
Carcharias punctatus, GÜNTHER, Cat., VIII, 361, 1870, New York, (not *Squalus punctatus*, MITCHILL, which is *Scoliodon terræ-novæ*).
Aprionodon isodon, POEY, Enumeratio, 200, 1875.
Carcharias isodon, DUMÉRIL, Elasmobranches, 349, 1870.

28. SCOLIODON, Müller & Henle.

Scoliodon, MÜLLER & HENLE, Wiegmann's Archiv. f. Naturg., III, 1837, (*laticaudus*).

Teeth entire or very nearly so, oblique and flat, the points directed toward the sides of the mouth, so that the inner margins are more or less nearly horizontal, the teeth in front more nearly erect; teeth not swollen at the base, each of them with a deep notch on the outer margin below the sharp point; lips with conspicuous grooves. Otherwise as in *Carcharhinus*, from which the genus is scarcely distinct. Size small. (*σχόλιος*, oblique; *ὀδούς*, tooth.)

a. Teeth minutely serrulate above in the adult, less oblique than in the next; snout sharp, its length from mouth greater than width of mouth. LONGURIO, 58.
aa. Teeth entire, all very oblique; snout not sharp, its length from mouth less than width of mouth. TERRÆ-NOVÆ, 59.

58. SCOLIODON LONGURIO, (Jordan & Gilbert).

Snout much produced, sharp, its length from mouth 1¼ times width of mouth; labial folds well developed, that on upper jaw reaching about ⅓ distance to middle of jaw, the lower fold ½ as long; upper teeth broadly triangular, minutely serrated, serrulate on both margins; lower teeth entire, suberect, less oblique than in *S. terræ-novæ*. Pectorals short, not reaching end of first dorsal; first dorsal large, close behind pectorals, its base 2¼ in interspace between dorsals; second dorsal very small, over anal, which is nearly twice its length; base of anal nearly ½ that of first dorsal. Dark gray, the young with the fins dusky edged. Pacific Coast of Mexico; not rare. (*longurio*, a slender youth, or stripling.)

Carcharias longurio, JORDAN & GILBERT. Proc. U. S. Nat. Mus., 1882, 106, Mazatlan. (Type, Nos. 28306, 28330, 28331, 29541, 29551.)

59. SCOLIODON TERRÆ-NOVÆ, (Richardson).

(SHARP-NOSED SHARK.)

Body slender; snout depressed, moderately rounded; mouth U-shaped, with a short labial groove at its angle, which groove extends on the upper jaw as well as on the lower; distance between nostrils greater than distance from nostrils to end of snout; gill openings narrow; first dorsal moderate, midway between pectorals and ventrals; second dorsal very small, slightly behind, and rather smaller than anal; anal fin much shorter than distance from anal to ventrals; pectoral fins rather large, reaching about to middle of first dorsal; ventrals small. Color gray; caudal fin with a conspicuous narrow blackish edge. Cape Cod to Brazil, very common southward along the Atlantic Coast. Size rather small. L. 3 feet. (Name from Newfoundland, where the species was erroneously supposed to occur.)

Squalus (Carcharias) terræ-novæ,* RICHARDSON, Fauna Bor. Amer., III, 289, 1836, Newfoundland.
Carcharias terræ-novæ, GÜNTHER, Cat., VIII, 360, 1870.
Squalus punctatus, MITCHILL, Trans. Lit. & Phil. Soc. N. Y., 1, 483, 1815, New York; name preoccupied.
Carcharias lalandi, MÜLLER & HENLE, Plagiostomen, 30, 1838, Brazil.

Family XII. SPHYRNIDÆ,

(THE HAMMER-HEADED SHARKS.)

General characteristics of the GALEIDÆ, but the head singularly formed, kidney-shaped or "hammer"-shaped, from the extension of its sides, the nostrils being anterior and the eyes on the sides of the "hammer"; mouth crescent-shaped, under the "hammer"; teeth of both jaws similar, oblique, each with a notch on the outside near the base; no spiracles; last gill opening over the pectoral; first dorsal and pectorals large, the dorsal nearer pectorals than ventrals; second dorsal and anal small; a pit at the root of the caudal; caudal fin with a single notch toward its tip, its lower lobe developed. One genus with 5 species, inhabiting most warm seas. Large sharks, known at once by the singular form of the head, which is not quite the same in any two species. (CARCHARIIDÆ, part, group ZYGÆNINA, Günther, Cat., VIII, 380–383.)

29. SPHYRNA, Rafinesque.

(HAMMER-HEAD SHARKS.)

Sphyrna, RAFINESQUE, Indice d' Ittiol. Siciliana, 60, 1810, (*zygæna*).
Cestrorhinus, BLAINVILLE, Journ. Phys., 264, 1816, (*zygæna*).
Zygæna, CUVIER, Règne Animal, Ed. 1, 127, 1817, (*zygæna*; name preoccupied)
Platysqualus, SWAINSON, Classn. Anim., II, 318, 1839, ("*tiburo*"=*tudes*).
Cestracion (KLEIN: pre-Linnæan), GILL, Ann. Lyc. Nat. Hist. N. Y., VIII, 1861, 412, (*zygæna*).
Eusphyra, GILL, *l. c.*, (*blochii*).
Reniceps, GILL, *l. c.*, (*tiburo*).

---

* This species, with others belonging to the Florida fauna, is said by Richardson to have been brought from Newfoundland by Audubon. They doubtless came from some locality in Florida or Carolina.

Characters of the genus included above. In the form of the head, there is a perfect gradation among the species from the narrow hammer of *S. blochii*, with the lobes 3 times as long as broad and deeply grooved along the anterior edge, to the kidney-shaped head of *S. tiburo*, in which the anterior grooves are obsolete. (*σφῦρα*, hammer.)

a. Nostrils near the eyes.
  b. Nostril with the frontal groove short or obsolete; lateral extension of head moderate so that the head is rather kidney-shaped than hammer-shaped.
    c. Reniceps, (*rena*, kidney; *ceps*, head): Nostril with the groove obsolete; anterior and lateral margins of head confluent into a semicircle. TIBURO, 60.
    cc. Platysqualus, (*πλατύς*, broad; *squalus*): Nostril with a short groove; anterior margin of head curved, not continuous with lateral edges. TUDES, 61.
Sphyrna:
  bb. Nostril with a well-developed groove, which extends along the front of the hammer-shaped head, the anterior and posterior outlines of which are nearly parallel. ZYGÆNA, 62.

Subgenus RENICEPS, Gill.

60. SPHYRNA TIBURO, (Linnæus).

(Shovel-head Shark; Bonnet-head.)

Body rather slender, not much compressed; head depressed, semicircular in front, reniform, the posterior free margins short, the lateral margins continuous with the anterior; pectorals large; first dorsal high, midway between pectorals and ventrals; second dorsal much smaller, produced behind, higher and shorter than anal; ventral fins moderate; caudal moderate; mouth small, crescentic; teeth small, very oblique, with a deep notch on the outer margin. Head $4\frac{1}{3}$ in length, 6 to tip of caudal; width of head slightly less than length of head. Color uniform ashy, paler beneath. L. 3 to 5 feet. Atlantic Ocean; abundant on our coast from Long Island southward; ranging to China. (*tiburo*, shark, in Spanish.)

Squalus tiburo, Linnæus, x, 1758, 234, America.
Zygæna tiburo, Günther, Cat., viii, 382, 1870.
Reniceps tiburo, Jordan & Gilbert, Synopsis, 25, 1883.

Subgenus PLATYSQUALUS, Swainson.

61. SPHYRNA TUDES, (Cuvier).

Intermediate in all respects between *S. zygæna* and *S. tiburo*, the head longer and the hammer less produced laterally than in the former. Anterior margin of the head much curved, but not continuous with the lateral edge; length of hinder margin of one side of the hammer less than its width near the eye. Nostril close to the eye, its groove longer than in *S. tiburo*, but very short, continued for but a short distance along the side of the head, and followed by a line of pores. A large shark, of the warm seas; Gulf of California, West Indies, Mediterranean, and Indian Ocean. (*tudes*, hammer.) (Eu.)

Zygæna tudes (Cuvier MS.), Valenciennes, Mém. Mus., ix, 225, 1822, Nice, after Pantouflier of Risso.
Sphyrna tudes, Müller & Henle, Plagiostomen, 53, 1838.
Zygæna tudes, Günther, Cat., viii, 382.
Sphyrna tudes, Jordan & Gilbert, Bull. U. S. Fish Com., 1882, 105.
Sphyrna tudes, Jordan, Cat. Fish. N. A., 9, 1885.

Subgenus SPHYRNA.

62. SPHYRNA ZYGÆNA, (Linnæus).

(Hammer-headed Shark.)

Head truly hammer-shaped; width of head about twice its length; length of hinder margin of hammer nearly equal to its width near the eye; nostril close to eye, prolonged into a groove which runs along nearly the whole front margin of head; first dorsal large; second quite small, smaller than anal; pectoral rather large. Color gray. A large voracious shark, reaching a length of 15 feet or more, found in all warm seas; occasional on our coasts from Cape Cod and from Point Concepcion southward. (*ζύγαινα*, *Zygæna*, the ancient name, from *ζυγόν*, yoke.) (Eu.)

Squalus zygæna, Linnæus, Syst. Nat., Ed. x, 1758, 234, Europe; America.
Squalus malleus, Risso, Ichth. Nice., 34, 1810, Nice.
Zygæna malleus, Storer, Fish. Mass., 238, 1867.
Sphyrna zygæna, Jordan & Gilbert, Synopsis, 25, 1883.
Zygæna lewini, Lord in Griffith, Animal Kingdom, x, 640, 1834, New Holland.
Zygæna subarcuata, Storer, Proc. Bost. Soc. Nat. Hist., 1848, 70, Cape Cod.

Family XIII. ALOPIIDÆ.

(The Thresher Sharks.)

Body moderately elongate, the snout rather short; mouth crescent-shaped; teeth equal in both jaws, moderate sized, flat, triangular, not serrated; the third tooth of the upper jaw on each side much smaller than the others; gill openings moderate, the last one above the root of the pectorals; no nictitating membrane; spiracles just behind eye, minute or absent; first dorsal large, midway between pectorals and ventrals; second dorsal and anal very small; caudal fin exceedingly long, about as long as the rest of the body, a pit at its root, a notch on the upper lobe near its tip; lower lobe moderately developed; no caudal keel; ventrals rather large; pectorals very large, falcate. A single species, reaching a large size, inhabiting most seas, known at once by the great length of the tail. (*Lamnidæ*, part, Günther, VIII, 393; genus *Alopecias*.)

30. ALOPIAS, Rafinesque.

(Thresher Sharks.)

Alopias, Rafinesque, Caratteri di Alcuni Generi, etc., 12, 1810, (*macrourus*=*vulpes*).
Alopecias, Müller & Henle, Plagiostomen, 74, 1838, amended orthography.

The characters of the genus are included above. (*ἀλωπός*, a fox, Latin, *vulpes*. *A. vulpes* was known to the ancients as *ἀλωπεκίας*, fox-like).

63. ALOPIAS VULPES, (Gmelin).

(Thresher; Fox-shark; Swingle Tail; Long-tail Shark.)

A large shark, abounding in all warm seas, especially in the Mediterranean and Atlantic. It is also frequently taken on our Pacific coast. (*vulpes*, fox.) (Eu.)

Squalus vulpes, Gmelin,* Syst. Nat., I, 1496, 1788, Mediterranean, (after Pennant).
Squalus vulpinus, Bonnaterre,* Tableau Encycl. Icthy., 9, 1788, Mediterranean, (after Pennant).
Alopecias vulpes, Günther, Cat., VIII, 393, 1870.
Alopias vulpes, Jordan & Gilbert, Synopsis, 27, 1883.
Alopias macrourus, Rafinesque, *l. c.*, 1810, 12, Sicily.
Squalus alopecias, Gronow, Cat. Fishes, 7, 1854.

Family XIV. CARCHARIIDÆ.

(The Sand Sharks.)

Body rather elongate, the snout sharp; mouth crescent-shaped, wide; the teeth large, long, narrow, and subulate, most of them with 1 or 2 small cusps at the base, their edges entire; gill openings rather large, all of them in front of the pectorals; two dorsals, moderate, subequal; the anal similar; first dorsal well behind pectorals; caudal well developed, with a short basal lobe and a notch toward its tip; no caudal keel; pectorals rather short; no nictitating membrane; spiracles minute, pore-like. A single genus, with 3 recognized species. A number of fossil species belong to this family. Voracious sharks of moderate size, chiefly inhabiting the Atlantic. (Lamnidæ, part, Günther, Cat., VIII, 392; genus *Odontaspis.*)

31. CARCHARIAS, Rafinesque.

Carcharias, Rafinesque,† Caratteri di Alcuni Nuovi Generi, 10, 1810; in part, the only species mentioned, *taurus*, belongs here. (See note under *Carcharhinus.*)
Odontaspis, Agassiz, Poissons Fossiles, III, 87, 1836, (*ferox*).
Triglochis, Müller & Henle, Mag. Nat. Hist., 1837, II, 88, (*ferox*).
Eugomphodus, Gill, Proc. Ac. Nat. Sci. Phila., 1864, 260, (*littoralis*).

Characters of the genus given above. (*καρχαρίας*, a rough shark.)

a. Teeth large, awl-shaped, most of them with 1 or 2 small cusps at base.

Eugomphodus, (εὖ, true; γόμφος, nail; ὀδούς, tooth):

b. First and fourth teeth of upper jaw and first tooth of the lower simple, without basal cusps. LITTORALIS, 64.

Subgenus EUGOMPHODUS, Gill.

64. CARCHARIAS LITTORALIS, (Mitchill).

(Sand Shark.)

Body elongate, its depth $\frac{1}{5}$ the length; head rather pointed, about $\frac{1}{7}$ of the length; fins small, the first dorsal not much longer than the second, both similar to the anal; pectoral fins short, obtuse or truncate. Color gray. L. 5 feet. A small voracious shark with very sharp teeth, rather common on our Atlantic coast, especially between Cape Cod and Cape Hatteras, said to differ from the European *C. taurus* in its more anterior dorsal; the two species need further comparison. (*littoralis*, pertaining to the shore.)

---

*The general works of Dr. J. F. Gmelin and the Abbé Bonnaterre bear the same date, 1788. We do not know which is the earlier, and follow common usage in retaining in this and other cases the name given by Gmelin. Neither writer mentions the other. Gmelin's preface is dated March 16, 1788, while the page devoted by Bonnaterre to the "Privilège du Roi" bears date of May 16, 1788. Bonnaterre states that there have been thirteen editions of Linnæus' Systema Naturæ. Of these the thirteenth is the work of Gmelin. But there is no evidence that Bonnaterre had seen or used this thirteenth edition, or that the latter had appeared when his own work was published. The two works were nearly simultaneous in appearance, but there is a slight probability in favor of Gmelin. Gmelin's names have been generally used by subsequent authors, while those of Bonnaterre have been almost totally ignored.

† *Carcharias*, Rafinesque, was established for those sharks, "the most enormous and most voracious of their order, which differ from the genus *Galeus*, Rafinesque, by the lack of spiracles." The group corresponds to the first subgenus under *Squalus*, in the arrangement of Lacépède. The type of this subgenus is *Squalus carcharias*, which was identified by Rafinesque with *Carcharhinus lamia*. *Carcharias lamia* should, therefore, have been designated as the type of *Carcharias*, but Rafinesque failed to so indicate, and we leave the name with the only species he mentions.

Squalus americanus, MITCHILL, Trans. Lit. and Phil. Soc., 1815, I, 483, New York, (not of Shaw).
Squalus littoralis, and *S. macrodus*, MITCHILL, Am. Monthly Mag., II, 1818, 328, New York.
Carcharias griseus, AYRES, Bost. Jour. Nat. Hist., 1844, 288, Long Island.
Odontaspis americanus, GÜNTHER, Cat., VIII, 392, 1870.
Eugomphodus littoralis, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 260.
Carcharias americanus, JORDAN & GILBERT, Synopsis, 27, 1883.

Family XV. LAMNIDÆ.

(THE MACKEREL SHARKS.)

Sharks of large size, with the body stout, the mouth wide, with large teeth, and the tail slender, the caudal fin lunate, the 2 lobes being not very unequal, the upper lobe strongly bent upward; caudal peduncle with a strong keel on each side; gill openings wide, all in front of the pectorals, entirely lateral, not extending under the throat; first dorsal large; pectorals large; ventrals moderate; second dorsal and anal very small; a pit at the root of the caudal; spiracles minute or absent. Genera 3; species 6 or more, besides numerous fossil species. In this family the dentition, as well as the muscular system, reaches its highest degree of specialization. (LAMNIDÆ, part, Günther, Cat., VIII, 389-392.)

a. LAMNINÆ. Teeth slender and sharp, with entire edges.
  b. Teeth without basal cusps, long, flexuous, and acute. ISURUS, 32.
  bb. Teeth, or most of them, with a small cusp on each side at base, compressed, sharp, and somewhat triangular. LAMNA, 33.
aa. CARCHARODONTINÆ. Teeth with serrated edges, compressed, and triangular in form, without basal cusp. CARCHARODON, 34.

32. ISURUS, Rafinesque.

Isurus, RAFINESQUE, Caratteri di Alcuni Nuovi Generi, 11, 1810, (*oxyrhynchus*).
Oxyrhina, AGASSIZ, Poissons Fossiles, III, 276, 1836, (*spallanzanii = oxyrhynchus*).
Isuropsis, GILL, Ann. Lyc. Nat. Hist. N. Y., VIII, 153, 1861, (*glaucus*).

Snout rather long and pointed; the body formed much like that of a tunny or mackerel; first dorsal and pectorals large; second dorsal and anal very small; caudal peduncle slender; teeth long, lanceolate, with sharp entire cutting edges and no basal cusps. (*ἴσος*, equal; *οὐρά*, tail; the two lobes of the tail being nearly equal, as in all the members of this family.)

ISUROPSIS, (ἴσος, equal; οὐρά, tail; ὄψις, appearance):
a. First dorsal inserted entirely behind pectorals, nearly midway between pectorals and ventrals.
  b. Height of dorsal 1¾ in head; pectoral as long as head. DEKAYI, 65.
ISURUS:
aa. First dorsal inserted close behind pectorals. OXYRHYNCHUS, 66.

Subgenus ISUROPSIS, Gill.

65. ISURUS DEKAYI, (Gill).

(MACKEREL SHARK.)

Head 5 in length to tip of caudal; pectoral as long as head, a little longer than upper caudal lobe. Dorsals and pectorals falcate; first dorsal inserted behind pectoral at a distance equal to ¼ head; base of first dorsal 2⅓ in head, its height 1¾. Middle teeth very long, much longer and narrower than lateral teeth. Dark bluish gray above, white below, the color abruptly changing on the tail; upper fins dusky, lower pale. L. 10 feet. Cape Cod to West Indies, not common; described here from a specimen taken at Pensacola. The American species seems to differ from the Asiatic *I. glaucus* in its longer pectorals and higher dorsal. (Named for James E. De Kay, author of the Fauna of New York.)

Lamna punctata, DE KAY, N. Y. Fauna: Fishes, 352, 1842, New York, (not *Squalus punctatus*, MITCHILL).

Isuropsis dekayi, GILL, Ann. Lyc. Nat. Hist. N. Y., 1861, 153, after De Kay.

Isuropsis glaucus, POEY, Synopsis, 446, 1868 (not *Oxyrhina glauca*, MÜLLER & HENLE).

Isurus dekayi, JORDAN & GILBERT, Synopsis, 874, 1883.

Subgenus ISURUS.

66. ISURUS OXYRHYNCHUS, Rafinesque.

(MACKEREL SHARK; PESCE TONDO; CANE DI MARE.)

Muzzle long and pointed, the preoral portion of the snout as long as the cleft of the mouth and greater than interorbital space; snout in the form of a cone flattened below; spiracles very small. Teeth $\frac{13}{13}$ on each side, long, lanceolate, without basal cusps; third tooth on each side of upper jaw much smaller than that next to it. Gill openings very wide, the width of the first rather more than its distance from the last. Origin of dorsal close behind base of pectorals, which are falciform, the length of the lower margin ¼ that of the upper; second dorsal very small, opposite the anal and of the same size; caudal lunate, the upper lobe ¼ longer than the lower. Size very large. A voracious shark, similar in habits to *Isurus dekayi*, from which it differs in the backward position of the dorsal; from *Lamna cornubica* it is separated by the absence of lateral denticles on the teeth. Mediterranean Sea and neighboring parts of the Atlantic, probably occasionally straying to our coast, as the description of the large shark published by Capt. Nathaniel E. Atwood, under the name of *Carcharias tigris*,* could refer to no other known species. (*ὀξύς*, sharp; *ῥύγχος*, snout.) (EU.)

---

*Capt. Atwood describes this specimen, which was 8 feet 10 inches in length, as dark blue above, an irregular lead-colored lateral band; belly white. Largest teeth 1¼ inches long, ¼ inch broad at base, smooth (edged) and curving upward. Snout pointed, 2 feet long, from first gill opening: branchial apertures 9 inches long, the distance from first to last 5 inches; 7¼ inches between the eyes; nostrils 2¾ inches before eyes. Front of first dorsal 3 inches behind pectorals; it is 13 inches high and 12 long at base, the free posterior edge 2¾ inches. Second dorsal 25 inches behind posterior root of first, 2¼ inches high, 4 inches long; pectorals 23 inches high, 11½ broad at base; ventrals inserted at a point midway between the two dorsals; anal similar to second dorsal, inserted an inch farther back. Upper lobe of caudal 23 inches long, lower 18; the distance between the tips 31 inches. "The first specimen of this very rare shark was brought from the Gulf of Mexico and presented to the State Cabinet, the second was taken at Truro and presented to the Museum of Comparative Zoölogy; the third, which had bitten off and swallowed large portions of a sword fish, was captured in 1864, at Provincetown and given to the (Boston) Society; a fourth specimen, and the one described above, at Provincetown in August last."—*Atwood.*

33. LAMNA, Cuvier.

(PORBEAGLES.)

Lamna, CUVIER, Règne Animal, Ed. I, 126, 1817, (*cornubicus*).
Lamia, RISSO, Eur. Merid., 123, III, 1826 (*cornubicus*, name preoccupied).
Selanonius, FLEMING, British Animals, 169, 1828, (*walkeri*=*cornubicus*).

Body short and stout, the back considerably elevated; snout prominent, pointed; teeth triangular, pointed, entire, each one with a small cusp on each side at base; one or both of these sometimes obsolete on some of the teeth in the young; gill openings wide; dorsal and pectoral fins somewhat falcate; second dorsal and anal fins very small, nearly opposite each other; first dorsal close behind the root of the pectorals. This genus is very close to *Isurus*, with which fossil forms seem to connect it. Perhaps the two should be united under the older name *Isurus*. (*λάμνα*, a kind of shark, from *λαμία*, a horrible anthropophagous monster, a bugbear used by the Greeks to frighten refractory children.)

67. LAMNA CORNUBICA, (Gmelin).

(PORBEAGLE; MACKEREL SHARK.)

Snout conical, pointed, rather longer than the cleft of the mouth; teeth $\frac{12-14}{10-14}$ on each side; the third tooth on each side in the upper jaw small; first dorsal beginning over the axil of the pectorals. Color bluish gray. A large and fierce pelagic shark reaching a length of 10 feet. North Atlantic and North Pacific, occasionally taken on the coast of New England and southward; not rare in California. (*cornubicus*, from Cornwall, from which region the species was early described.) (EU.)

Squalus cornubicus[*], GMELIN, Syst. Nat., I, 1497, 1788, **shores of Cornwall.**
Lamna cornubica, GÜNTHER, Cat., VIII, 389, 1870; JORDAN & GILBERT, Synopsis, 30, 1883.

Squalus selanonus, LEACH, Edinb. Mem. Wern. Soc., 1819, II, pl. 1, fig. 2, 55.
Selanonius walkeri, FLEMING, British Animals, 169, 1828, **Lochfyne, Argyleshire**, "*Sinus Selanonus*."

---

[*] We do not know which of the two names, *cornubicus* and *nasus*, has priority; we follow usage in retaining the name of Gmelin.

34. CARCHARODON,[*] Smith.

(MAN-EATER SHARKS.)

Carcharodon, ANDREW SMITH, Proc. Geol Soc. London, v, 86, 1837, (*capensis=carcharias*).

General characters of *Isurus* and *Lamna*, but with a different dentition, the teeth being large, flat, erect, regularly triangular, their edges serrated; first dorsal moderate, nearly midway between pectorals and ventrals; second dorsal and anal very small; pectorals large, ventrals moderate; caudal peduncle rather stout; spiracles minute or absent. Sharks of very large size; the strongest and most voracious of all fishes; pelagic, found in most warm seas. (*κάρχαρος*, rough; *ὀδούς*, tooth.)

68. CARCHARODON CARCHARIAS,[†] (Linnæus).

(MAN-EATER SHARK; GREAT WHITE SHARK.)

Body stout, depth about 5½ in total length; mouth very large; both jaws with 5 rows of large, triangular, serrated teeth, those in the lower jaw narrower, about $\frac{24}{22}$ in each row; first dorsal somewhat behind pectorals; caudal fin large and strong. Color leaden gray; tips and edges of pectorals black. One of the largest of the sharks, reaching a length of 30 feet. It is found in all temperate and tropical seas, and is occasionally taken on our coasts, both in the Atlantic and the Pacific. One caught near Soquel, California, was about 30 feet long and had a young sea lion, weighing about 100 pounds, in its stomach. (*καρχαρίας*, an old name of *Carcharhinus lamia* and of other man-eating sharks.) (EU.)

Lamia, RONDELET, Hist. Poiss., 305, 1558, good figure, **Nice, Marseilles.**
Squalus carcharias,[‡] LINNÆUS,[§] Syst. Nat., Ed. x, 1758, 235, **Europe**, after Artedi.
Carcharias verus, AGASSIZ, Poiss. Foss., III, 91, 1836.
Carcharodon rondeleti, MÜLLER & HENLE, Plagiostomen, 70, 1838, after Rondelet, **Mediterranean Sea and Atlantic Ocean.**
Carcharodon rondeleti, GÜNTHER, Cat., VIII, 392, 1870.
Carcharias atwoodi, STORER, Proc. Bost. Soc. Nat. Hist., II, 1848, 71, **Provincetown.**
Carcharodon carcharias, JORDAN & GILBERT, Synopsis, 875, 1883.
Carcharodon capensis, SMITH, Ill. Zoöl. S. Africa, pl. 4, 1842, **Cape of Good Hope.**
Carcharodon smithi, BONAPARTE, Selach. Tab. Anal., 9, 1839, after Smith.

Family XVI. CETORHINIDÆ.

(THE BASKING SHARKS.)

Sharks of immense size, with the gill openings extremely wide, extending from the back nearly to the median line of the throat, all of them in front of the pectorals; mouth moderate, the teeth very small, numerous, conical, without cusps or serratures; no nictitating membrane; spiracles very small, above the corners of the mouth; first dorsal large, midway between pectorals and ventrals; second dorsal and anal small; caudal fin lunate, the upper lobe considerably the larger; caudal peduncle keeled; pectorals and ventrals large. Brain very small. A single genus, with probably but one species; the largest of living fishes, pelagic, inhabiting the northern seas. (LAMNIDÆ, part, Günther, VIII, 394, genus *Selache.*)

---

[*] One species of this genus, *Carcharodon megalodon*, now extinct, must have reached a far larger size than the living *Carcharodon carcharias*. Its teeth are found in great abundance in tertiary deposits along the coast of South Carolina.

[†] A good account of this species is given by Dr. W. B. Stevenson, Proc. Vassar Brothers Sci. Soc., Poughkeepsie, 1884, and in the American Naturalist for the same year.

[‡] This species, well figured by Rondelet, and described by Artedi, and after him by Linnæus, seems to have been lost sight of by subsequent writers from 1758 to 1836, the various references to *Squalus carcharias*, between Linnæus and Müller & Henle, belonging chiefly to *Carcharias lamia*. The true *Squalus carcharias* of Linnæus is, however, unquestionably the *Carcharodon*.

[§] "Jonam Prophetam, ut veteres Herculem trinoctem, in hujus ventriculo tridui spatio, hæsisse verosimile est."—*Linnæus.*

35. CETORHINUS, Blainville.

(BASKING SHARKS.)

? *Tetroras*,* RAFINESQUE, Caratteri, 11, 1810, (*angiova*).
Cetorhinus, BLAINVILLE, Journ. Phys., 1816, 264, (*gunneri* = *maximus*).
Selache, CUVIER, Règne Animal, Ed. I, 129, 1817, (*maximus*).
Polyprosopus, COUCH, Hist. Brit. Fish., I, 67, 1861, (*rashleighanus* = *maximus*).

The characters of the genus are included above. (*κῆτος*, whale; *ῥίνη*, a shark (*Squatina*), from *ῥίνη*, a file or rasp, the rough skin of the shark being used for polishing wood and marble.)

69. CETORHINUS MAXIMUS, (Gunner).

(BASKING SHARK; PÉLÉRIN; ELEPHANT SHARK; BONE SHARK.)

Body rugose, the skin very rough with small spines; head small; snout blunt; eyes small; teeth in 6 or 7 rows in each jaw, about 200 in each row; first dorsal large, triangular, over the space between pectorals and ventrals; second dorsal much smaller, rather larger than anal; pectorals long, tail large. Gill rakers slender, long and close set, resembling whalebone (hence the name Bone Shark). Largest of the sharks, reaching a length of nearly 40 feet; found in the Arctic seas, straying southward to Portugal, Virginia, and California. Occasionally taken by whalers in Monterey Bay. It is in general a rare species, but gregarious in the breeding season, numbers swimming together on the surface, sluggishly, like logs. (*maximus*, greatest.) (EU.)

Squalus maximus, GUNNER, Trondhjem Selskabskr., III, 33, 1765, Coast of Norway.
Selachus maximus, STORER, Fish. Mass., 229, 1867.
Selache maxima, GÜNTHER, Cat., VIII, 394, 1870.
Cetorhinus maximus, JORDAN & GILBERT, Synopsis, 31, 1883.
Squalus gunnerianus, BLAINVILLE, Jour. de Phys., 1810, 256, after Gunner.
Squalus pelegrinus, BLAINVILLE, *l. c.*, 1810, 257, Europe.
Squalus homianus, BLAINVILLE, *l. c.*, 1810, 257, after Everard Home.
Cetorhinus shavianus, BLAINVILLE, *l. c.*, 1816, 264, after Shaw.
Squalus isodus, SAVERIO MACRI, Mem. della R. Ac. Sci. Napoli, 1819, I, 55, pl. 1, fig. 1, and pl. 2, fig. 2, Naples.
Squalus elephas, LE SUEUR, Jour. Ac. Nat. Sci. Phila., II, 343, 1821, New Jersey.
Squalus cetaceus, GRONOW, Cat. Fishes, 6, 1854, Norway.
Squalus rashleighanus, COUCH, Trans. Linn. Soc., XIV, 91, 1825, Cornwall, (a monstrosity).
Acanthias blainvillei, CAPELLO, Plagiostomos, I, 21, 1866.
Polyprosopus macer, COUCH, Hist. Brit. Fishes, 1, 67, 1861, England.

---

* The description of *Tetroras* is apparently taken from hearsay, and applies to no known shark. It comes nearest the present species, but may be mélange of *Isurus* and *Heptranchias*. We have therefore hesitated to substitute *Tetroras* for *Cetorhinus*. *Tetroras angiova* is described as having "two dorsals; one anal; four gill openings; tail unequal, oblique; snout blunt; teeth rasp like; a keel on each side of tail; eyes very small; gill openings rather large; length about 6 feet. Called *Angiova* at Palermo." The name *Anciova* is now applied at Palermo to *Heptranchias cinereus*, according to Prof. Doderlein.

Family XVII. RHINODONTIDÆ.

(The Whale Sharks.)

Origin of the first dorsal fin somewhat in advance of the ventrals; the second small, opposite the anal; both without spines; a pit at the root of the caudal; lower lobe of the caudal well developed; sides of the tail with a keel; no nictitating membrane; spiracles very small; mouth and nostril near the extremity of the snout; teeth very small and numerous, conical; gill openings wide, the last one above the base of the pectorals. Large sharks, of warm seas. Two species are known, *Rhinodon typicus*, from the Cape of Good Hope, and the following. (Rhinodontidæ, Günther, Cat., VIII, 396).

a. Teeth each recurved backward and acutely pointed, swollen, and with a heel-like projection in front rising from its base. Micristodus, 36.

36. MICRISTODUS, (Gill).

Micristodus, Gill, Proc. Ac. Nat. Sci. Phila., 1865, 177, (*punctatus*).

This genus is known from its teeth only. These are described as follows: "The teeth are fixed and extremely minute, the largest little more than a line in length (in a shark 20 feet long) and decrease towards the ends of the jaw; they are disposed in regularly transverse rows, of which there are 164 to 167 on each side, while in front there are 13 to 16 in each transverse row; each tooth is recurved backward and acutely pointed, swollen, and with a heel-like projection in front rising from its base." (Gill.) (*μικρός*, small; *ἱστός*, an upright projection; *ὀδούς*, tooth.)

70. MICRISTODUS PUNCTATUS, Gill.

A very large shark found in the Gulf of California. No description has been given, and only the teeth are yet known. (*punctatus*, spotted.)

Micristodus punctatus, Gill, Proc. Ac. Nat. Sci. Phila., 1865, 177, Gulf of California.

Order F. CYCLOSPONDYLI.

(The Cyclospondylous Sharks.)

Calcareous lamellæ arranged in one or more concentric series or rings about a central axis in each vertebra. Spiracles present. Anal fin wanting. Dorsal fins 2, with or without spine. As here understood, the order *Cyclospondyli* includes the sharks of the groups called *Cyclospondyli* and *Tectospondyli* by Hasse. The vertebræ in the rays show similar structures, and it is probably from sharks of this group that the Batoidei are descended. (*κύκλος*, circle; *σπόνδυλος*, vertebra.)

Families of Cyclospondyli.

a. Cyclospondyli: Vertebræ with the calcareous lamellæ arranged in a ring about the central axis. Pectoral fins normal, not expanded or deeply notched. Anal fin absent; spiracles present; no nictitating membrane; gill openings before pectorals; caudal bent upward, the lower lobe little developed.

b. Dorsal fins each provided with a stout spine, the first dorsal far in advance of ventrals. Squalidæ, XVIII.

bb. Dorsal fins without spine, the first dorsal over or in advance of ventrals.
  c. First dorsal much before ventrals; skin moderately rough. DALATIIDÆ, XIX.
  cc. First dorsal opposite ventrals; skin with thorn-like tubercles. ECHINORHINIDÆ, XX.

TECTOSPONDYLI (τέκτων, a builder; σπόνδυλος, vertebra):
aa. Vertebræ with the calcareous lamellæ ranged in several concentric series or rings about a central axis; pectoral fins very large, expanded horizontally and extended forward at base in front, giving the body the form of the flattened disk of the rays; the anterior extension separated from the neck by a deep notch, in which the gill openings lie; no anal fin; dorsal fins small, posterior; mouth broad, anterior. SQUATINIDÆ, XXI.

Suborder CYCLOSPONDYLI.

Family XVIII. SQUALIDÆ.

(THE DOG-FISHES.)

Body more or less elongate. Head depressed. Eyes lateral, without nictitating membrane. Mouth inferior, rather large, arched, a deep groove on each side. Teeth compressed, variously formed. Nostrils inferior, separate; spiracles rather large; gills openings moderate, all in front of the pectoral fins. Dorsal fins 2, each armed with a spine; the first dorsal in front of the ventrals; anal fin wanting; caudal fin with the lower lobe small or obsolete; ventral fins inserted posteriorly, not much before second dorsal. Oviparous.

Genera 6 or more; species about 15; rather small sharks, chiefly of the Atlantic. These sharks represent a comparatively primitive type, apparently not descended from any other existing *Squali*. (SPINACIDÆ, part, Günther, Cat., VIII, 417–425.)

a. Body rather elongate; no fold of skin along side of belly; dorsal spines both directed backward.
  b. Upper teeth simple, without smaller cusps at base.
    c. Teeth alike in both jaws, subquadrate, each with a nearly horizontal cutting edge and a point directed outward. SQUALUS, 37.
    cc. Teeth unequal, the upper very small, narrow, and lanceolate, erect, the lower more or less oblique; dorsal spines hidden in the skin. CENTROSCYMNUS, 38.
  bb. Upper teeth each with 1 or 2 small cusps at base on each side.
    d. Teeth unequal, the upper erect and tricuspid, the lower oblique. ETMOPTERUS, 39.
    dd. Teeth equal, very small and pointed. CENTROSCYLLIUM, 40.

37. SQUALUS, (Artedi), Linnæus.

Squalus, (ARTEDI) LINNÆUS, X, 1758, 233, (includes all sharks).
Squalus, RAFINESQUE, Caratteri, etc., 13, 1810, (*acanthias* and *uyato*; first restriction of the name *Squalus*, to species with spiracles and without anal fin).
Acanthorhinus, BLAINVILLE, Journal de Physique, 1816, 263, (*acanthias*).
Acanthias, RISSO, Europe Méridionale, III, 131, 1826, (*acanthias*).
Entoxychirus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 496, (*uyato*).

Body rather slender. Mouth little arched, with a long, straight, deep, oblique groove on each side; no labial fold. Teeth rather small, all simple, equal in the two jaws, their points so much turned aside that the inner margin forms the cutting edge. Spiracles rather wide, just behind the eye. Fins moderately developed, the first dorsal larger than the second, much in advance of the ventral fins, which are behind the middle of the body, although in advance of the second dorsal. Dorsal spines strong, not grooved. Tail scarcely bent upward. Small sharks abounding in the temperate seas; 4 or 5 species known.

The Linnæan genus *Squalus* was first subdivided by Rafinesque, who restricted the name to those species with spiracles and no anal fin, the type being *Squalus acanthias.* This genus must therefore be called *Squalus* and not *Acanthias.* (*squalus*, shark, a word cognate to the Greek *γαλῆ.*)

a. Spine of first dorsal about ⅖ the height of the fin, second about ⅗; some of the white spots on back usually persistent through life. ACANTHIAS, 71.

aa. Spine of first dorsal ¼ to ⅓ the height of the fin, that of the second dorsal about ½; white spots on back usually disappearing with age. SUCKLII, 72.

71. SQUALUS ACANTHIAS, Linnæus.

(DOGFISH; PICKED DOGFISH; BONEDOG; SKITTLE-DOG.)

Body slender; snout pointed; head 6½ in length; depth about 8. Dorsal spines rather high, that of the first dorsal about ⅖ height of fin, the second dorsal spine about ⅗ height of fin. Slate color above, pale below, back with oblong whitish spots, especially in the young, these rarely all obsolete in the adult. L. 2 to 3 feet; weight 5 to 15 pounds. A small sharp-toothed shark, ranging widely in the Atlantic, very abundant along the shores of the Northern and Middle States, and taken as far south as Cuba. From its livers "Dogfish" oil is extracted. It feeds largely on herrings. (*ἀκανθίας*, an old name from *ἄκανθα*, spine.) (EU.)

Squalus acanthias, LINNÆUS, Syst. Nat., Ed. x., 1758, I, 233, Coast of Europe.
Squalus acanthias, JORDAN & GILBERT, Synopsis, 16, 1883.
Acanthias americanus, STORER, Mem. Am. Ac., II, 1846, 506, Massachusetts.
Acanthias americanus, STORER, Fish. Mass., 232, 1867.
Acanthias vulgaris, RISSO, Eur. Mérid., III, 131, 1826, Nice.
Acanthias vulgaris, GÜNTHER, Cat., VIII, 418, 1870.

72. SQUALUS SUCKLII, (Girard).

(CALIFORNIA DOGFISH.)

Very similar to the Atlantic species, *S. acanthias*, but with the dorsal spines lower, the first about ⅓ the height of its fin, the second about ½. Gray, the fins usually edged with black; young with white spots on the back, which usually wholly disappear with age. Aleutian Islands to Santa Barbara, very abundant, similar in habits to the preceding, and likewise producing "Dogfish" oil. A similar species, possibly the same, *S. fernandinus* (Molina) occurs in Chile. (Named for Dr. George Suckley, a naturalist on the U. S. Pacific R. R. Survey.)

Spinax (*Acanthias*) *sucklii*, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 196, Fort Steilacoom, Washington.
Squalus sucklii, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 499.
Acanthias sucklii, GIRARD, Pacific R. R. Survey, 368, 1858.

38. CENTROSCYMNUS, Bocage & Capello.

Centroscymnus, BOCAGE & CAPELLO, Proc. Zoöl. Soc., 1864, 263, (*cœlolepis*).

Dorsal fins each with a spine, which is hidden in the skin; mouth wide, but little arched; a long, deep, straight, oblique groove on each side of mouth. Teeth of lower jaw oblique, with the point more or less directed outward. Upper teeth lanceolate, on a quadrangular base, with a single cusp. Spiracles wide, behind the eye. Gill openings narrow. (*κέντρον*, spine; *σκύμνος*, an ancient name of some shark, from *σκύμνος*, a lion's whelp.)

73. CENTROSCYMNUS CŒLOLEPIS, Bocage & Capello.

Labial groove prolonged forward, but separated by a broad space from that of the other side. Upper teeth very small, narrow, and lanceolate. Distance between the nostrils rather less than ½ the length of the præoral portion of the snout. Lower angle of the pectoral rounded, not produced. Dorsal fins short, especially the first, the length of which (without the spine) is only about ⅙ its distance from the second; extremity of the ventrals below the end of the second dorsal. Scales on the head and nape with striæ, the others smooth, with a depression at the base. Uniform blackish brown. (Günther.) Coast of Portugal and neighboring parts of the Atlantic, occasionally taken in deep water off Gloucester, Mass., and off the banks of Nova Scotia. (*κοῖλος*, hollow; *λεπίς*, scale.) (Eu.)

Centroscymnus cœlolepis, Bocage & Capello, Proc. Zoöl. Soc., 263, 1864, Portugal.
Centrophorus cœlolepis, Günther, Cat., viii, 423, 1870.
Centroscymnus cœlolepis, Jordan & Gilbert, Synopsis, 17, 1883.

39. ETMOPTERUS, Rafinesque.

Etmopterus, Rafinesque, Caratteri, etc., 14, 1810, (*aculeatus*).
Spinax, Cuvier, Règne Animal, Ed. i, 129, 1817, (*acanthias* and *spinax*).
Spinax, Müller & Henle, Plagiostomen, 86, 1838, (*spinax*).
Acanthidium, Lowe, Proc. Zoöl. Soc. London, 1839, 91, (*pusillum*).

Mouth little arched. Teeth of lower jaw with the point so much turned aside that the inner margin of the tooth forms the cutting edge; upper teeth erect, each with a long pointed cusp and 1 or 2 smaller ones on each side; spiracles wide. Two species, in the Atlantic. (*ἔτμαγον*, to cut; *πτερόν*, fin, the original type having frayed fins.)

74. ETMOPTERUS PUSILLUS, (Lowe).

Body smooth, scales very small, each with a minute tuberosity, but without spines; first dorsal fin much shorter than the second, midway between second dorsal spine and the eye; tail relatively shorter than in *E. spinax*, its length less than the space between the snout and the origin of the pectorals; color brown. (Gunther.)

The *Blake* took a single individual, believed to belong to this species, at Station CVIII, off St. Christopher, in 208 fathoms. It had previously been known only from Madeira and Cuba, and the *Travailleur* found it at the Cape Verdes at about 290 fathoms. (Goode & Bean.) (*pusillus*, weak.)

Acanthidium pusillum, Lowe, Proc. Zoöl. Soc. London, 1839, 91, Madeira.
Spinax pusillus, Günther, Cat., viii, 425, 1870.
Spmax hillianus, Poey, Memorias, ii, 310, 1861, Cuba.

40. CENTROSCYLLIUM, Müller & Henle.

Centroscyllium, MÜLLER & HENLE, Systematische Beschreibung der Plagiostomen, 191, 1838, (*fabricii*).

Teeth equal in both jaws, very small, straight, pointed, each with 1 or 2 smaller cusps on each side at base; mouth crescent-shaped, with a straight, oblique groove at its angle; spiracles moderate; gill openings rather narrow; dorsal fins small, each with a strong spine; the second dorsal entirely behind the ventrals. One species, in the Arctic Seas. (*κέντρον*, spine, *σκυλλίον*, *Scyllium*, an allied genus, from *σκύλλω*, to rend or tear to pieces.)

75. CENTROSCYLLIUM FABRICII, (Reinhardt).

Body covered with minute stellate ossification; dorsal fins short, with strong spines; second dorsal behind ventrals; color nearly black; Greenland Seas, southward in deep water; occasionally taken off Gloucester and off the Nova Scotia Banks. (Named for Otho Fabricius, a Danish naturalist, the first to study the fishes of Greenland.)

Spinax fabricii, REINHARDT, Dansk. Vid. Selsk. Forh., 1828, 111, XIV, Greenland.
Centroscyllium fabricii, GÜNTHER, Cat., VIII, 425, 1870.
Centroscyllium fabricii, JORDAN & GILBERT, Synopsis, 16, 1883.

Family XIX. DALATIIDÆ.

(THE SCYMNOID SHARKS.)

Sharks with no anal fin and with 2 dorsal fins, each without spine; fins all small; gill openings small, entirely in advance of pectorals; mouth but little arched; a long, deep, straight, oblique groove on each side of it; spiracles present. Oviparous, the eggs without horny case (at least in SOMNIOSUS). Vertebræ cyclospondylous. The absence of dorsal spine chiefly distinguishes this family from the SQUALIDÆ, of which these are somewhat degenerate allies. Genera, 5; species, about 10, mostly of the North Atlantic, some of them reaching a large size. (SPINACIDÆ, part, Günther, Cat., VIII, 425–429.)

SOMNIOSINÆ:
- *a.* First dorsal much in advance of ventrals.
  - *b.* Upper teeth narrow, the lower quadrate, with a horizontal edge ending in a point directed outward; body very robust, the fins very small, the dorsals about equal; skin moderately rough. SOMNIOSUS, 41.

41. SOMNIOSUS, Le Sueur.

Somniosus, LE SUEUR, Jour. Ac. Nat. Sci. Phila., 1818, I, 222. (*brevipinna=microcephalus*).
Leiodon, WOOD, Proc. Bost. Soc. Nat. Hist., II, 174, 1847, (*echinatum=microcephalus*).
Læmargus, MÜLLER & HENLE, Plagiostomen, 93, 1838, (*borealis=microcephalus*).
Rhinoscymnus, GILL, Proc. Ac. Nat. Sci. Phila., 1864, 264, (*rostratus*).

Body thick and clumsy; mouth transverse, little arched, with a deep, straight groove running backward from its angle; nostrils near the extremity of the snout; jaws feeble; teeth in upper jaw small, narrow, conical; lower teeth numerous, in two or more series, the point so much turned aside that the inner margin forms a cutting edge, which is entire; spiracles moderate; no nictitating membrane; gill openings narrow; fins all very small, the ventrals between the dorsal fins; skin uniformly covered with minute tubercles. Tail short, much bent upward. Eggs large, soft, globular, without shell, dropped in the ooze on the sea bottom. Species 2, of the Northern Seas. (Latin *somniosus*, sleepy.)

76. SOMNIOSUS MICROCEPHALUS, (Bloch).

(SLEEPER SHARK; NURSE.)

Body robust, rapidly tapering behind: greatest depth a little more than $\frac{1}{5}$ the length; head somewhat less; mouth moderate, upper jaw with 5 rows of small sharp teeth, which are incurved and lancet-shaped; lower jaw with 2 rows of broad, quadrangular teeth, divided in their centers by a perpendicular ridge and directed outward, about 26 teeth on each side; fins small, the first dorsal about as large as the ventrals and larger than the second dorsal; pectorals short, caudal short and bluntish. L. about 25 feet. Arctic Seas south to Cape Cod, Oregon and France; a huge clumsy shark, not rare northward. An enemy to the whales, biting out large masses of flesh from their bodies. (*μικρός*, small; *κεφαλή*, head.)
(EU.)

Family XX. ECHINORHINIDÆ.

(THE BRAMBLE SHARKS.)

Characters of the family included below in those of the single genus.

a. First dorsal opposite ventrals, both fins very small. Teeth equal in the two jaws, very oblique; skin with scattered round tubercles, like the thorns of brambles.
ECHINORHINUS, 42.

42. ECHINORHINUS, Blainville.

Echinorhinus, BLAINVILLE, Bull. Sci. Philom., 1816, 121, (*spinosus*).
Goniodus, AGASSIZ, Poissons Fossiles, III, 183, 1836, (*spinosus*).

Two very small dorsal fins without spine, the first opposite the ventrals; no anal fin; skin with scattered, large, round tubercles, surmounted by prickles like those on a bramble, and, like them, leaving a scar when detached. Mouth crescent-shaped; a labial fold around the angle of the mouth and the end of the snout. Teeth equal in both jaws, very oblique, the point being turned outward; several strong denticulations on each side of the principal point; no nictitating membrane; spiracles small; gill openings of moderate width. A single species of the East Atlantic, straying to our coast. (*ἐχῖνος*, a hedgehog, or sea urchin; *ῥίνη*, shark.)

77. ECHINORHINUS SPINOSUS, (Gmelin).

Spiracles behind the eye, behind the vertical from the angle of the mouth. Teeth $\frac{22-26}{22-26}$. Dorsal fins close together. Each tubercle with a small spine in the center. Brownish violet, with or without dark spots. (Günther.) A large shark of the Atlantic coasts of Europe and Africa, in rather deep water; a stray individual taken on Cape Cod. L. 10 feet. (Eu.)

Squalus spinosus, GMELIN,* Syst. Nat., 1788, 1500, "the ocean."

Echinorhinus obesus, ANDREW SMITH, Ills. Zoöl. So. Africa; Fishes, plate I, 1845, Cape of Good Hope.

Suborder TECTOSPONDYLI.

Characters of the group given above. (See page 53.)

Family XXI. SQUATINIDÆ.

(THE ANGEL SHARKS.)

Ray-like sharks. Body depressed and flat, the snout obtuse, the mouth anterior; teeth conical, pointed, distant; pectoral fins very large, expanded in the plane of the body, but not adherent to the side of the head, being deeply notched at the base; ventral fins very large; dorsal fins 2, small, subequal, on the tail behind the ventrals; no anal fin; caudal small; gill openings wide, partly inferior, partly hidden by the base of the pectoral; spiracles wide, crescent-shaped, behind the eyes; nostrils on the front margin of the snout, with skinny flaps; males with small prehensile appendages; vertebræ tectospondylous. A single genus among living forms, with but one species so far as known; a small shark of singular appearance, found in most warm seas. In appearance, as in structure, this family is strictly intermediate between the sharks and the rays. Its nearest living allies are probably the DALATIIDÆ. Two or more related genera are found as fossils. (RHINIDÆ, Günther, Cat., VIII, 430.)

43. SQUATINA, Duméril.

(ANGEL FISHES.)

Squatina, CONSTANT DUMÉRIL, Zoöl. Analyt., 102, 1806, (*angelus=squatina*).
Rhina, RAFINESQUE, Caratteri Alcuni Nuovi Generi, 14, 1810, (*squatina*).
Rhina, (KLEIN), AUGUSTE DUMÉRIL, Elasmobranches, 464, 1870, (*squatina*).

Characters of the genus included above. (*Squatina*, the ancient name, akin to the English words "skate" and "squat.")

78. SQUATINA SQUATINA, (Linnæus).

(MONKFISH; ANGEL FISH; SQUATO.)

Caudal fin triangular, the lower lobe the longer; dorsals short and high; skin rough, with small stiff prickles, largest along the middle line of the back; eyes small. Ashy gray above, much blotched and speckled with olive, white below. L. 2 to 3 feet. Warm seas; common in the Mediterranean; rather scarce on our Atlantic coast from Cape Cod southward; rather common on the coast of California, especially from San Francisco to Monterey.

---

*We do not know which of these names has priority, but follow usage in retaining that of Gmelin.

The East coast form has been named *Squatina dumérili*, the Pacific form *Squatina californica*, but all belong apparently to the same species. (Eu.)

Squalus squatina, Linnæus, x, 1758, 233, Coasts of Europe.
Squatina lævis, Cuvier, Règne Anim., Ed. 1, 131, 1817, after Linnæus.
Squatina angelus, Duméril, Zöol. Anal., 102, 1806, after Linnæus.
Squatina dumérili, Le Sueur, Jour. Ac. Nat. Sci. Phila., 1, 225, 1818, probably Florida.
Squatina californica, Ayres, Proc. Cal. Ac. Sci., 1859, 29, San Francisco.
Rhina squatina, Günther, Cat., viii, 430, 1870.

Squatina vulgaris, Risso, Ichth. Nice, 45, 1810, Nice.
Squatina fimbriata, Müller & Henle, Plagiostomen, 101 and 192, 1838, Mediterranean Sea.
Squatina oculata, Bonaparte, Fauna. Ital., Pesc., xxviii, 1840, Italy.
Squatina japonica, Bleeker, Act. Soc. Sci., Indo-Neerl, iii, Japan.
Squatina lewis, Couch, Trans. Linn. Soc., xiv, 90, 1825, Cornwall.

Order G. BATOIDEI.

(The Rays.)

Gill openings inferior, slit-like, 5 in number; spiracles present; no anal fin; dorsal fins, if present, inserted on the tail; body typically disk-like, broad and flat, the margin of the disk being formed by the expanded pectorals; tail comparatively slender, the caudal fin small or wanting. Vertebræ cyclospondylous. With the exception of the Rajidæ, most or all of the rays are ovoviviparous. (Suborder Batoidei, Günther, Cat., viii, 434–498.) (*βάτος*, a ray, *εἶδος*, likeness.)

a. Sarcura (*τάρξ*, flesh; *οὐρά*, tail). Tail comparatively thick, with 2 dorsals and a caudal fin; no serrated caudal spine.
  b. Snout saw-like, much produced, flat, armed with strong teeth on each side, set at right angles to its axis; body somewhat shark-like, the disk gradually passing into the tail. Pristidæ, xxii.
  bb. Snout not saw-like.
    c. Electric organs absent; skin not perfectly smooth.
      d. Species ovoviviparous, the young developed within the body of the parent. Disk passing gradually into the long stout tail; pectorals not extending to the snout. Rhinobatidæ, xxiii.
      dd. Species oviparous; the eggs deposited in wheelbarrow-shaped leathery egg-cases; disk abruptly contracted at base of the tail; pectorals extending to the snout. Rajidæ, xxiv.
    cc. Electric organs present; a structure composed of honeycomb-like tubes between pectoral fins and head; skin perfectly smooth. Narcobatidæ, xxv.
aa. Masticura (*μάστιξ*, whip. *οὐρά*, tail). Tail comparatively slender, the dorsal fin single or wanting; the back of the tail usually with a serrated spine.
  e. Pectoral fins uninterrupted, confluent around the snout; teeth small. Dasyatidæ, xxvi.
  ee. Pectoral fins interrupted, one portion forming detached appendages on the snout ("cephalic fins").
    f. Teeth very large, flat, tessellated, few in number. Myliobatidæ, xxvii
    ff. Teeth numerous, very small, flat or tubercular; size enormous; cephalic fins conspicuous, resembling horns. Mantidæ, xxviii

The rays form a highly specialized group of Selachians, of which the typical forms present an appearance quite unlike that of the average shark. The intergradations between the two groups are, however, extremely perfect, the families of Squatinidæ and Pristiophoridæ, ray-like sharks, closely approaching the PRISTIDÆ and RHINOBATIDÆ. As above noticed, the *Batoidei* seem to be descended from the *Cyclospondylous* sharks.

Suborder SARCURA.

(THE THICK-TAILED RAYS.)

Family XXII. PRISTIDÆ.

(THE SAWFISHES.)

Body elongate, depressed; pectoral fins moderate, the front margin quite free, not extending to the head; snout produced into a very long, thin, flat blade, which is armed with a series of strong, tooth-like processes placed in sockets along each edge; teeth in jaws minute, obtuse; gill openings moderate, inferior; spiracles wide, behind the eye; nostrils inferior; no tentacles; no nictitating membrane; dorsal fins large, without spine, the first nearly opposite the ventrals. Caudal well developed, bent upward; a fold along each side of tail. A single genus, with 5 or more species, inhabiting warm seas on sandy shores, sometimes ascending rivers. A family of sharks, PRISTIOPHORIDÆ, similarly armed with a "saw," occurs in the Pacific Ocean. (PRISTIDÆ, Günther, VIII, 436–439.)

44. PRISTIS, Latham.

Pristis, LATHAM, Trans. Linn. Soc., II, 276, 1794, (*pristis*).
Pristobatus, BLAINVILLE, Journ. Phys., 1816, 262, (*antiquorum*=*pristis*).
Myriosteon, GRAY, Proc. Zoöl. Soc., 1864, (*higginsi*, based on a fragment of a rostral process).

Characters of the genus included above. (πρίστης, the ancient name, meaning one who saws.)

a. Rostral teeth in 18 to 20 pairs; first dorsal chiefly before ventrals; caudal with a small lower lobe. PERROTTETI, 79.
aa. Rostral teeth in 24 to 32 pairs; first dorsal opposite ventrals; caudal without lower lobe. PECTINATUS, 80.

79. PRISTIS PERROTTETI, Valenciennes.

First dorsal fin chiefly in advance of ventrals; second dorsal much smaller than first; caudal with a small lower lobe; root of pectoral before first gill opening, its outer angle a right angle. Saw with 18 to 20 pairs of teeth, well separated and not trenchant behind. (Günther.) Tropical seas, north to Mazatlan on the Pacific coast; also said to occur in the West Indies; not so common as the next. It may be that our Pacific species is distinct from the true *perrotteti*, first obtained in Africa. (Named for M. Perrottet, a French naturalist, who obtained the types.)

Pristis perrotteti, VALENCIENNES MS., MÜLLER & HENLE, Plagiostomen, 108, 1838, Senegal River; GÜNTHER, Cat., VIII, 436, 1870.

80. PRISTIS PECTINATUS, Latham.

(COMMON SAWFISH; PEZ SIERRA.)

First dorsal over ventrals; second dorsal scarcely smaller than first; no lower caudal lobe. Saw with 24 to 32 pairs of teeth, the posterior farther apart than the anterior. L. 10 to 20 feet. Tropical seas; north to West Indies and Florida; abundant in the Gulf of Mexico; ascending the lower Mississippi. (*pectinatus*, comb-toothed.)

Pristis pectinatus, LATHAM, Trans. Linn. Soc., II, 278, 1794, "in the ocean."
Pristis granulosa, BLOCH & SCHNEIDER, Syst. Ichthyol., 352, 1801, (after Parra), Havana.
Pristis pectinatus, GÜNTHER, Cat., VIII, 437, 1870.
Pristis pectinatus, JORDAN & GILBERT, Synopsis, 875, 1883.
Pristis mississippiensis, RAFINESQUE, Ich. Oh., 80, 1820, lower Mississippi.
Pristis megalodon, DUMÉRIL, Elasmobranches, 476, pl. 9, fig. 4, 1870, Cayenne.
Pristis acutirostris, DUMÉRIL, *l. c.*, 479, 1870, Martinique.
Pristis occa, DUMÉRIL, *l. c.*, 479, 1870, locality unknown.

Family XXIII. RHINOBATIDÆ.

(THE GUITAR FISHES.)

Shark-like rays. Trunk gradually passing into the long and strong tail, which is provided with 2 well-developed dorsal fins, a caudal fin and a conspicuous dermal fold on each side; disk not very broad, the rayed portion of the pectoral fins not being continued to the snout; no conspicuous spines, the skin being nearly smooth; no electric organs. Genera about 5; species about 20; inhabiting warm seas, distinguished from the RAJIDÆ chiefly by the fact that the eggs are hatched within the body. The typical species are also much more elongated in form. (RHINOBATIDÆ, Günther, Cat., VIII, 440–448.)

a. First dorsal much behind the ventrals; anterior nasal valves not confluent.
  b. Disk subtriangular or rhombic; the snout more or less produced; skin covered with fine shagreen, usually with somewhat larger spines on the back of tail. RHINOBATUS, 45.
  bb. Disk rhombic, the snout less produced; nasal valves dilated, extending on the space between nostrils; body covered with irregular tubercles and prickles instead of shagreen. ZAPTERYX, 46.
  bbb. Disk broad, rounded in front; nasal valves broad; body covered with shagreen, with stout spines on back and tail; labial fold well developed. PLATYRHINOIDIS, 47.

45. RHINOBATUS, Bloch & Schneider.

(GUITAR FISHES.)

Rhinobatus, BLOCH & SCHNEIDER, Syst. Ichth., 353, 1801, (*rhinobatus*).
Leiobatus, RAFINESQUE, Caratteri, 16, 1810, (*panduratus*).
Syrrhina, MÜLLER & HENLE, Plagiostomen, 113, 1838, (*columnæ = panduratus*).
Glaucostegus, BONAPARTE, Catologo Metodico, 14, 1846, (*rhinobatus*).

Body depressed, gradually passing into the tail. Cranial cartilage produced into a long rostral process, the space between the process and the pectoral fin being filled by membrane; spiracles wide, behind the eye; nostrils oblique, wide; anterior valves not confluent; teeth obtuse, with an indistinct transverse ridge. Dorsal fins without spine; both far behind the ventral fins; caudal fin without lower lobe. Claspers slender and pointed. Species numerous in warm seas, varying considerably as to the form of the snout; those with the snout shortened and the nasal valves broader constituting the subgenus *Leiobatus*, or *Syrrhina*. (*ῥίνη*, a shark; *βάτος*, a skate.)

RHINOBATUS:

a. Nasal valves not extending on the space between the nostrils; disk subtriangular, the snout slender and pointed.
  b. Spiracle with two folds.
    c. Skin above everywhere closely freckled with whitish; ridges of rostral cartilage close together, narrowly separated at base. LENTIGINOSUS, 81.

cc. Skin above plain olivaceous, or with obscure large whitish blotches.
  d. Ridges of rostral cartilage separate throughout.
    e. Disk above marked with faint, round slate-colored spots as large as eye; snout 2½ in length of disk, not very sharp at tip. GLAUCOSTIGMA, 82.
    ee. Disk without traces of pale spots above; snout rather longer, acute at tip. LEUCORHYNCHUS, 83.
  dd. Ridges of rostral cartilage confluent about ½ the length; snout rounded at tip. PRODUCTUS, 84.
  ddd. Ridges of rostral cartilage united more than ½ their length; snout produced, narrow.
    f. Groove between rostral cartilages moderate; upper surface with some large, faint whitish spots; shoulders with 2 patches of spines. PERCELLENS, 85.
    ff. Groove between rostral cartilages very short and small. SPINOSUS, 86.
bb. Spiracle with a single fold; snout blunt, rounded. PLANICEPS, 87.

81. **RHINOBATUS LENTIGINOSUS**, Garman.

Snout long and narrow, its ridges close together throughout. Eyes large, twice as large as spiracles. Interorbital space narrow, concave, as wide as nostrils or the interspace between them. Distance between outer angles of nostrils more than ½ the snout. Mouth straight, its width not quite the interorbital space. Dorsal and preocular spines very small; five larger spines on tip of snout; supraocular and scapular spines obsolete. L. 2 feet. Grayish, densely freckled with small paler spots, uniform below. Width 3 in length; tail about 2; snout to the mouth 5¾. Charleston southward, not rare on the Florida coast. (*lentiginosus*, freckled.)

Rhinobatus lentiginosus, GARMAN, Bull. Mus. Comp. Zoöl., 1880, 168, Coast of Florida.
Rhinobatus lentiginosus, JORDAN & GILBERT, Synopsis, 65, 1883.

82. **RHINOBATUS GLAUCOSTIGMA**, Jordan & Gilbert.

(GUITARRO.)

Disk long and narrow, the snout produced but not acute at tip, its length 2½ in disk; interorbital width 3½ in snout; spiracle large, with 2 folds; rostral ridges moderately separated, slowly convergent anteriorly, but not united; snout in female without fimbriate appendage; vent somewhat nearer snout than base of caudal; dorsal fins similar; skin everywhere rough with fine shagreen; no spines on snout; superciliary spines very small; 1 or 2 spines on shoulder; a series of low, bluntish spines along the middle of back, becoming larger and farther apart behind. Color light gray, with the usual translucent area on sides of snout. Disk with numerous round, clear slate-colored spots as large as eye, symmetrically arranged; a blackish blotch below snout. L. 2½ feet. Gulf of California, locally abundant; close to the next, but well distinguished by its color, which does not fade in spirits. (*γλαυκός*, hoary blue; *στίγμα*, spot.)

Rhinobatus glaucostigma, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1883, 210, Mazatlan. (Type, Nos. 28205; 28206; 29547; 29602.)

83. **RHINOBATUS LEUCORHYNCHUS**, Günther.

Disk rather long, the snout acute at tip; rostral ridges separate for their whole length, converging toward tip of snout; eye moderate;

interorbital width 3½ in snout; spiracle with 2 folds. Body covered with uniform shagreen; small spines on orbital ridges; a row of small spines on back, a pair on each shoulder; dorsal fins similar. Light olivaceous brown, unspotted, the usual pale areas on snout. Panama and vicinity, not rare. (*λευκός*, white; *ῥύγχος*, snout.)

Rhinobatus leucorhynchus, GÜNTHER, Proc. Zoöl. Soc. Lond., 604, 1866, Panama.
Rhinobatus leucorhynchus, GARMAN, Proc. U. S. Nat. Mus., 1880, 517.

84. RHINOBATUS PRODUCTUS, Ayres.

(GUITAR FISH.)

Snout rather long, rounded at the tip; rostral ridges armed with small spines above and confluent about ½ their length; spiracle with 2 folds; moderate, hooked spines along middle line of back; smaller spines on shoulder and around eye; females with a small digitate flap, free behind, above tip of snout. Color dull grayish, unspotted, a black blotch below snout. San Francisco to San Diego, common southward. (*productus*, produced.)

Rhinobatus productus, AYRES MS., GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 196, Monterey.
Rhinobatus productus, GARMAN, Proc. U. S. Nat. Mus., 1880, 517.
Rhinobatus productus, JORDAN & GILBERT, Synopsis, 876, 1883.

85. RHINOBATUS PERCELLENS, (Walbaum).

(FIDDLER FISH; PURAQUE.)

Rostral cartilages very narrow, confluent more than ½ their length; snout long and narrow, about 4½ times interorbital width; eye moderate; spiracles with 2 tubercles on hinder margin. Mouth nearly straight. Skin covered above and below with shagreen; a vertebral series of small spines; a row of several near the middle of shoulder girdle on each side, none on snout. Olivaceous, with a few round white spots on middle of disk; snout with translucent spaces; adult sometimes unspotted. West Indies to southern Brazil, generally common southward, north to Jamaica (Cockerell). (*percellens*, smiting.)

Raja percellens, WALBAUM, Artedi Piscium, 525, 1792 (after Puraque of Marcgrave, 151).
Rhinobatus electricus, BLOCH & SCHNEIDER, Syst. Ichth., 356, 1801, Brazil, based on Puraque of Marcgrave.
Rhinobatus undulatus, ÖLFERS, Torpedo, 22, 1831, Brazil.
Rhinobatus undulatus, GÜNTHER, Cat., VIII, 444, 1870.
Rhinobatus glaucostictus, ÖLFERS, *l. c.*, 1831, Brazil.
Rhinobatus marcgravii, HENLE, Ueber Narcine, 34, 1834, Brazil.

86. RHINOBATUS SPINOSUS, Günther.

Snout much produced, the rostral ridges very narrow, largely confluent, with a very small, short groove at base, their whole length armed with spines; mouth nearly straight; compressed spines dilated at base along median line of back, on shoulder, and above eye and spiracle. Color plain. Mexico (probably the east coast). (Günther.) (*spinosus*, spiny.)

Rhinobatus spinosus, GÜNTHER, Cat., VIII, 518, 1870, Mexico; not recorded by any other author

87. RHINOBATUS PLANICEPS, Garman.

Disk rhombic, about $1\frac{1}{2}$ times as long as wide; head broad, flat; rostral cartilages moderate, dilated at tip, with the ridges close together anteriorly; snout rounded; spiracle with a single fold. Back and tail with compressed, hooked spines; 2 patches of spines on each shoulder and a series above eye. Color brownish; young with some white spots on back. Coast of Peru and Galapagos Islands. (Garman.) (*planus*, flat; *-ceps*, for *caput*, head.)

Rhinobatus planiceps, GARMAN, Bull. Mus. Comp. Zoöl., 168, 1880, Peru; Galapagos.

46. ZAPTERYX, Jordan & Gilbert.

Zapteryx, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 53, (*exasperata*).

This genus is close to the section *Leiobatus* (*Syrrhina*) of *Rhinobatus*, from which it differs mainly in having the upper parts covered with coarse, irregular stellated prickles, instead of a uniform shagreen. The snout is of moderate length and the nasal valve broader, extending on the space between the nostrils. Two species known. (*ζα-*, an intensive particle; πτέρυξ, fin, the vertical fins being larger than in *Raja*, and the ventrals not emarginate.)

a. Disk slightly longer than broad; no yellow spots above. EXASPERATUS, 88.
aa. Disk slightly broader than long; back with yellow spots above, surrounded with black. XYSTER, 89.

88. ZAPTERYX EXASPERATUS, (Jordan & Gilbert).

Disk rhombic, rather longer than broad. Snout prominent, but bluntish at tip, anterior margin of pectorals forming less than a right angle; eyes rather large; anterior nasal valve prolonged to the internal angle of the nostrils; rostral ridges parallel, separate their whole length. Tail stout, depressed, with a narrow lateral fold. Upper surface entirely covered with stout, close-set, stellated prickles of different sizes, largest on the bases of the pectorals and smallest on the outer edges of the fins, those on the tip of snout and anterior edge of the pectorals not enlarged; stout, bluntish, slightly recurved spines present as follows: One at the upper anterior angle of the eye and 2 behind it; 1 large one at the middle of the shoulders, in front of which are 2 others; 2 series on the shoulders outside the median line, the inner of 2, the outer of 2 to 4; a series of about a dozen on the median line of the back and tail; no lateral series on the tail. Under side covered with shagreen, made of triangular depressible asperities; region from the nostrils to the shoulder girdle smooth, except the lower lip; a few other small naked areas below. Upper lip developed. Teeth $\frac{32}{26}$. Color brown, mottled and barred with blackish; the markings mostly in the form of transverse bands; fore part of head blackish; a black blotch on hinder part of pectorals below. Tail rather shorter than disk. First dorsal not far behind ventrals, nearer hind part of root of ventrals than front of second dorsal. Snout $\frac{1}{3}$ the length of disk, twice the interorbital space. San Diego Bay; locally abundant; only male specimens known. L. $2\frac{1}{2}$ feet. (*exasperatus*, made rough.)

Platyrhina exasperata, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 32, San Diego. (Type, No. 35050.)
Zapteryx exasperatus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 53.
Trygonorhina alveata, GARMAN, Bull. Mus. Comp. Zoöl., 1880, 169, San Diego.
Syrrhina exasperata, GARMAN, Proc. U. S. Nat. Mus., 1880, 521.
Rhinobatus exasperatus, JORDAN & GILBERT, Synopsis, 63, 1883.

89. ZAPTERYX XYSTER, Jordan & Evermann, new species.

Disk somewhat broader than long, its length slightly greater than that of tail. Coloration similar to that of *Z. exasperatus*, including the large black blotch on posterior angle of pectoral below; upper side of disk with several round yellowish spots as large as pupil, each spot ocellated with blackish; a very distinct spot on each side of shoulder; a second on pectoral fin near posterior angle; a third midway between latter and median line of back; several fainter spots on back anteriorly. Spines and prickles above as in *Z. exasperatus*, but entire lower surface covered with fine shagreen, this perhaps a sexual character. L. 22 inches. Two female specimens (Museum Yale University), collected by Prof. Frank H. Bradley at Panama in 1866. (*ξυστήρ*, a scraper.)

Syrrhina exasperata, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 621.

47. PLATYRHINOIDIS, Garman.

Platyrhinoidis, GARMAN, Proc. U. S. Nat. Mus., 1880, 522, (*triseriata*).

Disk broad, flat, and rounded, the tail moderate, depressed; dorsals posterior; middle line of back and edges of pectorals and tail with stout spines; skin covered with fine shagreen as in *Rhinobatus*; labial fold well developed; nasal valves not reaching the mouth, the posterior lobe rudimentary. One species, with the general form of a ray and the color and appearance of *Rhinobatus*, like which genus, it is viviparous. (*Platyrhina*, or *Discobatus*, an Asiatic genus of *Rajidæ*, which species it resembles in form; *εἶδος*, like; *Platyrhina* from *πλατύς*, broad; *ῥίν*, snout.)

90. PLATYRHINOIDIS TRISERIATUS, (Jordan & Gilbert).

Disk broad, ovate, broader than long; snout very bluntly rounded, not projecting; the angle formed by the pectorals anteriorly very obtuse; anterior outline of the pectorals slightly convex, not undulated. Tail very stout, much longer than the disk, its edges with a broad fold, broader than in *Z. exasperatus*; pectoral fins extending almost to the tip of the snout; rostral ridges wide apart, strongly converging forward, inclosing a triangular area. Eyes small, wide apart; the broad spiracles close behind them. Caudal fin well developed above and below; dorsals similar, their posterior free margins very convex; first dorsal well backward, its origin nearer root of caudal than ventrals. Mouth broad, its width nearly equal to its distance from tip of snout, a deep crease passing around it behind, in front of which the lower lip has 3 folds of skin; upper lip not developed, a fold of skin passing from the angle of the mouth on either side to the inner angle of the nostrils, thence straight across, inclosing a depressed, trapezoidal ⏢ shaped area, bounded below by the curved outline of the upper jaw: in this are 3 cross folds of skin.

Teeth $\frac{60}{56}$. Gill openings narrow. Skin everywhere, above and below, covered with fine shagreen, the prickles coarser on the anterior outer margin of the pectorals (♂), where are 2 or 3 rows of retrorse spines; 4 strong spines on the tip of the snout, forming a rhombic figure; 4 or 5 spines around each eye; a long series of very strong spines along the median line of back and tail, and a series of similar ones on each side of the tail; a single strong spine on the outer edge of the shoulder girdle and 2 between this and the median series. Breadth of disk $\frac{1}{10}$ more than its length; tail usually $\frac{1}{2}$ longer than disk; snout $\frac{2}{9}$ of length of disk, not $\frac{1}{2}$ longer than width of interorbital area. Color light olive brown, without distinct markings. L. 2 feet. Coast of California from Point Concepcion southward; abundant. (*triseriatus*, 3-rowed, from the spines on the tail.)

Platyrhina triseriata, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 36, Santa Barbara, California. (Type, No. 26893.)
Rhinobatus triseriatus, JORDAN & GILBERT, Synopsis, 64, 1883.
Platyrhinoidis triseriatus, GARMAN, Proc. U. S. Nat. Mus., 1880, 522.

Family XXIV. RAJIDÆ.

(THE SKATES.)

Disk broad, rhombic, the skin more or less roughened with spines or prickles; tail stout, rather long, with a longitudinal fold on each side; usually 2 dorsal fins and sometimes a caudal fin present, all on the tail; pectoral fins extending to the snout; ventrals large; no serrated spine on the tail; no electric organs. Oviparous, the eggs being laid in large leathery egg cases, 4-angled, with 2 long tubular "horns" at each end. Genera 4 or more; species 40, most of them belonging to the genus *Raja*. Found in all cool seas, some of them in deep water. (RAJIDÆ, Günther, VIII, 455–471.)

a. Caudal fin rudimentary or absent; pectorals not confluent around the snout; ventrals deeply notched. RAJA, 48.

48. RAJA, (Artedi) Linnæus.

Raja (ARTEDI) LINNÆUS, Syst. Nat., Ed. x, 1758, 231, (*batis*).
Dipturus, RAFINESQUE, Caratteri, 16, 1810, (*batis*).
Platopterus, RAFINESQUE, Analyse de la Nature, 93, 1815, (*batis*).
Dasybatus, BLAINVILLE, Journ. Phys., 1816, 260 (*communis*).
Propterygia, OTTO, Nova acta Acad. Cæs. Leop. Carol. Nat. Curios., 1824, 111, (*hyposticta*; monstrous example, with fins not adnate to head).
Læviraja, BONAPARTE, Fauna Italica, XXV, 130, 1839, (*oxyrhynchus*).
Uraptera, MÜLLER & HENLE, Plagiostomen, 155, 1838, (*agassizi*); (species without caudal fin.)
Batis, BONAPARTE, Cat. Metod., 12, 1846, *radula*, no description.
Malacorhinus, GARMAN, Bull. Mus. Comp. Zool., XI, 236, 1881, (*plutonia*); (species with imperfect rostral cartilage; probably recognizable as a valid genus, when the species are better known.)
Raia, various authors, change of spelling.

This genus, as here understood, comprises all those *Rajidæ* which have the pectoral fins not continued around the snout, the ventrals deeply notched, and the caudal fin little developed or wanting. The tail is very distinct from the disk, and is provided with 2 rayed dorsal fins. The skin of the body is usually more or less spinous; the dentition differs in the two sexes, and the male is usually provided with a differentiated patch of spines on each pectoral. Species numerous, mostly of the Northern seas. They are, on the whole, not very well known, and an analytical table which would show their natural affinities can not be made out in the present condition of our knowledge. There is considerable variety within the genus, but the natural subgenera are yet to be defined. Thus far all attempts at natural subdivision have resulted in failure. We are, therefore, forced to make a primary division on the unnatural character of the geographical distribution of the species. The synonymy of some species is still uncertain. The best account of the eastern species is that given by Mr. Garman in Proc. Bost. Soc. Nat. Hist., 1874, 170, *et seq.* Of this we have made large use in the following analysis. (*raja*, or *raia*, a ray, or skate.)

I. Atlantic species.

a. Middle line of back and tail behind shoulders unarmed in the adult, with a row of spines in the young; outline of disk before spiracles obtuse, without acute angle at tip of snout; species with round dark spots.

b. Teeth in about 50 series in each jaw; size small. ERINACEA, 91.

bb. Teeth in about 90 series in each jaw; size large; usually a pectoral ocellus. OCELLATA, 92.

aa. Middle line of back with a row of spines at all ages.

c. Tip of snout rounded, very blunt, without marked angle. Skin very rough; color variegated. FYLLÆ, 93.

cc. Tip of snout with a more or less marked angle.

d. Angle at tip of snout short, obtuse; teeth in 30 to 50 series.

e. Body and tail armed with large bucklers, each with a radiated or stellate base. RADIATA, 94.

ee. Body and tail armed with small, close-set, stellate spines; color dark brown with irregular markings. PLUTONIA, 95.

eee. Body and tail smooth or with small asperities. Larger spines on orbital region, back and tail; brownish, with lighter and darker spots.

f. Disk a little longer than broad. ACKLEYI, 96.

ff. Disk a little broader than long. ORNATA, 97.

dd. Angle at tip of snout acute, moderately long.

g. Spines on skin above scarcely stellate; teeth in 50 rows; color brown with darker markings. EGLANTERIA, 98.

gg. Spines on skin above small, their base stellate; teeth in about 40 rows; color brown, sometimes with 1 or 2 paler spots above. SENTA, 99.

ddd. Angle at tip of snout much produced, blunt at tip; teeth in 30 rows.

h. Skin nearly smooth, its spines few and small; color brownish, with paler spots. LÆVIS, 100.

II. Pacific species; median line of tail always with stronger spines.

i. Snout acute or acuminate, more or less projecting beyond the disk, the rostral cartilage well developed.

j. Snout very long acuminate; usually no spines on median line of back in front of ventrals; interorbital space little concave.

k. Snout tapering to a point; skin almost everywhere prickly above; color nearly plain brown. RHINA, 101.

kk. Snout long, but bluntish at the tip; skin minutely prickly above, smoother than in preceding; 1 or 2 spines at center of back; color brown, with large rounded white spots above. BINOCULATA, 102.

jj. Snout of moderate length, rather sharp, but shortish; color brownish; usually with 2 faint ocelli; interorbital space deeply concave; prickles on body rather small.

l. Eye with few or no spines below it; disk $\frac{1}{10}$ broader than long.
INORNATA, 103.

ll. Eye with 4 rows of spines below it; disk $\frac{1}{3}$ broader than long.
EQUATORIALIS, 104.

ii. Snout bluntish, its tip little if any projecting; most of upper surface rough with prickles; lower surface nearly or quite smooth; nasal cartilage weak.

m. Color olive brown; the spots, if any, pale; interorbital width $3\frac{1}{2}$ in snout.
PARMIFERA, 105.

mm. Color dark brown or blackish; whole upper surface rough with stellate prickles.

n. Shoulder girdle with spines.

o. Orbital rim with a row of stout prickles; brown, much variegated with black spots and bars, some of the spots ocellate.
STELLULATA, 106.

oo. Orbital rim without spines; prickles fine; size, very large.
ALEUTICA, 107.

nn. Shoulder girdle without spines; color dusky, nearly plain.
TRACHURA, 108.

iii. Snout soft, bluntish; disk above and below, with close-set, velvety prickles.
ABYSSICOLA, 109.

91. RAJA ERINACEA, Mitchill.

(COMMON SKATE; LITTLE SKATE; TOBACCO BOX.)

Form rhomboid, with all the angles rounded; spines largest on the anterior extensions of the pectorals, where they are close set, strong, laterally compressed, and hooked backward; smaller ones are scattered over the head above the spiracles, above and in front of the eyes, and on the back, the median line of which is comparatively smooth, without larger median series, except in the young; a triangular patch on the shoulder girdle; inner posterior angles of the pectorals nearly smooth; in the males near the exterior angles of the pectorals are 2 rows of large erectile hooks, pointing backward. Females with groups of small scales on each side of the vent; teeth small, the middle ones sharp in the males; all blunt in the females; jaws much curved; each side of tail with a dermal fold; caudal fins rough, not separate to the base. Color light brown, with small round spots of dark brown ; no pectoral ocelli; females larger than the males. L. 1 to 2 feet. The smallest and commonest of our skates; abundant on our coast, from Virginia northward to Maine. (*erinaceus*, like a hedgehog.)

Raia erinacea, MITCHILL, Am. Jour. Sci. Arts, XI, 290, 1825, New York; GARMAN, *l. c.*, 176; JORDAN & GILBERT, Synopsis, 41, 1883.

Raia eglanteria, GÜNTHER, Cat., VIII, 462, 1870, not of Lacépède.

92. RAJA OCELLATA, Mitchill.

(BIG SKATE.)

General form and appearance of the preceding but much larger; the arrangement of spines similar, except that additional rows of spines are present down the back and along the sides of the tail; caudal fin not separate, rough with small spines; jaws curved. Color light brown, with rounded dark spots; a translucent space on each side of the snout; near the posterior angle of the pectoral there is usually (but not always) a large white ocellus, with a dark spot in the center and a darker border;

2 smaller similar spots often present. (Garman.) Coast of New York, Massachusetts, and northward. Size very much larger than in *R. erinacea*, reaching a length of nearly 3 feet. The egg cases are more than twice as large as those of the smaller species. (*ocellatus*, with eye-like spots.)

Raia ocellata, Mitchill, Trans. Lit. Phil. Soc., I, 477, 1815, New York; Garman, *l. c.*, 177; Jordan & Gilbert, Synopsis, 40, 1883.

93. RAJA FYLLÆ, Lütken.

Disk rather broader than long, broadly rounded anteriorly; the tip of the snout very blunt and scarcely projecting; a row of strong backward-hooked spines along median line of back and tail; 2 similar spines on each shoulder and 4 or 5 over each eye; skin very rough with close set spinules, which are coarser than in most species; sides of tail very rough; tail longer than rest of body. Brown, with numerous rounded blackish blotches on disk, tail, and fins. Davis Straits, Greenland, in 80 fathoms. Known from a young example about 8 inches long. (Lütken.) (*Fylla*, name of the Danish cruiser by which the type was taken.)

Raja fyllæ, Lütken, Vid. Medd. Naturh. Foren. Kjöbenh., 1887, 1, pl. 1, Davis Straits.

94. RAJA RADIATA, Donovan.

Besides the spines on the pectorals, head, back, and tail common to most species, this species is marked by the presence of large spinous plates or bucklers; these are large, strong spines, with broad, stellate or shield-like bases arranged as follows: 1 or 2 in front of each eye; 1 on each side between the eye and the spiracle; a pair on the shoulder, the smaller in front; and 14 or more forming a dorsal row, beginning just back of the head and extending to the caudal; an irregular row of spines on each side of the tail, separated from the membrane by a band of shagreen; males with 2 or more rows of claw-like spines on the pectorals. Teeth with a long, sharp point rising from the middle and hooking backward in the male, bluntish in the female; females larger than the males and more spinous. (Garman.) Size medium. L. $1\frac{1}{2}$ to 2 feet. North Atlantic; found both in America and Europe, not common on our coast. (*radiatus*, radiated.) (Eu.)

Raia radiata, Donovan, Hist. Brit. Fish., v, pl. 114, 1820, Great Britain; Günther, Cat., VIII, 460, 1870; Garman, *l. c.*, 177; Jordan & Gilbert, Synopsis, 41, 1883.
Raia americana, De Kay, N. Y. Fauna: Fishes, 368, 1842, Staten Island.

95. RAJA PLUTONIA, Garman.

Disk broader than long, subquadrangular, rounded in front; snout a very blunt angle; rostral cartilage short, imperfect; tail $\frac{1}{2}$ longer than disk; width of mouth $\frac{1}{2}$ its distance from snout; teeth in 32 series. Eyes large, their length more than interorbital width. Back and tail covered with small, close-set, stellate spines, the points slender, compressed, directed backward, a close series of large spines along median line of back and tail; a supraorbital row, and a single spine on each side of back of head; about 5 on each side of shoulder girdle, in front of which are 1 or 2 more; 2 series on each side of tail; smooth below. Color brown, the adults purplish, with irregular transverse series of ill-defined, often confluent brown spots, besides some white spots; tail with white and dark bands; dorsals dark, lower surface white. Deep water off South Carolina. (Garman.) (*plutonius*, dusky; from Pluto.)

Raja plutonia, GARMAN, Bull. Mus. Comp. Zoöl., XI, 236, 1881, off South Carolina; JORDAN & GILBERT, Synopsis, 878, 1883.

96. RAJA ACKLEYI, Garman.

Disk, including the ventrals, rhombic, longer than wide; anterior margins sinuous, posterior outline convex; tail moderate, depressed, with a narrow cutaneous fold on each side; angle formed by snout less than right. Rostral cartilage rather slender. Mouth moderate, much curved, width 1⅔ in distance from end of snout. Teeth small, cusps sharp, in 42 rows on the upper jaw (male adult). Eyes moderate; interorbital space narrow, deeply concave, its width 3 times in the distance from the end of the snout to the eye. Spiracles smaller than the eye. Ventrals medium. Dorsals small, separated by a space with tubercles; a vertebral series of small tubercles on back and tail; 2 lateral series on each side of tail; a series on each orbital ridge; a group of several above the end of the rostral cartilage; a group on each pectoral opposite eye and spiracle; a group of retractile spines opposite the shoulder near the outer angle of the pectoral; the disk otherwise smooth above; lower side of snout with fine, sharp scales or shagreen. Differing from *R. eglanteria*, which it resembles in shape, in a somewhat shorter snout and in coloration. Disk, including ventrals, 9.5 inches; width 9; tail from vent 9.6; total length 16.25 inches. Light yellowish brown, sprinkled with small spots of brown intermixed with others of white; on base of each pectoral a little behind the shoulder girdle, a transversely oblong spot of brown, ½ inch in diameter, surrounded by a ring of small spots forming a sort of rosette. Yucatan Banks, in deep water. (Garman.) (Named for Lieut. Seth N. Ackley, of the "Blake.")

Raja ackleyi, GARMAN, Bull. Mus. Comp. Zoöl., XI, 235, 1881, Yucatan Banks.

97. RAJA ORNATA, Garman.

Disk little broader than long, the anterior margins convex; tip of snout obtuse; snout not produced; width of mouth ¾ its distance from tip of snout; teeth in 44 series; entire upper surface rough with small asperities; a median series of spines on back and tail, a lateral series on each side of this on back and 2 on tail, a series on each orbital ridge; a single spine on forehead between eyes, several above tip of snout; a group on hinder angle of pectoral and on its front; lower surface smooth. Tail a little longer than disk. Light brownish, freckled with paler, marked with a few groups of small darker spots; several spots on the tail; one at base of each dorsal. Deep water off South Carolina and Florida. Perhaps a variety of the preceding. (Garman.) (*ornatus*, adorned.)

Raja ornata, GARMAN, Bull. Mus. Comp. Zoöl., XI, 235, 1881; off South Carolina, and Alligator Key, Florida; JORDAN & GILBERT, Synopsis, 877, 1883.

98. RAJA EGLANTERIA, Bosc.

Prickles comparatively small and very sharp, most numerous on the anterior portion of the pectoral, over the head, on the snout, on the middle of the back, and on the tail between the rows of larger ones; enlarged spines present around the eyes and spiracles, on the middle of the snout, in a median row along the back, and in 2 rows along each side of the tail; these spines very sharp; larger and smaller ones alternating in the rows; a large spine in the middle of each shoulder; a spine between the caudal fins. Color brown, with bands, bars, lines, blotches, and spots of darker color in the middle of the pectoral; a translucent space on each side of snout. (Garman.) L. about 2 feet. Cape Cod southward to Florida; not very common. (*eglantina*, the briar rose.)

Raia eglanteria (Bosc), Lacépède, Hist. Nat. des Poiss., II, 103, 1800, Charleston, South Carolina; Garman, *l. c.*, 179, 1881; Jordan & Gilbert, Synopsis, 41, 1883.
Raia diaphana, Mitchill, Trans. Lit. Phil. Soc. I, 1815, 478, New York.
Raia desmarestia, Le Sueur, Jour. Ac. Nat. Sci. Phila., IV, 100, 1824, Florida.
Raia chantenay, Le Sueur, *l. c.*, 106, 1824, Delaware Bay.

99. RAJA SENTA, Garman.

Form of *R. eglanteria*. Snout projecting, its tip acute and flexible; interorbital space concave, 3⅔ in snout; mouth little curved, ½ preoral part of snout; eyes and spiracles small; teeth in 36 to 40 rows. Tail slender, tapering. Entire upper surface covered with very small, close-set spines, each slender, acute, strongly hooked backward over a broad stellate base; vertebral line with a series of large spines with smaller interspersed; 2 or 3 large, hooked spines before each eye; a few moderate spines on snout and back of head. Olivaceous, clouded with darker, a whitish spot sometimes on middle of back, and a pale bar on back of tail. (Garman.) Banks of Newfoundland to Cape Cod, in deep water. (*sentis*, briar.)

Raja senta, Garman, Proc. U. S. Nat. Mus., 1885, 43, Cape Cod Bay; Le Have Bank. (Type, No. 21004 and 24309.)

100. RAJA LÆVIS,* (Mitchill).

(Barndoor Skate.)

Angles of the disk more acute than in any of the others; muzzle much produced, somewhat shovel-shaped at tip. Spines of the body very few and small; some present above the eyes and spiracles, on the snout, along the anterior border of the pectorals, and on the back; those on the back very small; a median dorsal row of larger hooked spines extending along the median line of the posterior portion of the back and the tail; usually 2 lateral rows on the tail. Female rougher, as usual among rays. Color variable, brownish, with paler spots, which are usually ringed with darker. The largest of our Atlantic species, reaching a length of 4 feet. New England to Florida; not uncommon northward. (*lævis*, smooth.)

**Raja granulata*, Gill. Allied to *R. lævis*. Back and ventrals surface covered with minute sharp granular ossifications. Teeth in about 30 rows; claspers slender and scarcely expanded. Slate color, the ventrals with reticulate markings. (Gill.) Banks of Newfoundland; a doubtful species, imperfectly described, apparently not different from *R. lævis*. (*granulatus*, granular.)

Raja lævis, MITCHILL, Amer. Monthly Mag., II, 327, 1817, New York.

Raja lævis, STORER, Hist. Fish. Mass., 1867, 242; GARMAN, *l. c.*, 180, 1881; JORDAN & GILBERT, Synopsis, 41, 1883.

Raia granulata, GILL MS., GOODE & BEAN, Bull. Essex. Inst., XI, 1879, 28, Le Have Bank.

101. RAJA RHINA, Jordan & Gilbert.

Disk broad, the outer pectoral angle sharp, farther forward than in *R. binoculata.* Anterior outline of pectoral somewhat undulated and exceedingly concave, so that the snout is very long, acuminate, and tapering to the extreme point; interorbital space quite narrow, little concave. Supraocular ridges slightly elevated; eyes large, much longer than spiracles. Spines on body comparatively strong; 5 to 7 above the eyes; 2 or 3 near the middle of the back; none on the median line of the back until opposite the posterior end of ventrals, where a series of rather sharp spines begins; prickles on body above rather large, sharp, strongly stellate, those on the snout largest and most stellate; skin above everwhere prickly in the female; the prickles small and sparse on the base and edges of the pectorals and on ventrals; larger on the median region of the disk. Male with bases of fins smooth, and the prickles generally fewer and smaller; anterior edge of pectoral with spines; under side of disk almost everywhere prickly in the females, smooth posteriorly in the males. Mouth somewhat arched. Teeth $\frac{46}{40}$. Color light brown, nearly plain, with a dark ring at base of pectorals, which grows obscure with age. Disk $\frac{1}{10}$ broader than long, its breadth twice the length of the tail. Snout nearly ⅓ the length of the disk, 3¾ times the interorbital width. L. 2½ feet. Monterey to Alaska; not rare, especially northward. (*ῥίν*, snout; *ῥίνη*, rasp.)

Raja rhina, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 251, Monterey; San Francisco.

Raia rhina, JORDAN & GILBERT, Synopsis, 45, 1883.

102. RAJA BINOCULATA, Girard.

(BIG SKATE OF CALIFORNIA.)

Disk broad, its widest part behind the middle. Snout long, regularly long acuminate, but not very sharp at tip; the anterior outline of the pectoral not much undulated, and little concave; interorbital space very broad, almost flat, slightly depressed in the middle; supraocular ridge scarcely elevated; eyes small, shorter than the spiracles. Spines on body small and few; 2 or 3 small spines around the eye; 1 or 2 near the center of the back; otherwise none on median line of back in front of base of ventrals, where a series of spines begins, feeble anteriorly, but growing larger backward; females (as in other species) with lateral series of spines on the tail; upper surface mostly covered with minute prickles which are largest on the median line of the back, on the tail, and the front of the pectorals. Disk smooth below, except anteriorly. Teeth about $\frac{48}{38}$; the jaws rather strongly arched. Disk ⅕ broader than long, its width twice the length of the tail; snout 3½ in length of disk, 2¾ in interorbital width. Color brown, with a dark ocellate ring at base of pectorals; upper surface everywhere with round pale spots. The largest of our skates, reaching a length of over 6 feet; the egg case nearly a foot long. Pacific coast from Monterey to Sitka, abundant. (*bis*, two; *oculatus*, eyed, from the pectoral ocelli.)

Raja binoculata, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 196, San Francisco; JORDAN & GILBERT, Synopsis, 878, 1883.

Raia cooperi, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 135.

103. RAJA INORNATA, Jordan & Gilbert.

(COMMON SKATE OF CALIFORNIA.)

Disk broad, its widest part well forward; outer angle of pectoral blunt; posterior edge convex; anterior margin of pectoral undulated, not strongly concave; snout rather pointed and projecting at tip, but not very long, its acumination being confined to its anterior half. Interocular space narrow, deeply and uniformly concave; eyes large, longer than spiracles; supraocular ridge prominent. Spines on body rather stronger than in related species; 4 or 5 over the eye; 5 or 6 (rarely fewer) along the median line in front of the middle of the back; a series of very small spines along the middle of the back, changing opposite the middle of the ventrals into a series of rather strong, hooked spines; tail with a strong lateral series in females only, as usual in the genus; prickles on the body small and few; a small band of sparse prickles near the median line of back on each side of the median series of spines; snout and interorbital space prickly; no prickles on the shoulders or on the fins, except the anterior edge of the pectorals; smooth below, except on the snout and front of pectorals; armature variable, smoothest specimens in deeper water. Teeth $\frac{40}{42}$. Jaws somewhat curved. Color light brown, slightly mottled; a blackish ring at base of pectorals, which becomes faint in the adult; a small dusky spot at base of ventrals and on posterior edge of pectorals. Disk $\frac{1}{10}$ broader than long, its breadth twice the length of the tail. Snout $\frac{1}{4}$ the length of the disk, 3 times the interorbital width. L. 2 feet. Coast of California; very abundant from San Diego to Cape Mendocino. (*inornatus*, unadorned.)

Raja inornata, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 457, and 1881, 74, San Francisco.

Raia inornata, JORDAN & GILBERT, Synopsis, 878, 1883.

Raia jordani,* GARMAN, Proc. U. S. Nat. Mus., 1885, 43, San Francisco. (Type, 16704.)

Raia inornata inermis, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 74, Santa Barbara. (Type, No. 26926.)

---

* *Raja jordani*, Garman. Disk broader than long, the snout a little sharper than a right angle, the tip pointed; width of disk $1\frac{1}{2}$ times length of tail from ventrals; tail slender, tapering regularly to a point. Dorsals separated by a large spine. Interocular space broad, deeply concave, 3 in snout. Eye moderate, as large as spiracle. Mouth wide, curved forward; $1\frac{2}{3}$ in preoral part of snout; teeth in 38 rows. Head above, including rostral cartilages and skin between them, rough with small spines; a row of larger spines along orbital ridges and median line of back and tail; type (♂) without lateral spines on tail; 2 large spines side by side in front of and near dorsals; a group of large spines on front of each pectoral; most of the disk smooth. Claspers long, slender, pointed, their form unlike that of *R. erinacea*. Dark olivaceous, a rounded pale spot with a darker center on each shoulder; dark mottlings on lower side. L. 2 feet. (Garman.) San Francisco, apparently not distinct from *R. inornata*. (Named for David Starr Jordan.)

104. RAJA EQUATORIALIS, Jordan & Bollman.

Disk to posterior base of pectorals $\frac{1}{3}$ broader than long, the breadth exceeding the length by a distance equal to snout and eye; the breadth somewhat longer than length of tail (measured from vent); anterior margin concave in front of eyes. Snout produced at a rather acute angle, its tip rounded, its length from eye $3\frac{3}{5}$ in length of disk. Interorbital space rather strongly concave, its width $2\frac{2}{5}$ in snout. Eye not much larger than spiracles, 3 in snout. Width of mouth $1\frac{1}{2}$ in prenasal part of head; nasal flaps at angle of mouth deeply fringed. Pectorals reaching middle of ventrals, which are as long as from tip of snout to posterior border of spiracle. Claspers in typical example $1\frac{3}{5}$ in disk. Dorsals small, their length 2 in snout. Caudal small, not longer than eye. Snout above with 2 rows of spines, besides smaller asperities; a row of about 12 before and above eye and spiracle; a row of strong spines along line of back from posterior border of spiracle to second dorsal, these alternately large and small on the tail; a row of similar spines on each side of tail commencing just behind posterior base of ventrals and extending to caudal; a single spine on the shoulder on each side; 4 or 5 irregular rows near the anterior margin of the disk opposite the eyes; the length of this patch not as long as snout. Pectorals with the usual strong retrorse spines characteristic of the males of this genus. Small prickles present along the outer anterior margin of pectorals, interorbital area, on top of snout, and along its margin for a distance equal to $\frac{3}{4}$ of snout, and beneath from tip to opposite posterior teeth, the anterior prickles strongest; a small patch in front of eyes. Teeth $\frac{42}{40}$.

Color light brown, spotted with paler; the back with obscure reticulations of the ground color, forming honeycomb-like markings, surrounding paler; an obscure roundish dusky blotch at middle of base of pectorals, and a darker one near their posterior base; edges of ventrals, pectorals, and snout pale; dark markings on interorbital area and below eye; no markings below.

Related to *Raja inornata*, Jordan & Gilbert, from which it is at once distinguished by having 4 rows of spines below eyes, a series of stout spines on each side of tail in the male, and no prickles on back except the median series and the spine on each shoulder. The size is much smaller, it being one of the smallest of the rays, known from a single male specimen 14 inches in length; dredged at a depth of 33 fathoms, at station 2797, off the west coast of Colombia, between Panama and the Galapagos Islands, 8° 06′ 30″ N., 78° 51′ W. (*equatorialis*, of the equator.)

Raja equatorialis, JORDAN & BOLLMAN, Proc. U. S. Nat. Mus., 1889, 150, off Colombia. (Type, No. 41132.)

105. RAJA PARMIFERA, Bean.

Disk considerably broader than long; tip of snout slightly projecting; interorbital width $3\frac{1}{2}$ in distance from snout to eye; tail as long as from its root to eye. Teeth in 27 rows. Snout, supraoccipital region and whole margin of pectorals and ventrals covered with small prickles, as also an area on tail; back and tail with a median row of 22 to 29 large spines; tail with a marginal row of large spines (♀); rest of disk mostly smooth; lower side mostly smooth except below snout. Olive brown, with numerous paler blotches, 2 larger than the others. L. 3 feet. Coast of Alaska, common. (Bean.) (*parma*, shield; *fero*, I bear.)

Raia parmifera, BEAN, Proc. U. S. Nat. Mus., 1881, 157, Iliuliuk, Unalaska; (Type, No. 27651). JORDAN & GILBERT, Synopsis, 878, 1883.

106. RAJA STELLULATA, Jordan & Gilbert.

Disk much broader than long, anteriorly broadly arched; the snout very obtuse, but its tip slightly exserted and acutish: anterior margin of pectorals somewhat undulated and convex; posterior margin very convex. A row of small stoutish spines above eye; about 6 spines on the scapular region, and a median row of strong spines on the tail; entire upper surface rough with strong stellate prickles; these largest on head, middle of back, and on tail; underside smooth, except anteriorly. Teeth $\frac{40}{35}$. Nasal cartilage very weak. Color brown, everywhere strongly variegated with light and dark colors; a black spot at base of each pectoral, surrounded by a pale ring, and this by a black ring; numerous black spots of various sizes, some of them ocellated, scattered over the body; head with black crossbars. Disk $\frac{1}{5}$ broader than long; the length of tail more than $\frac{1}{2}$ the width of disk; the snout $4\frac{1}{2}$ in length of disk, and $2\frac{1}{2}$ times the interorbital width; the snout is as long as in *inornata*, but much wider, appearing blunt and short. L. $2\frac{1}{2}$ feet. Coast of California and northward, Santa Barbara to Unalaska; locally abundant about Monterey. (*stellula*, a small star, from the form of prickles.)

Raja stellulata, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 133, Monterey; JORDAN & GILBERT, Synopsis, 45, 1883.

107. RAJA ALEUTICA, Gilbert & Thoburn.

Closely related to *R. stellulata*, differing in the much finer stellate prickles, which uniformly cover the entire upper side of disk, the continuous series of median spines, the narrower disk, and longer, sharper snout. The latter forms a right angle, its length more than $\frac{1}{3}$ length of disk. Interorbital space deeply concave, the rostral cartilage a slender rod, with semitransparent spaces on either side. Anterior margins of disk gently convex near snout, concave near pectoral angle. Length of tail equaling distance from snout to vent. Teeth $\frac{38}{43}$. No spines or enlarged prickles on orbital rim. Two large spines on shoulder. A broad band of enlarged prickles on each side of tail.

The single specimen is a young male, 33 inches long, taken south of Unalaska Island, Aleutian group, at a depth of 81 fathoms. The species evidently reaches a larger size than either *stellulata* or *parmifera*, as the claspers failed to reach ventral margin, and the pectoral hooks were undeveloped in the type.

Raja aleutica, GILBERT & THOBURN, Bull. U. S. Fish Com., 1891; Sannak Island, Aleutians.

108. RAJA TRACHURA, Gilbert.

Allied to *Raja isotrachys*, a deep water species, but the disk broader, the snout much blunter, the angle much greater than a right angle. Upper surface sparsely and evenly covered with small sharp prickles with stellate base, crowded between eyes, in a broad band along front of disk, behind shoulders and especially on sides of tail; no spines on orbital rim or shoulders; a small spine on middle of back between shoulders; 23 spines along median line of tail. Anterior outline strongly undulated, convex near tip of snout, which slightly projects. Length of disk $1\frac{1}{2}$ in its width; interorbital space concave, $1\frac{1}{6}$ times eye, which is $3\frac{3}{5}$ in snout. Distance from front of eye to edge of disk, $1\frac{2}{5}$ in snout. Tail longer than body by $\frac{1}{2}$ snout; dorsals small, equal, prickly. Color plum color, darker at margin; brownish below, becoming dark on fins. L. 18 inches. One specimen known from Santa Barbara Channel, in 822 fathoms. (Gilbert.) (*τραχύς* rough; *οὐρά* tail.)

Raia trachura, GILBERT, Proc. U. S. Nat. Mus., 1891, 539, Santa Barbara.

109. RAJA ABYSSICOLA, Gilbert & Thoburn.

Three strong spines on middle of back and a series down median line of tail. No other spines present. A band of enlarged prickles on each side of tail. Both upper and lower surface hispid with close-set, slender bristles; the margins of disk, the ventrals, and the under surface of tail partly naked. No scapular spines. Anterior margin of disk concave near snout and near pectoral angle, a convex area intervening. Snout broad, but not short nor blunt. Interorbital space deeply concave. Claspers long, slender and flexible. Rostral cartilage imperfect; skeleton generally very flexible. Hooks on pectorals in male imperfectly developed. Nearly uniform sooty brown on both upper and lower sides, with a few scattered black spots above.

A single specimen known, a male 45 inches long, taken off the Queen Charlotte Islands, British Columbia, at a depth of 1,588 fathoms, the greatest depth at which a ray has been found. A strongly marked species, probably type of a distinct genus. (*abyssicola*, living in the depths.)

Raja abyssicola, GILBERT & THOBURN, Bull. U. S. Fish Com., 1894, Queen Charlotte Islands.

Family XXV. NARCOBATIDÆ.

(THE ELECTRIC RAYS.)

Trunk broad and thick, covered with perfectly smooth skin. Tail comparatively short and thick, with rayed caudal fin, and commonly 2 rayed dorsal fins, the first of which is over or behind the ventrals; a longitudinal fold on each side of the tail; anterior or nasal valves confluent into a quadrangular lobe; a large electric organ composed of many hexagonal tubes between the pectoral fins and the head. Genera 7; species about 15; rays of moderate or large size, noted for their power of giving electric shocks; found in most warm seas. According to Fritsch, the torpedoes pass through 3 distinct phases of development, a shark-like, a ray-like, and finally a torpedo-like stage. The very young have long external gills. (TORPEDINIDÆ, Günther, Cat., VIII, 448–455.)

- *a.* Dorsal fins 2.
  - *b.* Ventral fins separate, tail moderate.
    - *c.* Spiracles at some distance behind the eyes.

d. Spiracles rounded, with entire edges, (not fringed). TETRONARCE,* 49.
cc. Spiracles placed close behind the eyes, not fringed, but with the margin sometimes tuberculate. NARCINE, 50.
bb. Ventral fins united; spiracles close to the eyes, not fringed. DISCOPYGE, 51.

49. TETRONARCE, Gill.

Tetronarce, GILL, Ann. Lyc. Nat. Hist. N. Y., 1861, VIII, 387, (*occidentalis*).
Gymnotorpedo, FRITSCH, Arch. Anat. Phys., 1886, 365, (*occidentalis*).

Electric rays with the disk very broad, abruptly contracted at the tail; 2 dorsal fins; caudal fin well developed; ventral fins large, separate; spiracles large, rounded, with entire (not fringed) edges, placed behind the eyes; mouth small; teeth pointed; skin perfectly smooth. Species about 4, 2 European, the others American. (τέτρα-, four—four-cornered; νάρκη, an old name of *Tetronarce narce*, meaning numbness, equivalent to *Torpedo*.)

a. Color nearly uniform black, rarely spotted; first dorsal over middle of ventrals. OCCIDENTALIS, 110.
aa Color dark brown, usually spotted with black; first dorsal inserted behind middle of ventrals. CALIFORNICA, 111.

110. TETRONARCE OCCIDENTALIS, (Storer).

(CRAMPFISH; TORPEDO; NUMBFISH.)

First dorsal more than twice as large as second, its insertion over middle of the ventrals; spiracles not fringed, their edges smooth. Color almost uniform black, with obscure darker spots; beneath white. L. 2 to 5 feet; breadth ⅔ of length, the disk very blunt or almost emarginate in front. Atlantic coast of United States, Cape Cod to Cuba; not very common. A large species, allied to the European *T. nobiliana*, said to reach a weight of 200 pounds. According to the figures, *T. nobiliana* has the second dorsal smaller and inserted farther back. (*occidentalis*, western.)

Torpedo occidentalis, STORER, Am. Jour. Sci. Arts, 1843, 165, Massachusetts.
Torpedo occidentalis, STORER, Fishes Mass., 247, 1867.
Torpedo occidentalis, JORDAN & GILBERT, Synopsis, 39, 1883.

111. TETRONARCE CALIFORNICA, (Ayres).

(CALIFORNIA TORPEDO.)

Color very dark brown, with small round black spots, which are sometimes obsolete. Eye small; spiracles at a distance behind them more than twice eye and more than length of spiracle; edges of spiracles not fringed; breadth of mouth about equal to its distance from tip of snout; teeth small, sharp. First dorsal more than twice second, half of it opposite ventrals. A large species, reaching a length of about 3 feet. Coast of California, on sandy shores, scarce, rarely seen except about San Francisco and Santa Cruz; not noticed south of Monterey. Perhaps not different from *T. occidentalis*.

---

* In the Old World genus *Narcobatus*, the typical genus of the family, the edges of the spiracles are fringed with papillæ. The synonymy of this genus is:

Torpedo, DUMÉRIL, Zoöl. Anal., 102, 1806, (*torpedo*); name preoccupied for an electric catfish.
Narcobatus, BLAINVILLE, Journ. Phys., 1816, 262, (*maculatus*, *galvani*, *etc.*).
Narcacion, (KLEIN), BLEEKER, Nederl. Tidskr. Dierk. III, 171, (*torpedo*).
Fimbriotorpedo, FRITSCH, Arch. Anat. Phys. 1886, 365, (*marmorata* = *torpedo*).

Torpedo californica, AYRES, Proc. Cal. Ac. Sci., 1854, 70, San Francisco.
Torpedo californica, JORDAN & GILBERT, Synopsis, 876, 1883.

50. NARCINE, Henle.

Narcine, HENLE, Ueber Narcine, 31, 1834, (*brasilensis*).
Cyclonarce, GILL, Ann. Lyc. Nat. Hist. N. Y., 1861, VIII, 387, (*timlei*).
Gonionarce, GILL, *l. c.*, (*indica*).

Disk more or less rounded, not emarginate in front; spiracles very close to the eyes, their edges tuberculate or smooth; mouth narrow, surrounded by a circular fold of skin, which forms the frenum of the nasal valve; teeth in quincunx, not occupying the whole of the jaw, most of them visible when the mouth is closed. Tail about as long as disk; second dorsal larger than first. Warm seas; the species usually smaller than the species of Torpedo. (*νάρκη*, numbness, an old name of the Torpedo).

112. NARCINE BRASILIENSIS, (Ölfers).

Disk oval or nearly circular, the snout broadly rounded, not exserted; spiracles with roughened edges; snout 4⅓ in disk, twice interorbital width; mouth 1¾ in preoral part of snout; tail 1⅖ times length of disk; second dorsal a little higher and a little longer than first. Color variable, a fact which has given rise to several nominal species; sometimes nearly uniform dark brown (in deep water); sometimes marked above with dark spots and dashes (*umbrosa*); sometimes with a dark band across head and dark spots elsewhere (*corallina*). West Indies and Brazil, occasionally northward to Key West and Pensacola. L. 2 feet.

Torpedo brasiliensis, VON ÖLFERS, Torpedo, 19, 1831, Brazil.
Narcine brasiliensis, GÜNTHER, Cat., VIII, 453, 1870.
Narcine brasiliensis corallina, GARMAN, Bull, Mus. Comp. Zoöl., XI, 234, 1881, Florida; JORDAN & GILBERT, Synopsis, 877, 1883.
Narcine umbrosa, JORDAN, Proc. U. S. Nat. Mus., 1884, 105, Key West.
Narcine brasiliensis, JORDAN & EVERMANN, Proc. U. S. Nat. Mus., 1886, 472.
Torpedo bancrofti, GRIFFITH, Anim. Kingdom, X, 649, pl. XXXIV, 1834, Jamaica.
Narcine nigra, DUMÉRIL, Revue Zoöl., 272, 1852, Brazil.
Torpedo pictus, GRONOW, Cat. Fishes, 13, 1854, Antilles.

51. DISCOPYGE, Tschudi.

Discopyge, TSCHUDI, Fauna Peruana, 32,1844, (*tschudii*).

Ventral fins united into a continuous disk below the tail. Disk circular; tail with 2 dorsal fins and with a fold on each side; nasal valves confluent; teeth flat, the hinder edge angular; spiracles close behind eyes. Two species in the Eastern Pacific; small electric rays resembling *Narcine*, but with united ventrals. (*δίσκος*, disk; *πυγή*, rump, from the disk-like ventrals).

113. DISCOPYGE OMMATA, Jordan & Gilbert.

Spiracles with coarse fringes. Snout 4½ in disk; eye small; interorbital space 1½ in snout. Width of mouth 1⅔ in preoral part of snout; tail slightly shorter than rest of body; second dorsal narrower and higher than first; ventrals large, adnate behind. Color brown, mottled and spotted above with lighter and darker; center of disk with a large, blackish, ocellated spot, the darker center surrounded by a pale ring, a pale spot at center; ocellus as long as snout. Panama, rare. (*ὀμματός*, eyed, from the color markings.)

Discopyge ommata, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1889, 151, Panama. (Type, No. 41133.)

Suborder MASTICURA.

(THE WHIP-TAILED RAYS.)

Family XXVI. DASYATIDÆ.

(THE STING RAYS.)

Disk usually more or less broad than long; the pectoral fins uninterruptedly confluent in front, forming the tip of the snout; tail variously formed, usually whip-like, sometimes short and stout, sometimes bearing a single dorsal or caudal fin, but never with 2 dorsals; usually 1 or more vertical folds of skin on the tail, rarely a lateral fold. Tail generally armed with a large, sharp, retrorsely serrate spine on its upper surface toward the base; 2 or 3 spines occasionally present. Ventral fins not emarginate. Skin smooth or variously prickly or spinous, roughest in the adult; no differentiated spines on the pectorals in the males, the sexes being similar. Mouth rather small; teeth small, paved, usually more or less pointed or tubercular. Nostrils close together; nasal valves forming a rectangular flap, which is joined to the upper jaw by a narrow frenum. Spiracles large, placed close behind the eyes. Skull not elevated, the eyes and spiracles superior. Ovoviviparous. Genera about 10; species 50. Found in most warm seas, some of them in the fresh waters of the northern parts of South America. The large, jagged spine on the muscular tail is capable of inflicting a severe and even dangerous wound. (TRYGONIDÆ, Günther, Cat., VIII, 471–488.)

UROLOPHINÆ:

a. Tail stout, provided with a rayed caudal fin; no dorsal fin; disk roundish; caudal spine strong. UROLOPHUS, 52.

DASYATINÆ:

aa. Tail slender, without caudal fin; pelvis without sword-shaped* process. (Marine species).

b. Tail whip-like, longer than the disk which is rhomboid or roundish; caudal spine strong. DASYATIS, 53.

bb. Tail very short, shorter than the very broad, transversely rhombic disk; caudal spine weak, often wanting. No trace of dorsal fin. PTEROPLATEA, 54.

52. UROLOPHUS, Müller & Henle.

(ROUND STING RAYS.)

Leiobatus, † BLAINVILLE, Jour. Phys., LXXXIII, 1816, 262, (*cruciatus*; not *Leiobatus*, Rafinesque, 1810).

---

* In the fresh water genera *Ellipesurus* and *Paratrygon*, species of which are found in the waters of Colombia, Venezuela, and Guiana, the pelvis has a sword-shaped continuation or process. See Garman, Proc. Bost. Soc. Nat. Hist., 1877, 210, and Steindachner, Fische des Magdalenenstromes, 1878, 58.

† In the Faune Française, 1828, Blaineville changes "*batus*" in this and all similar names to "*batis*," thus *Leiobatis*, *Aëtobatis*.

Urolophus, MÜLLER & HENLE, Plagiostomen, 1838, 173, (*aurantiacus* = *cruciatus*).
Urotrygon, GILL, Proc. Ac. Nat. Sci. Phila., 1863, 173, (*mundus*).

Disk oval or rhombic, the length and breadth not very unequal; snout rounded or the tip exserted; skin smooth or more or less prickly. Tail rather short, little if any longer than the disk, muscular, provided with a distinct rayed caudal fin; no dorsal fin. Upper part of the tail with a strong serrated spine. Warm seas. Sting rays of small size, the most vigorous and most dangerous of the group, mostly confined to tropical America. (*οὐρά*, tail; *λόφος*, crest.)

- *a.* Middle line of back or tail with no enlarged shields, spines or prickles, the skin smooth or with prickles similar to those found elsewhere; disk roundish, the snout not prominent.
  - *b.* Skin everywhere perfectly smooth; snout little prominent; tail shorter than disk; body with yellow streaks and spots. HALLERI, 114.
  - *bb.* Skin more or less prickly above.
    - *c.* Skin mostly smooth, some weak prickles present on middle of back. NEBULOSUS, 115.
    - *cc.* Skin above everywhere beset with small prickles.
      - *d.* Tail rather shorter than disk, which is longer than broad. Color brown, everywhere sprinkled with yellow dots. JAMAICENSIS, 116.
      - *dd.* Tail rather longer than disk, the caudal spine inserted behind its middle; disk as broad as long; prickles stellate. Color plain brownish. MUNDUS, 117.
- *aa.* Middle line of back or tail with 1 or more enlarged spines or prickles; tip of snout more or less prominent. Color nearly plain.
  - *e.* Middle of back with 1 or 2 stout spines; no spines on tail; rest of disk smooth or slightly prickly; disk broader than long, shorter than tail. GOODEI, 118.
  - *ee.* Middle of back without differentiated spines; median line of tail with spines.
    - *f.* Median line of tail with 2 to 8 strong, broad rooted spines; rest of body entirely smooth; tail longer than disk which is slightly longer than broad; the snout strongly projecting. ASPIDURUS, 119.
    - *ff.* Median line of back and tail with 18 to 22 recurved spinules; these largest on tail; disk above mostly covered with small stellate prickles; snout slightly projecting; tail as long as disk, which is slightly broader than long. ASTERIAS, 120.

114. UROLOPHUS HALLERI, Cooper.

Disk nearly round, a little broader than long, with the anterior margins straightish, meeting in a slight angle. Snout (from the eyes) longer than the width of the interorbital space; less than ¼ disk. Tail somewhat shorter than the disk. Teeth obtuse in both sexes. Skin perfectly smooth, without spines or prickles. Color light brownish, with marblings and wavy lines of yellowish and dusky, sometimes with yellowish spots, occasionally with wide, obscure dusky streaks, which are crossed by similar transverse streaks; belly yellowish tinged. Coast of California from Point Concepcion southward to northen Mexico; exceedingly abundant in sheltered bays. L. 12 inches. The smallest of our sting rays. Closely related to the Australian *U. cruciatus*. (Named for Mr. Haller, of Port Townsend, Washington, who, as a boy, was stung by this species at San Diego in 1862.)

Urolophus halleri, COOPER, Proc. Cal. Ac. Sci., 1863, III, 95, San Diego; JORDAN & GILBERT, Synopsis, 46, 1883.

115. UROLOPHUS NEBULOSUS, Garman.

Disk nearly round, formed much as in *U. halleri*. Skin not quite smooth, some asperities present about the middle of the back; no median series of spines on back or tail; mouth with 3 small papillæ. Color clouded olivaceous above, whitish below. Gulf of California to Panama; not rare, replacing *U. halleri* southward, and differing chiefly in the prickly back. (*nebulosus*, clouded.)

Urolophus nebulosus, GARMAN, Proc. U. S. Nat. Mus., 1885, 41, Colima. (Type, No. 7356.)

116. UROLOPHUS JAMAICENSIS, (Cuvier).

Disk ovate, longer than broad, rather longer than tail, its front rounded, the snout not projecting. Skin above everywhere sparsely covered with small prickles. Color brown, sprinkled with small yellow spots, edged with darker. West Indies, generally common; once (perhaps erroneously) recorded from New Jersey.

Leiobatus sloani, BLAINVILLE, Journ. Phys., 1816, 262, name only.
Raja jamaicensis, CUVIER, Règne Animal, II, 137, 1817, Jamaica, after Pastinaca Marina of Sloane.
Trygonobatus torpedinus, DESMAREST, Prém. Déc. Ichth., 6, 1823, Cuba.
Urolophus torpedinus, GÜNTHER, Cat., VIII, 485, 1870; GARMAN, Proc. U. S. Nat. Mus., 1885, 43.
Raja sloani, BANCROFT, Zoöl. Journal, V, 83, 1829, Jamaica.

117. UROLOPHUS MUNDUS, (Gill).

Disk orbicular, rounded in outline; the snout slightly projecting, as long as broad; tail a little longer than disk; caudal spine inserted a little behind middle of tail; as long as from nostrils to tip of snout; teeth pointed. Skin beset with numerous small stelliform tubercles, largest on the back. Color uniform dark brown. (Gill.) Panama; not seen by us. (*mundus*, clean.)

Urotrygon mundus, GILL, Proc. U. S. Nat. Mus., 1863, 173, Panama.

118. UROLOPHUS GOODEI, Jordan & Bollman.

Disk broader than long, by a distance equal to snout and ½ eye; front margins of disk slightly convex, the tip of snout exserted and sharply pointed, its length 3¾ in length of disk; eye equal to spiracle, 3¼ in snout; edge of spiracles entire; width of mouth 2 in snout before it; ventrals projecting beyond disk, their length 1¼ in their breadth. Caudal spine large, as long as snout and ½ eye, its edge with 8 to 10 retrorse spinules, its insertion before middle of tail (from axil of pectoral), its tip reaching front of caudal; tail longer than disk by a distance equal to eye and spiracle; skin smooth or somewhat prickly on upper surface of snout; 1 or 2 strong spines near middle of back. Color plain brown, nearly uniform, the margins bright yellow in life. About Panama, at a depth of 33 fathoms; also taken in Magdalena Bay; snout longer, 3 in disk (Gilbert.) (Named for George Brown Goode.)

Urolophus goodei, JORDAN & BOLLMAN, Proc. U. S. Nat. Mus., 1889, 151, near Panama. (Type, No. 41150.)

119. UROLOPHUS ASPIDURUS, Jordan & Gilbert.

Disk very slightly longer than broad, its length slightly less than tail, its anterior margins nearly straight, the tip of snout projecting abruptly as a narrow triangular prominence, rounded at end; snout from eye 3 in disk; eyes small, much less than spiracles. Mouth 2½ in its distance from snout. Caudal spine very large, a little more than twice interorbital width, its insertion in front of middle of tail. Skin entirely smooth, except for a series of a few (2 to 8) strong, broad-rooted spines or bucklers on upper part of tail before caudal spine; these are straight, sharp, directed backward, their height equal to width at base, which is greater than pupil. Color plain brown. L. 18 inches. Panama. (ἀσπίς, shield; οὐρά, tail.)

Urolophus aspidurus, Jordan & Gilbert, Bull. U. S. Fish Com., 1881, 307, Panama. (Type, Nos. 29410; 29307; 29454.)

120. UROLOPHUS ASTERIAS, Jordan & Gilbert.

Disk almost round, a little broader than long, about as long as tail; anterior margins of disk nearly straight, the tip acute, slightly exserted. Snout, from eye, 4 in disk. Eyes small, much smaller than spiracles, about ½ interorbital width. Mouth 2⅙ in distance to tip of snout. Teeth sharp in males, pavement-like in females. Caudal spine very long, longer than snout, inserted in front of middle of tail. Skin above everywhere covered with small stellate prickles, these larger and more numerous on median line; ventrals smooth; both sexes equally rough; median line of back with a series of 18 to 32 sharp, recurved, spinules, from shoulders to caudal spine, these becoming larger and sharper backward, but all much smaller than the prickles in *U. aspidurus*. Color plain light brown. Mazatlan to Panama, not rare. (ἀστήρ, a star, from the stellate spines.)

Urolophus asterias, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 579, Mazatlan; Panama. (Type, Nos. 28204; 29524; 29542; 29058; 29318.)

53. DASYATIS, Rafinesque.

(Sting Rays.)

Dasybatus, Klein, 1742, (pre-Linnæan).
Dasyatis, Rafinesque, Caratteri di Alcuni Nuovi Gen., 16, 1810, (*ujus*=*pastinaca*).
Uroxis, Rafinesque, Indice d'Ittiol. Sicil., 61, 1810, (*ujus*).
Trigonobatus, Blainville, Jour. Phys., 1816, 261, (*vulgaris*).
Trygon, (Adanson), Cuvier, Règne Animal, Ed. I, 136, 1817, (*pastinaca*).
Hemitrygon, Müller & Henle, Mag. Nat. Hist., 1837, 90, (*bennetti*).
Himantura, Müller & Henle, Wiegmann's Archiv., 1837, 400, (*uarnak*).
Pastinaca, Swainson, Classn. Anim., 319, 1839, (*olivacea*).
Anacanthus, Ehrenberg, in Swainson, *l. c.*, (*orbicularis*).
Pastinaca, De Kay, N. Y. Fauna: Fishes, 373, 1842, (*pastinaca*).
Dasibatis, Garman, in Jordan & Gilbert, Synopsis, 65, 1883, (*pastinaca*; corrected orthography).

Disk oval, flat, with rounded angles. Tail very long and slender, whiplike, without fin, but often with 1 or 2 vertical membranous folds; a strong serrated spine toward the base of the tail. Skin more or less spinous or prickly, rarely smooth. Teeth small, paved; a few papillæ usually present in the mouth behind the lower jaw. Species about 30. Sting rays of large size, abundant in warm seas. Many of the spinous species are nearly or quite smooth when young, becoming rough with age. Some of our species are yet imperfectly known and much of the synonymy is uncertain. (δασύς, shaggy or rough; βατίς, a skate; abbreviated from *Dasybatis*.)

Hemitrygon, (ἡμι-, half; τρυγών, Trygon, a dove, the same name also applied to the sting rays):
- *a.* Tail with a keel or wing-like expansion below only; adult with stout bucklers on back and tail; tail rough, more than twice length of disk. CENTRURA, 121.

Dasyatis:
- *aa.* Tail with a narrow keel or expansion both above and below.
  - *b.* Tail simply keeled above, with a wing-like expansion below.
    - *c.* Shoulder with 3 series of tubercles; tail less than twice length of disk. HASTATA, 122.
    - *cc.* Shoulder with less than 3 series of tubercles.
      - *d.* Tail round, more than twice disk; back with strong tubercles; snout sharp. GYMNURA, 123.
  - *bb.* Tail more or less compressed, with a wing-like expansion above, a larger one below.
    - *e.* Skin more or less prickly in adult, with a median series of tubercles on back.
      - *f.* Tail more than ½ longer than disk.
        - *g.* Disk subcircular, the snout prominent. SABINA, 124.
        - *gg.* Disk subquadrangular, the snout blunt. LONGA, 125.
      - *ff.* Tail not ½ longer than disk; disk subquadrangular, the snout blunt. DIPTERURA, 126.
    - *ee.* Skin nearly or quite smooth in adult; median line of back not prickly or with but 1 spine. SAY, 127.

Subgenus HEMITRYGON, Müller & Henle.

121. DASYATIS CENTRURA, (Mitchill).

(Common Sting Ray; Stingaree; Clam Cracker.)

Disk quadrangular, about ¼ wider than long. Anterior margins sinuous, concave opposite the eyes, convex toward the slightly protuberant snout and rounded outer angles: posterior margin straighter, very little convex; inner convex; hinder angles blunt. Ventrals truncate, with rounded angles. Tail more than twice as long as the disk, much compressed, rounded above, with keel or cutaneous expansion below, with 1 or more strong serrated spines at the termination of the anterior fifth of its length, rough on all sides with spines or tubercles. Till half grown, the young are smooth; as they approach maturity, broad stellate-based, conical-pointed, irregularly placed bucklers appear on the middle of the hinder part of the back and on top and sides of the tail; very large examples have the central portion of the back closely mailed with small flattened tubercles. Mouth arched forward, with 5 papillæ; teeth in quincunx, blunt, smooth. Color on back and tail olive brown; nearly white below. From *D. pastinaca*, the common sting ray of Europe, which this species resembles in shape, it is distinguished by the tubercles, by the length and compression of the tail, and absence of all trace of keel or expansion on its upper side. (Garman.) Coast of Maine to Cape Hatteras, abundant, reaching a length of 10 to 12 feet. (*κέντρον*, spine; *οὐρά*, tail.)

Raja centrura, Mitchill, Trans. Lit. Phil. Soc. N. Y., I, 479, 1815, New York.
Dasibatis centrura, Jordan & Gilbert, Synopsis, 67, 1883.

Subgenus DASYATIS.

122. DASYATIS HASTATA, (De Kay).

Disk quadrangular, about ¼ wider than long; anterior margins nearly straight, meeting in a blunt angle on the end of the snout, curved near the outer angle to meet the slightly convex posterior margins; inner borders convex; outer and hinder angles rounded. Ventrals almost entirely covered by the pectorals, their hinder margins convex. Tail more than 1½ times the length of the disk, low-keeled on the upper side, a long, broad, membranous expansion below, roughened with small asperities; 1 or more serrated spines. Body smooth in young; very old with scattered small asperities; a row of narrow compressed tubercles along the middle of the back and on the base of the tail; the points of these tubercles are depressed and directed backward. On each shoulder, parallel with the median row, there is a shorter row, the length of which varies according to age. Mouth with 3 papillæ. Jaws with more curvature than those of *centrura* and less than those of *sabina;* young without tubercles. Color bluish or olivaceous brown, pale below. West Indies to Brazil, north to Florida, the original description from a specimen taken in Rhode Island. (*hastatus,* armed with a spear.)

Trygon hastata, De Kay, N. Y. Fauna: Fishes, 373, pl. 65, fig. 214, ♀, 1842, Rhode Island.
Trygon hastata, Storer, Syn. Fish. N. Amer., 261, 1846.
Trygon hastata, Duméril, Elasmobranches, 592, 1870.
Dasibatis hastata, Jordan & Gilbert, Synopsis, 70, 1883.

123. DASYATIS GYMNURA, (Müller).

Disk quadrangular, a little wider than long. Snout produced, sharp-pointed; anterior and posterior margins nearly straight, the anterior curved near the outer angle to meet the posterior, and the latter curved near the hinder angle to meet the inner. Tail nearly 3 times the length of the disk, with a slight ridge above and a narrow cutaneous expansion below, roughened with small spines similar to those on the head; a row of elongated tubercles on the back and anterior portion of tail, and 1 or more smaller ones on each shoulder; the posterior tubercles of the median row much elongated, so as to resemble the spines. Mouth much undulated, with 3 papillæ; teeth small, unequal. Young without tubercles; as the animal grows older a few scattered asperities appear on the head; still later these increase in number and size to such an extent as to cover the head and back with a heavy coat of mail made up of closely set flattened scales; the tubercles of the back cease growing as the scales enlarge, and ultimately there is little distinction between them; usually the tubercle on the middle of the pectoral arch is larger; those on the tail continue to increase in size with age. Disk wider than long; tail 3 times length of disk. Color yellowish to olivaceous brown, darkening with age. (Garman.) Surinam to Brazil, recorded from Grenada by Günther, otherwise not known from the West Indies. (*γυμνός*, naked; *οὐρά*, tail.)

Raie tuberculée, Lacépède, II, 106, pl. 4, fig. 1, 1800, Cayenne.
Raia tuberculata, Shaw, Genl. Zool., v, 290, 1804, after Lacépède, not of Bonnaterre, 1788.

Trygon tuberculata, Günther, Cat., VIII, 480, 1870.
Dasibatis tuberculata, Jordan & Gilbert, Synopsis, 66, 1883.

124. DASYATIS SABINA, (Le Sueur).

Disk subcircular. Snout produced, blunt. Anterior margins of the pectorals concave near the snout, becoming convex toward the broadly rounded outer extremities; hinder and inner margins convex. Upper jaw with a deep indentation, receiving a corresponding prominence on the lower. Teeth at the sides of this indentation much larger; mouth with 5 papillæ. Tail less than twice as long as the disk, tapering to a fine point, rough with small prickles, similar to those scattered over the head and back, a cutaneous expansion above, and a broader, longer one below; these end nearly opposite each other, the lower extends forward under the spine. A median row of tubercles on the dorsum and 1 or a pair on each shoulder. Distinguished from *D. gymnura* by the shape of the snout, the rounded pectorals, the shorter tail, the larger teeth, the greater curvature of jaws, the smaller size, and the 2 cutaneous expansions. Proportional length of body and tail as 4½ to 8; in no case is the tail twice as long as the disk. Color ochraceous brown. Streams and estuaries of Florida, abundant on both coasts; several specimens were taken in Lake Monroe, at a distance from salt water. (Garman.)

Trygon sabina, LE SUEUR, Jour. Ac. Nat. Sci. Phila., IV, 109, 1824, Florida.
Dasibatis sabina, JORDAN & GILBERT, Synopsis, 68, 1883.

125. DASYATIS LONGA, Garman.

Disk quadrangular, about $\frac{1}{6}$ wider than long. Margins nearly straight, anterior meeting in a blunt angle on the end of the snout. Outer angles rounded, posterior blunt. Ventrals rounded. Tail variable in length, usually more than twice as long as the body, roughened with small asperities, depressed anteriorly, compressed behind the spine, keeled above the compressed portion, with a long, narrow, cutaneous expansion on the lower side. Mouth curved, with 5 papillæ; a row of small tubercles behind the head on the shoulder girdle. Larger specimens probably with tubercles on back and tail. Gulf of California to Panama. Perhaps not distinct from *D. dipterura*, from which it usually differs in the slightly longer tail, and perhaps in the presence of 5 papillæ instead of 3 in the mouth. (*longus*, long.)

Dasibatis longa, GARMAN, Bull. Mus. Comp. Zoöl., VI, 170, 1880, Acapulco; Panama; JORDAN & GILBERT, Synopsis, 66, 1883.

126. DASYATIS DIPTERURA, Jordan & Gilbert.

Disk rhomboid, slightly broader than long, its anterior margins nearly straight, meeting anteriorly in a very obtuse angle; posterior margins curved; lateral angles rounded; tail variable, usually ½ longer than the disk, with a conspicuous cutaneous fold below and a smaller but evident one above; jaws considerably arched; buccal papillæ 3; teeth $\frac{21}{23}$. Young perfectly smooth; adult with a row of low but rather stout tubercles on the median line of the scapular region and 2 others on the humeral region; tail with small prickles; caudal spine long, its length nearly 3 times the width of the mouth. Color bluish brown, nearly plain. L. 6 feet or more. Bay of San Diego, and southward; locally abundant. (*δίς*, two; *πτερόν*, wing; *οὐρά*, tail.)

Dasybatis dipterurus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 31, San Diego.
Dasibatis dipterura, JORDAN & GILBERT, Synopsis, 71, 1883.

127. DASYATIS SAY, (Le Sueur).

(SOUTHERN STING RAY.)

Disk quadrangular, 1/6 wider than long, anterior margins nearly straight, posterior and inner borders convex, outer and posterior angles rounded. Snout not protruding beyond the lines of the margins. Ventrals rounded. Tail strong, rather more than 1½ times the length of the disk, with a strong serrated spine, bearing a short, low, cutaneous expansion behind the spine on the upper side, and a longer, little wider one below, ending nearly opposite. Upper jaw undulated; lower prominent in the middle. Teeth small, smooth in young and females, sharp in adult males; 3 papillæ at the bottom of the mouth, and 1 at each side. Body and tail smooth. Color olive brown in adult, reddish or yellowish in young; lower surface whitish. Closely resembles the European species, *D. pastinaca*. In *D. say*, the anterior margins form a more blunt angle at the end of the snout, which is less prominent at the apex, the outer and posterior extremities of the pectorals are rounder, the posterior margins are more convex, the disk is broader toward the ventrals, and the tail is longer; in *D. pastinaca* the lateral and hinder angles of the pectorals and the lateral angle of the ventrals are marked by blunted corners; a single small rounded tubercle on the middle of the back. Carolina to Brazil, common in Florida, occasional northward to New York. (Garman.) (Named for Thomas Say.)

Raja say, LE SUEUR, Jour. Ac. Nat. Sci. Phila., I, 42, 1817, New Jersey.
Myliobatis sayi, DE KAY, N. Y. Fauna: Fishes, 376, 1842.
Trygon sayi, DUMÉRIL, Elasmobranches, 603, 1870.
Dasibatis sayi, JORDAN & GILBERT, Synopsis, 69, 1883.

54. PTEROPLATEA, Müller & Henle.

Pteroplatea, MÜLLER & HENLE, Plagiostomen, 168, 1838, (*altavela*).

Disk much broader than long, its anterior margins meeting in a very obtuse angle, its outer angles more or less acute, the form, therefore, transversely rhombic. Tail very short and slender, shorter than the disk, without fin, armed with a very small serrated spine, which is often wanting. Skin smooth or very nearly so. Size rather large. Warm seas. The species are closely related. (*πτερόν*, fin; *πλατύς*, broad; an ancient name of *P. altavela*.)

a. Spiracle without tentacle.
b. Front of disk with a row of close-set paler spots or half spots.
c. Disk scarcely twice as broad as long; upper surface finely marbled with grayish mottlings, besides specks; tail with 4 cross blotches. MACLURA, 128.
cc. Disk twice as broad as long; upper surface with thick-set dark points. CREBRIPUNCTATA, 129.
bb. Front of disk without distinct pale spots; dark markings above forming reticulations around pale spots; tail without dark cross blotches. MARMORATA, 130.

128. PTEROPLATEA MACLURA, (Le Sueur).

(BUTTERFLY RAY.)

Disk scarcely twice as broad as long, covered with perfectly smooth skin. Tail about ⅓ as long as the disk, with a very slight dermal fold above and below. Snout a little projecting, so that the anterior edge of each pectoral is somewhat concave. Color brownish olive, finely marbled with grayish, and finely speckled; anterior edge of disk with half spots of paler; tail with 4 dark blotches above, forming half rings. (Caudal spine wanting in all the specimens examined.) Long Island to Brazil; not uncommon on the Carolina coast. (Named for William Maclure, founder of the Academy of Natural Sciences at Philadelphia.)

Raia maclura, Le Sueur, Jour. Ac. Nat. Sci. Phila., 1817, 41, Rhode Island; Duméril, Elasmobranches, I, 614, 1870.
Pteroplatea maclura, Günther, Cat., VIII, 487, 1870; Jordan & Gilbert, Synopsis, 46, 1883.

129. PTEROPLATEA CREBRIPUNCTATA, Peters.

Breadth of disk twice the distance from tip of snout to vent. Snout with a blunt projection; anterior margin of pectorals undulate, convex anteriorly and posteriorly, medially weakly concave; outer angle sharply rounded; posterior margins weakly convex, the posterior angle rounded, covering outer half of base of ventrals; spiracle without tentacle; tail with a low fold on its upper edge. Brown above, with thick-set black points; a row of small close-set yellow spots on front of disk. Gulf of California and southward, along the west coast of Mexico; common. (*creber*, abundant; *punctatus*, spotted.)

Pteroplatea crebripunctata, Peters, Monatsber. Berl. Akad., 703, 1869, Mazatlan.

130. PTEROPLATEA MARMORATA, Cooper.

Disk about twice as broad as long, covered with perfectly smooth skin. Tail 3¾ in length of disk, with a rather small cutaneous fold above and below, the lower fold the longer, the upper about as deep. Interorbital space a little shorter than the snout. Snout slightly prominent, but forming a very obtuse angle. Olive brown, finely mottled everywhere with darker, the dark forming reticulations around pale roundish spots; tail without dark rings. Caudal spine very small, present in all specimens examined. Coast of California from Point Concepcion southward to Cerros Island; common. (*marmoratus*, marbled.)

Pteroplatea marmorata, Cooper, Proc. Cal. Ac. Sci., III, 112, 1863, San Diego; Jordan & Gilbert, Synopsis, 47, 1883.

Family XXVII. MYLIOBATIDÆ.

(The Eagle Rays.)

Disk broad; the pectoral fins not continued to the end of the snout, but ceasing on the sides of the head and reappearing in front of the snout as 1 or 2 fleshy protuberances (cephalic fins), which are supported by fin rays. Tail very long and slender, whip-like, with a single dorsal fin near its root, behind which is usually a strong retrorsely serrated spine. Nasal valves forming a rectangular flap, with the posterior margin free, attached by a frenum to the upper jaw. Skull less depressed than usual among rays, its surface raised so that the eyes and spiracles are lateral in position. Teeth hexangular, large, flat, tessellated, the middle ones usually broader than the others. Ovoviviparous. Skin smooth; no differentiated spines on the pectorals in the males, the sexes being similar. Ventrals not emarginate. Genera 3; species about 20. Large sting rays; inhabiting warm seas, feeding chiefly on mollusks which they crush with their large grinding teeth. (Group MYLIOBATINA, Günther, Cat., VIII, 488–495.)

AËTOBATINÆ:
a. Teeth in a single series, very broad; muzzle entire. AËTOBATUS, 55.
RHINOPTERINÆ:
aa. Teeth in several series, the middle series very broad.
  b. Muzzle entire. MYLIOBATIS, 56.
  bb. Muzzle emarginate; cephalic fins below the level of the disk. RHINOPTERA, 57.

55. AËTOBATUS, Blainville.

Aëtobatus, BLAINVILLE, Jour. de Phys., LXXXIII, 1816, 261, (*vulgaris*, *narinari*, etc.).
Aetobatis, BLAINVILLE, Faune Française, Livr. 26, 38, 1828, (*aquila*, *etc.*).
Aëtobatis, MÜLLER & HENLE, Plagiostomen, 179, 1838, (*narinari*, first restriction).
Stoasodon, CANTOR, Catalogue Malayan Fishes, 434, 1850, (*narinari*, substitute for *Aëtobatis;* restricted to *aquila*).
Goniobatis, AGASSIZ, Proc. Bost. Soc. Nat. Hist., 1859, 385, (*flagellum*).

General form of *Myliobatis*. Muzzle entire. Teeth flat, broad, forming a single series corresponding to the middle series in *Myliobatis*, there being no small lateral teeth. Upper dental lamina straight, lower curved, the latter projecting beyond the upper. Free border of the nasal valve deeply emarginate. Skin smooth. Tropical seas. (*ἀετός*, eagle; *βάτος*, ray).

a. Disk twice as broad as long; pale spots rather small. Atlantic Coast. NARINARI, 131.
aa. Disk more than twice as broad as long; pale spots large. Pacific Coast. LATICEPS, 132.

131. AËTOBATUS NARINARI, (Euphrasen).

(SPOTTED STING RAY.)

Disk twice as broad as long, its anterior borders a little convex, posterior concave, outer angles pointed. Cephalic fin about ⅓ broader than long. Teeth of the lower jaw straight or more or less angularly bent. Tail 3 to 4 times length of disk. Brown, with small round pale spots. (Duméril.) Tropical seas, north on the Atlantic coast to Virginia; not very common on our shores. (*narinari*, a Brazilian name.)

Raia narinari, EUPHRASEN, Vet. Ak. Nya Handl., XI, 217, 1790, Brazil, (after *narinari* of Marcgrave).
Raia flagellum, BLOCH & SCHNEIDER, Syst. Ichth., 361, 1801, Coromandel.
Aëtobatis narinari, GÜNTHER, Cat., VIII, 492, 1870; DUMÉRIL, Elasmobranches, 641, 1870.

Goniobatis macroptera, MCCLELLAND, Calcutta Jour. Nat. Hist., 1841, I, 60, Bengal.

132. AËTOBATUS LATICEPS, (Gill).

Disk rather more than twice as broad as long; fontanelle on top of head gradually expanding backward; tail 4 to 5 times length of disk. Bluish black with numerous rounded yellowish spots on head smaller than eye, much larger on body, assuming on the pectoral the form of ocelli. Gulf of California to Panama, abundant southward. (*latus*, broad; -*ceps*, head).

Aëtobatis laticeps, GILL, Ann. Lyc. Nat. Hist. N. Y. 1865, 137, locality unknown, received from San Francisco. It has never been properly compared with *A. narinari*, and may not be different.

56. MYLIOBATIS, Duméril.

(EAGLE RAYS.)

? *Cephaleutherus*, RAFINESQUE, Indice Ittiol. Sicil., 61, 1810, (*maculatus*, probably a deformed ray).
Myliobatis, DUMÉRIL in Cuvier, Règne Animal, Ed. 1, II, 137, 1817, (*aquila*).
Holorhinus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 331 (*vespertilio* = *californicus*).

Disk broad, the outer angles acute. Cephalic fins forming a soft convex appendage in front of snout. Jaws about equal. Median teeth very broad, much broader than long in the adult, proportionally narrower in the young. Several series of narrower teeth on each side of the median series; teeth changing considerably with age. Free edge of the nasal valve not deeply emarginate. Tail very long and slender, with a small dorsal fin, and one or more serrated spines. Skin smooth or nearly so. Size large. In all warm seas. (*μυλίας*, grinder; *βατίς*, ray.)

MYLIOBATIS:
  a. Ventral fins moderate.
    b. Teeth of main row 4 to 6 times as broad as long; skin smooth. FREMINVILLEI, 133.
HOLORHINUS, (ὅλος, solid; ῥίν, snout):
  aa. Ventral fins large; rhomboid, broader than long.
    c. Teeth of main row 3 to 4 times as broad as long. CALIFORNICUS, 134.

Subgenus MYLIOBATIS.

133. MYLIOBATIS FREMINVILLEI, Le Sueur.

Disk broader than long; the breadth equal to the length of the tail. Ventral fins much narrower than in *C. californicus*. Skin entirely smooth. A blunt, whitish prominence over each eye. Muzzle prominent. Teeth of the main row 4 to 6 times as broad as long; small teeth in 3 rows. Reddish brown; tail nearly black. Cape Cod to Brazil; not uncommon. (For Chrétien Paulin de Fréminville, a French naturalist.)

Myliobatis fréminvillei, LE SUEUR, Jour. Ac. Nat. Sci. Phila., IV, 111, 1824, Rhode Island.
Myliobatis bispinosus, STORER, Proc. Bost. Soc. Nat. Hist., I, 1841, 53, Massachusetts.
Myliobatis bispinosus, DUMÉRIL, Elasmobranches, 637, 1870.
Myliobatis acuta, AYRES, Proc. Bost. Soc. Nat. Hist., I, 65, 1841, Connecticut.
Myliobatis fréminvillei, JORDAN & GILBERT, Synopsis, 51, 1883.

Subgenus HOLORHINUS, Gill.

134. MYLIOBATIS CALIFORNICUS, Gill.

(CALIFORNIA STING RAY; BATFISH.)

Disk not quite twice as broad as long; the wings anteriorly convex, posteriorly somewhat concave. Cephalic fin very blunt, nearly 4 times as broad as long. Tail nearly twice as long as the disk. Ventral large, broader than long. Lateral teeth in 3 to 5 series on each side; median teeth only 3 to 4 times as broad as long, even in the adult. Skin wholly smooth. Color dusky brownish; the young somewhat variegated.

California from Cape Mendocino southward; very common along mud flats. Destructive to oysters.

Rhinoptera vespertilio, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 137, Tomales Bay; not *Myliobatis vespertilio*, BLEEKER, also a *Myliobatis*.

Holorhinus vespertilio, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 331.

Myliobatis californicus, GILL, Ann. Lyc. Nat. Hist. N. Y., 1865, 137, (after Girard).

Myliobatis californicus, JORDAN & GILBERT, Synopsis, 51. 1883.

57. RHINOPTERA, Kuhl.

Rhinoptera, (KUHL), CUVIER, Règne Animal, Ed. 2, 1828, (*marginata*).

Zygobatis, AGASSIZ, Poissons Fossiles, III, 79, 1836, (*jussieui*).

Mylorhina, GILL, Ann. Lyc. Nat. Hist. N. Y., 1865, 136, (*lalandi*).

Micromesus, GILL, *l. c.*, (*adspersus*).

Disk broader than long, with the anterior angles more or less acute. Snout more or less emarginate on the median line. Cephalic fin emarginate and placed on a plane below the level of the pectorals, the snout thus appearing 4-lobed. Free border of the nasal valve not emarginate. Teeth in 5 to 20 rows, the median teeth enlarged or not, but often smaller than in *Cephaleutherus*. Tail long, whip-like, with a small dorsal fin and a serrated spine. Tropical seas. The species vary considerably in their dentition. (*ῥίν*, snout; *πτερόν*, fin.)

RHINOPTERA:

- *a.* Teeth of middle of upper jaw much broader than those of sides, the lateral teeth gradually diminishing.
  - *b.* Teeth in 7 rows; the median teeth above about 4 times as broad as long; breadth of disk 1¼ times its length. BONASUS, 135.
  - *bb.* Teeth in 7 rows, the median teeth 3¾ times as broad as long; breadth of disk 1¾ times its length. STEINDACHNERI, 136.

MICROMESUS (*μικρός*, small; *μέσος*, middle):

- *aa.* Teeth of middle of upper jaw not much larger than the outer teeth; teeth in many series.
  - *c.* Teeth of lower jaw in about 15 series; the teeth unequal but all small, the broadest being those of the 6th to 8th series from the side which are twice as broad as long. ENSENADÆ, 137.

Subgenus RHINOPTERA.

135. RHINOPTERA BONASUS, (Mitchill).

(COW-NOSE RAY.)

Disk ½ broader than long; anterior borders almost straight, posterior undulated; muzzle deeply emarginate; teeth in 7 rows in each jaw, the median teeth above 4 times as broad as long, the others gradually diminishing outward. Tail very slender, a little longer than the disk. Skin smooth or nearly so. Color brownish. Cape Cod to Florida; not rare; feeds on mollusks.* (*bonasus*, buffalo.)

Raja bonasus, MITCHILL, Trans. Lit. and Phil. Soc. N. Y., 1815, 479, New York.

Raia quadriloba, LE SUEUR, Jour. Ac. Nat. Sci. Phila., I, 44, 1817, New Jersey.

Rhinoptera quadriloba, GÜNTHER, Cat., VIII, 494, 1870.

Rhinoptera quadriloba, DUMÉRIL, Elasmobranches, 648, 1870; JORDAN & GILBERT, Synopsis, 51, 1883.

---

* "He enters the bay and ranges very extensively on the flats where the soft clam lives. These shellfish he is supposed to devour, for a shoal of cow-noses root up the salt-water flats as completely as a drove of hogs would do."—*Mitchill.*

136. **RHINOPTERA STEINDACHNERI**, Evermann & Jenkins.

(GABILAN.)

Width of disk 1¾ times its length; anterior border nearly straight; tail very slender, 1⅛ to 1⅓ times length of disk; muzzle emarginate; cephalic fin a little broader than head; tail with 1 or 2 serrated spines, their length 2½ times eye. Skin everywhere smooth. Teeth in lower jaw in 7 series, 7 in the median series, 6 in each of the others. Median teeth hexagonal, their length 3⅔ in the breadth, which is nearly twice the breadth of a tooth in the second series; this is again nearly twice as wide as teeth in third series; upper teeth very similar to lower. Uniform dark brown above, paler below. Gulf of California. (Named for Dr. Franz Steindachner, director of the Museum at Vienna, one of the most accurate and conscientious workers in ichthyology.)

Rhinoptera steindachneri, EVERMANN & JENKINS, Proc. U. S. Nat. Mus., 1891, 130, pl. 1, fig. 1, Guaymas, Sonora, Mexico. (Type, No. 43235.)

Subgenus MICROMESUS, Gill.

137. **RHINOPTERA ENSENADÆ**, Rosa Smith.

Teeth of lower jaw in 14 or 15 series, all small, unequal in size, the broadest being those of the sixth series from the left side, which are twice as broad as long. Known only from a lower jaw picked up on the beach at Ensenada, on Todos Santos Bay, in Lower California. (Smith.)

Rhinoptera ensenadæ, ROSA SMITH (MRS. C. H. EIGENMANN), Proc. U. S. Nat. Mus., 1886, 220, Ensenada, Lower California. (Type, No. 37966.)

Family XXVIII. MANTIDÆ.

(THE SEA DEVILS.)

Rays of enormous size, with the disk broader than long and the pectoral fins not continued on the sides of the head, the anterior or cephalic portion being separate, developed as 2 long horn-like or ear-like appendages. Mouth wide, terminal or inferior. Teeth very small, flat or tubercular, in many series, those of the upper jaw sometimes wanting. Eyes lateral. Nostrils widely separated, their valves united, forming a flap as wide as the cleft of the mouth. Tail long and slender, whip-like, with a single dorsal fin at its base, and with or without a serrated spine. Ventral fins not emarginate. Skin more or less rough. Males without differentiated spines on the pectorals, the sexes similar. Ovoviviparous Genera 2; species about 7. Largest of all rays and among the largest of all fishes; found in the tropical seas. (MYLIOBATIDÆ, group CERATOPTERINA, Günther, Cat., VIII, 496–498.)

a. Teeth in both jaws; mouth inferior. AODON, 58

aa. Teeth in lower jaw only; mouth terminal. MANTA, 59

58. AODON, Lacépède.

Aodon, LACÉPÈDE, Hist. Nat. Poiss., I, 300, 1798, (*massassa*, French name only).
Aodon, RAFINESQUE, Indice, 46, 1810.
Mobula, RAFINESQUE, Indice d'Ittiol. Sicil., 61, 1810, (*auriculata* = *edentula*)
Apterurus, RAFINESQUE, *l. c.*, 62, (*fabroni* = *edentulus*).

Cephalopterus, (Duméril) Risso, Ichthyol. Nice, 14, 1810, (*giorna* = *edentula;* not of Geoffroy St. Hilaire, 1809, a genus of birds).
Dicerobatus, Blainville, Jour. de Phys., 1816, 262, (*mobular* = *edentula*).
Cephaloptera, (Duméril) Cuvier, Règne Animal, Ed. 1, ii, 138, 1817, (*giorna*).
Aodon, Lacépède, Hist. Nat. Poiss., Edition Pillot, ii, 55, 1830, (*massassa*).
Pterocephala, Swainson, Nat. Hist. Fishes, ii, 321, 1839, (*giorna*).

Head free from pectoral fin, truncated in front, with the cephalic fin on each side developed as a straight, horn-like appendage pointing forward. Nostrils widely separated. Mouth inferior, wide. Teeth in both jaws very small, flat, or tubercular, in many series. Tail very slender, with a dorsal fin between the ventrals; the serrated spine present or absent. Species about 5, in tropical seas, reaching an enormous size and therefore not well known. (ἀ—, without; ὀδούς, tooth; *Mobular* is a name said to be used for the European species, *Aodon edentulus* (Brünnich), in the Azores, "diable des Caraïbes.")

138. AODON HYPOSTOMUS, (Bancroft).

Skin smooth; mouth inferior; anterior margin of pectoral straight; the spiracles situated in a groove under anterior base of pectoral fin.

This species, described from Jamaica, is very imperfectly known, and may be the same as *Aodon olfersi* (Müller & Henle), afterward described from Brazil. (ὑπό, below; στόμα, mouth.)

Cephalopterus hypostomus, Bancroft, Proc. Comm. Zoöl. Soc., 1830, 134, Jamaica.

59. MANTA, Bancroft.

Manta, Bancroft, Zoöl. Jour., 1828–1829, iv, 444, (*manta* = *birostris*).
Ceratoptera, Müller & Henle, Plagiostomen, 186, 1838, (*vampyrus* = *birostris*).
Brachioptilon, Newman, Zoölogist, 1849, 74, (*hamiltoni* = *birostris*).
Diabolichthys, Holmes, Proc. Elliott Soc. Nat. Hist., 1856, 39, (*elliotti* = *birostris*).

Disk broader than long, its exterior angles acute, the posterior margins of the pectorals concave. Head truncate in front; the cephalic fins long, turned forward and inward. Mouth large, terminal. Teeth minute, present in lower jaw only. Tail whip-like, often (always?) without serrated spine. Skin rough, with small tubercles. Two species known. (*manta*, blanket, "a name used at the pearl fisheries between Panama and Guayaquil to designate an enormous fish much dreaded by the divers, whom it is said to devour after enveloping them in its vast wings." Duméril.)

139. MANTA BIROSTRIS, (Walbaum).

(Sea Devil; Devil Fish; Manta.)

Disk not quite twice as broad as long. Tail about as long as the disk. Teeth in about 100 longitudinal series, which are separated by distinct interspaces. Skin of body and tail everywhere covered with small stellate tubercles, rendering the surface very rough. Brownish, the margins of the disk darker. Tropical waters of America; north to New Jersey and San Diego; not rare on the Florida coast. Reaches a width of about 20 feet, one of the most enormous of aquatic vertebrates. (*bis*, two; *rostrum*, snout.)

Raia birostris, Walbaum, Artedi Piscium, 535, 1792, after *Diabolus marinus* Willughby, etc.
Raia manatia, Bloch & Schneider, Syst. Ichth., 364, 1801, Tropical America; after *Raie manatie*, Lacépède.
Raja diabolus marinus, Bloch & Schneider, *l. c.*, 368, 1801, India; after Willughby.

Cephaloptera johni, Müller & Henle, Plagiostomen, 186, 1838, West Indies.
Brachioptilon hamiltoni, Newman, Zoöl., 74, 1849, Gulf of California.
Diabolichthys elliotti, Holmes, Proc. Elliott Soc. Nat. Hist., 1856, 39, Charleston.
Manta birostris, Jordan & Gilbert, Synopsis, 52, 1883.

Subclass HOLOCEPHALI.

(The Chimæras.)

Skeleton cartilaginous. Gill cavity with 4 clefts within, but having one external opening only, which is covered by a fold of skin. No spiracles. Mouth inferior. Jaws with teeth, confluent into bony plates; upper jaw, palate, and hyomandibular coalescent with the skull; intestine with a spiral valve. Pectoral fins normally developed, placed low; ventral fins abdominal, with claspers in the male. Derivative radii sessile on the sides of the basal bones of the limbs. Skin scaleless, its muciferous system well developed. This group contains a single order, Chimæroidei. (Holocephala, Cat., Günther, viii, 348–352.) (*ὅλος*, solid; *κεφαλή*, head).

Order H. CHIMÆROIDEI.

(The Chimæroids.)

Characters of the order included above. The group includes one existing family, Chimæridæ. (*χίμαιρα*, chimæra; *εἶδος*, resemblance.)

Family XXIX. CHIMÆRIDÆ.

(The Chimæras.)

Body elongate, rather robust anteriorly, tapering posteriorly. Head compressed; mouth small, inferior, the upper lip deeply notched. Nostrils confluent with the mouth, separated by a narrow isthmus; jaws with the teeth confluent into 4 bony laminæ above and 2 below. No spiracles. Pectoral fins free, placed low; ventral fins abdominal, many-rayed, provided in the male with claspers; dorsal fin usually divided, anteriorly with a very strong spine, which is grooved behind; caudal fin low, fold-like. Skin naked, rarely somewhat prickly. Lateral line present, usually with numerous branches anteriorly. Three free gills and 2 half gills, 1 on each side; isthmus moderate; gill rakers small. Oviparous, the egg cases long, elliptical, with silky filaments. Genera 4, (the following and *Callorhynchus*); species about 7. Fishes of singular appearance, found only in the seas of the cold regions. Numerous extinct genera are also referred to this family. (CHIMÆRIDÆ, Günther, Cat., VIII, 349-352).

CHIMÆRINÆ:

a. Snout short, soft, not terminating in a cutaneous flap; tail not bent upward.
  b. Claspers in the male trifid; tail ending in a filament. CHIMÆRA, 60.
  bb. Claspers in the male bifid; tail not ending in a filament. HYDROLAGUS, 61.

HARRIOTTINÆ:

aa. Snout excessively long, with leaf-like lateral expansions; dorsal spine very large; claspers small, simple. HARRIOTTA, 62.

60. CHIMÆRA, Linnæus.

(ELEPHANT FISHES.)

Chimæra, LINNÆUS, Syst. Nat., Ed. x, 1758, 236, (*monstrosa*).

Head somewhat compressed, the snout bluntish, protruding, fleshy, not armed at tip with an appendage. Eyes very large, lateral. Teeth rather strong. Lips thickish, the lower with a frenum. Lateral line simple on the body, but forking anteriorly, forming several series of mucous tubes on the head. Male with a club-shaped cartilaginous hook on the head above the snout; this hook is curved forward and downward, and is armed at its tip with decurved spines; its tip fitting into a depression in front of the eyes; females without this appendage. Gill opening small. Pectorals moderate; ventrals rather large, with large bifid claspers in the male; male also with rough appendages at the base of the ventrals, protruding from a sheath of skin. First dorsal triangular, preceded by a strong spine, which is grooved behind and serrated on its edges; second dorsal and caudal fins low, often more or less notched. Tail extending in the line of the axis of the body, more or less produced in a filament at tip. Skin smooth. Fishes of singular appearance; mostly of the northern seas; not valued for food. (*Χίμαιρα*, chimæra, a fabulous monster, with the head of a lion, body of a goat, and tail of a serpent).

a. First dorsal almost continuous with second; body stout; pectorals reaching posterior end of ventrals. MONSTROSA, 140.
aa. First dorsal well separated from second; body slender; pectorals not nearly reaching ventrals. AFFINIS, 141.

140. CHIMÆRA MONSTROSA, Linnæus.

(CHIMÆRA.)

Tail ending in a very long rayless filament about as long as body and head. First dorsal fin close to second and subcontinuous with it, the upper margin even, not notched except just in front of the low caudal fin; pectoral reaching posterior extremity of ventrals. Each clasper of the male with 2 long slender branches, each rather longer than snout, the inner branch again divided into a simply cartilaginous styliform part, and another coated with spiny membrane. Brown, marbled with lighter; dorsal fins with a broad black margin. (Günther.) Deep waters off the coast of Europe; recorded by Poey at Matanzas, Cuba. (*monstrosus*, monstrous.) (EU.)

Chimæra monstrosa, LINNÆUS, Syst. Nat., Ed. x, 1758, 236, Atlantic.
Chimæra monstrosa, GÜNTHER, Cat., VIII, 349, 1870; POEY, Synopsis, 445, 1868.
Chimæra argentea, ASCANIUS ICONES, Rev. Nat., pl. XV, 1806.
Chimæra borealis, SHAW, Gen. Zoöl., V, 2, 365, pl. 157, 1804, after Linnæus.
Chimæra mediterranea, RISSO, Eur. Merid., III, 168, 1827, Nice.
Chimæra cristata, FABER, Fische Islands, 45, 1829, Iceland.
Callorhynchus centrina and *C. atlanticus*, GRONOW, Cat. Fishes, 15, 16, 1854, Atlantic.

141. CHIMÆRA AFFINIS, Capello.

Body more elongate than in *C. monstrosa;* base of first dorsal equal to interspace between them; second dorsal low, with a straight border: pectoral not nearly reaching ventrals; caudal very small, ending in a minute filament; cephalic appendages with 5 spines on the inner surface; claspers in male trifid, the division of the 3 portions at $\frac{2}{3}$ the length from the base, the cylindrical portion larger, different in form from the others. (Capello.) L. 3 feet. Deep waters of the Atlantic, off Portugal and off the American Coast from Cape Cod northward. (*affinis*, related to *Chimæra monstrosa.*) (EU.)

Chimæra affinis, CAPELLO, Jour. Soc. Math. Lisbon, IV, 1868, 314, pl. III, Coast of Portugal; GÜNTHER, Cat., VIII, 350, 1870.
Chimæra plumbea, GILL, Proc. Philos. Soc. Wash., Dec. 22, 1877, Gulf stream off Cape Cod.
Chimæra plumbea, JORDAN & GILBERT, Synopsis, 54, 1883.
Chimæra abbreviata, GILL, Proc. U. S. Nat. Mus., 1883, 254, Lat. 40° N., Long. 60° W. (Type, No. 33435.)

61. HYDROLAGUS, Gill.

Hydrolagus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 331, (*colliei*).

This genus is very close to *Chimæra*, differing chiefly in the form of its claspers, which are simply bifid, the 2 parts subequal. The tail is not produced in a filament. The single species lives in the North Pacific, in water of moderate depth. (*ὕδωρ*, water; *λαγώς*, hare, from the form of the lips and teeth.)

142. HYDROLAGUS COLLIEI, (Lay & Bennett).

(RATFISH; ELEPHANT FISH.)

Body anteriorly stoutish, tapering into a slender tail, which is not produced in a filament. Pectorals about as long as head, reaching about to base of ventrals. Dorsal spine $\frac{3}{4}$ the length of the head. Second dorsal low, highest in front, then very low, then higher, ending abruptly just before the beginning of the upper caudal fold; a small fold between first and second dorsal, free from both; lower caudal fold higher than upper, neither quite reaching the tip of the tail. No distinct anal fin. Color grayish, with numerous round white spots; both dorsals edged with blackish. L. 2 feet. Pacific coast from Monterey northward to Alaska; very abundant in cold waters at a moderate depth; rarely used as food. (A personal name).

Chimæra colliei, LAY & BENNETT, Beechey's Voy., Zoöl., 71, 1849, North Pacific; GÜNTHER, Cat., VIII, 350, 1870; JORDAN & GILBERT, Synopsis, 55, 1883.

62. HARRIOTTA, Goode & Bean.

Harriotta, GOODE & BEAN, Oceanic Ichthyology, 32, 1894, (*raleighana*).

Snout exceedingly elongate, with a cartilaginous midrib, and foliaceous lateral expansions of the skin at its base. Two dorsal fins, the anterior with an immense triangular spine, finely serrated upon its lateral edges. Anal fin reduced to a cutaneous fold. Longitudinal axis of the tail nearly the same as that of the trunk, very elongate, with filamentous tip, the fin below much more extensive than that above. No cephalic organ. Gill openings lateral, separated by a wide isthmus. Claspers small and simple. ("Named in honor of Thomas Harriott, the most eminent philosopher and naturalist of his day in England, who was a member of Raleigh's Roanoke colony in Virginia in 1585, and who published the first work in English on American natural history.")

143. HARRIOTTA RALEIGHANA, Goode & Bean.

Tail extended in a very long filament, much longer in the older individuals than in the young; not present in very young. First dorsal fin separated from the second by an interval nearly equal to the diameter of the eye in the older individuals, very much greater in the younger ones, in which the cartilaginous portion is exceedingly narrow and high; Second dorsal fin long and low, its height about equal to diameter of the eye, its length equal to that of head. Dorsal spine very strong; its length in the older individuals equal to the distance from its own base to the origin of the second dorsal; in the young it is proportionately much longer and stouter; a double row of strong spines in advance of the second dorsal, and in the notch between the second dorsal and its continuation upon the upper part of the tail; a similar group of at least 6 strong spines upon the top of the head back of the interorbital space, and surrounded by the curve of the forward extension of the lateral line. Traces of these spines may be felt beneath the skin in older individuals of both sexes. Claspers in the young male examined, small and simple, in length scarcely equal to $\frac{2}{3}$ the long diameter of the eye. Pectoral fins immense, wing-like, rounded in the young, subfalcate in the older individuals; inserted slightly in advance of the origin of the first dorsal, and extending in the older forms beyond the root of the ventral. Ventrals also subfalcate; similar in form and appearance to the pectoral, and extending to a point at $\frac{2}{3}$ the distance from the origin to the end of the second dorsal; in length little less than $\frac{1}{2}$ the snout. In the young the ventrals are placed somewhat farther back and reach to a point under the origin of the third section of the dorsal fin. Tail prolonged in a slender filament, and in the older individuals the cutaneous flap upon its lower edge is 3 or 4 times as deep as that above, and extends beyond it anteriorly and posteriorly. In the younger specimens the upper and lower flaps are about equal in height, and the upper flap extends far in advance of the insertion of the lower one. Lateral line extending in a straight line from a point beneath the origin of the first dorsal approximately to the middle of the lower caudal lobe, which it follows along its base for the remainder of its course; in advance of the dorsal fin it bends downward in an elliptical course, and then rises vertically from the occiput to join its counterpart from the other side; bridle-like extensions of the same system extend on the sides of the head under the eyes, curving upward in front of the eye, then downward and joining on the underside of the snout to a branch running from beneath the eye downward to the base of the pectoral in the young, or under the throat to a junction in the older ones, and also forward from the same point under the eyes to join on either side the circle which surrounds the mouth. An elaborate system of mucous pores upon all sides of the snout; on the under surface of the snout in 4 longitudinal series. In the older individuals there is an extension of the lateral line system on either side of the midrib on the snout to its tip, and there are also symmetrical continuations of the same upon the under surface of the snout. Color brown; caudal filament pale. Eye 5½ in snout in the older specimens, and the distance between the eyes is equal to their diameter. Four specimens known, the largest, a female (No. 39415, U. S. N. M.), 25 inches in length, from 39° 44′ 30″ N. lat., 70° 30′ 45″ W. long., in 1,081 fathoms, taken by the steamer *Albatross*. Another, a male (No. 38200, U. S. N. M.), 19½ inches in length, was taken by the *Albatross* in 36° 45′ N. lat., 74° 28′ 30″ W. long., at a depth of 781 fathoms. A third, a young individual (No. 35520, U. S. N. M.), 4 inches in length, was obtained by the *Albatross* in 39° 37′ 45″ N. lat., 71° 18′ 45″ W. long., in 991 fathoms. Still another (No. 35631), was taken at station 2235, lat. 39° 12′, long. 72° 03′ 30″, 707 fathoms. (Goode & Bean.) (Named in honor of Sir Walter Raleigh, by whom the first English scientific explorer was sent to the New World.)

Harriotta raleighana, GOODE & BEAN, Oceanic Ichthyology, 33, 1894, 39° N., 70° W.

With this extraordinary creature we close the Selachian series and take up the group of Ganoids, from which stock the true fishes of the present day, as well as all the higher vertebrates, seem to be descended. The old Ganoids were doubtless largely amphibious. The group has apparently early differentiated into the lung-bearing series, from which the two orders of the *Dipnoi* and the *Batrachia* are descended, and the aquatic series, in which the lung becomes degraded to a swim bladder, the last being the ancestors of the true fishes.

Subclass TELEOSTOMI.

(THE TRUE FISHES.)

Skeleton usually bony, sometimes cartilaginous. Skull with sutures; membrane bones (opercle, preopercle, etc.) present; gill openings a single slit on each side; gills with their outer edges free, their bases attached to bony arches, normally 4 pairs of these, the fifth pair being typically modified into tooth-bearing lower pharyngeals; median and paired fins developed, the latter with distinct rays. Ova small; no claspers. Heart developed, divided into an auricle, ventricle, and arterial bulb. Lungs imperfectly developed or degraded to form a swim bladder, or entirely absent.

We here include under one head the GANOIDS and the TELEOSTS. The former group is chiefly composed of extinct forms. While many of its representatives are extremely dissimilar to the bony fishes, there is a gradual series of transitions, and between the CYCLOGANOIDEA of the GANOIDS and the CLUPEOIDS and others of the true TELEOSTS, the resemblance is much greater than that between the CYCLOGANOIDEA and many other GANOIDS. The GANOIDS are, in fact, the most generalized of the true fishes, those nearest the stock from which the TELEOSTS on the one hand, and the DIPNOI and BATRACHIA on the other, have sprung. The real value or rank of some of the current orders or suborders is still doubtful. (*τέλειος*, perfect; *στόμα*, mouth.)

Omitting orders not represented in our waters, we have the following analysis of—

ORDERS OF TRUE FISHES.

a. Arterial bulb muscular with numerous valves; optic nerves forming a solid chiasma; ventrals abdominal; air bladder with a well developed duct; tail strongly heterocercal throughout life; some fins usually with fulcra. (Series *Ganoidei.*)

CHONDROGANOIDEA:

b. Skeleton cartilaginous; ventrals with an entire series of basilar segments.

c. Maxillary and interopercle obsolete; skin naked; air bladder cellular. SELACHOSTOMI, I.

cc. Maxillary and interopercle present; skin with bony shields; air bladder simple. CHONDROSTEI, J.

HOLOSTEI OR HYOGANOIDEA:

bb. Skeleton bony; ventrals with basilar segments rudimentary; air bladder cellular.

d. Vertebræ opisthocœlian (concavo-convex); maxillary transversely divided into several pieces; scales rhombic, enameled plates. RHOMBOGANOIDEA, K.

dd. Vertebræ amphicœlian (double concave); maxillary not transversely divided; scales cycloid. CYCLOGANOIDEA, L.

aa. Arterial bulb thin, with a pair of opposite valves; optic nerves crossing, not forming a solid chiasma. (Series *Teleostei.*)

e. Anterior vertebræ (about 4), much modified, coössified and provided with ossicula auditus, or weberian apparatus; shoulder girdle suspended from the skull by a bony post-temporal; mesocoracoid arch well developed. Air bladder (if present) connected by a slender air duct with the intestinal canal, this persistent throughout life; ventral fins (if present) abdominal, without spines, their basilar segments rudimental. (OSTARIOPHYSI.)

f. Maxillary bone imperfect, forming the base of a conspicuous barbel; no subopercle nor symplectic bone; no scales; supraoccipital and parietals coössified. NEMATOGNATHI, M.

ff. Maxillary bone perfect (rarely wanting) and never entering into the base of a barbel; subopercle and symplectic present; scales usually present. PLECTOSPONDYLI, N.

ee. Anterior vertebræ unmodified, similar to the others, or more elongate; separate and without ossicula auditus. (Descendants of Holostean Ganoids.)

g. Body eel-shaped, provided with very many (100 to 250) vertebræ; scales minute or wanting; no ventral fins; gill openings restricted.

h. Gill arches 4 pairs; the hindmost being modified as pharyngeal bones; palatopterygoid arch present.

i. Premaxillary, maxillary, and palatine bones well developed and distinct from each other as in ordinary fishes; no paired fins; gill openings confluent; shoulder girdle joined to the cranium in our species (but not in all). SYMBRANCHIA, O.

ii. Premaxillaries and maxillaries present, united by suture and immovably connected to the cranium; otherwise as in *Apodes*. Carencheli, P.

iii. Premaxillary atrophied or lost; maxillaries lateral, more or less confluent with the palatines; shoulder girdle not attached to the skull. Apodes, Q.

hh. Gill arches 5 or 6 pairs; the posterior not modified into pharyngeals, and all of them, as well as the shoulder girdle, disconnected from the cranium; no palatopterygoid arch; no opercular elements. Lyomeri, R.

gg. Body not truly eel-shaped; the vertebræ usually in moderate or rather large number (14 to 150); ventral fins usually present; gill openings typically ample; premaxillary always present, and maxillary usually so; shoulder girdle near the cranium, usually but not always attached to it.

j. Hypercoracoid and hypocoracoid coalesced in a single lamellar imperforate plate; scapular arch formed of proscapula and posttemporal, the latter impinging on supraoccipital only; dorsal fin with many spines. Heteromi, V.

jj. Hypercoracoid and hypocoracoid imperfectly differentiated, represented by a cartilaginous strip or plate, not perforate, and without separate actinosts; ventrals abdominal; no fin spines. Xenomi, W.

jjj. Hypercoracoid and hypocoracoid well developed, not coalescent.

k. Interclavicles present; air bladder without duct; ventrals abdominal or subabdominal, if present; no mesocoracoid.

l. Gills pectinate; gill openings large; dorsal and ventral usually with spines. Hemibranchii, Z.

ll. Gills tufted; gill openings very small; opercle a simple plate; skin with bony plates. Lophobranchii, AA.

kk. Interclavicles wanting, so far as known.

m. Preopercle entirely detached from the suspensorium, rudimentary and attached only to lower jaw, its normal position taken by the subopercle; no spines; no mesocoracoid. Lyopomi, U.

mm. Preopercle normally connected.

n. Mesocoracoid well developed; fins without spines; air bladder with a persistent duct; pectoral fins inserted low; ventrals abdominal. Isospondyli, S.

nn. Mesocoracoid always wanting.

o. Ventral fins abdominal, without spines; no true spines in dorsal or anal fins.

p. Air bladder with a persistent duct; lower pharyngeals separate.

q. Shoulder girdle not connected with the skull in the usual way, the post-temporal barely touching the cranium. (Mostly deep-sea fishes, with weak skeletons.) Iniomi, T.

qq. Shoulder girdle connected with the skull by a bifid post-temporal. (Mostly fresh-water fishes, the skeleton well ossified.) Haplomi, X.

pp. Air bladder without duct in adult; lower pharyngeals fully united. Synentognathi, Y.

oo. Ventral fins usually anterior in position; spines usually present in the fins; pectoral fins not on the plane of the abdomen; parietal bones usually separated by the supraoccipital. (Spiny-rayed fishes chiefly.)

r. Pectoral fins not pediculate, the gill openings in front of them. Acanthopteri, BB.

rr. Pectoral fins pediculate, the basal bones reduced in number and elongate; gills in the axil of the pectorals. Pediculati, CC.

Series GANOIDEI.

(THE GANOID FISHES.)

The name GANOIDEI was first used by Agassiz, for those fishes which are armed with bony plates, instead of regular cycloid or ctenoid scales. Later, Johannes Müller restricted the group to those fishes thought to show more or less distinct reptilian or batrachian affinities, and especially, affinities with the mailed fishes of the Devonian and Carboniferous ages. The group is a heterogeneous one, and one practically scarcely susceptible of definition. In some of the GANOIDS, the air bladder still retains its original function, a lung. The existence of the solid optic chiasma, the presence of several valves in the arterial bulb, and of a more or less developed spiral valve in the rectum, distinguish the living GANOIDS from all TELEOSTS, but none of these characters can be verified in the extinct forms. We begin the series with forms having the skeleton still cartilaginous as in the sharks, but even less developed. (*γάνος*, splendor, from the enameled scales.)

CHONDROGANOIDEA.

(THE CARTILAGINOUS GANOIDS.)

Skeleton chiefly cartilaginous, the vertebral column entirely so, the vertebral segments little developed, arranged along the notochord. Anterior vertebræ simple, imperfectly formed. Ventral fins abdominal, with an entire series of basilar segments. No suboperculum or preoperculum. Branchiostegal single or wanting; a mesocoracoid arch; no symplectic bone. Mesopterygium distinct; interclavicles present.* Arterial bulb with several pairs of valves. Optic nerves forming a chiasma. Intestine with a spiral valve. Air bladder connected by a duct with the œsophagus. Tail heterocercal, its fin with fulcra. Skin naked or armed with bony plates, never with true scales. This group comprises two orders. Its place seems to be intermediate between the Sharks and the Catfishes, though without close relation to either. (CHONDROSTEI, Günther, Cat., VIII, 332-347.) (*χόνδρος*, cartilage; *Ganoidea.*)

ANALYSIS OF ORDERS OF CHONDROGANOIDEA.

a. Maxillary and interopercle obsolete; skin naked; branchihyals cartilaginous; air bladder cellular. SELACHOSTOMI, I.

aa. Maxillary and interopercle present; skin with bony shields; branchihyals osseous; air bladder simple. CHONDROSTEI, J.

Order I. SELACHOSTOMI.

(THE PADDLE-FISHES.)

Notochord persistent, the division into vertebræ imperfect. Mesocoracoid developed; no symplectic bone; premaxillary forming border of mouth; no suboperculum, preoperculum, nor interoperculum; mesopterygium distinct; basihyals and superior ceratohyal not ossified; interclavicles present; maxillaries obsolete; branchihyals cartilaginous. This order contains but one family, POLYODONTIDÆ. (*σελάχη*, shark; *στόμα*, mouth.)

---

* The osteological characters here and in some other parts of this work are partly taken from Cope's "Contribution to the Ichthyology of the Lesser Antilles," Trans. Am. Phil. Soc., 1870.

Family XXX. POLYODONTIDÆ.

(THE PADDLE-FISHES.)

Body fusiform, little compressed, covered with mostly smooth skin. Snout prolonged, expanded into a thin flat blade, the inner portion formed by the produced nasal bones, the outer portion with a reticulate bony framework, the whole somewhat flexible. Mouth broad, terminal, but overhung by the spatulate snout, its border formed by the premaxillaries, the maxillaries being obsolete; jaws with many fine deciduous teeth; similar teeth on palatines; no tongue. Spiracles present. Operculum rudimentary, its skin produced behind into a long acute flap; no pseudobranchiæ, or opercular gill; gills 4½; gill rakers long, in a double series on each arch, the series divided by a broad membrane; gill membranes considerably connected, free from the isthmus; a single broad branchiostegal. No barbels. Nostrils double at base of blade. Lateral line continuous, its lower margin with short branches. Dorsal fin well back, of soft rays only; anal similar, rather farther back; tail heterocercal, the lower caudal lobe well developed, so that the fin is nearly equally forked; sides of the bent portion of the tail armed with small rhombic plates; caudal fin with fulcra. Pectorals moderate, placed low; ventrals abdominal, many-rayed. Air bladder cellular, not bifid; pyloric cœca in the form of a short, broad, branching, leaf-like organ; intestine with a spiral valve. Two species known—*Polyodon spathula* and *Psephurus gladius;* singular fishes, inhabiting the fresh waters of the United States and China. They feed chiefly on mud and minute organisms contained in it, stirring it up with the spatulate snout. (POLYODONTIDÆ, Günther, Cat., VIII, 346–347.)

a. Gill rakers very fine and numerous; caudal fulcra small and numerous. POLYODON, 63.

63. POLYODON, Lacépède.

(PADDLE-FISHES.)

Polyodon, LACÉPÈDE, Hist. Nat. Poiss., I, 402, 1798, (*feuille*); French name only.
Polyodon, BLOCH & SCHNEIDER, Syst. Ichth., 457, 1801, (*folium*).
Spatularia, SHAW, Gen. Zoöl., V, 362, 1804, (*reticulata*).
Platirostra, LE SUEUR, Jour. Ac. Nat. Sci. Phila., I, 1817, 227, (*edentula*).
Planirostra, RAFINESQUE, Ich. Oh., 83, 1820, (*edentula*).
Proceros, RAFINESQUE, Ich. Oh., 87, 1820, (*maculatus*).

Gill rakers exceedingly numerous, very slender; spatula broad. Caudal fulcra 13 to 20 in number, of moderate size. Characters otherwise those of the family. Rivers of the middle United States. (*πολύς*, many; *ὀδούς*, tooth.)

144. POLYODON SPATHULA, (Walbaum).

(PADDLE-FISH; SPOON-BILL CAT; DUCK-BILL CAT; SPADE-FISH.)

Opercular flap very long, nearly reaching to ventrals; premaxillary extending far behind the small eye. Skin smooth, or nearly so, except the rhombic plates on the sides of the tail. Ventrals near the middle of the body; dorsal well behind them; anal mostly behind the dorsal, and somewhat larger; these fins somewhat falcate. Fin rays slender. Spiracle with a minute barbel. Isthmus papillose in the young. Spatula broad, 2½ to 4 times in length, proportionately longer in young. Head, with opercular flap, more than ½ length; head, without spatula flap, about 5. Color pale olivaceous. D. 50 to 60; A. 50 to 65; V. 45. L. 5 to 6 feet. Mississippi Valley and rivers of the southern States; generally abundant in the larger streams; also known from Lake Erie. A singular fish of rather sluggish habits, the flesh coarse, resembling that of the larger catfishes, but inferior in quality. (*spathula*, spatula.)

Squalus spathula, WALBAUM, Artedi Pisc., 522, 1792, after *Spathula* of Rozier, Jour. Phys., 1774, 384, pl. 2.

"*Polyodon feuille*," LACÉPÈDE, Hist. Nat. Poiss., I, 402, 1798, locality unknown.

Polyodon folium, BLOCH & SCHNEIDER, Syst. Ichth., 457, 1801, after Lacépède.

Spatularia reticulata, SHAW, Gen. Zoöl., V, 362, 1804, after Lacépède.

Platirostra edentula (adult), LE SUEUR, Jour. Ac. Nat. Sci. Phila., I, 1817, 227, Ohio River.

Polyodon folium, GÜNTHER, Cat., VIII, 346, 1870.

Polyodon spathula, JORDAN & GILBERT, Synopsis, 83, 1883.

Acipenser lagenarius, RAFINESQUE, Ich. Oh., 86, 1820, Ohio River.

Procerus maculatus, St. Genevieve, Missouri, and *Proceros vittatus*, Lake Ontario, RAFINESQUE, Ich. Oh., 86, 87, 1820.

Planirostra spatula, OWEN, Osteol. Cat., I, 83, 1853.

Order J. CHONDROSTEI.

(THE STURGEONS.)

Notochord persistent, the cartilaginous vertebræ imperfectly developed. A mesocoracoid. No symplectic bone. Maxillary present. No suboperculum or preoperculum. Interoperculum present. Mesopterygium distinct. Interclavicles present. Basihyals and superior ceratohyal not ossified. Branchihyals osseous. This group is composed of the single family ACIPENSERIDÆ. (*χόνδρος*, cartilage; *ὀστέον*, bone.)

Family XXXI. ACIPENSERIDÆ.

(THE STURGEONS.)

Body elongate, subcylindrical, armed with 5 rows of bony bucklers, each with a median carina which terminates in a spine, which sometimes becomes obsolete with age; a median dorsal series, and a lateral and abdominal series on each side, the abdominal series sometimes deciduous; between these the skin is rough with small irregular plates. Head covered with bony plates joined by sutures; snout produced, depressed, conical, or subspatulate. Mouth small, inferior, protractile, with thickened lips. No teeth. Four barbels in a transverse series on the lower side of the snout in front of the mouth. Eyes small; nostrils large, double, in front of eye. Gills 4; an accessory opercular gill; gill membranes united to the isthmus; no branchiostegals. Maxillary distinct from the premaxillary. Head covered with bony plates united by sutures. Fin rays slender, all articulated; vertical fins with fulcra. Pectorals placed low; ventrals many-rayed, behind middle of body; dorsal placed posteriorly;

anal somewhat behind it, similar; tail heterocereal, the lower caudal lobe developed; the upper lobe of the tail covered with rhomboid scales. Air bladder large, simple, connected with the œsophagus. Pseudobranchiæ small or obsolete. Stomach without blind sac; rectum with a spiral valve; pancreas divided into pyloric appendages.

Large fishes of the seas and fresh waters of northern regions, feeding on small animals and plants sucked in through the tube-like mouth. Most of the species are migratory, like the salmon, which are found in the same waters. Genera 2; species about 20; although more than 5 times that number have been described. The American species especially have been unduly multiplied, particularly by Auguste Duméril, who has found upwards of 40 of them in the museum at Paris. But 6 American species are known to us, and we doubt if any more exist. The changes with age are considerable; the snout, in particular, becomes much shorter and less acute, and the roughness of the scales is greatly diminished; the ventral shields sometimes disappear altogether. The number of plates, although one of the best specific characters, is subject to considerable variation. (ACIPENSERIDÆ, Günther, Cat., VIII, 332-345.)

a. Spiracles present; snout subconic; rows of bony shields distinct throughout; the tail not depressed nor mailed; gill rakers lanceolate. ACIPENSER, 64.

aa. Spiracles obsolete; snout subspatulate; rows of bony shields confluent behind the dorsal so that the depressed tail is completely mailed; gill rakers small, fan-shaped, ending in 3 or 4 points. SCAPHIRHYNCHUS, 65.

64. ACIPENSER, Linnæus.

(STURGEONS.)

Acipenser, (ARTEDI), LINNÆUS, Syst. Nat., Ed. x, 1758, 237, (*sturio*).
Sturio, RAFINESQUE, Indice Itt. Sicil., 41, 1810, (*sturio*).
Sterletus, RAFINESQUE, Ich. Oh., 79, 1820, (*serotinus*).
Dinectus, RAFINESQUE, *l. c.*, 82, (*truncatus*).
Huso, BRANDT & RATZEBURG, Medizin. Zoöl., II, 3, 1833, (*huso*).
Sterletus, BRANDT & RATZEBURG, *l. c.*, 3, (*ruthenus*).
Helops, BRANDT & RATZEBURG, *l. c.*, 3, (*stellatus*).
Lioniscus, FITZINGER & HECKEL, Ann. Wien. Mus., 370, 1836, (*glaber*).
Antaceus, BRANDT, Bull. Ac. Sci. Petersb., v, 138, 1865, (*schypa*).

Snout subconical, more or less depressed below the level of the forehead. A small spiracle over the eye. Caudal peduncle moderately long, deeper than broad, the rows of bony bucklers distinct to the base of the caudal fin. Tail not produced into a filament, its tip surrounded by the caudal rays. Gill rakers small, narrowed or lanceolate. Pseudobranchiæ present. Species numerous in all northern rivers and seas. (*acipenser*, sturgeon.)

a. Plates between ventrals and anal small, in 2 rows of 4 to 8; space between dorsal and lateral shields with stellate plates of moderate size, in about 5 rows, interspersed with smaller ones. Dorsal shields about 12; lateral about 45; ventral about 2. D. 47; A. 29. Color plain grayish. TRANSMONTANUS, 145.

aa. Plates between ventrals and anal large, in 1 row, or in 2 rows anteriorly and 1 posteriorly, of 1 to 4 plates each.

b. Space between dorsal and lateral shields with stellate plates of rather large size, in 5 to 10 series; last dorsal shield of moderate size, more than ½ length of one before it.

c. Shields all roughly striated and ridged; anal nearly as long as dorsal and almost entirely behind it. D. 33; A. 22. Dorsal shields about 9; lateral about 26; ventral about 8. Color decidedly greenish. MEDIROSTRIS, 146.

cc. Shields not roughly striated; anal a little more than ½ length of dorsal and almost entirely below it. D. 38; A. 27. Dorsal shields about 10; lateral 29; ventral 9. Color grayish. STURIO, 147.

bb. Space between dorsal and lateral shields with minute spinules in very many series.

d. Last dorsal shield of moderate size, more than ½ the one before it. Anal 1½ in dorsal and beginning below its middle. Dorsal shields about 15; lateral 38; ventral 10. D. 35; A. 37. RUBICUNDUS, 148.

dd. Last dorsal shield very small, less than ½ length of the one before it; dorsal shields 11; lateral 32; ventral 9. D. 41; A. 22. Anal entirely below dorsal and ½ as long. BREVIROSTRUM, 149.

145. ACIPENSER TRANSMONTANUS, Richardson.

(White Sturgeon; Oregon Sturgeon; Sacramento Sturgeon.)

Color dark grayish, scarcely olive tinged, and without stripes. Dorsal shields mesocentrous, with a compressed bluntish spine, which is anteriorly often serrated, and followed behind by a compressed keel. Skin with stellate roughnesses, but smoother than in *A. medirostris.* Space between lateral shields with stellate plates of moderate size, in about 5 series interspersed with smaller ones; last dorsal shield ½ length of one before it. Snout sharp in the young, becoming rather blunt and short in the adult, when it is considerably shorter than the rest of the head. Barbels rather nearer to the tip of snout than to the mouth. Gill rakers comparatively long, more than 3 times as high as broad, about 26 in number. Upper lobe of tail with rhombic plates. First caudal fulcrum, above and below, enlarged and granular. Lower lobe of caudal rather sharp and long, not much shorter than upper. Dorsal plates 11 or 12; lateral 36 to 50, usually about 44; ventral 10 to 12. Anal fin below dorsal, its base about ½ as long. D. 45 (44 to 48); A. 28 to 30. Depth 7 in length; head 4. Pacific coast from Alaska south to Monterey, ascending the Sacramento, Columbia, and Fraser rivers in large numbers in spring. It reaches a weight of 300 to 600 pounds, and is largely used as food, but is rather coarse. (*transmontanus*, beyond mountains.)

Acipenser transmontanus, Richardson, Fauna Bor. Amer., III, 278, 1836; Fort Vancouver.

Acipenser brachyrhynchus, and *acutirostris* (young), Ayres, Proc. Cal. Ac. Sci., 1854, 15, 16, San Francisco.

Acipenser transmontanus and *brachyrhynchus*, Günther, Cat., VIII, 336, 337, 1870.

Acipenser transmontanus, Jordan & Gilbert, Synopsis, 86, 1883.

? *Acipenser aleutensis*, Fitzinger & Heckel, Ann. Wien. Mus., 1836, Aleutian Islands, after Pallas.

Acipenser caryi, *ayresi*, and *putnami*, Duméril, Nouv. Arch. Mus., III, 169, 171, 178, 1867, San Francisco.

Acipenser transmontanus, Kirsch & Fordice,* Proc. Ac. Nat. Sci. Phila., 1889, 254.

146. ACIPENSER MEDIROSTRIS, Ayres.

(Green Sturgeon.)

Color olive-green, with an olive stripe on the median line of the belly and one on each side above the ventral plates, these stripes ceasing opposite the vent. Shields generally opisthocentrous with a strongly hooked spine; the surface very rough. Space between lateral and dorsal rows of shields with about 5 series of stellate plates interspersed with smaller ones; last dorsal shield moderate; more than ½ the one before it. Snout about as in *A. transmontanus*, sharp in the young, becoming blunt with age, usually rather shorter than the rest of head. Barbels nearly midway between tip of snout and mouth. Gill rakers scarcely higher than broad, about 17 in number. Upper lobe of tail with some scattered plates. Caudal fulcra not enlarged. Lower lobe of caudal short and blunt, little more than ½ the length of the upper. Dorsal plates 10 (9 to 11); lateral 26 to 30; ventral 9 (7 to 10). Anal nearly as long as dorsal and mostly behind it. D. 33 to 35; A. 22 to 28. Depth 7½ in length; head 4¼. Pacific coast, ascending the rivers from San Francisco northward, reaching a large size; less abundant than *A. transmontanus*, and smaller in size; not used for food, being reputed poisonous. (*medium*, moderate; *rostrum*, snout.)

---

* This paper contains descriptions and synonymy of all the American Sturgeons.

Acipenser medirostris, Ayres, Proc. Cal. Ac. Sci., I, 15, 1854, San Francisco; Günther, Cat., VIII, 342, 1870; Jordan & Gilbert, Synopsis, 86, 1883.

Acipenser medirostris, Kirsch & Fordice, *l. c.*, 249, 1889.

147. ACIPENSER STURIO, Linnæus.

(Common Sturgeon.)

Shields not strongly striated; stellate plates small, in about 10 rows, with smaller ones interspersed; last dorsal shield moderate, more than ½ length of one before it. Snout rather sharp, nearly as long as the rest of the head, becoming comparatively shorter and blunter with age. Barbels nearly midway between mouth and tip of snout, shortish, not reaching the mouth. Gill rakers small, slender, pointed, sparse, not longer than the pupil. Fulcra roughish, not enlarged. Lower lobe of tail rather sharp. Anal more than ½ dorsal, placed mostly below it. Anterior rays of pectoral thickened. D. 38; A. 27. Dorsal plates 10 to 14; lateral 29 (27 to 36); ventral plates 9 (8 to 11). Olive gray, paler below. Atlantic coasts; ascending rivers of northern Europe and the United States.

The American Sturgeon (var. *oxyrhynchus*, Mitchill) has the number of lateral plates generally fewer (27 to 29 instead of 29 to 36, as in European examples). The stellate ossifications are also said to be somewhat rougher than in the European form. New England to Carolina; abundant. (*sturio*, sturgeon.) (Eu.)

Acipenser sturio, Linnæus, Syst. Nat., X, 1758, 237; Günther, Cat., VIII, 342, 1870.

Acipenser lichtensteini, latirostris, hospitus, thompsoni, attilus, and *yarrelli* of European authors; *A. mitchilli*, New York; *kennicotti*, James River; *girardi*, Maryland; *macrorhinus*, New York; *megalaspis*, Lake Champlain, *milberti*, New York, *bairdi*, Maryland; *storeri*, Boston; *holbrooki*, Charleston; and *lecontei*, New York; Duméril, Nouv. Arch. Mus., III, 1867.

148. ACIPENSER RUBICUNDUS, Le Sueur.

(Lake Sturgeon; Ohio Sturgeon; Stone Sturgeon; Rock Sturgeon; Red Sturgeon.)

Dark olive above, sides paler or reddish, often with irregular blackish spots. Body comparatively elongate; snout slender and long in the young, becoming quite blunt with age, when it is considerably shorter than the rest of the head; shields large, rough, with strongly hooked spines, becoming later comparatively smooth, the old examples almost smooth. Skin with minute rough spinules in many series; ventral shields growing smaller with age, and finally deciduous; last dorsal shield of moderate size, about ½ length of next the last. Anal ⅔ length of dorsal, beginning near its middle. Dorsal shields 15 (11 to 16); lateral shields 38 (30 to 39); ventral plates 10 (8 to 11). D. 35; A. 26. L. 6 feet. Weight 50 to 100 pounds. Mississippi Valley, Great Lakes, and northward; the common fresh-water sturgeon of the lakes and streams of the middle west, usually not descending to the sea. The small rough "Rock Sturgeon," *A. maculosus*, Le Sueur, we regard as the young of this species. (*rubicundus*, reddish.)

Acipenser rubicundus, Le Sueur, Trans. Amer. Phil. Soc., I, 1818, 388, Lakes Ontario, Erie, and all the upper Lakes.

Acipenser maculosus, Le Sueur, *l. c.*, I, 393, 1818, (young), Ohio River.

Acipenser rupertianus, Richabdson, Fauna Bor. Amer., III, 11, 1836, Albany River, Rupert Land.

Acipenser serotinus, *ohiensis*, and *macrostomus*, Rafinesque, Ich. Oh., 80, 1820, Ohio River.

Dinectus truncatus, Rafinesque, Ich. Oh., 80, 81, 1820, (erroneous, on a drawing by Audubon).

Acipenser copei, ? upper Missouri; *rauchi*, Osage River; *richardsoni*, Missouri River; *anasimos*, Missouri River; *paranasimos*, Huntsville, Ala.; *anthracinus*, Lake Erie; *lamarii*, Mississippi River; *atelaspis*, Saskatchewan River; *rafinesquei*, Ohio River; *rosarium*, upper Mississippi, or Lake Erie; *platyrhinus*, upper Mississippi or Lake Erie; *kirtlandi*, Lake Erie; *nertinianus*, Michigan; *honneymani*, no locality; *cincinnati*, Ohio River; and *buffalo*, Lake Erie; Duméril, Hist. Poiss., II, 108–231, 1870.

149. ACIPENSER BREVIROSTRUM, Le Sueur.

(Shortnosed Sturgeon.)

Dusky above, paler below. Snout very short and obtuse, about ¼ of the length of the head. Barbels short, simple. Skin between rows of shields with many rows of small prickle-like plates; last dorsal shield very small, less than ½ the one before it. Shields rather large and smoothish. Anal about half dorsal and entirely below it. Dorsal shield 11 (8 to 11); lateral 32 (22 to 33); ventral 9 (6 to 9); D. 41; A. 22. Cape Cod to Florida, rare northward, extending further southward than other species; our specimen from Charleston. (*brevis*, short; *rostrum*, snout.)

Acipenser brevirostrum, Le Sueur, Trans. Amer. Phil. Soc., I, 390, 1818; Günther, Cat., VIII, 841; Jordan & Gilbert, Synopsis, 87, 1883.

Acipenser obtusirostris, Lovetzky, Nouv. Mem. Soc. Nat., III, 257 (after Le Sueur).

Acipenser microrhynchus, New York; *lesueuri*, New York; *dekayi*, New York; and *rostellum*, probably New York; Duméril, Hist. Poiss., II, 164–173, 1870.

65. SCAPHIRHYNCHUS,* Heckel.

(SHOVELNOSE STURGEONS.)

Scaphirhynchus, HECKEL, Ann. Wiener Mus. Naturgesch., I, 1835, 71, (*rafinesquei* = *platorynchus*), (not *Scaphorhynchus*, Maximilian, a genus of birds).

Scaphyrhynchops, GILL, Trans. Amer. Phil. Soc., V, 12, 178, 1863, (*platorynchus*).

Snout broad, depressed, subspatulate or shovel-shaped. No spiracles. Caudal peduncle very long, strongly depressed, broader than deep. Rows of bony bucklers confluent below the dorsal fin, forming a complete coat of mail on the tail; tail produced in a filament beyond the caudal fin, this longest in the young. Gill rakers somewhat fan-shaped. Pseudobranchiæ obsolete. Species about 4, one of them inhabiting the fresh waters of the United States, the others in Central Asia (Tartary, etc.). (*σκάφη*, spade; *ῥύγχος*, snout.)

150. SCAPHIRHYNCHUS PLATORYNCHUS, (Rafinesque).

(SHOVELNOSE STURGEON; WHITE STURGEON.)

Body elongate, tapering into a slender, depressed tail, which extends beyond the caudal fin in the form of a filament; this filament is long and slender in the young, but is usually lost in the adult. Bony shields opisthocentrous (or with the bony spine behind the middle), sharply keeled, the series confluent below the dorsal, obliterating the smaller plates between; 2 occipital plates, with short keels; a spine in front of eye, and one at the posterior edge of the rostral "shovel": snout in the young with a few spines. Barbels nearer mouth than tip of snout. Greatest width of head about $\frac{1}{2}$ its length. None of the fulcra enlarged. Dorsal and anal small; anal a little more than $\frac{1}{2}$ length of dorsal and entirely behind it. Gill rakers small, lamellate, somewhat fan-shaped, ending in 3 or 4 points. Dorsal shields 18 (15 to 20); lateral 46 (41 to 46); ventral 13 (11 to 13). D. 32; A. 20. Head 4 in length. Color pale olive. L. 5 feet. Mississippi Valley and streams of the western and southern States; common. (*πλατύς*, broad; *ῥύγχος*, snout.)

Acipenser platorynchus, RAFINESQUE, Ichth. Oh., 80, 1820, Ohio River.

Acipenser cataphractus, GRAY, Proc. Zoöl. Soc. London, 1834, 122.

Scaphirhynchus rafinesquei, HECKEL, Ann. Wiener Mus. Naturgesch., I, 1835, 71.

Scaphirhynchus cataphractus, GÜNTHER, Cat., VIII, 345, 1870.

Scaphirrhynchops platyrrhynchus, JORDAN & GILBERT, Synopsis, 88, 1883.

Scaphirhynchus platyrhynchus, KIRSCH & FORDICE, Proc. Ac. Nat. Sci. Phila., 1889, 246.

HOLOSTEI.

(THE BONY GANOIDS.)

Skeleton bony. Ventral fins abdominal, with the basilar segments rudimentary, as in ordinary fishes. Primary radii of posterior limb generally reduced to one rudiment. Suboperculum and preoperculum present. Branchiostegals present. Coronoid bone and mesocoracoid present. Arterial bulb with several pairs of valves. Optic nerves forming a chiasma. Intestine with a spiral valve. Air bladder cellular, lung-like, connected by a sort of glottis with the œsophagus. Tail heterocercal. Skin covered with scales, which are ganoid or cycloid. As here understood, this group consists of the two orders RHOMBOGANOIDEA and CYCLOGANOIDEA, the CROSSOPTERYGII* being considered as forming a distinct subclass. (GANOIDEI HOLOSTEI, part, Günther, Cat., VIII, 324–325, 328-331.) (*ὅλος*, complete; *ὀστέον*, bone; also called HYOGANOIDEA.)

---

* By the rules of the American Ornithologists' Union, the generic name *Scaphirhynchops* should be preferred. We regard all generic names not spelled alike as distinct.

Order K. RHOMBOGANOIDEA.

(THE GAR PIKES.)

Parietals in contact; pterotic, basis cranii, and anterior vertebræ simple; symplectics present. Mandible with coronoid, angular, articular, and dentary bones; third superior pharyngeal small, lying on fourth; upper basihyal wanting; maxillary transversely divided. A cartilaginous mesocoracoid. Vertebræ opisthocœlian, that is, connected by ball-and-socket joints, the concavity in each vertebra being behind. Pectoral fins with mesopterygium and 5 other basal elements. Tail heterocercal. Air bladder lung-like, single, connecting with the dorsal side of the œsophagus. This order consists of a single family, LEPISOSTEIDÆ, (*ῥόμβος*, rhomb; GANOIDEA; also called GINGLYMODI, *γίγγλυμος*, hinge; *εἶδος*, like, in allusion to the hinge joints of the vertebræ.)

Family XXXII. LEPISOSTEIDÆ.

(THE GAR PIKES.)

Body elongate, subcylindrical, covered with hard, rhombic ganoid scales or plates, which are imbricated in oblique series running downward and backward. Both jaws more or less elongate, spatulate or beak-like, the upper jaw projecting beyond the lower. Premaxillary forming most of the margin of the upper jaw; the maxillary transversely divided into several pieces. Lower jaw composed of as many pieces as in reptiles; coronoid present. Both jaws with an outer series of small teeth, followed by 1 (or 2) series of large teeth, besides which on the jaws, vomer, and palatines are series of small, close-set, rasp-like teeth. Large teeth of the jaws conical in form, pointed and striate, placed at right angles to the jaw; these large teeth rest, according to Agassiz, in a rather deep furrow, protected on the outside by the raised border of the jaw, and on the inside by a ridge of the same nature; these teeth are pierced in the center by a foramen, which communicates with the maxillary canal, and through which the nerves and blood vessels enter the pulp cavity of the tooth; the forms of the folded layers of dentine within the teeth are peculiar. Pharyngeals with rasp-like teeth. Tongue toothless, short, broad, emarginate, free at tip. External bones of skull very hard and rugose. Eyes small. Nostrils near the end of the upper jaw. An accessory gill on the inner side of the opercle. Pseudobranchiæ present. No spiracles. Gills 4, a slit behind the fourth. Branchiostegals 3. Gill membranes somewhat connected, free from the isthmus. Gill rakers very short. Air bladder cellular, lung-like, somewhat functional. Fins with fulcra; dorsal fin short, rather high, posterior, nearly opposite the anal, which is similar in form; tail heterocercal, in the young produced as a filament beyond the caudal fin; caudal convex; ventrals nearly midway between pectorals and anal; pectorals and ventrals moderate, few-rayed. Stomach not cœcal; pyloric appendages numerous. Spiral valve of intestines rudimentary. Fishes of the fresh waters of North America and China, of sluggish habits, but voracious and destructive to smaller fishes. The flesh is tough and rank, valueless as food. One genus with about 5 species, although more than 40 have been described. These fishes are of much interest to geologists from their relationship to extinct ganoid genera, many of which are usually placed in this family. (LEPIDOSTEIDÆ, Günther, Cat., VIII, 328–331.)

---

* *Polypteridæ*; all the species belonging to the Old World.

66. LEPISOSTEUS, Lacépède. GAR PIKES.

Lepisosteus, LACÉPÈDE, Hist. Nat. Poiss., v, 331, 1803, (*gavialis* = *osseus*).
Cylindrosteus, RAFINESQUE, Ich. Ohiensis, 72, 1820, (*platostomus*).
Atractosteus, RAFINESQUE, *l. c.*, 72, (*ferox*).
Sarchirus, RAFINESQUE, *l. c.*, 86, (*argenteus*).
Lepidosteus, AGASSIZ, (corrected spelling).

Upper jaw with an outer series of small, sharp, even teeth, then a series of large teeth, some of the anterior teeth being usually movable; next comes a series of fine teeth, in one row in front, becoming a band behind. In some species, the inner row of these teeth contains larger ones; next the vomerine teeth, also in a long band, and posteriorly a palatine band. These bands on the roof of the mouth are frequently somewhat confluent or irregular. In young specimens some of the palatine teeth are often enlarged, these sometimes forming regular series. Lower jaw with an outer series of small teeth, next a series of large teeth, next again a broad band of fine teeth on each side. Each of the large teeth fitting into a depression in the opposite jaw. Rivers of North America. A single species (*L. sinensis*, Bleeker) found in China. (*λεπίς*, scale; *ὀστέον*, bone.)

a. Large teeth of upper jaw in a single row on each side.
  LEPISOSTEUS:
    b. Beak long and slender; the snout more than twice the length of the rest of the head. OSSEUS, 151.
  CYLINDROSTEUS, (*κύλινδρος*, cylinder; *ὀστέον*, bone):
    bb. Beak shorter and broader, little longer than rest of head. PLATOSTOMUS, 152.
ATRACTOSTEUS,* (*ἀτρακτός*, spindle; *ὀστέον*, bone):
aa. Large teeth in upper jaw in 2 rows on each side; beak short and broad, not longer than rest of head.
    c. Scales in lateral line about 60. TRISTŒCHUS, 153.
    cc. Scales larger, those in lateral line 52. TROPICUS, 154.

Subgenus LEPISOSTEUS.

151. LEPISOSTEUS OSSEUS, (Linnæus).

(LONG-NOSED GAR; BILLFISH; COMMON GAR PIKE.)

Snout a little more than twice the length of the rest of the head, its length 15 to 20 times its least width. Olivaceous, pale, and somewhat

---

*The name *Litholepis*, Rafinesque, applied by him to a gigantic gar, *Litholepis adamantinus*, the "Devil-jack Diamond fish," is based on a drawing by Audubon, not intended by Audubon to represent any possible fish.

silvery below; vertical fins and posterior part of the body with round black spots, which are more distinct in the young; very young with a blackish lateral band. Head 3 in length; depth 12. D. 8; A. 9; V. 6; P. 10. Lat. line about 62. L. about 5 feet. Great Lakes and rivers of the United States from Vermont to the Rio Grande; generally abundant and quite variable, the local variations having given rise to many specific names.* Southern specimens are often more distinctly spotted. A detailed comparison of many specimens, from different parts of the country, will probably show the existence of recognizable subspecies, but this comparison is yet to be made. (*osseus*, bony.)

Esox osseus, Linnæus, Syst. Nat., Ed. x, 1758, 313, after Artedi, based on *Acus maxima squamosa viridis*, the Green Gar Fish of Catesby, 1738, pl. 30, Virginia.

Esox viridis, Gmelin, Syst. Nat., 1389, 1788, also after Catesby.

Lepisosteus gavailis, Lacépède, Hist. Poiss., v, 333, 1803, "lakes and rivers of both Indies."

Lepisosteus oxyurus, Rafinesque, Ichth. Oh., 73, 1820, Ohio River.

Lepisosteus longirostris, Rafinesque, *l. c.*, 74, 1820, Ohio River.

Lepisosteus huronensis, Richardson, Fauna Bor. Amer., iii, 237, 1836; Penetanguishene, Lake Huron; Günther, Cat., viii, 330, 1870.

Lepidosteus gracilis, Agassiz, Poissons Fossiles, ii, 2, 1836.

Lepidosteus osseus Günther, Cat., viii, 330, 1870.

Lepisosteus semiradiatus, Agassiz, *l. c.*, ii, 2, plate 2, 1836.

Lepidosteus osseus, Jordan & Gilbert, Synopsis, 91, 1883.

Sarchirus vittatus, and *Sarchirus argenteus*, Rafinesque, Ichth. Oh., 86, 1820, (young), Ohio River.

Lepisosteus bison, De Kay, New York Fauna: Fishes, 271, 1842, Buffalo, New York.

Lepisosteus lineatus, Thompson, Hist. Vermont, 145, 1842, Lake Champlain.

Macrognathus loricatus, Gronow, Cat. Fish., 148, 1854, after Linnæus.

Lepidosteus leptorhynchus, Girard, Pac. R. R. Expl., 351, 1858, Devil River, Texas.

Lepidosteus crassus, Cope, Proc. Ac. Nat. Sci. Phila., 1865, 86, Bombay Hook, Delaware River.

Lepidosteus otarius, Cope, *l. c.*, 86, "Platte River near Fort Riley;" but Fort Riley was on the the Kansas River.

Subgenus CYLINDROSTEUS, Rafinesque.

152. LEPISOSTEUS PLATOSTOMUS, Rafinesque.

(Short-nosed Gar.)

Snout usually about $\frac{1}{3}$ longer than the rest of the head, sometimes about equal to it, its length 5 to 6 times its least width. Colors of *L. osseus* or rather darker. Head 3½ in length; depth 8. D. 8; A. 8; V. 6. Lat. line about 56. L. 2 to 3 feet. Great Lakes and southern and western rivers, with the preceding, but less abundant northward. Still more variable than the preceding; possibly more than 1 species confounded; not always readily distinguishable from the young of the next. (πλατύς, broad; στόμα, mouth.)

Lepisosteus platostomus, Rafinesque, Ichth. Oh., 72, 1820, Ohio River.

Lepisosteus albus, Rafinesque, *l. c.*, 73, Ohio River.

Lepisosteus platystomus, Günther, Cat., viii, 329, 1870; Jordan & Gilbert, Synopsis, 91, 1883.

---

*M. Auguste Duméril (Hist. Nat. Poiss., Vol. ii, 1870) divides this species, as represented in the Museum at Paris, into 17, which are distinguished by trifling differences in proportions and numbers of scales. His new names are *L. treculi*, Mississippi, 327; *L. milberti*, New York, 328; *L. harlani*, Wabash River, 329; *L. smithi*, upper Mississippi, 330; *L. ayresi*, Wabash River, 331; *L. copei*, northern North America, 332; *L. lesueuri*, Wabash River, 335; *L. elisabeth*, no locality, 336; *L. lamari*, northern North America, 337; *L. clintonii*, no locality, 338; *L. troosti*, United States, 339; *L. piquotianus*, Lake Erie, 340; *L. horatii*, northern North America, 341; *L. thompsoni*, upper Mississippi, 342; *L. louisianensis*, New Orleans, 344.

Lepidosteus grayi, Agassiz, Poissons Fossiles, II, 2, 1836, Louisiana.
Lepisosteus platyrhincus, De Kay, N. Y. Fauna: Fishes, 273, 1842, Florida.
Lepidosteus latirostris, Girard, Pac. R. R. Expl., 352, 1858, Rio Pecos, Texas.
Lepidosteus oculatus, Winchell, Proc. Ac. Nat. Sci. Phila., 1864, 183, Huron River, Mich.
Cylindrosteus productus, Cope, Proc. Ac. Nat. Sci. Phila., 1865, 86, San Antonio, Texas.
Cylindrosteus agassizii, Duméril, Hist. Nat. Poiss., II, 351, 1870, St. Louis.
Cylindrosteus zadocki, Duméril, *l. c.*, 353, upper Mississippi.
Cylindrosteus rafinesquei, Duméril, *l. c.*, 354, United States.
Cylindrosteus castelnaui, Duméril, *l. c.*, 355, Lake Lafayette, Florida.
Cylindrosteus bartoni, Duméril, *l. c.*, 356, New Orleans.

Subgenus ATRACTOSTEUS, Rafinesque.

153. LEPISOSTEUS TRISTŒCHUS, (Bloch & Schneider).

(Alligator Gar; Great Gar; Manjuari.)

Snout usually not quite so long as the rest of the head, its least width contained 3½ times in its length. Head 3½ in length. D. 8; A. 8; V. 6. Lat. line 60. Scales in an oblique series from the ventrals to middle of back 18 to 20. Color greenish, paler below, the adult usually not spotted. L. 8 to 10 feet. Rivers of the southern States, Cuba, and northern Mexico, north to St. Louis and Cincinnati. A huge, muscular, voracious fish, useless as food, remarkable for its armature of enameled scales. (*τρεῖς*, three; *στοῖχος*, row.)

Esox tristœchus, Bloch & Schneider, Syst. Ichth., 395, 1801, Cuba, after Manjuari of Para.
Lepisosteus spatula, Lacépède, Hist. Poiss., v, 333, 1803, no locality.
Lepisosteus (*Atractosteus*) *ferox*, Rafinesque, Ichth. Oh., 73, 1820, Ohio River.
Lepidosteus manjuari, Poey, Memorias, I, 273, 1860, Cuba.
Lepidosteus (*Atractosteus*) *berlandieri*, Girard, Pac. R. R. Expl., 353, 1858, Tamaulipas.
Lepidosteus viridis, Günther, Cat., VIII, 329, 1870, not *Esox viridis*, Gmelin, which is *L. osseus*.
Litholepis tristœchus, Jordan & Gilbert; Synopsis, 92, 1883.
Atractosteus lucius, Duméril, *l. c.*, 364, 1870, Tampico, Mexico.

154. LEPISOSTEUS TROPICUS, (Gill).

Head 4 in extreme length; depth 8½; scales 8–52 to 54–12. Otherwise as in *L. tristœchus*, from which it may not be distinguishable. (Gill.) Streams of the Pacific Coast of Central America. (*tropicus*, tropical.)

Atractosteus tropicus, Gill, Proc. Ac. Nat. Sci. Phila., 1863, 172, streams near Panama.
Atractosteus tropicus, Duméril, *l. c.*, 367, 1870.

Order L. CYCLOGANOIDEA.

(The Bowfins.)

Parietals in contact. Pterotic, basis cranii, and anterior vertebræ simple. Mandible with opercular and coronoid. Maxillary not transversely segmented, bordering the mouth. Third superior pharyngeal lying on enlarged fourth. Upper basihyal wanting. Vertebræ amphicœlian, the anterior not modified. Pectoral fins with mesopterygium and 8 other elements. Air bladder cellular and lung-like. This order includes only the family Amiidæ. (*κύκλος*, circle; *Ganoidea;* also called Halecomorphi, *halecomorphus*, formed like a shad; *halec*, in allusion to the resemblance between this group of Ganoids and the Isospondyli. It is probable that the ancestors of the Isospondyli are to be found among forms allied to the existing Halecomorphi.)

Family XXXIII. AMIIDÆ.

(The Bowfins.)

Body oblong, compressed behind, terete anteriorly. Head subconical, anteriorly bluntish, slightly depressed, its superficial bones corrugated and very hard, scarcely covered by skin. Snout short, rounded; lateral margins of upper jaw formed by the maxillaries, which are divided by a longitudinal suture. Jaws nearly even in front; cleft of the mouth nearly horizontal, extending beyond the small eye; lower jaw broad, U-shaped, the rami well separated; between them a broad bony plate, with radiating striæ, its posterior edge free; jaws each with an outer series of conical teeth, behind which in the lower is a band of rasp-like teeth; bands of small teeth on the vomer and pterygoids; palatines with a series of larger, pointed teeth; premaxillaries not protractile; tongue thick, scarcely free at tip. Nostrils well separated, the anterior with a short barbel; suborbital very narrow; a bony plate covering the cheek, similar to the plates on the top of the head; operculum with a broad dermal border. Branchiostegals 10 to 12. No pseudobranchiæ nor opercular gill; no spiracle; gills 4, a slit behind the fourth; gill membranes not connected, free from the isthmus. Two peculiar, long, lanceolate, obliquely striate appendages on each side of the isthmus, projecting backward and covered by the branchiostegal rays, the anterior wholly adnate to the isthmus, the posterior free behind.* Isthmus scaleless. Gill rakers stoutish, very short. Scales of moderate size, rather firm, cycloid, with a membranous border. Lateral line present. Dorsal fin long and low, nearly uniform; the posterior rays not much higher than the others; its insertion in front of the middle line of the body, opposite the end of the pectoral. Tail somewhat heterocercal (more so in the young), convex behind. No fulcra. Anal fin short and low. Pectoral and ventral fins short and rounded, the ventrals nearer anal than pectorals. Vertebræ amphicœlian or double concave, as usual among fishes, none of them specially modified. Abdominal and caudal parts of the vertebral column subequal. Air bladder cellular, bifid in front, lung-like, connected by a glottis with the pharynx, and capable of assisting in respiration. Stomach with a blind sac; no pyloric cœca. No closed oviduct. Intestine with a rudimentary spiral valve. Fresh waters of the United States. A single species known among living fishes. Several fossil genera are usually referred to this family. (Amiidæ, Günther, Cat., viii, 324–325.)

67. AMIA, Linnæus.

(Bowfins.)

Amia,† Linnæus, Syst. Nat., Ed. xii, 1766, 500; (*calva*), not of Gronow, 1763, which is a non binomial name for *Apogon*.

---

* See Wilder "On the Serrated Appendages of the Throat of Amia," Proc. Amer. Assoc. Adv Sci., 1876, 259, for a discussion of these curious organs.

†If the nonbinomial generic names of Gronow are to be recognized, the name *Amia* must be transferred to *Apogon* and the present genus must be called *Amiatus*. The date of Gronow's work lies between that of the tenth edition (1758), of Linnæus, Systema Naturæ, and that of the twelfth (1766). The character of Gronow's work is essentially pre-Linnæan, and it contains no reference to the Linnæan system. It seems to us that the genera of nonbinomial writers should not be given precedence over those of the binomial system.

Amiatus, Rafinesque, Analyse de la Nature, 88, 1815, (*calva*); substitute for *Amia*, regarded as too short for symmetry.

Characters of the genus included above. (*ἀμία*, ancient name of some fish, probably the bonito, *Sarda sarda.*)

155. AMIA CALVA, Linnæus.

(Mudfish; Dogfish; Bowfin; Grindle; "John A. Grindle;" Lawyer; Poisson de Marais.)

Dark olive or blackish above, paler below; sides with traces of dark reticulate markings; lower jaw and gular plate often with round blackish spots; fins mostly dark, somewhat mottled. Male with a round black spot at base of caudal above, this surrounded by an orange or yellowish shade; in the female this ocellus is wanting. Lateral line nearly median, directed slightly upward at each end. D. 48 (42 to 53); A. 10 to 12; V. 7. Lat. line, 67 (65 to 70). Head 3¾ in length; depth 4 to 4½. Male about 18 inches in length; female 24 or more. Great Lakes and sluggish waters from Minnesota to Virginia, Florida, and Texas; abundant. A voracious and gamy fish of remarkable tenacity of life. The flesh is peculiarly soft and pasty and is of no value for food.

Amia calva, Linnæus, Syst. Nat., Ed. xii, 1766, 500, Charleston, S. C.; Günther, Cat., viii, 325, 1870.

Amia ocellicauda, Richardson, Fauna Bor. Amer., iii, 236, 1836, ♂, Lake Huron.

Amia occidentalis, De Kay, New York Fauna: Fishes, 269, 1842, ♀, St. Marys River, Mich.

Amia marmorata, Cuvier & Valenciennes, xix, 412, 1846, New Orleans.

Amia ornata, Le Sueur, in Cuvier & Valenciennes, *l. c.*, 420, Chibault, on Mississippi River.

Amia viridis, Le Sueur, *l. c.*, 421, New Orleans.

Amia canina, Cuvier & Valenciennes, *l. c.*, 424, Lake Erie, after Kirtland.

Amia lentiginosa, Cuvier & Valenciennes, *l. c.*, 426, after Bonnaterre, no locality.

Amia subcærulea, Cuvier & Valenciennes, *l. c.*, 427, New Orleans.

Amia cinerea, Cuvier & Valenciennes, *l. c.*, 430, Charleston, South Carolina.

Amia reticulata, Le Sueur, *l. c.*, 431, Wabash River.

Amia thompsoni, Duméril, Hist. Nat. Poiss., ii, 419, 1870, Lake Champlain.

Amia piquotii, Duméril, *l. c.*, 423, 1870, Upper Mississippi.

Series TELEOSTEI.

(The Bony Fishes.)

This group is sufficiently characterized in the analysis on page 97. The name (*τέλειος*, perfect; *ὀστέον*, bone) is not entirely distinctive, inasmuch as the skeleton is well ossified in certain Ganoids. In general, however, the group is well characterized by the absence of the anatomical features ascribed to the Ganoids.

We begin the series with those Teleosts in which the air bladder connects throughout life with the alimentary canal as distinguished from those in which this connection is a feature of immaturity. Slight as this character is, it has value as an indication of relationship. Among these forms in which the air duct is retained there are 2 well-marked series, probably distinct in origin, the one characterized by a singular modification of the anterior vertebræ, the other without this character. The first of the groups (Ostariophysi) includes the great majority of living fresh-water fishes. From the other group the specialized spiny-rayed fishes and most marine fishes seem to be descended.

OSTARIOPHYSI.

This group, which includes the great majority of the living fresh-water fishes of the world, is characterized chiefly by the modification of the anterior vertebræ. These are coössified and have some of their lateral and superior elements detached and modified to form a chain of small bones, the Weberian ossicles, which connect the air bladder with the ear. The three orders, NEMATOGNATHI, PLECTOSPONDYLI, and SCYPHOPHORI (*Mormyridæ*), which compose this group, are doubtless derived from a common stock. (*ὀστάριον*, a little bone; *φῦσος*, bladder.)

Order M. NEMATOGNATHI.

(THE CATFISHES.)

Parietals and supraoccipital confluent. Four anterior vertebræ coössified, and with ossicula auditus or weberian apparatus. No mesopterygium. Basis cranii and pterotic bone simple; no coronoid bone. Third superior pharyngeal bone wanting, or small and resting on the fourth; second directed backwards. One or 2 pairs of basal branchihyals; 2 pairs of branchihyals. Suboperculum wanting, or modified into the uppermost branchiostegal. Mesocoracoid present. Premaxillary forming border of mouth above, except in one family, DIPLOMYSTIDÆ, in which the maxillaries also bear teeth. Interclavicles present. No scales. Skin naked or with bony plates.

"This division is the nearest ally to the sturgeons (CHONDROSTEI) among Physostomous fishes, and I imagine that future discoveries will prove that it has been derived from that division by descent. In the same way the Isospondylous fishes are nearest the HALECOMORPHI, and have probably descended from some Crossopterygian, near the HAPLISTIA, through that order. The affinity of the catfishes to the sturgeons is seen in the absence of symplectic, the rudimental maxillary bone, and, as observed by Parker, in the interclavicles. There is a superficial resemblance in the dermal bones."—(Cope, *l. c.*, 454.)

This group comprises the SILURIDÆ* and their relatives, now divided into several families by Prof. Gill. (SILURIDÆ, Günther, Cat., v, 1–277.) (*νῆμα*, thread; *γνάθος*, jaw; from the maxillary barbels, which are always present.)

ANALYSIS OF FAMILIES OF NEMATOGNATHI.

a. Air bladder well developed, usually simple or with transverse constrictions, lying free in the abdominal cavity. Mouth terminal; teeth villiform, conical, incisor or molar like; intestines short; arranged in longitudinal folds; body naked, or with one series of lateral plates; diaphragm membranous; tip of scapular process reaching basioccipital. Dorsal fin short, confined to the abdominal part of the vertebral column; opercle well developed and movable; adipose fin normally present; gill openings generally wide; caudal vertebræ not compressed, the neural spines simple, spine-like. Maxillary rudimentary, forming the base of a long barbel, the premaxillaries alone forming the margin of the upper jaw. SILURIDÆ, XXXIV.

---

* In the arrangement of the tropical genera of NEMATOGNATHI, we have followed closely the "Revision of the South American NEMATOGNATHI," by Eigenmann & Eigenmann, 1890.

aa. Air bladder rudimentary, one division on either side of the coalesced vertebræ and entirely surrounded by a bony capsule; this capsule formed by the skull and by the lateral processes of the anterior vertebræ; diaphragm wholly osseous, formed by the expansions of the clavicle and scapular process. Scapula and its process firmly joined to the skull. Gill membranes joined to the isthmus; skin covered with bony plates.

b. Caudal vertebræ compressed, the neural and hæmal spines expanded, forming a continuous ridge above and below; skin with several series of plates; mouth inferior, the lower lip reverted; teeth turned abruptly back above and usually expanded; a single series of teeth erect and in function, the premaxillaries and dentaries box-shaped, filled with numerous relay teeth; intestinal canal coiled; cavity of air bladder communicating with the exterior at a notch in the posterior margin of the temporal plate at beginning of lateral line. LORICARIIDÆ, XXXV.

Family XXXIV. SILURIDÆ.

(THE CATFISHES.)

Body more or less elongate, naked or covered with bony plates. No true scales. Anterior part of head with 2 or more barbels, the base of the longest pair formed by the small or rudimentary maxillary. Margin of upper jaw formed by premaxillaries only. Suboperculum absent; operculum present. Dorsal fin usually present, short, above or in front of the ventrals. An adipose fin usually present. Anterior rays of dorsal and pectorals usually spinous. Air bladder usually present, large, and connected with the organ of hearing by means of the auditory ossicles. Lower pharyngeals separate.

After the removal of numerous aberrant forms as distinct families, the family of SILURIDÆ contains more than 100 genera and upward of 900 species. Most of the SILURIDÆ are fresh-water fishes, inhabiting the rivers of warm regions, particularly South America and Africa; comparatively few of them are marine, and these few are mostly tropical. They are especially characteristic of the Amazon region in South America. (SILURIDÆ, part, Günther, Cat., v, 30–65; 69–220.)

a. Gill membranes free or forming a free fold across the isthmus, rarely joined to the isthmus; anal fin shorter than caudal portion of vertebral column.

TACHYSURINÆ:

b. Nostrils close together, neither with a barbel, the posterior with a valve; teeth on the palate; caudal forked. (Species chiefly marine.)

c. Lower jaw with 2 barbels; maxillary barbel band-like; pectoral spine with a band-like filament. FELICHTHYS, 68.

cc. Lower jaw with 4 barbels; palatine teeth fixed; both jaws with teeth.

d. Gill rakers few, 5 to 25; eyes above level of mouth. GALEICHTHYS, etc., (genera 69 to 74).

dd. Gill rakers very many—40 or more, long and slender; eyes scarcely above level of mouth. CATHOROPS, 75

bb. Nostrils remote from each other. (Fresh-water species.)

ICTALURINÆ:

e. Posterior nostril with a barbel; barbels 8; no teeth on vomer or palate.

f. Adipose fin with its posterior margin free.

g. Premaxillary band of teeth truncate behind; not produced backward at the outer angles.

h. Eyes normal.

i. Supraoccipital bone continued backward from the nape, its notched tip receiving the bone at base of dorsal spine, so that a continuous bony bridge is formed under the skin from snout to base of dorsal; caudal fin forked. ICTALURUS, 76.

ii. Supraoccipital not reaching interspinal bones, the bony bridge more or less incomplete. AMEIURUS, 77.

gg. Premaxillary band of teeth with a lateral backward extension on each side; lower jaw projecting; dorsal spine weak. LEPTOPS, 78.

ff. Adipose fin keel-like, adnate to the back.

j. Band of teeth in upper jaw with a backward extension at its outer posterior angle, as in *Leptops.* NOTURUS, 79.

jj. Band of teeth in upper jaw without backward extension, as in *Ameiurus.* SCHILBEODES, 80.

PIMELODINÆ:

ee. Posterior nostril without barbel; barbels 6; adipose fin well developed; teeth in villiform bands.

k. Teeth on vomer none, or in small patches.

l. Head covered with soft skin above, not granulated. Snout broad, scarcely produced; barbels terete or slighlty flattened, not margined; head longer than broad.

m. Occipital process, if present, not reaching the dorsal plate; dorsal spine pungent. RHAMDIA, 81.

mm. Occipital process narrow, reaching the dorsal plate; fontanelle reaching base of occipital process, a bridge across it above posterior margin of eye; humeral process spine-like. PIMELODELLA, 82.

ll. Head granulated above, naked or partially naked; occipital process usually reaching dorsal plate; fontanelle not continued behind eyes; adipose fin longer than high; humeral process broad; not spine-like. PIMELODUS, 83.

68. FELICHTHYS, Swainson.

(GAFF-TOPSAIL CATFISHES.)

Breviceps, SWAINSON, Nat. Hist. Fishes, 1, 328, 1838, (*bagre*), name preoccupied.
Felichthys, SWAINSON, *l. c.*, II, 305, 1839, substitute for *Breviceps*, (*bagre*).
Ailurichthys, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 26, (*marinus*).
Ælurichthys, GILL, corrected spelling.
Mystus, GRONOW, Cat. Fishes, Ed. Gray, 165, 1854, (*carolinensis*), name preoccupied.
Pimelodus, BLEEKER, Silures de Suriname, 65, 1864, (*bagre*), not of Lacépède, as restricted by Gill.

Body rather elongate, little compressed. Head depressed, broad above. Mouth large, the upper jaw the longer. Teeth all villiform; those on the vomer and palatines forming a more or less perfectly crescent-shaped band. Barbels 4; maxillary barbels band-like, very long; chin with 2 short barbels. Nostrils close together, the posterior with a valve; nuchal region with a granulated, bony buckler. Fontanelle large, well forward. Dorsal fin short, in front of the ventrals, with 1 sharp spine and 7 rays. Pectorals with a similar spine; pectoral spines, and sometimes dorsal spine also, ending in a long, striated, band-like filament. Adipose fin moderate, free behind. Caudal fin widely forked; anal moderate, emarginate; ventral rays 6. Gill membranes somewhat connected. Tropical waters of America, the species all marine. (*felis*, cat; *ἰχθύς*, fish.)

a. Dorsal spine not produced in a long filament; occipital process large, shaped like a clover leaflet; gill rakers 5 + 14; base of ventrals about equidistant from snout and caudal. PANAMENSIS, 156.

aa. Dorsal spine produced in a long filament; occipital process normal; gill rakers not more than 9.

b. Distance from dorsal fin to tip of snout 3⅓ to 4 in length; base of anal more than ⅕ length.

c. Anterior lobe of anal with minute dots, its highest ray less than ½ its base; vomerine and palatine patches of teeth separate; anal rays 32 to 35. BAGRE, 157.

cc. Anterior lobe of anal with a large dark blotch, its highest ray more than ½ its base; vomerine and palatine patches of teeth joined; anal rays 28 to 30. PINNIMACULATUS, 158.

ccc. Head broader; occipital process narrower than in *F. pinnimaculatus;* body and fins uniformly colored; no black blotch on ventrals or anal. EYDOUXII, 159.

bb. Distance of dorsal from tip of snout about 3 in length; highest anal ray about equal to base of anal, which is about ⅙ the length; anal rays 20 to 26.

d. Anal rays about 26; occipital buckler large, triangular, its width at base 1⅙ in its length. FILAMENTOSUS, 160.

dd. Anal rays 22 to 24; occipital buckler small, oblong, nearly as wide behind as before; top of head smoother than in most other species; pectoral spine shorter than head, a little longer than dorsal spine. MARINUS, 161.

ddd. Anal rays 19 to 21; pectoral spine as long as head, much longer than dorsal spine; palatine teeth in a narrow band. BAHIENSIS, 162.

156. FELICHTHYS PANAMENSIS, (Gill).

Body robust; dorsal spines not produced; maxillary barbels reaching base of ventrals; caudal deeply forked. Steel blue, with bright reflections; fins dotted. Head 4; depth 5. D. I, 7; A. 29. Mazatlan to Panama; common. (*panamensis*, from Panama.)

Ailurichthys panamensis, GILL, Proc. Ac. Nat. Sci. Phila., 1863, 172, Panama.
Ailurichthys nuchalis, GÜNTHER, Cat., v, 179, 1864, Panama.
Ailurichthys panamensis, EIGENMANN & EIGENMANN, S. A. Nematognathi, 31, 1890.

157. FELICHTHYS BAGRE, (Linnæus).

Body rather elongate; maxillary barbels reaching beyond front of anal; gill rakers very slender, 2 + 6; dorsal filament reaching caudal. Dark purplish, fins dotted. Head 4¾; depth 5¼. D. I, 7; A. 32 to 35. Coast of Brazil, accredited to the West Indies, but rare north of Surinam. (*bagre*, Portuguese name of some catfish.)

Silurus bagre, LINNÆUS, Syst. Nat., Ed. XII, 505, 1766, South America, after Gronow.
Ailurichthys bagre, EIGENMANN, S. A. Nematognathi, 33, 1890.
Galeichthys gronovii, CUVIER & VALENCIENNES, XV, 40, 1840, Guiana, Maracaibo, Naua, Bahia, Cayenne.
Ailurichthys gronovii, GÜNTHER, Cat., v, 178, 1864.
Bagrus macronemus, RANZANI, Nov. Com. Ac. Sci. Bonon. 1842, v, 334, pl. 28, Brazil.
Mystus carolinensis, GRONOW, Cat. Fishes, Ed. Gray, 156, 1854, Rivers of South America.

158. FELICHTHYS PINNIMACULATUS, (Steindachner).

Rather elongate; maxillary barbels reaching middle of anal; dorsal spine 1⅓ in head, its filament reaching to caudal. Metallic blue; anal with a large black blotch in front; lower caudal lobe pale. Head 4⅗; depth 4⅗. D. I, 7; A. 28 to 30. Mazatlan to Panama; common on sandy shores. (*pinna*, fin; *maculatus*, spotted.)

Ailurichthys pinnimaculatus, STEINDACHNER, Ichth. Beitr., IV, 15, 1875, Panama, Altata, Costa Rica; EIGENMANN, *l. c.*, 35, 1890.

159. FELICHTHYS EYDOUXII, (Cuvier & Valenciennes).

Head broader than in *F. pinnimaculatus.* Dorsal shield as long as broad, the lateral edges rounded; its surface granulated and grooved; occipital process narrower than in *F. pinnimaculatus.* Teeth on palate forming a transverse band, subinterrupted in the middle. Maxillary barbel reaching middle of pectoral spine. Dorsal spine grooved, granulated on anterior edge; pectoral filament reaching end of anal. Body and fins uniformly colored, no black blotch on ventrals or anal. Head 4¾. D. I, 7; A. 30. Guayaquil. (Sauvage.) (Named for M. Eydoux, its discoverer.)

Galeichthys eydouxii, Cuvier & Valenciennes, xv, 43, 1840, Guayaquil.
Ailurichthys eydouxii, Sauvage, in Jordan, Proc. U. S. Nat. Mus., 1884, 40; description of original type.

160. FELICHTHYS FILAMENTOSUS, Swainson.

Very close to *F. marinus*, which it represents southward. Shields on top of head rougher than in *F. marinus*, the granulations extending on each side of fontanelle to before it; granulated area before occipital process broader than long, its width more than ½ head; occipital process triangular, emarginate behind, its width at base 1⅙ in its length; basal bone of dorsal spine short but broad. Dorsal spine a little shorter than head, a little longer than pectoral spine; its filament reaching to or beyond adipose fin; pectoral filament to front of anal; maxillary barbels to end of pectoral spine. A. 26. Sandy coast of tropical America, on the Atlantic side; here described from specimens from Lake Nicaragua. (*filamentosus*, bearing filaments.)

Felichthys filamentosus, Swainson, Nat. Hist. Anim., ii, 305, 1839, after Bloch, pl. 365.
Ailurichthys filamentosus, Jordan, Proc. U. S. Nat. Mus., 1888, 411.
Galeichthys blochii, Cuvier & Valenciennes, xv, 44, 1840, Bahia.

161. FELICHTHYS MARINUS, (Mitchill).

(Sea Catfish; Gaff Topsail.)

Head rather short and broad, rounded anteriorly. Occipital buckler small, oblong, not much broader before than behind; band of palatine teeth nearly continuous, extremely variable. Maxillary barbels extending about to the end of the pectoral spine; pectoral spine longer than the dorsal spine, ⅔ the length of the head, its filament reaching the vent; dorsal filament reaching adipose fin; upper lobe of caudal much the longer; anal fin falcate. Dusky bluish, silvery below. Head 4¼. D. I, 7; A. 23. P. I, 12; B. 6. Vert. 20 + 30. Cape Cod to Texas; common southward; not valued as food.

Silurus marinus, Mitchill, Trans. Lit. and Phil. Soc. N. Y., i, 1815, 433, New York.
Ailurichthys marinus, Günther, Cat., v, 178, 1864.
Ailurichthys marinus, Jordan & Gilbert, Synopsis, 111, 1883.
Ailurichthys marinus, Eigenmann, *l. c.*, 36.

162. FELICHTHYS BAHIENSIS, (Castelnau).

Very close to *F. marinus* and perhaps not distinct, the pectoral spine longer, as long as head, the maxillary barbels extending about to root of ventral; palatine teeth in a very narrow band. A. 19 to 21. (Günther.)

Mexico to Bahia, a doubtful species, placed by Eigenmann with *F. filamentosus*, as synonym of *F. marinus*.

Galeichthys bahiensis, CASTLENAU, Anim. Amer. Sud., 37, 1855, Bahia.
Ailurichthys longispinis, GÜNTHER, Cat., v, 178, 1864, Mexico; South America.

69 to 74. GALEICHTHYS, Cuvier & Valenciennes

(SEA CATFISH.)

Tachysurus, LACÉPÈDE, Hist. Nat. Poiss., v, 151, 1803, (*chinensis*).
Galeichthys, CUVIER & VALENCIENNES, XV, 28, 1840, (*feliceps*, etc.)
Arius, CUVIER & VALENCIENNES, *l. c.*, 52, (*grandicassis*, *arius*, etc.) (Restricted to *arius* by Bleeker in 1858)=*Tachysurus*.
Ariodes, MÜLLER & TROSCHEL, Horæ Ichthyol., III, 9, 1849, (*arenarius*, etc.) (=*Tachysurus*.)
Hexanematichthys, BLEEKER, Ichthyol. Archip. Indici Siluri, 61, 1858, (*sondaicus*).
Cephalocassis, BLEEKER, *l. c.*, 62, (*melanochir*). (=*Hexanematichthys*.)
Netuma, BLEEKER, *l. c.*, 62, (*nasuta*).
Guiritinga, BLEEKER, *l. c.*, 62, (*commersoni*). (=*Netuma*.).
Sciadeichthys, BLEEKER, *l. c.*, 62, (*emphysetus*).
Selenaspis, BLEEKER, *l. c.*, 62, (*herzbergii*).
Hemiarius, BLEEKER, Nederl. Tijdskr. Dierk., I, 1862, 90, (*stormi*). (=*Hexanematichthys*.)
Pseudarius, BLEEKER, *l. c.*, 91, (*arius*; *grandicassis* being regarded as type of *Arius*). (=*Tachysurus*.)
Leptarius, GILL, Proc. Ac. Nat. Sci. Phila., 1863, 170, (*dowi*). (=*Selenaspis*.)
Ariopsis, GILL, *l. c.*, (*milberti*=*felis*). (=*Hexanematichthys*.)
Notarius, GILL, *l. c.*, (*grandicassis*). (=*Netuma*.)

Body more or less elongate, subterete. Head armed with a bony shield above, behind which projects an occipital shield; another smaller shield at the base of the dorsal spine; these shields usually distinct but sometimes covered by the skin as in *Felichthys*. Skull with a fontanelle. Mouth not large, the upper jaw the longer. Teeth villiform or granular, in a band in each jaw; teeth in 1 or 2 patches each on the vomer and palatines, all of them sometimes confluent into one band; the palatine teeth never movable. Barbels 6 (the nostrils without barbel), close together, the posterior with a valve; maxillary barbels usually short and terete or somewhat compressed. Eyes with a more or less free orbital margin, the upper edge sometimes adnate. Dorsal fin short, in front of the ventrals, with a pungent spine and about 7 rays; adipose fin well developed, posteriorly free; caudal fin deeply forked; anal fin short; pectorals each with a spine; ventral rays 6. Skin smooth, naked, except on the occipital and nuchal regions, where it is usually confluent with the surface of the bony bucklers. Marine catfishes. Species very numerous on sandy shores in the tropical seas, never about coral reefs. This group has been treated as one genus by Günther, Eigenmann, and Jordan & Gilbert. It seems to us more natural to separate the American species into several genera, which is done in the descriptive text below, too late for insertion in the key. (*ταχύς*, swift; *οὐρά*, tail.)

GALEICHTHYS,* (γαλῆ, weasel; *ἰχθύς*, fish): (genus 69.)

a. Head and occiput entirely covered by flesh and skin; occipital process sparingly granulated.

---

* This analysis of species is condensed from that given by Eigenmann, S. A. Nematognathi, 43, and from that given by Jordan & Gilbert, Bull. U. S. Fish Com., 1882, 37. We omit from this analysis all those species which have not as yet been found north of Guiana. The subgeneric groups are recognized below as genera.

b. Anal fin twice as long as high, with 22 rays; fontanelle with an indistinct groove; occipital process twice as long as broad; sides freckled. LENTIGINOSUS, 163.

bb. Anal fin higher than long, with about 15 rays; fontanelle continued as a deep groove to base of occipital process, which is 3 times as long as broad; sides with a broad pale band. PERUVIANUS, 164.

aa. Occipital process and bones of head exposed or covered with very thin skin; bones on top of head and occipital process granular.

c. Palatine patches of teeth with a backward projecting angle on the inner margin (this often obsolete in the young in *Selenaspis*); vomerine bands contiguous or confluent. General color brown, with bronze reflections.

d. Dorsal plate saddle-shaped, enlarged; its length on the median line more than ⅒ that of head; teeth on the palate villiform or bluntly conical; vomerine bands of teeth united.

SCIADEICHTHYS, (*Sciades*, a related genus, from σκιά, shade; ἰχθύς, fish): (genus 70.)

e. Posterior nasal openings not connected by a membrane. Species 165–172.

f. Dorsal plate longer than broad, pointed in front, entering the short, emarginate occipital process; fontanelle large, ending acutely at a point nearer base of dorsal than tip of snout; eye moderate, 5½ or less in interorbital space; maxillary barbels not reaching beyond base of pectorals; no pterygoid teeth; head 3¼ in length. TROSCHELI, 165.

SELENASPIS, (σελήνη, the moon; ἀσπίς, shield:) (genus 71.) Species 173 to 176.

ee. Posterior nasal openings connected by membrane (young with the dorsal plate reduced and no backward prolongation to palatine patch of teeth). Dorsal shield much broader than long, its anterior margin truncate.

g. Occipital process very short, truncate behind, ½ wider at base than at tip, its length less than ½ its greatest width; gill rakers 7 + 15; fontanelle short, ending obtusely at a point much nearer tip of snout than front of dorsal; head 3¼ in length. DOWI, 174.

dd. Dorsal plate crescent-shaped, not enlarged, its length on the median line much less than ⅒ head.

NETUMA, (*Netuma keleti*, a name used at Pondicherry for *Netuma netuma*): (genus 72.) Species 177 to 185.

h. Occipital process widest at its base.

i. Fontanelle obtuse, not produced backward as a groove; interorbital region granular; barbels short; caudal not ⅔ head; posterior nostrils not connected by membrane; head very large, 3⅓ in length. KESSLERI, 180.

ii. Fontanelle continued backward as a groove (in one species nearly obsolete), and the top of head not granular.

j. Interorbital region and shields of head finely granular; no axillary pore; maxillary barbels long, reaching middle of pectorals; caudal more than ⅔ head, which is 4 in length. INSCULPTUS, 181.

jj. Interorbital region flat and smooth or with smooth ridges, a triangular smooth area extending backward from it.

k. Vomerine patches of teeth united, except in young.

l. Groove of fontanelle almost obsolete, not reaching occipital process, which is about as broad at base as long, with concave margins; caudal a little shorter than head, which is 3⅕ in length; shields of head coarsely granular. PLANICEPS, 182.

ll. Groove of fontanelle well defined, reaching occipital process, which is longer than broad at base and with straight edges; barbels short, compressed at base; head long 3⅗ in length, its shields finely granular; paired fins often black at base. PLATYPOGON, 183.

kk. Vomerine patches of teeth separate on the median line.

m. Spines long, scarcely shorter than head; caudal nearly as long as head; head small, 4 in length; mouth small, its breadth not ½ head. OSCULUS, 184.

mm. Spines short, not ⅔ head; head large, about 3⅔ in length; teeth on palate in 4 patches, bluntly conical; occipital process scarcely as long as broad; caudal shortish; mouth large, its breadth at least ½ length of head. ELATTURUS, 185.

cc. Palatine patches of teeth without a backward projecting angle on the inner margin; dorsal shield small, crescent-shaped; general color brown with blue reflections.

HEXANEMATICHTHYS, (ἕξ, six; νῆμα, thread; ἰχθύς, fish): (genus 73.) Species 186 to 196.

n. Teeth on palate villiform.

o. Teeth on palate mostly in 4 patches.

p. Granulations of head not extending forward to between eyes.

q. Fontanelle continued backward as a narrow groove.

r. Occipital process long, about ⅓ head, its tip convex; inner edge of ventrals pale; head 3¾ in length. FELIS, 186.

rr. Occipital process moderate, not ⅓ head; inner edge of ventrals black; head longer.

s. Head flat, depressed in front; occipital keel bluntish; granulations of head coarse and conspicuous; fontanelle reaching base of occipital process. SEEMANI, 187.

ss. Head scarcely depressed; occipital keel sharper than in any other species; shields of head smoother than in *H. seemani;* patches of palatine teeth much smaller, fontanelle narrow, not quite reaching occipital keel. JORDANI, 188.

qq. Fontanelle not continued backward as a groove into the granulated region of the head.

t. Palatine patches of teeth small, scarcely larger than vomerine patches, which are widely separated; occipital process keeled, truncate at tip; barbels rather long; vertical fins dark; inside of ventrals dusky. CÆRULESCENS, 189.

tt. Palatine patches much larger than vomerine.

u. Fontanelle almost obsolete, ending between eyes, not prolonged backward as a groove; body slender, caudal about as long as head; paired fins pale. GUATEMALENSIS, 190.

uu. Fontanelle ending midway between tip of snout and middle of dorsal plate; head broader than in preceding. ASSIMILIS, 191.

pp. Granulations of head continued forward to between the eyes; fontanelle continued as a groove to base of occipital process; interorbital area with 4 granular ridges.

v. Head moderate, 4½ in length; dorsal spine 1¼ in head; highest anal ray less than 2 in head. DASYCEPHALUS, 193.

vv. Head long, 3⅗ in length; dorsal spine 1¾ in head; highest anal ray 2⅓ in head. LONGICEPHALUS, 194.

TACHYSURUS: (genus 74.)

uu. Teeth on palate granular; gill membranes not forming a free margin across the isthmus.

w. Anal rays 19 to 22; head broader than high, more than 3 in length.

x. Ventral fins blackish on inner margin; axillary pore large; groove of fontanelle scarcely reaching base of occipital process; vomerine teeth small, the patches widely separated; head 3½ in length. MELANOPUS, 200.

xx. Ventral fins pale; axillary pore small; pectoral spine reaching at least halfway to middle of ventral; occipital process little narrowed behind; vomerine teeth course, the patches close together; head 3⅔ in length. FURTHII, 201.

ww. Anal rays 27; teeth on palate in 2 small bands widely separated; fontanelle long and narrow; head rough. MULTIRADIATUS, 202.

69. GALEICHTHYS,* Cuvier & Valenciennes.

163. GALEICHTHYS LENTIGINOSUS (Eigenmann & Eigenmann).

Gill rakers 3 + 4. Color light brown, paler below, the sides freckled; head 4 to 4⅕. A. 22. Panama. (Eigenmann.) (*lentiginosus*, freckled.)

Tachisurus lentiginosus, EIGENMANN, Proc. Cal. Ac. Sci., 1888, 139, Panama.

164. GALEICHTHYS PERUVIANUS, (Lütken).

Gill rakers 3 + 10. Back and sides blue black; a conspicuous broad pale band along the lateral line. Head 3⅕. A. 14 to 16. Pacific Coast of Mexico to Peru, rather rare; this and the preceding species well marked by the skin-covered head, similar to that of species of *Felichthys*.

Galeichthys peruvianus, LÜTKEN, Vidensk. Med., 204, 1874, Callao.
Tachisurus peruvianus, EIGENMANN, S. A. Nematognathi, 51, 1890.

70. SCIADEICHTHYS, Bleeker.

165. SCIADEICHTHYS TROSCHELI, (Gill).

(BAGRE COLORADO.)

Body robust; dorsal plate longer than wide, its surface granular; granulations of head extending to above eye; occipital process short, emarginate behind; fontanelle large, ending acutely at a point nearer base of dorsal than tip of snout; upper caudal lobe 5 in length. Head 3⅐ to 3¼. A. 18. No axillary pore. Female as in some other species, with the head smoother and covered with thicker skin, as in the subgenus *Galeichthys*. Dark brown, with a brassy luster. Mazatlan to Panama, not rare; one of the largest species, used as food. (Named for Dr. Franz Hermann Troschel.)

Sciades troscheli, GILL, Proc. Ac. Nat. Sci. Phila., 1863, 171, Panama.
Arius brandti, STEINDACHNER, Ichth. Beitr., IV, 21, 1876, Altata; Panama.
Tachisurus brandti, EIGENMANN, S. A. Nematognathi, 55, 1890.

166. SCIADEICHTHYS EMPHYSETUS, (Müller & Troschel).

Closely allied to *S. troscheli*, of which it is the Eastern representative. Palatine bands of teeth with a backward projecting angle; teeth villiform; posterior nostrils not connected by membrane. Eye moderate, 5 in the interocular space, 11 in head. Maxillary barbels flattened, reaching middle or end of dorsal fin. Dorsal plate pointed in front, entering the notched occipital process; as wide as long, its surface pitted. Granulations of the head extending to above middle of cheeks. An elongate patch of teeth behind each palatine patch. Caudal deeply forked, the upper lobe 3⅔ in the length. Head 3⅗. Depth 6. D. 17; A. 18. Yellowish brown, paler below. Surinam. (Eigenmann.) (ἐμφυσάω, to inflate.)

Bagrus (Sciades) emphysetus, MÜLLER & TROSCHEL, Horæ Ichthyol., III, 8, 1849, Surinam.
Arius emphysetus, GÜNTHER, Cat., V, 150, 1864.
Tachisurus emphysetus, EIGENMANN, S. A. Nematognathi, 53, 1890.

167. SCIADEICHTHYS TEMMINCKIANUS, (Cuvier & Valenciennes).

Palatine bands of teeth with a backward projecting angle on the inner margin; teeth on palate villiform or nearly so. Dorsal plate pointed in front, entering the notched occipital process, ½ as wide as the skull behind the eye; surface of the bones striate rather than granulate. Eye small, 6 to 7 in the interorbital. Maxillary barbels reaching tips of ventrals. D. I, 6; A. 21. (Cuvier & Valenciennes.) Cayenne. Like the next, known only from the original description, both apparently allied to *S. troscheli.* (Named for C. J. Temminck, then director of the Museum of Holland.)

---

* For the characters of this and other genera related to *Tachysurus* see the analysis above.

Bagrus temminckianus, CUVIER & VALENCIENNES, XIV, 463, 1839, Cayenne.
Arius temminchii, GÜNTHER, Cat., v, 151, 1864, after Cuvier & Valenciennes.
Tachisurus temminckianus, EIGENMANN, S. A. Nematognathi, 53, 1890.

168. SCIADEICHTHYS FLAVESCENS, (Cuvier & Valenciennes).

Palatine bands of teeth with a backward projection on the inner margin. Dorsal plate enlarged, pointed in front, entering the notched occipital process; emarginate behind, as wide as the cranium behind eye; granulations not extending forward to eyes; opercle and humeral process striate, not granular. Eye very small, 9 in interorbital. Dorsal and pectoral spines granular, moderately serrate. Upper jaw little longer; palatine bands of teeth oval. Maxillary barbel extending to middle of pectoral. Ventral shorter than pectoral fins; adipose ⅓ less than anal fin. Upper caudal lobe little the longer D. I, 7; A. 18. (Cuvier & Valenciennes.) Cayenne. (*flavescens*, yellowish.)

Bagrus flavescens, CUVIER & VALENCIENNES, XIV, 462, 1839, Cayenne.
Arius flavescens, GÜNTHER, Cat., v, 151, 1864.
Tachisurus flavescens, EIGENMANN, S. A. Nematognathi, 53, 1890.

169. SCIADEICHTHYS MESOPS, (Cuvier & Valenciennes).

Palatine teeth villiform, the band with a backward projection; posterior nostrils not connected by membrane. Dorsal plate enlarged, notched in front, receiving the point of occipital process. Eye midway between snout and preopercle; occipital process twice as long as broad, its tip mucronate, corresponding to a notch in the dorsal plate; top of head granulated to front of eyes; opercle granulated superiorly; humeral process as long as high, strongly granulated. Ventrals as long as pectorals. D. I, 7; A. 18. (Cuvier & Valenciennes.) Guiana. (*μέσος*, middle; *ὤψ*, eye.)

Bagrus mesops, CUVIER & VALENCIENNES, XIV, 456, 1839, Guiana.
Arius mesops, GÜNTHER, Cat., v, 145, 1864.
Tachisurus mesops, EIGENMANN, S. A. Nematognathi, 57, 1890.

170. SCIADEICHTHYS PROOPS, (Cuvier & Valenciennes).

Head 4 to 4⅓; depth, 7. D. I, 7; A. 18. Palatine bands of teeth with a backward projecting angle; posterior nostrils not connected by membrane; dorsal plate large, butterfly shaped, notched in front, receiving the point of occipital process; bones of head coarsely granular. Eye nearer snout than to preopercle, 1¼ in snout, about 3 in interorbital. Jaws subequal: occipital process broader than long, mucronate at tip; opercle striate. Body slender and elongate; head depressed; teeth on roof of mouth in 6 contiguous patches. Caudal deeply forked, the longer upper lobe 4¼ in body; pectoral spine 1¼ in head. Plumbeous above, with blue luster; fins dotted with brown. (Eigenmann.) West Indies from Porto Rico to Surinam and south to Pernambuco. (*πρό*, before; *ὤψ*, eye.)

Bagrus proops, Cuvier & Valenciennes, xiv, 457, 1839, Guiana; Porto Rico.
Arius proops, Günther, Cat., v, 148, 1864.
Netuma proops, Bleeker, Silures de Suriname, 62, 1864.
Tachisurus proops, Eigenmann, S. A. Nematognathi, 57, 1890.

171. SCIADEICHTHYS PASSANY, (Cuvier & Valenciennes).

D. I, 7; A. 17. Palatine patches of teeth with a backward projecting angle; dorsal plate notched in front, receiving the point of occipital process. Eye nearer snout than to preopercle. Lower jaw longer; occipital process wider and shorter than in *S. proops*, its tip reduced; dorsal plate more or less crescent-shaped. Eye nearer snout than in *S. proops*. Head flat, especially forward; opercle strongly granular; humeral process obtuse, higher than long, granular; dorsal and pectoral spine granular in front, weakly serrate behind; ventrals longer than pectorals. (Cuvier & Valenciennes.) Cayenne. (*passany*, the vernacular name at Cayenne.)

Bagrus passany, Cuvier & Valenciennes, xiv, 458, 1839, Cayenne.
Arius passany, Günther, Cat., v, 149, 1864.
Tachisurus passany, Eigenmann, S. A. Nematognathi, 58, 1890.

172. SCIADEICHTHYS ALBICANS, (Cuvier & Valenciennes).

D. I, 7; A. 19. Palatine bands of teeth with an angle behind, the teeth villiform; dorsal plate notched in front, receiving the point of occipital process. Eye nearer snout than to preopercle. Jaws equal; dorsal plate large, almost as wide as the skull behind eye; opercle striate; top of head granular forward to between eyes; a triangular smooth area in front; humeral process, dorsal plate, and outer margins of dorsal and pectoral spines granular. Snout 3 in space from eye to preopercle; eye 5 in interocular space. Maxillary barbels scarcely reach gill opening. Adipose almost as long as anal. Caudal lobes subequal, 5½ in the total length. Head 4⅔ in the total, its width 1½ in its length. (Cuvier & Valenciennes.) Guiana to the Amazon. (*albicans*, whitish.)

Bagrus albicans, Cuvier & Valenciennes, xiv, 461, pl. 420, 1839, Cayenne.
? *Bagrus valenciennesi*, Castelnau, Anim. Amer. Sud., 31, pl. xiii, f. 1, 1855, Amazon.
Arius valenciennesi, Günther, Cat., v, 150, 1864.
Tachisurus albicans, Eigenmann, S. A. Nematognathi, 59, 1890.

71. SELENASPIS, Bleeker.

173. SELENASPIS HERZBERGII, (Bloch).

Head 3⅗ to 3¾; depth, 5 to 6. D. I, 7; A. 18. Palatine bands of teeth with a backward projecting angle; teeth all villiform. Posterior nasal openings connected by a membrane; dorsal plate and occipital process truncate where they meet, at least in the adult; in the young the dorsal plate is somewhat convex in front, the backward projecting angles of the palatine patches not developed. Occipital process ½ as wide at tip as at base; its length more than ½ its width; its middle scarcely keeled; gill rakers 5 + 10. Body elongate, the head longer than wide; plates on head granular; fontanelle not continued behind the eyes and without backward projecting groove. Plumbeous above, sides silvery, fins dusky. (Eigenmann.) Coasts of South America from Cayenne to Para; common. (Named for Herzberg.)

Silurus herzbergii, Bloch, Ichthyol., VIII, 33, pl. 367, 1801, Surinam.
Arius herzbergii, Günther, Cat., V, 144, 1864.
Tachisurus herzbergii, Eigenmann, S. A. Nematognathi, 59, 1890.
Pimelodus argenteus, Lacépède, Hist. Nat. Poiss., V, 94, 1803, Surinam.

Bagrus cœlestinus, Müller & Troschel, Horæ Ichth., III, 7, 1849, Guiana.
Hexanematichthys hymenorhinus, Bleeker, Silures de Suriname, 57, pls. XI and XIII, 1864, Surinam.

174. SELENASPIS DOWI, (Gill).

Head 3¼ in length. Gill rakers 7 + 15; A. 16. Dorsal shield and occipital process truncate, the former much broader than long, the latter very short; the length of occipital process not ½ its greatest width; fontanelle short, ending obtusely at a point much nearer tip of snout than front of dorsal. Young with dorsal shield reduced, vomerine bands separated and the backward prolongation of palatine bands obscure. Panama to Guayaquil. (Named for Capt. John M. Dow.)

Leptarius dowi, Gill, Proc. Ac. Nat. Sci. Phila., 1863, 170, Panama.
Arius alatus, Steindachner, Ichth. Beitr., IV, 19, 1876, Panama.
Arius dowi, Jordan & Gilbert, Bull. U. S. Fish Com., 1881, 37.
Tachisurus dowi, Eigenmann, S. A. Nematognathi, 61, 1890.

175. SELENASPIS LUNISCUTIS, (Cuvier & Valenciennes).

Head 3⅗; depth 5½ to 6. D. I, 7; A. 16 to 19. Palatine bands of teeth with a backward projection. Teeth in jaws coarse, conical; those on vomer and palate finely granular. The patches separate in young, but united and covering most of roof of mouth in adult. Margin of dorsal plate and of occipital process convex where they meet; palatine patches of teeth connected by the vomerine patch in front, their inner margins not touching behind. Body rather stout. Head large, flattish above; top of head coarsely granular in young, becoming more finely granular with age. Occipital process broader than long. Dorsal plate large, saddle-shaped, broader than long or longer than broad. Fontanelle crossed by 2 or 3 bony bridges, the middle portion more than ½ its total length. Barbels short. Purplish brown, with brown dots below. (Eigenmann.) Surinam to Rio Janeiro; common. (*luna*, moon; *scutum*, shield.)

Arius luniscutis, Cuvier & Valenciennes, XV, 109, 1840, Brazil.
Arius luniscutis, Günther, Cat., V, 152, 1864.
Tachisurus luniscutis, Eigenmann, S. A. Nematognathi, 63, 1890.

176. SELENASPIS PARKERI, (Traill).

(Bresson.)

Allied to *S. luniscutis*; the teeth on the palate granular. Dorsal plate large, emarginate in front, receiving the pointed occipital process; palatine patches either separate or united for their whole length. (Bleeker.) Muddy river mouths, Guiana to Para. (Named for Mr. Parker.)

Silurus parkeri, TRAILL, Mem. Werner. Soc., 1832, VI, 377, pl. 6, Guiana.
Arius parkeri, GÜNTHER, Cat., V, 153, 1864.
Tachisurus parkeri, EIGENMANN, S. A. Nematognathi, 65, 1890.
Arius quadriscutis, CUVIER & VALENCIENNES, XV, 111, 1840, Cayenne; Mana.
Netuma quadriscutis, BLEEKER, Silures de Suriname, 59, 1864, with plates.

72. NETUMA, Bleeker.

177. NETUMA GRANDICASSIS, (Cuvier & Valenciennes).

Head $3\frac{2}{5}$ to $3\frac{3}{4}$; depth $5\frac{2}{3}$ to 6. D. I, 7; A. 18. Dorsal plates cresent-shaped, not enlarged. Occipital process shaped like a clover leaflet, emarginate at tip, narrowly and deeply constricted at base, its margins regularly and strongly convex; its middle keeled or not; its length not much greater than its breadth. Body cylindrical in front, tapering behind. Head greatly depressed, longer than broad; center of fontanelle over middle of eye, not continued backward as a groove; interorbital region with 4 ridges; upper jaw considerably projecting; lip wide; vomerine teeth in small patches or wanting; palatine patches triangular, produced backward. Guiana to Bahia. (Eigenmann.) (*grandis*, large; *cassis*, helmet.)

Arius grandicassis, CUVIER & VALENCIENNES, XV, 53, pl. 427, 1840, Guiana?
Arius grandicassis, GÜNTHER, Cat., V, 153, 1864.
Tachisurus grandicassis, EIGENMANN, S. A. Nematognathi, 65, 1890.

178. NETUMA STRICTICASSIS, (Cuvier & Valenciennes).

Entirely similar to *N. grandicassis*, but with the occipital process much narrowed, its margins scarcely convex, and its length 2 or 3 times its greatest breadth. The form of this process varies, so that Eigenmann regards this form as a variety of *N. grandicassis*, another subspecies (*parmocassis*, Cuvier & Valenciennes, from Bahia), being intermediate between the two. Surinam to Bahia. (Eigenmann.) (*strictus*, narrowed; *cassis*, helmet.)

Arius stricticassis, CUVIER & VALENCIENNES, XV, 58, 1840, Cayenne.
Arius stricticassis, GÜNTHER, Cat., V, 154, 1864.
Tachisurus grandicassis stricticassis, EIGENMANN, S. A. Nematognathi, 68, 1890.

179. NETUMA DUBIA, (Bleeker).

Head $4\frac{1}{3}$ to $4\frac{1}{6}$ in length; eye 4 to $4\frac{3}{4}$ in head, $1\frac{1}{3}$ to $1\frac{2}{3}$ in interocular space; body little broader than high; caudal compressed; head depressed, acute, its width $1\frac{1}{4}$ to $1\frac{1}{5}$ in its length; width of mouth $2\frac{1}{3}$ to $2\frac{1}{5}$. D. I, 7; A. 18 to 20. Dorsal plate, crescent shaped, not enlarged. Palatine bands of teeth without backward extension. Teeth villiform. Occipital process widest at its base. Interorbital region granular, or if smooth, the fontanelle without a groove. Posterior nasal openings not connected by a membrane. Fontanelle not produced backward as a groove. Maxillary barbels reaching to base of ventrals. Occipital process keeled, not much longer than broad; snout scarcely longer than eye, depressed, a large axillary pore; dorsal spine $1\frac{1}{4}$ in head, granulated on its basal half in front; striate on sides, slightly serrate behind; adipose longer than dorsal fin, twice as long as high; pectoral spine broader but not longer than dorsal spine, its inner margin conspicuously serrated; ventrals much shorter than pectorals; anal as high as long; caudal $4\frac{2}{5}$ to 6 in the length. Surinam. (Bleeker.) (*dubius*, doubtful.)

Netuma dubia, BLEEKER, Versl. Med. Ac. Wet. Amsterd., XIV, 382, 1862, Surinam.
Arius dubius, GÜNTHER, Cat., V, 144, 1864.
Tachisurus dubius, EIGENMANN, S. A. Nematognathi, 69, 1890.

180. NETUMA KESSLERI, (Steindachner).

Head large, 3½; caudal not ⅔ head; fontanelle obtuse behind. A. 17. Shields of head coarsely granular; barbels short, reaching base of pectorals. Altata to Panama; not rare. (Named for Dr. K. P. Kessler, author of the Ichthyology of Turkestan.)

Arius kessleri, STEINDACHNER, Ichth. Beitr., IV, 24, 1876, Altata; Panama.
Arius kessleri, JORDAN & GILBERT, Bull. U. S. Fish Comm., 1882, 40.
Tachisurus kessleri, EIGENMANN, S. A. Nematognathi, 69, 1890.

181. NETUMA INSCULPTA, (Jordan & Gilbert).

Head 4. A. 18. Eye 6½ in head; Fontanelle gradually narrowd behind, becoming a narrow groove nearly reaching occipital process; dorsal and pectoral spines subequal, 1⅓ in head; fins pale. Panama. (*insculptus*, sculptured.)

Arius insculptus, JORDAN & GILBERT, Bull. U. S. Fish Com., 1882 (1883), 41, Panama.

182. NETUMA PLANICEPS, (Steindachner).

Head 3¾ to 4. A. 17. Shields of head rather coarsely granular; barbels very short, scarcely reaching pectoral; caudal a little shorter than head; interorbital area flat and smooth; fins dusky. Altata to Panama; not rare. (*planus*, flat; *-ceps*, head.)

Arius planiceps, STEINDACHNER, Ichth. Beitr., IV, 26, 1876, Altata; Panama.

183. NETUMA PLATYPOGON, (Günther).

Head 3⅗. A. 18. Shields of head finely and irregularly granular, the granules not in lines. Inner margins of palatine patches of teeth straight; fontanelle continued abruptly backward as a groove; anterior margin of dorsal spine sharply serrate; body rather elongate, the top of head with an unusually large smooth area. Gulf of California to Peru; generally common. (*πλατύς*, broad; *πώγων*, beard, the barbels being widened at base.)

Arius platypogon, GÜNTHER, Cat., V, 147, 1864, San Jose de Guatemala.
Arius platypogon, JORDAN & GILBERT, *l. c.*, 44, 1882.
Tachisurus platypogon, EIGENMANN, S. A. Nematognathi, 71, 1890.

184. NETUMA OSCULA, (Jordan & Gilbert).

Head 3⅞. A. 18. Mouth small, with thick lips; occipital process narrow, its edges almost parallel until abruptly widened at base; median keel well developed; fontanelle broad and shallow, becoming a narrow groove behind, nearly reaching occipital process. Shields coarsely and sparsely granular; interorbital space nearly plane, with smooth ridges; barbels short; fins blackish. Panama; scarce. (*osculus*, diminutive of *os*, mouth.)

Arius osculus, JORDAN & GILBERT, *l. c.*, 1882, 46, Panama.
Tachisurus osculus, EIGENMANN, S. A. Nematognathi, 74, 1890.

185. NETUMA ELATTURA, (Jordan & Gilbert).

Head $3\frac{2}{3}$. A. 18. Mouth rather large; vomerine teeth rather coarse; palatine patches small; barbels rather short; occipital process short, broadly triangular, with concave sides, the base abruptly broadened: median keel well developed; fontanelle broad and shallow, with a narrow groove behind, nearly reaching occipital process; shields roughish, but smoother than in *N. kessleri;* barbels rather short; caudal short, $1\frac{3}{5}$ in head. Panama; scarce. (*ἐλάττων*, reduced; *οὐρά*, tail.)

Arius elatturus, JORDAN & GILBERT, *l. c.*, 45, 1882, Panama.

73. HEXANEMATICHTHYS, Bleeker.

186. HEXANEMATICHTHYS FELIS, (Linnæus).

(SEA CATFISH.)

Head $3\frac{3}{4}$; depth 5. D. I, 7; P. I, 6; A. 16. Body rather elongate, not compressed, tapering into the slender tail; head subconic, depressed, flattish above; maxillary barbel nearly as long as the head; gill membranes broadly united, forming a narrow, free fold across the isthmus; occipital process with a median keel, long, about $\frac{1}{3}$ head, its tip convex; fontanelle forming a narrow groove; top of head comparatively smooth; humeral process nearly $\frac{1}{2}$ the length of the pectoral spine; caudal deeply forked, the upper lobe the longer. Steel blue, sides and belly silvery, lower fins pale. L. 24 inches. Cape Cod to Texas; common southward along the sandy coast, the most abundant of the salt-water catfishes on the United States coast, and the only one of the *Tachysurus* type found much north of the Tropic of Cancer. (*felis*, cat.)

Silurus felis, LINNÆUS, Syst. Nat., Ed. XII, 503, 1766, Charleston, S. C.
Arius milberti, CUVIER & VALENCIENNES, XV, 74, 1840, New York; Charleston.
Arius milberti, GÜNTHER, Cat., V, 155, 1864.
Arius equestris, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1855, 26, Indianola, Texas.
Arius equestris, GÜNTHER, Cat., V, 173, 1864.
Arius felis and *equestris*, JORDAN & GILBERT, Synopsis, 110, 1883.

187. HEXANEMATICHTHYS SEEMANI, (Günther).

Head $3\frac{3}{4}$. A. 18. Head flat, depressed in front, its shields coarsely granular; occipital process wider than long, with a bluntish keel; fontanelle open to above the posterior margin of the eye, with a deep backward extending groove; barbels reaching slightly beyond base of pectorals; vomerine teeth in 2 small ovate patches; each joined to a larger palatine patch; axillary pore large; gill rakers 5 + 12. Paired fins dusky within. Panama. (Named for Dr. Seeman, who obtained the type.)

Arius seemani, GÜNTHER, Cat., V, 147, 1864, "Central America."
Tachisurus seemani, EIGENMANN, S. A. Nematognathi, 78, 1890.

188. HEXANEMATICHTHYS JORDANI, (Eigenmann & Eigenmann.)

Head $3\frac{1}{2}$. A. 18. Rather robust; interorbital area flat and smooth; shields of head finely and sparsely granular; opercle smooth; occipital process about as long as head, with an unusually sharp keel; fontanelle continued as a deep groove to base of occipital process; maxillary barbels reaching axil; snout blunt; vomerine teeth in 2 small, separate patches, contiguous to the larger palatine patches; gill rakers 6 + 9. Caudal deeply forked. Inner surface of paired fins black. Panama; two specimens known. (Named for David Starr Jordan.)

Tachisurus jordani, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., 1888, 142, Panama; EIGENMANN, S. A. Nematognathi, 79, 1890.

189. HEXANEMATICHTHYS CÆRULESCENS, (Günther).

Head 3½ to 3⅗. A. 17. Palatine patches of teeth small, scarcely larger than the vomerine patches which are oval and widely separated on median line; occipital process broader than long; head ¾ as wide as long; eye 6½ in head, 2 in snout, 3 in interorbital width; maxillary barbels to middle of pectorals; occipital process keeled, subtruncate posteriorly: dorsal spine 2 in head; pectoral spine equal to head without snout; upper caudal lobe about as long as head. Steel blue; fins largely black. West coast of Guatemala. (Günther.) (Latin, bluish.)

Arius cærulescens, GÜNTHER, Cat., v, 149, 1864, Rio Huamuchal, Guatemala.

190. HEXANEMATICHTHYS GUATEMALENSIS, (Günther).

Head 3⁵⁄₇. A. 18. Palatine patches of teeth much larger than vomerine; fontanelle almost obsolete, ending between the eyes, and not prolonged into a groove; head ⅔ as wide as long; body slender; fins mostly dusky; caudal about as long as head; body slender. Mazatlan to Central America; not rare.

Arius guatemalensis, GÜNTHER, Cat., v, 145, 1864, Guatemala; Chiapas.
Arius guatemalensis, JORDAN & GILBERT, *l. c.*, 48, 1882.

191. HEXANEMATICHTHYS ASSIMILIS, (Günther).

Fontanelle short and narrow, ending midway between tip of snout and middle of dorsal plate; head ¾ as wide as long. D. I, 7; otherwise essentially as in *H. guatemalensis*. (Günther). Atlantic coast of Central America, ascending streams. (*assimilis*, similar.)

Arius assimilis, GÜNTHER, Cat., v, 146, 1864, Lake Yzabal, Guatemala.
Arius assimilis, JORDAN, Proc. Ac. Nat. Sci. Phila., 1883, 281.

192. HEXANEMATICHTHYS SURINAMENSIS, (Bleeker).

Head 3⅗; depth 6. D. I, 7; A. 18. Palatine bands of teeth without backward projecting angle; teeth all villiform, those on the palate in 4 patches, the vomer and palatine patches sometimes contiguous. Granulations of the head continued forward to between the eyes. Fontanelle not continued backward as a groove; interorbital area without ridges; adipose fin about as high as long, shorter than the dorsal fin. Depth of head 1⅚ in its length; width 1⅓. Eye 5⅙ in the head, 2⅙ in the interocular, less than 2 in snout. Occipital process not longer than broad, not conspicuously keeled. Snout depressed; upper jaw little longer than lower. Vomer and palatine teeth contiguous. Maxillary barbels reaching to the base of the pectorals. Opercle smooth. Dorsal spine shorter than the pectoral spine, about 2 in the head, granulated in front, striated on sides; caudal 4 in length Surinam. (Bleeker).

Hexanematichthys surinamensis, BLEEKER, Versl. Med. Akad. Wet. Amsterd., 380, 1862, Surinam.
Arius surinamensis, GÜNTHER, Cat., v, 148, 1864.
Tachisurus surinmensis, EIGENMANM, S. A. Nematognathi, 81, 1890.

193. HEXANEMATICHTHYS DASYCEPHALUS, (Günther).

Head 4½. A. 21. Interorbital area with 4 very rough granulated ridges; (smoother in ♀); shields of head coarsely granular; vomerine and palatine teeth on each side confluent in a small roundish patch; gill membranes not forming an angle; fontanelle continued backward as a groove to base of occipital process; spines high; the dorsal 1¼ in head. Fins blackish. Panama (wrongly ascribed to the Hawaiian Islands). (*δασύς*, rough; *κεφαλή*, head.)

Arius dasycephalus, GÜNTHER, Cat., v, 1864, 157, Oahu, apparently an error.
Arius dasycephalus, JORDAN & GILBERT, *l. c.*, 51, 1882.

194. HEXANEMATICHTHYS LONGICEPHALUS, Eigenmann & Eigenmann.

Head 3⅗. A. 20. Allied to *H. dasycephalus*, but with the granular ridges on the head largely obscured by thick skin; occipital process as long as broad, its margins concave; fontanelle produced as a deep groove; barbels short; gill rakers short and thick, 4 + 5; spines short; fins dusky. Panama. (Eigenmann.) (*longus*, long; *κεφαλή*, head.)

Tachisurus longiçephalus, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., 1888, 143, Panama; EIGENMANN, S. A. Nematognathi, 82, 1890.

195. HEXANEMATICHTHYS RUGISPINIS, (Cuvier & Valenciennes).

Head 3½ to 4; depth 5½ to 6. D. I, 7; A. 19 to 21. Palatine bands of teeth not continued backward; teeth all villiform. Teeth on the palate in 2 patches. Eye small, about 10 in the length of the head; fontanelle not continued as a groove. Sides of the dorsal and pectoral spines granular; fontanelle angular behind, its posterior portion separated by a bridge and not ending in a groove; interorbital region with 4 ridges; intermaxillary band of teeth 4 times as wide as deep; palatine patches of teeth less than diameter of eye in width. Barbels villiform, the maxillary barbel reaching beyond base of pectoral; mouth inferior, the lips thick; no axillary pore. Body slender; head broad, depressed. Surinam to Para. (Eigenmann.) (*ruga*, wrinkle or roughness; *spina*, spine.)

Arius rugispinis, CUVIER & VALENCIENNES, xv, 77, 1840, Cayenne.
Arius rugispinis, GÜNTHER, Cat., v, 156, 1864.
Tachisurus rugispinis, EIGENMANN, S. A. Nematognathi, 83, 1890.

196. HEXANEMATICHTHYS PHRYGIATUS, (Cuvier & Valenciennes).

This species or variety is very close to *H. rugispinis*, differing as follows: Teeth on the palate in 2 patches. Eye small, about 10 in the length of the head; fontanelle not continued as a groove. Sides of the dorsal and pectoral spines striate; fontanelle broadly rounded behind; intermaxillary band of teeth 6 times as wide as deep; palatine patches 1½ diameters of eye in width and length. (Eigenmann.) Surinam to Maranhão. This form is regarded by Eigenmann as a subspecies of the preceding. As the two inhabit the same waters, *phrygiatus* should be either a distinct species or an extreme of individual variation. (*phrygiatus*, embroidered in gold.)

Arius phrygiatus, CUVIER & VALENCIENNES, XV, 79, 1840, Cayenne.
Arius phrygiatus, GÜNTHER, Cat., V, 156, 1864.
Tachisurus rugispinis phrygiatus, EIGENMANN, S. A. Nematognathi, 84, 1890.

74. TACHYSURUS, Lacépède.

197. TACHYSURUS NUCHALIS, (Günther).

Head 4; depth 5. D. I, 7; A. 21. Teeth on palate large, granular; no teeth on vomer; occipital process triangular, as long as broad, obtusely keeled; groove of fontanelle not reaching base of occipital process; palatine teeth in 2 subtriangular patches which sometimes meet in front; maxillary barbels nearly reaching tip of pectorals. Dorsal spine slightly serrated on both edges 1⅕ in head; adipose fin shorter than dorsal; pectoral spine as long as dorsal spine and stronger. Guiana. (Günther.) (*nuchalis*, pertaining to the nape.)

Arius nuchalis, GÜNTHER, Cat., V, 171, 1864, British Guiana.
Tachisurus nuchalis, EIGENMANN, S. A. Nematognathi, 86, 1890.

198. TACHYSURUS FISSUS, (Cuvier & Valenciennes).

Head 3 in length; maxillary barbels reaching almost to the middle of the pectoral fin. Teeth on the palate granular; no teeth on vomer; gill membrane not forming a free margin across the isthmus. Head broader than high. Soft portions of the head not pitted. Surinam. (Eigenmann.) (*fissus*, split.)

Arius fissus, CUVIER & VALENCIENNES, XV, 107, 1840, Cayenne.
Arius fissus, GÜNTHER, Cat., V, 172, 1864.
Tachisurus fissus, EIGENMANN, S. A. Nematognathi, 88, 1890.
Arius puncticulatus, CUVIER & VALENCIENNES, XV, 108, 1840, Buenos Ayres.

199. TACHYSURUS SPIXII, (Agassiz).

Head 3⅗ to 4; depth 5 to 5½. D. I, 7; A. 21. Palatine bands without backward prolongation. Teeth on the palate, granular; no teeth on vomer; gill membrane not forming a free margin across the isthmus. Head broader than high, more than 3 in the length. Axillary pore much smaller than nasal opening. Pectoral spine reaching halfway to the posterior third of the ventrals, or shorter; upper jaw projecting; posterior margin of the eye about in the middle of the head. Occipital process greatly narrowed behind, its width at tip not more than ½ diameter of eye. Teeth on the palate large, granular, 20 or fewer, some of the posterior ones usually much enlarged. Body compressed; head narrowed forward, fontanelle narrow; not interrupted, continued as a deep tapering groove to near base of occipital process. Maxillary barbels variable, long. Brownish above, silvery below, sometimes dotted. Coast of Guiana and Brazil, south to Santos; common. (Named for Jean Baptiste Spix, of Munich, explorer in Brazil.)

Pimelodus albidus, SPIX, in Agassiz, Gen. Spec. Pisc. Brasil, 19, 1829, Equatorial Brazil; name preoccupied.

Pimelodus spixii, AGASSIZ, Gen. Spec. Pisc. Brasil, 19, 1829, after Spix.

Tachisurus spixii, EIGENMANN, S. A. Nematognathi, 88, 1890.

Arius arenatus, CUVIER & VALENCIENNES, XV, 106, 1840, Cayenne.

Arius arenatus, GÜNTHER, Cat., V, 172, 1864.

Arius laticeps, GÜNTHER, Cat., V, 171, 1864, British Guiana; Trinidad.

200. TACHYSURUS MELANOPUS, (Günther).

Head 4⅓. P. 10; A. 21. Palatine teeth, bluntish conical; axillary pore large. Dorsal spine as long as from front of eye to gill opening; pectoral spine nearly as long; shields of head finely granular; groove of fontanelle not quite reaching occipital process; orbital rim of eye not free above; fins all more or less blackish; inner surface of ventral blackish. Both coasts of Central America; Rio Motagua (Günther); Panama (Steindachner). Our specimens from Rio Ahome, on the west coast of Mexico, above Mazatlan; the original specimens from the east slope of Guatemala. It is possible that the Pacific Coast form may be different from the original *melanopus*. According to Günther, the axillary pore in *melanopus* is nearly as large as the nostril. In our specimens the pore is much smaller than the nostril. (*μέλας*, black; *πούς*, foot or ventral fin.)

Arius melanopus, GÜNTHER, Cat., V, 172, 1864, Rio Motagua.

201. TACHYSURUS FÜRTHII, (Steindachner).

Head 3½; A. 25. Palatine teeth granular, coarser than in *T. melanopus;* pectoral spine reaching at least halfway to middle of ventrals; jaws subequal; occipital process not greatly narrowed behind; gill rakers long and slender, 4 + 11; gill membranes united to isthmus, without free margin; axillary pore small. (Eigenmann.) Panama. (For Ignatius Fürth, Austrian consul at Panama.)

Arius fürthii, STEINDACHNER, Ich. Beitr., IV, 29, 1876, Panama.

Tachisurus fürthii, EIGENMANN, S. A. Nematognathi, 90, 1890.

202. TACHYSURUS VARIOLOSUS, (Cuvier and Valenciennes).

A. 22 or 23. Teeth on the palate granular, the patches without backward projection; no teeth on vomer; gill membrane not forming a free margin across the isthmus. Head broader than high; soft portions of the head pitted; length of head to end of occipital process little less than 3 in the length, granular portion ⅕ longer than smooth portion of the head. Fontanelle not continued as a groove. Maxillary barbels extending beyond middle of pectorals. Cayenne. (Cuvier & Valenciennes.) (*variolosus*, pock-marked.)

Arius variolosus, CUVIER & VALENCIENNES, XV, 107, 1840, Cayenne.

Arius variolosus, GÜNTHER, Cat., V, 173, 1864.

Tachisurus variolosus, EIGENMANN, S. A. Nematognathi, 92, 1890.

203. TACHYSURUS MULTIRADIATUS, (Günther).

Head 4 in total length; depth 5¾. D. I, 7; A. 27 (5, 22). Barbels short, not reaching gill openings; teeth on palate granular, paved, in 2 small bands, widely separated on median line; fontanelle long and narrow, reaching almost to occipital process; bones of head roughly granular and sculptured; occipital process as long as broad; fins pale. Rio Bayano, near Panama. An ally of *T. fürthii*, apparently distinguished by the longer anal fin. (Kner.) (*multus*, many; *radiatus*, rayed.)

Bagrus arioides, KNER, Sitzber. Akad. Wiss., München, 1863, 227, not of Cuvier & Valenciennes; and KNER & STEINDACHNER, Bayer Akad., 1864, 47.

Arius multiradiatus, GÜNTHER, Cat., v, 173, 1864; (after Kner), Rio Bayano.

75. CATHOROPS, Jordan & Gilbert.

Cathorops, JORDAN & GILBERT, Bull. U. S. Fish Comm., 1882, 54, (*hypophthalmus*).

This group is closely allied to the typical section or genus of *Tachysurus*. It is distinguished chiefly by the slender and numerous gill rakers and by the low insertion of the eyes, suggesting the genus *Hypophthalmus*. The two species are American. (*καθοράω*, to look down; *ὤψ*, eye.)

a. Upper jaw much produced; breadth of mouth 2½ in head. HYPOPHTHALMUS, 204.
aa. Upper jaw scarcely produced; breadth of mouth 2 in head. GULOSUS, 205.

204. CATHOROPS HYPOPHTHALMUS, (Steindachner).

Head 3⅖. A. 22. Body elongate; head long, narrow, depressed; palantine teeth small, bluntly conic, almost granular; vomerine bands widely separate, each confluent with the large palatine band, which is not produced backward; both jaws thin, depressed, with narrow bands of teeth; barbels very long; the maxillary reaching near middle of pectoral spine; dorsal spine long; pectoral shorter; dorsal shield small; occipital process subtriangular, longer than broad, its sides concave, its middle angular but not keeled; fontanelle long and narrow, not quite reaching occipital process; shields of head rugose, with reticulating furrows. Fins mostly pale. Eye small, placed low, its middle below level of angle of mouth. L. 14 inches. Panama, rather scarce. (*ὑπό*, below; *ὀφθαλμός*, eye.)

Arius hypophthalmus, STEINDACHNER, Ichth. Beitr., IV, 31, pl. x, 1875, Panama.

205. CATHOROPS GULOSUS, (Eigenmann & Eigenmann).

Head 3¼. A. 23. Body slender; head broad, depressed; width of head 1½ in its length; occipital process about as broad as long, obtusely keeled; fontanelle narrow, continued backward as a groove; bones of head rugose; eye oblique, its center over posterior end of mandible, on level of angle of mouth; barbels reaching nearly to middle of pectoral: jaws very thin; no vomerine teeth; palatine teeth widely separated, in very narrow bands, the teeth obtusely conical; gill membranes united, with free margin. Gill rakers 12 + 30, 1½ times diameter of eye; pectoral pore large; spine slender, rather long. Panama. (Eigenmann.) (*gulosus*, large-mouthed.)

Tachisurus gulosus, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., 1888, 146, Panama; EIGENMANN, S. A. Nematognathi, 93, 1890.

76. ICTALURUS, Rafinesque.

(CHANNEL CATS.)

Ictalurus, RAFINESQUE, Ichth. Oh., 61, 1820, (*maculatus=punctatus*).

Elliops, RAFINESQUE, *l. c.*, 61, (*maculatus*).

Synechoglanis, GILL, Ann. Lyc. Nat. Hist. N. Y., 1859, 39, (*beadlei=punctatus*).

Body elongate, slender, compressed posteriorly. Head slender and conical. Supraoccipital bone or process prolonged backward, its emarginated apex receiving the acuminate anterior point of the second interspinal, thus forming a continuous bony bridge from the head to the dorsal spine. Mouth small, terminal, the upper jaw longer. Teeth subulate, in a short band on each jaw. Dorsal fin high, with one long spine, and usually 6 rays. Adipose fin over posterior portion of anal. Anal fin long, with 25 to 35 rays. Ventral fins each with 1 simple and 7 branched rays. Pectoral fins each with a stout spine, retrorse serrate within, and about 9 rays. Caudal fin elongate, deeply forked, the lobes pointed, the upper the longer. Coloration pale or silvery. Fresh waters of North America; 3 species known; the best of the Catfishes as food. They are active fishes, frequenting especially river channels and ripples in large streams. (*ἰχϑύς*, fish; *αἰλουρός*, cat; hence more correctly, *Ichthyælurus.*)

a. Anal fin very long, its base nearly ⅓ its body, its rays 32 to 35. FURCATUS, 206.
aa. Anal fin shorter, its rays 25 to 29.
  b. Barbels long, extending considerably beyond gill opening; anal rays usually about 26. PUNCTATUS, 207.
  bb. Barbels short, the longest only reaching gill opening; anal rays 28 or 29. MERIDIONALIS, 208.

206. ICTALURUS FURCATUS, (Le Sueur).

(CHUCKLE-HEADED CAT.)

Head small, about 4½ in length; depth 4 in adults to 5½ in young. Anal fin extremely elongate, its base nearly ⅓ the length of the body (without caudal); its rays 32 to 35 in number. Eye small, wholly anterior, the middle of the head being behind its posterior margin. Slope from dorsal to snout somewhat concave, especially in adults. Pectoral spine rather long; humeral spine stout, shortish, not reaching middle of pectoral spine. Skin thin. Color silvery, plain, or somewhat spotted. Size rather large, reaching a weight of over 40 pounds. Ohio to Iowa and Texas; not very common. (*furcatus*, forked.)

Pimelodus furcatus, LE SUEUR, in Cuvier & Valenciennes, IX, 136, 1840, New Orleans.
Ictalurus furcatus, JORDAN & GILBERT, Synopsis, 109, 1883.
Amiurus furcatus, GÜNTHER, Cat., V, 103, 1864.
Pimelodus affinis, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 26, Rio Grande. (Type, Nos. 837 and 838.)

207. ICTALURUS PUNCTATUS, (Rafinesque).

(CHANNEL CAT; WHITE CAT; BLUE CAT.)

Head 4; depth 5. Anal 25 to 30. Head rather small, narrow, convex above, so that the eye is little nearer the upper than the lower outline. Eye large, the middle point of the length of the head being near its posterior margin. Mouth small. Barbels long, the maxillary barbels reaching more or less beyond gill opening. Spines long. Humeral process long and slender, more than ½ the length of the pectoral spine, which is strongly serrated behind. Color light olivaceous above, the sides pale or silvery, and almost always with irregular small, round, dark spots; fins often with dark edgings. Body rather long and slender, back little elevated. Rivers of the Great Lake region and Mississippi Valley and streams tributary to the Gulf of Mexico; generally abundant in the channels of the larger streams, especially southwestward. It reaches a weight of 20 to 25 pounds, and is an excellent food fish, not inferior to the Black Bass. Variable. (*punctatus*, spotted.)

Silurus punctatus, RAFINESQUE, Amer. Month. Mag., 1818, 359, Ohio River.

Ichthælurus punctatus, JORDAN, Bull. U. S. Nat. Mus., x, 1877, 76.

Pimelodus caudafurcatus, LE SUEUR, Mém. Mus., v, 152, 1819, Wabash River, Mississippi River.

Pimelodus cærulescens, RAFINESQUE, Ichth. Oh., 63, 1820, Ohio River.

Amiurus caudafurcatus, GÜNTHER, Cat., v, 102, 1864.

Pimelodus maculatus, *pallidus*, *argentinus*, *argyrus*, with varieties *erythroptera*, *marginatus*, *lateralis*, *leucoptera*, RAFINESQUE, Quart. Jour. Sci. London, 1820, and Ichth. Oh., 62, etc., 1820, Ohio River.

Pimelodus furcifer, CUVIER & VALENCIENNES, xv, 139, 1840, Surinam, by error.

Pimelodus gracilis, HOUGH, Ann. Rept. Regents, Albany, 1852, 26, Somerville, N. Y.

Pimelodus vulpes, GIRARD, Proc. Ac. Nat. Sci. Phila., 1858, 170, Rivers of Texas. (Type, Nos. 843, 845, and 846.)

Synechoglanis beadlei, GILL, Trans. Lyc. Nat. Hist. N. Y., 1859, 2, St. Catherines, Ontario. (Type, No. 5115.)

Pimelodus houghi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 159, Somerville; Ogdensburgh; Foxburg, Penn. (Type, No. 1532.)

Pimelodus megalops, GIRARD, *l. c.*, 161, Black Warrior River; Bigsby River, Alabama. (Type, No. 1532.)

Pimelodus graciosus, GIRARD, *l. c.*, 161, Prairie Mer Rouge, Louisiana. (Type, No. 1511.)

Pimelodus hammondi and *notatus*, ABBOTT, Proc. Ac. Nat. Sci. Phila., 1860, 568, Fort Riley.

Ictalurus simpsoni, GILL, Proc. Bost. Soc. Nat. Hist., 1862, 43, Platte River.

Ictalurus robustus, JORDAN, Bull. U. S. Nat. Mus., x, 1877, 76, Cairo, Illinois. (Type, No. 2056.)

208. ICTALURUS MERIDIONALIS, (Günther).

Head 5; depth 4. D. I, 6; A. 28 or 29. Similar to *I. punctatus*, but with the barbels shorter, the longest only reaching gill opening. Brownish above, with blue reflections, silvery below. Rio Usumacinta, Guatemala. (Günther.) (*meridionalis*, southern.)

Amiurus meridionalis, GÜNTHER, Cat., v, 1864, 102, and in Trans. Zoöl. Soc. Lond., 1868, 473, Rio Usumacinta, Guatemala.

77. AMEIURUS,* Rafinesque.

(HORNED POUT.)

Ameiurus, RAFINESQUE, Ichth. Oh., 65, 1820, (*cupreus*=*natalis*).

Gronias, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 231, (*nigrilabris*).

Haustor, JORDAN AND EVERMANN, subgen. nov., (*lacustris*).

Amiurus or *Ameiurus*, corrected spelling.

Body moderately elongated, robust anteriorly, the caudal peduncle much compressed. Head large, wide; supraoccipital extended backward, terminating in a more or less acute point, which is entirely separate from the second interspinal buckler; skin covering the bones thick. Eyes rather small, but developed. Mouth large, the upper jaw in most species the longer. Teeth in broad bands on the premaxillaries and dentaries; band of upper jaw convex in front, of equal breadth, and without

---

*The Horned Pout are "dull and blundering fellows," fond of the mud and growing best in weedy ponds and rivers without current. They stay near the bottom, moving slowly about with their barbels widely spread, watching for anything eatable. They will take any kind of bait from an angle worm to a piece of tomato can, without hesitation or coquetry, and they seldom fail to swallow the hook. They are very tenacious of life, opening and shutting their mouths for half an hour after their heads have been taken off. They spawn in spring, and the old fishes lead the young in great schools near the shore, caring for them as a hen cares for her chickens. "A bloodthirsty and bullying set of rangers, with ever a lance at rest and ready to do battle with their nearest neighbor."—*Thoreau.*

backward prolongation at the angle. Dorsal between the pectorals and ventrals higher than long, with a pungent spine and about 6 branched rays. Adipose fin short, inserted over the posterior half of the anal. Anal fin of varying length, with 15 to 35 rays, the usual number being 20 or 21. Caudal fin short, truncate in typical species, more or less forked in those species which approach the genus *Ictalurus*. Ventrals each with 1 simple and 7 branched rays. Pectoral fins each with a stout spine, which is commonly retrorse serrate behind. Lateral line usually incomplete. Species very numerous, swarming in every pond and sluggish stream in the Eastern United States; especially characteristic of quiet waters; 1 species *(A. cantonensis)* in China. The species are variable and not easily distinguished. Those in which the caudal fin is forked make an approach to the genus *Ictalurus*. The lack of connection between the supraoccipital and the interspinal buckler is the only character by which these species can be separated from *Ictalarus*, of which group *Ameiurus* should perhaps be regarded as a section. (ἀ, privative; *μείουρος*, curtailed; the caudal fin not notched.)

HAUSTOR, (*haustor*, one who swallows):

a. Caudal fin lunate or forked; occipital process produced backward, not falling far short of the interspinal bones; species of large size, approaching *Ictalurus;* coloration more or less grayish or silvery.

  b. Anal rays 25 to 35; humeral process very short and blunt, usually covered by skin, about ½ length of pectoral spine. LACUSTRIS, 209.

  bb. Anal rays usually 20 to 22 (19 to 24).

    c. Base of anal fin longer than head; head rather narrow, the bony occipital bridge almost complete. LUPUS, 210.

    cc. Base of anal fin much shorter than head.

      d. Humeral process strongly rugose; head and mouth narrow in young, becoming very broad in the adult. CATUS, 211.

      dd. Humeral process slightly furrowed; head narrow. DUGESI, 212.

  bbb. Anal very short, of about 16 rays, its base not ⅕ length of body and little more than ½ head; head broad, with long barbels. OKEECHOBEENSIS, 213.

AMEIURUS:

aa. Caudal fin entire, truncate or very slightly marginate behind. Eyes well developed. Coloration, brown or yellowish, not silvery.

  e. Anal fin long, of 22 to 27 rays (counting rudiments), its base more than ¼ body.

    f. Head and body elongate, the back high, the head much longer than broad; pectoral and dorsal spines very long. EREBENNUS, 214.

    ff. Head and body robust, the back low, the head not much longer than broad, pectoral and dorsal spines moderate. NATALIS, 215.

  ee. Anal fin moderate or short, of 15 to 22 rays, its base 4 to 5 in the body.

    g. Lower jaw projecting; anal rays 20. VULGARIS, 216.

    gg. Lower jaw not projecting.

      h. Body rather robust, the depth in the adult 3½ to 4½ in length; head not very flat above.

        i. Pectoral spines long, 2 to 2½ in head; anal rays more than 20. NEBULOSUS, 217.

        ii. Pectoral spines short, 2½ to 3 in head, longest in young. Anal fin shorter, of 17 to 19 rays counting rudiments. MELAS, 218.

      hh. Body slender and low, varying with age, the depth 5½ to 8 times in length; head in adult broad and very flat; anal short, usually with 18 or 19 rays; a broad dusky shade across the base of dorsal which is rather high. PLATYCEPHALUS, 219.

GRONIAS, (*γρώνη*, a cavern):

aaa. Caudal fin entire; eyes covered by thick skin.

  j. Color chiefly black. NIGRILABRIS, 220.

Subgenus HAUSTOR, Jordan & Evermann.

209. AMEIURUS LACUSTRIS, (Walbaum.)

(Catfish of the Lakes; Great Fork-tailed Cat; Mississippi Cat; Florida Cat; Flannel mouth Cat; Mathemeg, or Ugly fish.)

Head 4 in length; depth 5; distance to dorsal spine 2¾. D. I, 5; P. I, 9; A. 28 (25 to 32). Body rather stouter, head much broader, lower, and more depressed than in *Ictalurus punctatus*, its greatest width ⅚ its length. Interorbital space somewhat more than ½ the length of head. Width of the mouth about ½ head. Eye moderate, wholly in front of middle point of head. Top of head covered with a thicker skin than in *punctatus*, so that the bones are nearly concealed. Upper surface of the head quite flattish; so that the eyes are much nearer the upper than the lower surface of the head. Barbels long, all black, the maxillary barbel reaching beyond head. Humeral process very short and blunt, covered by skin, a little more than ⅓ the length of the pectoral spine. Caudal deeply forked, the upper lobe rather longer and narrower than the lower; dorsal a little nearer snout than adipose fin. Anal base as long as head. Olivaceous slaty, growing darker with age; sides pale, without dark spots; anal dusky edged. Saskatchewan River and Great Lakes to Florida and Texas; abundant in all large bodies of water, especially in the Mississippi and the Great Lakes. One of the largest of the catfishes, reaching a weight of 150 pounds or more. (*lacustris*, living in lakes.)

Gadus lacustris, Walbaum, Artedi Pisc., 1792, 144, Arctic America, based on the Mathemeg, or Land Cod, of Pennant.

Pimelodus nigricans, Le Sueur, Mém. Mus., v, 153, 1819, Lake Erie; Lake Ontario.

Pimelodus nigrescens, Richardson, Fauna. Bor. Amer., III, 1836, 134, after Le Sueur.

Pimelodus borealis, Richardson, *l. c.*, 135, 1836, Pine Island Lake.

Amiurus borealis, Günther, Cat., v, 100, 1864; Jordan, *l. c.*, 84, 1877.

Ictalurus lacustris, Jordan & Gilbert, Synopsis, 108, 1883.

Amiurus ponderosus, * Bean, Proc. U. S. Nat. Mus., 1879, 286, St. Louis. (Type, 23388.)

Ictalurus ponderosus, Jordan & Gilbert, Synopsis, 189, 1883.

Ictalurus nigricans, Jordan & Gilbert, Synopsis, 882, 1883.

210. AMEIURUS LUPUS, (Girard).

Anal 23. Body rather slender. Head narrow, longer than broad, its width 4¾ in length, being less than its length above. Dorsal spine much nearer snout than adipose fin. Base of anal longer than head. Pectoral spines long and slender, dentate. Barbels long. Supraoccipital bone almost meeting the interspinal; the relations of the species therefore very close to *Ictalurus punctatus*. Dusky olivaceous, sides silvery. Rio Nueces and Rio Pecos, Texas; a rather doubtful species, apparently intermediate between *Ictalurus punctatus* and *Ameiurus catus*. (*lupus*, wolf.)

Pimelodus lupus, Girard, Pac. R. R. Expl., x. 211, 1858, Rio Pecos; Jordan, *l. c.*, 83, 1877; Günther, Cat., v, 101, 1864.

Ictalurus lupus, Jordan & Gilbert, Synopsis, 107, 1883.

---

* *Amiurus ponderosus*, Bean, described from the Mississippi River at St. Louis from a specimen 5 feet long, weighing 150 pounds, is probably a giant example of this species, from which it differs only in the presence of 35 anal rays. In 4 specimens, which we refer to *A. lacustris*, we count 25, 27, 28, and 32 rays. We see no reason for doubting the identity of the "Land Cod," or Mathemeg of the Hudson Bay region, with *Ameiurus nigricans*. This northern species, called *borealis* by Richardson, is the original *lacustris* of Walbaum.

211. AMEIURUS CATUS,* (Linnæus).

(WHITE CAT; CHANNEL CAT OF THE POTOMAC.)

Body stout, slender in the young, the head becoming excessively broad in the adult. Barbels long, except nasal barbel; caudal fin deeply forked, the upper lobe the longer. Humeral process more than ½ the length of the spine, extremely rugose. Anal rays 21 (19 to 22); base of anal 4½ to 5 in length. Dorsal fin inserted nearly midway between adipose fin and snout. Pale olive bluish, silvery below without dark spots, but sometimes mottled or clouded. L. 2 feet. Delaware River to Texas, very common in the coastwise streams and swamps, especially about Chesapeake Bay and in Florida; also lately introduced into the Sacramento and San Joaquin rivers, where it is becoming abundant. (Low Latin, *catus*, cat.)

Silurus catus, LINNÆUS, x, 305, 1758; based on the Catfish of Catesby, (*Bagre secundæ speciei marcgravei affinis*), which is a rude figure of the adult, or "*lophius*," form of this species; Northern part of America.

Pimelodus albidus, LE SUEUR, Mém. Mus., v, 148, 1819, Delaware River.

Pimelodus lynx, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 160, Potomac River.

Amiurus albidus, JORDAN, *l. c.*, 84, 1877.

Ictalurus albidus, JORDAN & GILBERT, Synopsis, 107, 1883.

Amiurus niveiventris, COPE, Proc. Am. Phil. Soc., 1870, 486, Neuse River; JORDAN, *l. c.*, 83, 1877.

Ictalurus niveiventris, JORDAN & GILBERT, Synopsis, 107, 1883.

Amiurus lophius, COPE, Proc. Am. Phil. Soc., 1870, 486, Potomac River; JORDAN, *l. c.*, 85, 1877.

Ictalurus lophius, JORDAN & GILBERT, Synopsis, 107, 1883.

Ictalurus macaskeyi and *I. kevinskii*, STAUFFER, History Lancaster County, Pa., 578, 1869, Lancaster County, Pa.

212. AMEIURUS DUGESI, Bean.

Allied to *A. catus*, but with narrower head, its width 5 in length; humeral process slightly furrowed, not strongly rugose as in *A. catus;* caudal deeply forked. Color plumbeous, silvery below. D. I, 6; A. 21. Rio Turbio, Guanajuato, Mexico, west of the Sierra Madre. (To Alfredo Dugès, a naturalist and teacher in Guanajuato.)

Ameiurus dugèsi, BEAN, Proc. U. S. Nat. Mus., 1879, 304, Rio Turbio, Guanajuato. (Type, No. 23122 and 23123.)

213. AMEIURUS OKEECHOBEENSIS, (Heilprin).

This species is known only from a figure,† no description having been published. This figure shows the form of *Ameiurus catus*, the caudal deeply forked, barbels long and slender, the fins low, the anal very short, apparently of 15 or 16 rays and much shorter than head, the spines small, the occipital bridge apparently complete as in *Ictalurus* (to which genus it may belong), and the color entirely black, as is the case with nearly all fishes in black-water swamps. The type is from Kissimee River, near Lake Okeechobee, in the everglades of Florida.

---

* We indentify the *Silurus catus* of Linnæus, or rather the figure of Catesby on which it is based with *Amiurus albidus* of Le Sueur, the adult of which species well answers to Catesby's account, and fairly matches his rough figure. Catesby's fish was from the "Northern part of America," and had a mouth so large that the fish could swallow another of its own size, ("ejusque amplitudinis rictus, et piscem æqualis magnitudinis capere possit." It reaches a length of 2 feet. The adult form (called "*lophius*") of the present species abounds in the Potomac, and has a larger mouth than any other of the tribe. Southern specimens called *niveiventris* by Cope, from the Neuse to St. Johns, are rather slenderer in from, but we know of no character by which the two can be positively separated. If a difference exists, the southern form may stand as *Ameiurus niveiventris*, the northern as *A. catus*.

† The figure of Heilprin has much in common with that of Catesby, which is the basis of the name *Ameiurus catus*.

Ictalurus okeechobeensis, HEILPRIN, Trans. Wagner Inst. Sci. Phila., I, 1887, pl. 18, Kissimee River, Florida.

Subgenus AMEIURUS.

214. AMEIURUS EREBENNUS, Jordan.

Body rather elongate, compressed, the depth about 4⅕ in length. Dorsal region rather elevated; the head quite long and narrowed forward, 4 times in length of body. Head more narrowed than in *A. natalis;* width of head in front of eye little more than ½ its length; width of the mouth about ½ length of head. Greatest width of head contained 1⅓ times in its length. Dorsal fin slightly nearer the snout than the adipose fin, unusually high, its spine long. Pectoral spines strong, about ½ as long as the head. Anal fin long, deep, nearly ⅓ the length of the body, of 22 to 24 rays. Adipose fin large; caudal fin rather short, truncate behind. Jaws subequal. Supraoccipital process but little free behind. Color black; belly paler; fins and barbels black. Coast swamps and black-water streams from New Jersey to Florida. Close to *A. natalis*, but with narrower head and longer spines. (ἐρεβεννός, color of Erebus, which is very black.)

Ameiurus erebennus, JORDAN, Bull. U. S. Nat. Mus., x, 85, 1877, St. Johns River, Florida; JORDAN & GILBERT, Synopsis, 105, 1883.
Amiurus prosthistius,* COPE, Proc. Ac. Nat. Sci. Phila., 1883, 133, Batstoe River, N. J.

215. AMEIURUS NATALIS, (Le Sueur).

(YELLOW CAT.)

Anal rays 24 to 27. Body more or less short and chubby, sometimes extremely obese (var. *natalis*), sometimes more elongate (var. *lividus*). Head short and broad; mouth wide, the jaws equal (var. *lividus*), or the upper jaw longest (var. *cupreus*). Yellowish, greenish, or blackish. Great Lake region to Virginia and Texas, and southward; generally abundant, extremely variable, and running into several varieties.† (*natalis*, having large nates, or buttocks.)

---

* Except that the caudal fin is said to be rounded rather than truncate, *A. prosthistius* agrees with *A. erebennus*, with which we think it will prove identical. Greatest width of head equal to depth of body; eye small, 5 in interorbital width; dorsal spine inserted much nearer tip of snout than adipose fin; pectoral spines a little larger than dorsal spine; maxillary barbel reaching middle of pectoral spine; humeral process extending a little farther; black, whitish below; fins black; pectoral and ventral pale at base; head 3⅔; depth 4¼. D. I, 6; A. 24 to 27. Batstoe River, New Jersey.—*Cope.*

† These varieties have been thus diagnosed:

a. Dorsal considerably nearer snout than adipose fin.
  b. Jaws equal; spines very short; anal rays 25; colors yellowish brown. Ohio River to Arkansas, North Carolina, and south. LIVIDUS
  bb. Jaws unequal, the upper the longer.
    c. Anal rays 24 or 25, the fin rather low, its base 3¼ in body, nape not swollen.
      d. Colors pale, yellowish brown. Mississippi valley and south. CUPREUS

Pimelodus natalis, LE SUEUR, Mém. Mus., v., 154, 1819, North America.

Amiurus natalis, GÜNTHER, v, 101, 1864; JORDAN, *l. c.*, 86, 1877.

Silurus lividus, var. *fuscatus*, and *Silurus cupreus*, RAFINESQUE, Quart. Jour. Sci. London, 1820, 48, 51, Ohio River.

Pimelodus felinus et antoniensis, GIRARD, Pac. R. R. Expl., x. 209, 1858, Canadian and San Antonio rivers, Texas. (Type, Nos. 924 and 923.)

Pimelodus catus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 159, Aux Plaines, Illinois.

Pimelodus cupreoides, GIRARD, *l. c.*, 1859, 159, Aux Plaines, Illinois. (Type, No. 1497.)

Pimelodus cœnosus, RICHARDSON, Fauna Bor. Amer., III, 132, 1836, Lake Huron.

Pimelodus cupreus, RAFINESQUE, Ichth. Oh., 65, 1820, Ohio River.

Amiurus natalis, JORDAN & GILBERT, Synopsis, 105, 1883.

Amiurus bolli, COPE, Bull. U. S. Nat. Mus., xx, 35, 1880, Little Wichita River, Texas.

Ameiurus bolli, JORDAN & GILBERT, Synopsis, 881, 1883; this form has rather longer spines than usual in *natalis*, approaching *erebennus*.

Amiurus natalis analis, JORDAN, *l. c.*, 1877, 81, Arkansas River. (Type, No. 31088.)

216. AMEIURUS VULGARIS, (Thompson).

Anal rays 20. Body moderately elongate; depth 4½ to 5 in length; head 3½ to 4. Barbels long; mouth wide; head longer than broad, rather narrowed forward; profile rather steep, evenly convex; dorsal region more or less elevated. Lower jaw more or less distinctly projecting; in other respects scarcely distinct from *A. nebulosus*, with which it may intergrade. Dark reddish brown or blackish. L. 18 inches. Vermont to Minnesota and Illinois, chiefly northward; not rare. (*vulgaris*, common, which is not true in most of its range.)

Pimelodus vulgaris, THOMPSON, Hist. Vermont, 138, 1842, Lake Champlain.

Pimelodus dekayi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 160, Oswego, N. Y. (Type, No. 1513.)

Pimelodus ailurus, GIRARD, Pac. R. R. Expl., x, 210, 1858, L. Amelia, Minnesota. (Type, No. 904.)

Amiurus ælurus, JORDAN, *l. c.*, 1877, 88.

Amiurus vulgaris, JORDAN & GILBERT, Synopsis, 105, 1883.

217. AMEIURUS NEBULOSUS, (Le Sueur).

(HORNED POUT; COMMON BULLHEAD; SMALL CATFISH; SCHUYLKILL CAT; SACRAMENTO CAT.)

Body rather elongate; depth 4 to 4½ in length. Anal fin usually with 21 or 22 rays, its base 4 in body; dorsal fin inserted rather nearer adipose fin than end of snout. Upper jaw usually distinctly longer than lower. Humeral process more than ½ the length of pectoral spine, which is rather long. Color dark yellowish brown, more or less clouded, sometimes yellowish, sometimes nearly black. L. 18 inches. Great Lakes, Ohio Valley, eastward to Maine, southwestward to Texas, and southeastward to Florida. The common bullhead, or Horned Pout of the North and East, abundant in every pond and stream; also introduced about 1877 into the Humboldt, Sacramento, San Joaquin and Gila rivers, where it is now excessively abundant. Variable. (*nebulosus*, clouded.)

Pimelodus nebulosus, LE SUEUR, Mém. Mus., v. 149, 1819, Lake Ontario.

Pimelodus atrarius, DE KAY, N. Y. Fauna: Fish., 185, 1842, Wappingers Creek, Dutchess County, N. Y.

---

dd. Colors dark, black or greenish. Great Lake region, north and east. CŒNOSUS.

cc. Anal 26; rays low, its base 3½ in body; spines weak; nape more or less swollen and elevated. Alabama River to Texas. ANTONIENSIS.

ccc. Anal 27, its base 3⅓ in length, its rays high, more than ½ head; spines strong, nape not swollen. Little Red River, Ark. ANALIS.

aa. Dorsal spine inserted nearer adipose fin than tip of snout, the posterior part of body thickened and shortened; jaws subequal. Great Lakes to North Carolina and south. NATALIS.

Amiurus catus, JORDAN & GILBERT, Synopsis, 104, 1883.
Pimelodus felis, AGASSIZ, Lake Superior, 281, 1850, Lake Superior.
Pimelodus vulpeculus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 160, Charleston. (Type, No. 1530.)
Pimelodus hoyi, GIRARD, *l. c.*, 159, 1859, Racine, Wisconsin. (Type, No. 1539.)
Ameiurus mispilliensis, COPE, Proc. Am. Phil. Soc., 1870, 486, Mispillion Creek, Delaware.

Of the variations of this species, the following seem worthy of recognition as subspecies:

217a. AMEIURUS NEBULOSUS CATULUS, (Girard).

Color nearly black; profile very steep. Abundant in the streams of Texas. (Diminutive of *catus*, cat.)

Pimelodus catulus, GIRARD, Pac. R. R. Survey, 208, 1858, Fort Smith, Arkansas.

217b. AMEIURUS NEBULOSUS MARMORATUS, (Holbrook).

Body sharply mottled with brown, greenish, and whitish; jaws equal, or nearly so; depth about 4 in length; slope of profile very steep. Dorsal fin high; the spine more than ½ length of head; dorsal spine nearer adipose fin than snout. Barbels long. Head 3¼ in length. Anal 21. Lowland streams and swamps from southwestern Indiana (Switz City) southward and eastward to Florida; the color strongly marked, but this intergrades with mottled specimens of *A. nebulosus*. (*marmoratus*, marbled.)

Pimelodus marmoratus, HOLBROOK, Jour. Ac. Nat. Sci. Phila., 1855, 54, South Carolina. (Type, No. 9031.)
Ameiurus marmoratus, JORDAN & GILBERT, Synopsis, 104, 1883.

218. AMEIURUS MELAS, (Rafinesque).

(BLACK BULLHEAD; SMALL CATFISH.)

Color almost black, varying to yellowish and brown. Body stout, short and deep, the depth 3½ to 4¼ in length. Head broad behind, rather contracted forward, the front steeply elevated. Pectoral spines short, 2½ to 3 in head. Anal fin short and deep, of 17 to 19 rays, its base nearly 5 in length, the color of the rays forming a sharp contrast with that of the dusky membranes. Jaws nearly equal. Barbels longer than head. Humeral process rather long, rugose. Size small. Northern New York (Genesee River) to Kansas and Texas. Common, especially west of the Mississippi. Variable. Much resembles *A. nebulosus*, but smaller, with shorter, deeper anal, and especially shorter pectoral spines. (*μέλας*, black.)

Silurus melas, RAFINESQUE, Quart. Jour. Sci. Lit. Arts Lond., 1820, 51, Ohio River.
Pimelodus confinis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 159, Racine, Wis. (Type, No. 1511.)
Amiurus obesus, GILL, Proc. Bost. Soc. Nat. Hist., 1862, 45, Nebraska. (Type, No. 8968.) JORDAN, *l. c.*, 89, 1877.
Pimelodus pullus, DE KAY, N. Y. Fauna: Fishes, 184, 1842, Lake Pleasant, Lake Janet, N. Y.
Amiurus pullus, JORDAN, *l. c.*, 93, 1883.
Amiurus cragini, GILBERT, Bull. Washb. Lab. Nat. Hist., 1884, I, 10, Garden City, Kansas. (Type, No. 36814.)
Amiurus brachyacanthus, COPE, Bull. U. S. Nat. Mus., XX, 35, 1880, Medina River, Texas.
Ameiurus brachyacanthus, JORDAN & GILBERT, Synopsis, 881, 1883.
Silurus xanthocephalus, RAFINESQUE, Quart. Jour. Sci. Lit. Arts Lond., 1820, 61, Ohio River; JORDAN, *l. c.*, 42, 1877.
Ameiurus xanthocephalus, JORDAN & GILBERT, Synopsis, 104, 1883.

219. AMEIURUS PLATYCEPHALUS, (Girard).

(MUD CAT; BROWN CAT.)

Body extremely elongate; mesially, nearly terete. Head low, flat, and broad; upper jaw strongly projecting, the head much broader and more depressed in old specimens. Dorsal fin high, $\frac{2}{3}$ length of head, its spines nearer snout than adipose fin; depth $5\frac{1}{2}$ to 8 in length. Head $3\frac{1}{2}$; its width 3 to 5, base of anal 6; anal rays 16 to 20. Caudal slightly emarginate. Young specimens much less elongate than adults. Clear olive brown, varying into yellowish or greenish; a blackish horizontal bar or shade at base of dorsal. L. 18 inches; slenderest of the species of the genus, and almost entirely herbivorous, its elongate intestine being always filled with water plants. A good food fish. The form called *brunneus* is the young, differing from the adult much as the young of *A. catus* differs. Abundant in the streams of Carolina and eastern Georgia, Cape Fear to the Chattahoochee. (πλατύς, wide; κεφαλή, head.)

Pimelodus platycephalus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 161, Anderson, S. C. (Type, No. 1534.)

Amiurus brunneus, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1877, 366, Ocmulgee River, Flat Shoals, Georgia. (Type, No. 20148.)

Ameiurus brunneus, JORDAN, *l. c.*, 93, 1877.

Amiurus brunneus, JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 28, 1878.

Amiurus brunneus and *platycephalus*, JORDAN & GILBERT, Synopsis, 103, 1883.

Subgenus GRONIAS, Cope.

220. AMEIURUS NIGRILABRIS, (Cope).

Black above; jaws and fins black; sides varied with yellowish; belly pale. Eyes more or less rudimentary and concealed beneath the skin. Jaws equal. Dorsal spine midway between snout and middle of adipose fin; barbels short; caudal slightly emarginate. Anal with 18 rays. Branchiostegals 10. Cave streams tributary to Conestoga River in eastern Pennsylvania. Very close to *Ameiurus melas*, from which, or some similar species, it is doubtless recently descended. (*niger*, black; *labrum*, lip).

Gronias nigrilabris, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 231, Conestoga River.

Amiurus nigrilabris, JORDAN, *l. c.*, 92, 1877.

Gronias nigrilabris, JORDAN & GILBERT, Synopsis, 102, 1883.

78. LEPTOPS, Rafinesque.

(MUD CATS.)

Leptops, RAFINESQUE, Ich. Oh., 64, 1820, (*viscosus* = *olivaris*).

Opladelus, RAFINESQUE, *l. c.*, 64, (*nebulosus*).

Ilictis, RAFINESQUE, *l. c.*, 66, (*limosus*).

Hopladelus, GILL, (corrected spelling).

Pelodichthys, JORDAN, corrected spelling of *Pilodictis*,* RAFINESQUE, which is an imaginary fish.

Body elongated, slender, much depressed anteriorly. Head large, very wide and depressed. Skin very thick, entirely concealing the skull; supraoccipital bone entirely free from the head of the second interspinal;

---

* "*Pilodictis limosus*," Rafinesque, Jour. Phys., Paris, 1819, 422, was based on a "drawing by Mr. Audubon," which drawing, as shown by Rafinesque's copy, is merely a fancy sketch of an imaginary catfish. The name should therefore be disregarded, although it is the earliest supposed to belong to this group. Of the remaining synonyms *Leptops* stands next in date.

eyes small. Mouth very large, anterior and transverse, the lower jaw always projecting beyond the upper. Teeth in broad villiform bands on the premaxillaries and dentaries; band of upper jaw convex anteriorly, and at insertion of the maxillaries, abruptly angularly deflected, proceeding backward as an elongated triangular extension. Band slightly divided at the symphysis; lower band of teeth anteriorly semicircular and attenuated to the corners of the mouth. Branchiostegals 12. Dorsal fin over the posterior half of the interval between pectorals and ventrals, with a spine and 7 rays; spine rather small, more or less enveloped in thick skin. Adipose fin large, its elongated base over posterior $\frac{1}{2}$ of anal. Anal fin small, commencing far behind the anus; of about 13 rays. Caudal oblong, subtruncate, with numerous accessory rays, recurrent above and behind. Pectorals with a broad compressed spine, serrated on both margins and with a prolonged fleshy integument, obliquely striated. One species known; a large catfish living in the muddy bottoms of deep rivers. (λεπτός, slender; ὤψ, face, the head being slender in profile.)

221. LEPTOPS OLIVARIS, (Rafinesque).

(Mud Cat; Yellow Cat; Bashaw; Russian Cat.)

Body slender, depressed forward, the head extremely flat, the lower jaw the longer. Barbels short. Dorsal spine very weak, $\frac{1}{2}$ the height of the fin; caudal very slightly emarginate behind. Anal short, its base about $\frac{1}{6}$ the length, its rays 12 to 15. Humeral process short. Yellowish, much mottled with brown and greenish, whitish below. Size very large, reaching a weight of 50 to 75 pounds. Rivers of the Mississippi Valley and Southern States, southwest to Chihuahua: abundant in deep, sluggish waters. A fish of unprepossessing appearance, although one of the best of the family as food. (*olivaris*, olive-colored.)

Silurus olivaris, Rafinesque, Amer. Month. Mag., 1818, 355, Ohio River.
Hopladelus olivaris, Gill, Ichth. Simpson's Expl., 426, 1876.
Pelodichthys olivaris, Jordan, *l. c.*, 95, 1877.
Silurus nebulosus, *viscosus*, and *limosus*, Rafinesque, Quart. Jour. Sci. Lit. Arts Lond., 1820, 50, Ohio River.
Pimelodus punctulatus, Günther, Cat., v, 101, 1864.
Pylodictis limosus, Rafinesque, Ichth. Oh., 67, 1820, based on a drawing by Audubon; Ohio and Mississippi rivers.
Pimelodus punctulatus, Cuvier & Valenciennes, xv, 134, 1840, New Harmony, Indiana.
Pimelodus æneus, Cuvier & Valenciennes, xv, 135, 1840, New Orleans.
Pilodictis olivaris, Jordan & Gilbert, Synopsis, 102, 1883.
Leptops olivaris, Jordan & Gilbert, Synopsis, 881, 1883.

79. NOTURUS, Rafinesque.

(Stone Cats.)

Noturus, Rafinesque, Amer. Month. Mag., November, 1818, 41, (*flavus*).

This genus contains a single species, similar to the species of *Schilbeodes* in appearance and habit, but having the dentition of *Leptops*, the band of teeth in the upper jaw having a backward prolongation from the outer posterior angle. The adipose fin is adnate to the back as in *Schilbeodes*, and there is a poison gland at the base of the pectoral fin. The species reaches a larger size than those of *Schilbeodes*, and it frequents rivers and channels rather than small brooks. (*νῶτος*, back; *οὐρά*, tail, in allusion to the connection of the caudal with the adipose fin; "means tail over the back." Rafinesque.)

222. NOTURUS FLAVUS, Rafinesque.

(Stone Cat.)

Body elongate; the head depressed, broad, and flat, nearly as broad as long; middle of body subcylindrical; tail compressed. Head about $4\frac{1}{4}$ in length; width of head $5\frac{1}{3}$; depth $5\frac{2}{3}$ in length; distance to dorsal about 3 in length. Barbels short. A strong keel on back behind dorsal, leading to adipose fin; adipose fin deeply notched. Dorsal spine very short; pectoral spine retrorsely serrate in front, slightly rough or nearly entire behind; its length 3 in distance from snout to dorsal; caudal rounded behind. Anal rays about 16. Humeral process very short and sharp. Color nearly uniform yellowish brown, sometimes blackish above, fins yellow-edged. The largest species of stone cat, reaching a length of more than a foot. Great Lake region, westward and south to Montana, Wyoming, and Texas; rather common, especially westward. (*flavus*, yellow.)

Noturus flavus, Rafinesque, Amer. Month. Mag., 1818, 41, Falls of Ohio River.
Noturus luteus, Rafinesque, Jour. de Phys., 1819, 421, Ohio River; Günther, Cat., v, 104, 1864; Jordan, *l. c.*, 99, 1877.
Noturus occidentalis, Gill, Proc. Bost. Soc. Nat. Hist., 1862, 45, Platte River; Günther, Cat., v, 105, 1864.
Noturus platycephalus, Günther, Cat., v, 104, 1864, North America.
Noturus flavus, Jordan & Gilbert, Synopsis, 100, 1883.

80. SCHILBEODES, Bleeker.

(Mad Toms.)

Schilbeodes, Bleeker, Ichth. Archip. Indici. Prodr. Siluri., 1858, 258, (*gyrinus*).
Rabida, Jordan & Evermann, new subgenus, (*furiosus*).

Body more or less elongate, anteriorly subcylindrical, thence more or less compressed. Head depressed. Skin very thick, entirely concealing the bones. Supraoccipital entirely free from the head of the second interspinal. Mouth anterior, rather large; the upper jaw more or less projecting. Teeth subulate, in a broad band, in each jaw; the band in the upper jaw is abruptly truncated at each end as in *Ameiurus* (not prolonged backward by a continuation from the external angle, as in *Leptops* and *Noturus*). Branchiostegals 9. Dorsal fin over the posterior half of the interval between pectorals and ventrals, with a short sharp spine and 7 rays. Adipose fin long and low, usually more or less connected with the accessory rays of the caudal fin, not free posteriorly, but adnate to the body; the membrane sometimes high and continuous, sometimes notched. Caudal fin very obliquely truncated or rounded, inserted on an equally obliquely rounded base; numerous rudimentary rays present, both above and below the caudal peduncle. Anal fin short, with 12 to 23 rays. Ventrals rounded. Pectoral fins with a sharp spine, of different forms in the different species. Vent at some distance in advance of the anal. Lateral line complete. In or above the axil of the pectoral fins is an orifice, which is the opening of the duct of a poison gland. "From it may frequently be drawn a solid gelatinous style ending in a tripod, each limb of which is dichotomously divided into short branches of regular length."—*Cope.* The sting from the pectoral spine is very painful, resembling the sting of a bee, but worse. Very small catfishes of the fresh waters of the Eastern United States, having somewhat the habits of *Etheostoma*, or *Cottus*, lying on the bottom among rocks and weeds, and delighting in small rocky brooks. They are especially numerous southward. (*Schilbe*, an African genus of *Siluroids*, with which these fishes were supposed to agree in lacking an adipose fin; *εἶδος*, likeness. The word *Schilbe* is of Arabian origin.)

SCHILBEODES:

- *a.* Pectoral spine entire or grooved behind, never retrorse serrate; adipose fin high and continuous, not separated by a notch from caudal; caudal much rounded.
  - *b.* Head short, broad and deep; pectoral spine without serration anywhere, grooved behind, 2 in head; barbels short; plain dark brown, with a narrow black lateral streak. A. 15 or 16. GYRINUS, 223.
  - *bb.* Head small and narrow; spines very short and weak; pectoral spine weakly retrorse serrate without, grooved within, 3½ in head. A. 14. Color yellowish, slightly mottled. LEPTACANTHUS, 224.

RABIDA, (*rabidus, mad*):

- *aa.* Pectoral spine more or less distinctly serrate behind (the serræ sometimes absent in *S. nocturnus*).
  - *c.* Adipose fin continuous with the caudal, there being no evident notch between them; pectoral spine short, 2 in head, its inner margin usually with a few short, sharp teeth on basal half, its outer nearly entire, a few points near the tip. A. 15 or 16. Color plain blackish. NOCTURNUS, 225.
  - *cc.* Adipose fin with a more or less distinct notch separating it from the caudal.
    - *d.* Anal fin comparatively long, of 23 rays; body elongate; adipose fin conspicuously notched; spines slender and short, pectoral spines with weak teeth on each margin. Color plain blackish. FUNEBRIS, 226.
    - *dd.* Anal fin rather short, of 12 to 18 rays.
      - *e.* Pectoral spine with its posterior serræ short, their length not ⅓ diameter of spine. Color nearly plain.
        - *f.* Adipose fin moderate, the notch shallow, not separating it from the caudal fin; caudal slightly rounded; vertical fins broadly edged with black.
          - *g.* Pectoral spine very short and weak, about 3 in head in adult; head small, 4 in length. EXILIS, 227.
          - *gg.* Pectoral spine moderate, about 2 (1¾ to 2¼) in head; head larger. INSIGNIS, 228.
        - *ff.* Adipose fin very low, the notch completely separating it from caudal; pectoral spine very short, 4 to 5 in head, its outer margin nearly entire, the inner with sharp teeth at base; caudal slightly emarginate; base of dorsal and lower lobe of caudal black. GILBERTI, 229.
      - *ee.* Pectoral spine with its posterior serræ strong, spine-like, recurved, almost as long as the diameter of the spine, the long curved spine itself more than ½ head; anal rays 13 to 15; caudal much rounded.
        - *h.* Adipose fin nearly or quite free from caudal; color nearly plain brownish, the saddle-like blotches faint; everywhere covered with small dots; anterior edge of pectoral spine retrorse-serrate. ELEUTHERUS, 230.
        - *hh.* Adipose fin not quite free from caudal; color much variegated, the back with black saddle-like blotches; fins marbled with black.
          - *i.* Pectoral spine strong, about 1⅔ in head, its anterior edge with few serrations. MIURUS, 231.
          - *ii.* Pectoral spine very strong, about 1¼ in head, its anterior edge with many serrations. FURIOSUS, 232.

Subgenus SCHILBEODES.

223. SCHILBEODES GYRINUS, (Mitchill).

Body comparatively short and thick. Head large, its width 3½ to 4½ in length of body; depth 4 to 5½; head 3½ to 4. Spines stout and rather long; that of the pectoral fin straight, not serrated, grooved behind, 2⅓ in the distance from snout to dorsal fin. Dorsal higher than long, inserted nearer anal than snout. Anal 13. Jaws nearly equal. Humeral process short. Nearly uniform yellowish brown, sometimes blackish, without transverse blotches; a narrow dark lateral streak and 1 or more dorsal ones. L. 5 inches. Hudson River and westward through almost the entire Mississippi Valley, and upper lake region; rather common, especially northwestward; the western specimens more robust and perhaps distinguishable as var. *sialis*. (*γυρινός*, tadpole.)

Silurus gyrinus, MITCHILL, Amer. Month. Mag., 1818, 322, Walkill River, New York.
Noturus gyrinus, JORDAN, Bull. U. S. Nat. Mus., x, 102, 1877.
Noturus sialis, JORDAN, Bull. U. S. Nat. Mus., x, 102, 1877, White River, Indiana.
Noturus gyrinus, JORDAN & GILBERT, Synopsis, 98, 1883.

224. SCHILBEODES LEPTACANTHUS, (Jordan).

Body slender, the head small and narrow, longer than broad. Eye small. Upper jaw much projecting. Spines very short and slender; that of the dorsal not ⅓ the height of the fin; all less than ⅓ the length of the head; that of the pectoral retrorsely serrate on the outer edge, entire within. Head 4⅘ in body; its width 5½; depth 5½; distance to dorsal 2⅘; pectoral spine 5 in this distance; dorsal nearer anal than snout. Anal 14. Humeral process very short. Color yellowish, somewhat mottled. L. 3 inches. Gulf States in sandy streams; scarce, known from the basins of the Ogeeche, Alabama, and Pearl rivers. (*λεπτός*, slender; *ἄκανθα*, spine.)

Noturus leptacanthus, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 352, Silver Creek, branch of Etowah River, Rome, Ga.
Noturus leptacanthus, JORDAN, *l. c.*, 102, 1877.
Noturus leptacanthus, JORDAN & GILBERT, Synopsis, 98, 1883.

Subgenus RABIDA, Jordan & Evermann.

225. SCHILBEODES NOCTURNUS, (Jordan & Gilbert).

Head 3⅔. A. 15 or 16. Rather robust; head moderate, little depressed, eyes small; barbels short, barely reaching gill opening; pectoral spine short, 2 in head, its inner margin with short, sharp teeth at base (entire in specimens from the lower Wabash); its outer margin with a few points near tip, otherwise entire; adipose fin high, continuous with caudal; anal high. Color very dark brown, everywhere dotted with black; fins dusky with narrow pale margins. L. 3 inches. Sandy streams, among weeds, in Lower Mississippi Valley, known from the lower Wabash in Indiana, and from the Poteau, Washita, and Saline rivers, Arkansas. (*nocturnus*, nocturnal, from its black color.)

Noturus nocturnus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1886, 6, Saline River, at Benton, Arkansas. (Type, 36461.)

226. SCHILBEODES FUNEBRIS, (Gilbert & Swain).

Head 4. A. 23, its base 3½ in body. Body elongate, the head slender but not depressed; mouth moderate, very convex, the lower jaw shorter; barbels slender, those of maxillary reaching beyond base of pectoral; eye very small. Spines slender and short; pectoral spine 3 in head, roughened without, and with 3 or 4 small weak teeth on inner margin. Adipose fin well developed, with a conspicuous notch. Anal much longer than in other species. L. 3½ inches. Body and fins uniform black. Tributary of Black Warrior River, Tuscaloosa, Ala. (*funebris*, funereal, from the dark color.)

Noturus funebris, Gilbert & Swain, Bull. U. S. Fish. Com., 1889, 153, North River, Tuscaloosa, Alabama. (Type, No. 36696.)

227. SCHILBEODES EXILIS, (Nelson).

Head 4 in length; depth 5 to 6½. Anal rays 14 to 17. Pectoral spine small, about 3 in head, slightly retrorse serrate without, with about 6 small straight teeth within, which are not ⅓ the diameter of the spine in length. Head small, not very broad, but thin and depressed; its width 5 to 6 in length of body; jaws nearly equal. Dorsal scarcely higher than long. Distance from snout to dorsal about 3 in length. Pectoral spine 3½ to 4 in this distance; dorsal spine low, as near snout as anal. Humeral process obscure. Color yellowish brown, mottled, the fins somewhat margined with dusky. L. 4 inches. Wisconsin to Missouri and Kansas, common in prairie streams; close to *S. insignis*, but slimmer, with weaker armature. (*exilis*, slim.)

Noturus exilis, Nelson, Bull. Ill. Mus. Nat. Hist., 1876, 51, Illinois River; Jordan, *l. c.*, 100, 1877; Jordan & Gilbert, Synopsis, 100, 1883.

Noturus elassochir, Swain & Kalb, Proc. U. S. Nat. Mus., 1882, 639, Illinois River, Napierville, Illinois. (Type, No. 29677.)

228. SCHILBEODES INSIGNIS, (Richardson).

(Mad Tom.)

Body rather elongate. Pectoral spine moderate, about 2 in head, retrorse serrate without, weakly serrate within. Head broad and flat, upper jaw projecting; head about 4¼ in length; depth 6. Dorsal fin ¼ higher than long. Distance from snout to dorsal about 2¾ in length. Length of pectoral spine 2¾ in same distance. Dorsal much nearer anal than snout. Anal rays 14 to 16. Humeral process conspicuous, sharp. Color dark brown, somewhat mottled, fins all broadly and conspicuously dark-edged. One of the largest species, reaching the length of nearly a foot. Pennsylvania to South Carolina; very common in streams east of the Alleghanies. (*insignis*, remarkable.)

Pimelodus insigne, Richardson, Fauna Bor. Amer., III, 32, 1836, based on *Pimelode livrée*, Le Sueur, Mém. Mus., v, 1819, 155; locality not known.

Pimelodus lemniscatus, Cuvier & Valenciennes, xv, 144, 1840, after Le Sueur.

Noturus marginatus, (Baird), Cope, Jour. Ac. Nat. Sci. Phila., 1869, 237, Pennsylvania. (Type, No. 1571.)

Noturus insignis, Jordan, *l. c.*, 100, 1877; Jordan & Gilbert, Synopsis, 100, 1883

229. SCHILBEODES GILBERTI, (Jordan & Evermann).

Body slender, less compressed than in *S. insignis*, the head narrower and not so low; eyes small; lower jaw included; barbels short, not reaching nearly to gill opening; spine very short, that of pectoral about 4 in head, its inner margin with sharp teeth at base, its outer nearly entire. Adipose fin very low, separated from the caudal by a deep notch which reaches its base. Anal short and high; dorsal spine scarcely longer than eye; caudal broad, slightly emarginate. Dark yellowish brown, base of caudal and most of its lower lobe black; dorsal black at base. Head $4\frac{4}{5}$. A. 15. L. 4 inches. Roanoke River in Southern Virginia, locally abundant. (Named for Charles Henry Gilbert.)

Noturus gilberti, JORDAN & EVERMANN, Proc. U. S. Nat. Mus., 1888, 352, Roanoke River. (Type, No. 39931.)

230. SCHILBEODES ELEUTHERUS, (Jordan).

Head $3\frac{4}{5}$. A. 13. Head broad, flat, depressed, the form resembling that of *Leptops olivaris;* humeral process obscure; eye $5\frac{1}{2}$ in head; lower jaw included; barbels short, not reaching gill opening; adipose fin free from caudal; pectoral spine stout, of moderate length, $1\frac{2}{3}$ to 2 in head, its outer margin more or less retrorse-serrate, its inner with about 6 to 8 retrorse hooks, scarcely weaker than in *S. miurus*. Color nearly plain brownish, the black saddle-like blotches usually not very distinct; body everywhere covered with fine dark dots. Dorsal blackish at tip; caudal dark at base. L. 4 inches. Mississippi Valley, rare, but widely distributed. Tributaries of French Broad River (Big Pigeon River, Clifton, Tenn.); French Broad, at Hot Springs, N. C.; White River, Gosport, Ind.; Green River, Greensburg, Ky. Schriner Lake, Columbia City, Ind.; White River, Fayettesville, Ark.; Sallisaw River, Indian Territory. Only a few specimens known. (*ἐλεύϑερος*, free.)

Noturus eleutherus, JORDAN, Ann. N. Y. Lyc. Nat. Hist., 1877, 371, Big Pigeon River; not of some later papers, in which it is confounded with *S. furiosus*.

231. SCHILBEODES MIURUS, (Jordan).

Head $3\frac{2}{3}$ to 4; depth $4\frac{1}{2}$ to 5. A. 13 to 15. Body rather stout, not much elongate nor much depressed; eyes not very small; barbels moderate, about reaching gill opening, mouth moderate, the lower jaw included. Adipose fin with a deep notch, but connected with the caudal fin. Distance from snout to dorsal about $2\frac{2}{3}$ in length. Pectoral spine $2\frac{1}{3}$ in this distance; $1\frac{2}{3}$ to $1\frac{5}{6}$ in head. Dorsal nearer anal than tip of snout. Pectoral spine somewhat curved and finely serrated without, with 6 strong recurved pectinations within, each nearly as long as the diameter of the spine. Humeral process short. Body much mottled, black and grayish; top of head, tip of dorsal, middle of adipose fin, and edge of caudal definitely blackish, occiput dark; body with 4 broad cross blotches, 1 before dorsal, 1 behind it, 1 on middle of adipose fin, and 1 small one behind it. L. 4 inches. Mississippi Valley and tributaries of Lake Michigan, south to Louisiana; common in the Ohio Valley. (*μείουρος*, curtailed.)

Noturus miurus, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1877, 371, White River, Indiana; JORDAN, *l. c.*, 100, 1877; JORDAN & GILBERT, Synopsis, 99, 1883.

232. SCHILBEODES FURIOSUS, (Jordan & Meek).

Form of *Schilbeodes miurus;* eyes rather large; barbels moderate, reaching gill opening; dorsal spine 2⅓ in head; pectoral spine 1¼ in head, much longer, stronger, more curved, and more heavily armed than in any other North American catfish; anterior margin of spine with many small antrorse teeth, the tip of spine without teeth; inner margin with 7 or 8 recurved hooks; adipose fin high, with a deep notch nearly to its base; caudal long, much rounded in outline. Coloration much variegated, the pattern as in *S. miurus.* Light brown, with black dots; a dusky area between eyes; a black saddle across occiput; 1 before and 1 behind dorsal, and 1 on adipose fin; a dusky bar at base of caudal; 3 dark curved streaks across caudal and 2 cross dorsal and anal. Head 3¾; depth 5½. A. 14. L. 5 inches. Eastern North Carolina, known from the Neuse, Tar, and Little rivers. Very close to *S. miurus*, and probably a geographical variety of that species, from which it differs only in the larger spines. Its sting is more virulent than that of any other "Mad Tom." (*furiosus*, furious.)

Noturus furiosus, JORDAN & MEEK, Proc. U. S. Nat. Mus., 1888, 351, Neuse River, N. C. (Type, 39932.)

Noturus eleutherus, JORDAN & GILBERT, Synopsis 99, 1883, not type.

81. RHAMDIA, Bleeker.

(BAGRES DE RIO.)

Pteronotus, SWAINSON, Nat. Hist. Fishes, II, 309, 1839, (*quinque-tentaculatus*); preoccupied in mollusks.

Rhamdia, BLEEKER, Ichth. Arch. Ind. Siluri, 1858, 197, (*quelen*).

Pimelonotus, GILL, Ann. Lyc. Nat. Hist. N. Y., IV, 391, 1859, (*vilsoni*).

Notoglanis, GÜNTHER, Cat., V, 136, 1864, (*multiradiatus*).

Rhamdella, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., 2d series, I, 129, 1888, (*eriarchà*).

Fresh water catfishes with no teeth on the vomer; the adipose fin more or less elongate; snout rather broad, not produced; barbels terete or somewhat flattened, not having a broad membranous border. Head not especially widened; occipital process small or wanting, not reaching to the dorsal plate; the fontanelle variously developed, in typical species short, not continued backward beyond the eye, except in the young, in which there are usually 2 bony bridges across the fontanelle, the one behind the eye, the other in front of the occiput; the depressions behind these bridges persistent, in some old specimens the entire fontanelle becomes obliterated. In the subgenus *Rhamdella*, the fontanelle is better developed, extending to base of occipital process. Species numerous, in streams from Mexico southward to Western Peru and the Rio de la Plata. This genus has been divided by Eigenmann into two—*Rhamdia* and *Rhamdella**—distinguished by the development of the fontanelle. As but few of the following species have been examined as to this character, we are forced to refer all to the single genus *Rhamdia*. (*Nhamdia* or *Bagre da Rio*, a Portuguese name, applied by Marcgrave to *Rhamdia sebæ*, and written "*Rhamdia*" by Valenciennes, perhaps a misprint.)

---

*This genus *Rhamdella* contains those species hitherto referred to *Rhamdia* or to *Pimelodus*, in which the fontanelle is continued backward to the occipital process, with a bridge across it behind the eyes. Ventral placed below or behind the dorsal, orbit with a free margin. Two North American species, *petenensis* and *parryi*, are known to belong to *Rhamdella*. It is probable that most of the others here mentioned belong to *Rhamdella* rather than to *Rhamdia*. In Eigenmann's latest catalogue, nearly all of them are provisionally placed in *Rhamdella*.

RHAMDIA:

a. Fontanelle in the adult not continued behind the eye; maxillary band of teeth not widened at the edge; occipital process present.

b. Sides with a dark lateral band; maxillary barbels reaching little beyond front of adipose fins; pectoral spine short. WAGNERI, 233.

aa. Species with the fontanelle undescribed, most of them probably belonging to *Rhamdella*.

c. Anal rays 11 or 12.

d. Adipose fin moderately long, 3¼ to 3⅔ in length.

e. Maxillary barbels very long, reaching tip of ventrals. BARONIS-MULLERI, 234.

ee. Maxillary barbels reaching end of dorsal.

f. Depth 6¼ in length. MOTAGUENSIS, 235.

ff. Depth 5⅓ in length. BRACHYPTERA, 236.

dd. Adipose fin short, 4 in length; barbels short, not reaching tip of pectorals. SALVINI, 237.

cc. Anal rays 13

g. Adipose fin short, about 4 in length; barbels reaching end of dorsal. HYPSELURUS, 238.

gg. Adipose fin moderate, 3 to 3½ in length.

h. Occipital process rather short. LATICAUDA, 239.

hh. Occipital process rather long. GODMANI, 240.

ggg. Adipose fin long, more than ⅓ of length.

i. Barbels very long, the longest reaching middle of adipose fin. GUATEMALENSIS, 241.

ii. Barbels moderate, the longest reaching front of adipose fin. NICARAGUENSIS, 242.

iii. Barbels shortish, the longest reaching end of dorsal. MICROPTERA, 243.

ccc. Anal rays 14 or 15.

j. Adipose fin long, more than ⅓ of length. MANAGUENSIS, 244.

jj. Adipose fin medium, 3⅓ in length. POLYCAULUS, 245.

RHAMDELLA, (diminutive of *Rhamdia*):

aaa. Fontanelle continued backward to the occipital process, with a bridge across it behind the eye.

k. Upper jaw scarcely longer than lower; tail deep; pectoral spine about ½ the head. PETENENSIS, 246.

kk. Upper jaw longer than lower; pectoral spine 2 to 2⅕ in head; dorsal spine very weak, about 2½ in head; caudal fin about 5 in length. PARRYI, 247.

Subgenus RHAMDIA.

233. RHAMDIA WAGNERI, (Günther).

(BARBUDO.)

Head 4⅓; depth 5 ½ to 7. D. I, 6; A. 9 to 11. Head flat above, with vertical sides; occipital process narrow, reaching about halfway to dorsal spine; maxillary barbel variable, never reaching to end of adipose fin, sometimes little beyond base of dorsal; gill rakers 3 + 7; caudal deeply divided; its lower lobe broad and rounded, the upper pointed. Color brown, with many dark dots; a dark lateral band, darkest forward; base of dorsal pale. Rivers of Central America, on both sides of the mountains, very abundant. (Eigenmann.) (Named for Prof. Moritz Wagner, an authority in zoögeography.)

Pimelodus wagneri, GÜNTHER, Fishes Cent. Am., 474, 1869, Atlantic and Pacific rivers of Panama.
Rhamdia bransfordi, GILL, Proc. Ac. Nat. Sci. Phila., 1876, 337, Panama.
Rhamdia wagneri, EIGENMANN, S. A. Nematognathi, 133, 1890.

Subgenus RHAMDELLA, Eigenmann & Eigenmann.

Besides the species ascertained by Dr. Eigenmann to belong to *Rhamdia*, the following additional species have been described from within our limits, but in none of these has the character of the fontanelle been given, so that it is impossible to say whether they belong properly to *Rhamdia* or to *Rhamdella;* most likely the majority of them will be found to have their places in the latter group:

234. RHAMDIA BARONIS-MULLERI, (Troschel).

Head 5 in total length. D. I, 6; A. 12; P. I, 9. Head flat, forehead broadly rounded; upper jaw the longer; maxillary barbels reaching tip of ventrals; outer mandibulary barbels to beyond base of pectorals, nearly twice as long as inner. Eye high, before middle of head; snout nearly twice length of eye; interorbital space 1½ times eye. Head covered with soft, smooth skin, occipital process narrow, pointed, covered with skin; humeral process reaching middle of pectoral spine. Body tapering backward from head, much compressed behind. Pectorals reaching to opposite third dorsal ray, the spine serrate within; ventrals shorter than pectorals, falling far short of anal, reaching halfway to base of third anal ray. Adipose fin 3½ times in the whole length. Caudal deeply divided, the lobes rounded, the lower larger. Brown, paler below, the lateral line a narrow black streak. "Pacific Ocean" in Mexico. (Troschel.) (Named for J. W. von Müller, the title "Baron" distinguishing him from the naturalist Johannes Müller.)

Pimelodus baronis-mülleri, TROSCHEL, in Müller's Beiträge zur Geschichte, Statistik und Zoölogie von Mexico, III, 636, 1865; no definite locality.

235. RHAMDIA MOTAGUENSIS, (Günther).

Head 5½; depth 6¼. D. I, 6; A. 12. Occipital process short; adipose fin 3¼ in length; maxillary barbels to end of dorsal; dorsal spine very feeble; pectoral spine striated; its inner margin strongly serrated. Caudal peduncle as high as long; caudal forked; the lower lobe rounded; the upper pointed and longer. Brownish, dorsal with a white band. Rio Motagua, Guatemala. (Günther.)

Pimelodus motaguensis, GÜNTHER, Cat., V, 127, 1864, Rio Motagua, Guatemala.

236. RHAMDIA BRACHYPTERA, (Cope).

Head 5⅔; depth 5⅓. D. I, 6; A. 11; P. I, 9. Occipital process short; maxillary barbels reaching beyond dorsal; lower jaw a little shorter; dorsal longer than high, its spine very weak; pectoral spine striate, flexible at top, strongly serrate on inner margin; adipose fin 3⅗ in body; caudal deeply emarginate; its lobes largely rounded. Blackish, a pale shade on dorsal. Orizaba, Mexico; allied to *R. motaguensis*, but with smaller eye, deeper body, and slight difference in fin rays. (Cope.) (*βραχύς*, short; *πτερόν*, fin.)

Pimelodus brachypterus, COPE, Trans. Am. Phil. Soc., 1866, 404, Orizaba, Mexico.

237. RHAMDIA SALVINI, (Günther).

Head 5; depth 6. A. 11. Occipital process short; adipose fin 4 in length; maxillary barbels short, not reaching tip of pectoral; dorsal spine very feeble; pectoral spine very short, not ⅓ head; caudal lobes subequal. Coloration plain brown. Rio San Geronimo, Guatemala. (Günther.) (Named for Oscar Salvin, who collected largely in Central America.)

Pimelodus salvini, GÜNTHER, Cat., v, 130, 1864, Rio San Geronimo, Guatemala.

238. RHAMDIA HYPSELURUS, (Günther).

Head 5; depth 6. D. I, 6; A. 13. Occipital process triangular; adipose fin 4 in length; maxillary barbels reaching to the end of dorsal. Caudal peduncle deeper than long; caudal lobes both rounded. Uniform blackish. Mexico. (Günther.) (*ὑψελός*, high; *οὐρά*, tail.)

Pimelodus hypselurus, GÜNTHER, Cat., v, 126, 1864, Mexico.

239. RHAMDIA LATICAUDA, (Heckel).

D. I, 6; A. 13. Occipital process short; adipose fin 3½ in length, maxillary barbels reaching ventral; tail about as deep as body; pectoral spine ½ as long as the rays; caudal subtruncate. Mexico. (Heckel.) (*latus*, broad; *cauda*, tail.)

Pimelodus laticaudus, HECKEL, in Kner, Sitz. Wien, Ac., XXVI, 420, 1857, Mexico.
Pimelodus laticaudus, GÜNTHER, Cat., v, 127, 1864.

240. RHAMDIA GODMANI, (Günther).

Head 4; depth 6. D. I, 6; A. 13. Occipital process triangular, much longer than broad. Adipose fin 3 in length. Lower jaw little shorter than upper. Pectoral spine not more than ½ head, serrated. Caudal lobes equal. Color brown; dorsal with the usual band. Valley of Rio Usumacinta, Guatemala. (Named for Mr. F. Godman, associate of Salvin.)

Pimelodus godmani, GÜNTHER, Cat., v, 124, 1864, Rio Usumacinta, Guatemala.

241. RHAMDIA GUATEMALENSIS, (Günther).

Head 4; depth 6. A. 13. Adipose fin long, 2½ in length; maxillary barbels about reaching middle of adipose fin. Dorsal spine very feeble; pectoral short, ½ as long as head; lower caudal lobe long. Blackish; dorsal with very light band. Huamuchal, Guatemala. (Günther.)

Pimelodus guatemalensis, GÜNTHER, Cat., v, 122, 1864, Rio Huamuchal, Guatemala.

242. RHAMDIA NICARAGUENSIS, (Günther).

Head 4½; depth 7. D. I, 6; A. 13. Adipose fin 2½ in length; maxillary barbels reaching its front; pectoral spine ⅔ head. Blackish; dorsal with a faint pale band. Lake Nicaragua. (Günther.)

Pimelodus nicaraguensis, GÜNTHER, Cat., v, 125, 1864, Lake Nicaragua, Nicaragua.

243. RHAMDIA MICROPTERA, (Günther).

Head 4½; depth 7½; D. I, 6; A. 13. Occipital process slender, not reaching base of dorsal; adipose fin 2¾ in length; maxillary barbels reaching end of dorsal. Pectoral spine a little more than ½ head. Ventral very short, shorter than pectoral. Anal small; caudal short, the lower lobe 7 in body. Blackish; dorsal with a faint band. Rio San Geronimo. (Günther.) (*μικρός*, small; *πτερόν*, fin.)

Pimelodus micropterus, GÜNTHER, Cat., v, 124, 1864, Rio San Geronimo, Guatemala.

244. RHAMDIA MANAGUENSIS, (Günther).

Head 5; depth 6. D. I, 6; A. 14 or 15. Occipital process slender, not reaching basal bone of dorsal; adipose fin more than ⅓ length; maxillary barbels short, reaching nearly to base of dorsal spine; dorsal spine short. Color uniform brown; dorsal with a pale cross-band. Lake Managua, Nicaragua. (Günther.)

Pimelodus managuensis, GÜNTHER, Fishes Cent. Am., 474, 1869, Lake Managua, Nicaragua.

245. RHAMDIA POLYCAULUS, (Günther).

Head 5; depth 6. D. I, 7; A. 15. Occipital process short; adipose fin long, 3⅓ in length; maxillary barbels to tip of pectoral; dorsal spine very short; caudal lobes equal. Uniform blackish. Rio San Geronimo. (Günther.) (*πολύς*, many; *καῦλος*, stem; the number of dorsal and anal rays being greater than usual.)

Pimelodus polycaulus, GÜNTHER, Cat., v, 131, 1864, Rio San Geronimo.

246. RHAMDIA PETENENSIS, (Günther).

Head 4½; depth 6. D. I, 6; A. 11. Adipose fin low but long, more than ⅓ length, the maxillary barbels reaching to its front. Tail deep; its depth more than ½ the head. Lower jaw scarcely shorter. Dorsal spine very feeble; pectoral spine not quite ½ head. Ventral fin short, brownish, with a dark lateral band; dorsal with the usual band. Lake Peten, Yucatan. (Günther.)

Pimelodus petenensis, GÜNTHER, Cat., v, 126, 1864, Lake Peten, Yucatan.

247. RHAMDIA PARRYI, (Eigenmann).

Head 4⅔; depth 4⅓ to 5. D. I, 6; A. 12 to 14. Upper jaw longer than lower. Occipital process moderate. Dorsal spine very low and weak; 2¼ to 2¾ in head; pectoral spine 2 to 2¼ in head; caudal 4⅓ to 5⅓. Occipital process very narrow and short. Maxillary barbels short, extending little beyond dorsal fin; caudal lobe short and broad. Adipose fin 3 to 3½ in length. Brownish, a dark lateral band. Rio Zanalenco, Chiapas. (Eigenmann.) (Named for Dr. C. C. Parry, a well-known botanist.)

Rhamdella parryi, EIGENMANN, Proc. Cal. Ac. Sci., 1888, 130, Rio Zanalenco, Chiapas.

82. PIMELODELLA, Eigenmann & Eigenmann.

Pseudorhamdia, STEINDACHNER, Süsswasserf. Sudöstl. Bras., III, 1876, 46, (*lateristriga*); not of Bleeker, which is *Pimelodus*.

Pimelodella, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., 1888, 131, (*cristatus*)

Occipital process narrow, reaching the bony plate at base of dorsal spine. Fontanelle continued to the base of the occipital process, with a bridge across it above the posterior margin of the eye. Dorsal and pectoral spines pungent; humeral process spine-like. Dorsal rays I, 6. This genus is an ally of *Pimelodus* and *Rhamdia.* The numerous species are confined chiefly to the Amazon region. (Diminutive of *Pimelodus; πιμελής*, fat.)

a. Adipose fin less than ⅓ the length. D. I, 6. Pectoral fins not reaching ventral, nor ventral to anal. Pectoral spine moderate, with 8 to 15 recurved hooks.
  b. Sides with a dark lateral band which continues forward on the head. Tip of pectoral spine ½ diameter of the spine; spine very broad. CHAGRESI, 248.
  bb. Sides without dark lateral band, the color plain. Maxillary barbels reaching front of anal. MODESTA, 249.

248. PIMELODELLA CHAGRESI, (Steindachner).

Head 4⅔; depth 5½. D. I, 6; A. 11 or 12. Body elongate, slender. Eye 3⅔ in head. Maxillary barbels reaching front of adipose fin. Dorsal spine straight, scarcely roughened in front, except near the tip, 1½ in head. Adipose fin 3½ in length; caudal deeply forked, upper lobe much the longer. Pectoral spine flat, 1⅓ in head. Color brown, with a well-defined band from tip of snout to middle of caudal; dorsal fin with a dark bar on the membrane upon each pair of rays. Rio Chagres. (Eigenmann.)

Pimelodus chagresi, STEINDACHNER, Ichth. Beitr., IV, 34, 1876, Rio Chagres, at Obispo.
Pimelodella chagresi, EIGENMANN, *l. c.*, 130, 1888.

249. PIMELODELLA MODESTA, (Günther).

Adipose fin long; nearly 3 in length. Maxillary barbels reaching front of anal fin; eye 4 in head. Dorsal spine slender, little more than ½ the head, somewhat shorter than pectoral spine; caudal forked, the upper lobe the longer. (Günther.) (Esmeraldas, Ecuador; also recorded, perhaps doubtfully, from Rio Chagres.) (*modestus*, modest.)

Pimelodus modestus, GÜNTHER, Proc. Zoöl. Soc. Lond., 1860, 239, Esmeraldas, Ecuador. GÜNTHER, Cat., V, 117, 1864.

83. PIMELODUS, Lacépède.

(CONGROS BARBOSOS.)

Pimelodus, LACÉPÈDE, Hist. Nat. Poiss., V, 94, 1803, (*quadrimaculatus*, etc.; includes various genera).
Pimelodus, CUVIER, Règne Animal, Ed. I, 203, 1817, (*quadrimaculatus*, etc.; species with one band of teeth above).
Pimelodus, SWAINSON, Class'n Fishes, etc., II, 305, 1839, (*quadrimaculatus*).
Pimelodus, GILL, LÜTKEN, etc., who take *maculatus* as type.
Pseudariodes, BLEEKER, Nederl. Tijdschr. Dierkunde, 1863, 99, (*clarias*).
Pseudorhamdia, BLEEKER, *l. c.*, 101, 1863, (*maculatus* = *clarias*).

Teeth on the vomer in small patches or none; no teeth on palatines; pterygoid teeth sometimes present. Fontanelle not extending backward beyond the eyes. Humeral process broad, not spine-like. Crown of head granulose, or covered with thin skin. Dorsal and pectoral spines stout; adipose fin long, longer than high; dorsal rays I, 6. Species chiefly Brazilian, about 10 recognized in the genus as now restricted. (πιμελής, fat.)

250. PIMELODUS MACULATUS, Lacépède.

(Congro Barboso.)

Head 3½ to 4½; depth 3⅘ to 5. D. I, 6; A. 11. Head granulated, entirely naked above. Vomerine teeth none or in very minute patches; teeth on the pterygoids. Eye 5 in head; interorbital space 3¼. Maxillary barbels extending beyond tip of dorsal. Dorsal spine with its dermal tip as long as head, not quite reaching the short adipose fin, which is 3⅓ to 5½ times in body. Anal emarginate, some rays extending beyond tips of last rays. No brown bars on caudal; a dark cross spot at base of first dorsal spine. Rio Mamoni (Panama) and southeastward to Rio de la Plata; extremely variable, generally abundant in Brazil. (Steindachner; Eigenmann.) (*maculatus*, spotted.)

Silurus clarias, Linnæus, x, 306, 1758, in part, not the type.
Pimelodus clarias, Steindachner, Flussfische Südamer., ii, 10, 1879, and of various authors.
Pimelodus maculatus, Lacépède, Hist. Nat. Poiss., v, 94, 107, 1803, Rio de la Plata; Günther, Cat., v, 115, 1864, and many authors.
Piramutana blochii, Günther, Cat., v, 111, 1864, Cayenne, Surinam.
Pimelodus rigidus, Spix, in Agassiz, Pisc. Brazil., 19, 1829, Brazil.
Pimelodus blochii, Cuvier & Valenciennes, xv, 188, 1840, after Bloch.
Mystus ascita, Gronow, Cat. Fishes, 156, 1854, no locality given.
Pimelodus macronema, Bleeker, Silures de Suriname, 79, pl. 14, 1864, Surinam.
Pseudariodes pantherinus, Lütken, Meddel. Nat. Hist. Forem., 1874, Nos. 1, 2, pp. 194, 198, Venezuela.
Pseudorhamdia piscatrix, Cope, Proc. Am. Phil. Soc. Phila., xi, 569, 1870, Pebas.
Piramutana macrospila, Günther, Ann. and Mag. Nat. Hist., July, 1880, 10, pl. ii, Rio de la Plata.
Pimelodus clarias, Eigenmann, S. A. Nematognathi, 171, 1890.

Family XXXV. LORICARIIDÆ.

Catfishes with sides and back covered with bony plates and with the caudal vertebræ compressed; the neural and hæmal spines expanded, forming a continuous ridge above and below. Mouth wholly inferior, provided with broad, disk-like lips. Maxillaries thin, with a terminal barbel, which is partly united with the disk at the mouth. No barbels at the chin or nostrils. Teeth, if present, hooked and usually two-lobed at the tip; the functional ones in one series; premaxillaries separate from each other, box-shaped, filled with numerous relay teeth; dentaries separate from each other and formed like the premaxillaries; no teeth on palate; no frontal or occipital fontanelle. Dorsal fin present, situated on the abdominal part of the vertebral column, not connected with the occipital process. Adipose fin, if present, composed of a spine with a thin membrane. Anal short. Gill membrane joined to the isthmus; the gill openings restricted to the sides. Intestinal canal long and coiled upon itself. Nostrils close together, a flap between them; placed a little above and in front of the eyes; iris with a flap encroaching on and sometimes dividing the pupil. Air bladder cavity narrow at the base;

expanded beneath the temporal plate, usually communicating with the outside air at a notch in the posterior margin of a temporal plate or sometimes by many holes in the temporal plate; strong movable bones or ribs extending from near the posterior end of the coalesced vertebræ outward; these compressed and sometimes forked at base; these structures form a more or less complicated arrangement which gives fixity to the dorsal spine, but prevents a lateral motion of the head. A large family of small and singularly armed catfishes, chiefly confined to the rivers of South America; 24 genera and 247 species are described by Dr. Eigenmann, who is the most recent authority on this group. (SILURIDÆ HYPOSTOMATINA in part, Günther, Cat., v, 221–260).

LORICARIINÆ:

a. Tail long, tapering posteriorly, with a single series of plates on the sides. Dorsal fin usually inserted behind the origin of the ventrals; no adipose fin. Intestinal canal usually not longer than body. Upper caudal lobe sometimes produced.

  b. Dorsal fin inserted above or slightly behind anal; 2 to 5 plates between it and occipital process. Eyes superior. Tail with strong lateral keels. Snout not expanded at tip nor margined with spines. LORICARIA, 84.

HYPOSTOMINÆ:

aa. Tail short, compressed or rounded. Lips entire. Adipose fin usually present; ventral surface naked, or covered with minute granular plates. Intestine greatly elongate, many times as long as the body; lower caudal lobe sometimes produced.

  c. Temporal plate not perforate.

    d. Margin of the snout granular, with sometimes a naked spot at tip. Scutes on lower surface of tail exposed. Dorsal rays I, 7; or I, 8. Teeth fine and numerous.

      e. Interopercle with erectile spines borne on a movable plate. Dorsal and anal distinct. HEMIANCISTRUS, 85.

  cc. Margin of the snout naked, without bristles, granules, or tentacles. Interopercle with erectile spines. CHÆTOSTOMUS, 86.

  ccc. Margin of the snout with tentacles, or, in the female, sometimes naked. Ventral surface naked. Interopercle with a bunch of spines inserted on a movable plate. ANCISTRUS, 87.

84. LORICARIA, Linnæus.

Loricaria, LINNÆUS, Syst. Nat., Ed. x, 1758, 307, (*cataphracta*).
Sturisoma, SWAINSON, Nat. Hist. Fishes, II, 304, 1839, (*rostrata*).
Hemiodon, KNER, Panzerwelse, 89, 1853, (*depressus*).
Loricariichthys, BLEEKER, Nederl. Tijdschr. Dierk., 80, 1863, (*dura* = *cataphracta*).
Pseudoloricaria, BLEEKER, *l. c.*, 80, (*læviuscula*).
Parahemiodon, BLEEKER, *l. c.*, 80, (*typus*).
Hemioloricaria, BLEEKER, *l. c.*, 81, (*caracasensis*).
Pseudohemiodon, BLEEKER, *l. c.*, 81, (*platycephalus*).
Rineloricaria, BLEEKER, *l. c.*, 81, (*lima*).
Oxyloricaria, BLEEKER, *l. c.*, 81, (*barbata*).

This genus, sufficiently characterized in the analytical key above, contains a very large number of species, abounding in the rivers in the eastern part of South America. They are remarkable for their elongate form and for the coat of mail which covers the body. A few of these extend northward to the waters about Panama. There is considerable variation in form among these fishes, but the different groups run into each other and are best regarded as subgenera. (*lorica*, a cuirass, or coat of mail.)

a. Snout long and narrow, its lower surface granular.

HEMIODON, (ἡμι, half; ὀδούς, tooth):

b. Margin of head in both sexes granular. Teeth minute or wanting. Lateral keels becoming parallel, not coalescing. No keels on head or scutes before dorsal.

c. Teeth minute, numerous in both jaws. Lower surface of head partly naked; upper and lower caudal rays greatly produced. Scales 33. PANAMENSIS, 251.

STURISOMA, (*sturio*, sturgeon; σῶμα, body):

bb. Margin of head in males with numerous bristles. Teeth well developed in both jaws; lateral keels coalescing.

d. Belly with 5 series of plates. Outer caudal rays produced. Scales 34. ROSTRATA, 252.

aa. Snout acute or rounded, not produced.

RINELORICARIA, (ῥίνη, rasp; *Loricaria*):

e. Margin of the head in males with numerous bristles. Teeth well developed. Upper caudal ray greatly produced. Lips not greatly expanded and without long cirri.

f. Orbit notched; head naked below.

g. Anal plate rather large, with 3 smaller plates before it; lower lip 2-lobed; nuchal plates each with 2 strong keels; mucous pores of anterior part of body black; all the fins spotted. LIMA, 253.

gg. Anal region with small scales like those on belly; nuchal ridges very low; fin rays spotted. BRANSFORDI, 254.

ee. Margin of the head in both sexes granular or hispid.

h. Plates between ventrals large; more or less connected to form a buckler.

PARAHEMIODON, (παρά, near; *Hemiodon*):

i. Head longer than broad. Belly with 3 or more longitudinal series of plates.

j. Uppermost caudal ray spinous; lower lobe emarginate with short cirri. Each jaw with 8 or 10 teeth; no keel on caudal or nuchal plates. URACANTHA, 255.

LORICARIA:

hh. Plates between ventrals, if present, small; no large anal plate.

k. Belly partly naked, the middle line and sides armed; lower lip with numerous cirri and marginal fringes; teeth few, small; an occipital keel; upper surface with light and dark lines; all fins, except anal, spotted with violet. VARIEGATA, 256.

Subgenus HEMIODON, Kner.

251. LORICARIA PANAMENSIS, Eigenmann & Eigenmann.

Head 4½. D. 8; A. 6; V. I, 5. Scales 33. Lower surface of head partly naked; no keels on the head or nape; a large naked area about the mouth. Orbit without notch, 4 in snout; anterior profile concave. Belly with 5 series of plates. Upper caudal filament about as long as body; first dorsal ray very high. Brownish, a blackish area in front of eye; dorsal somewhat spotted; a stripe on each lobe of caudal. Panama. (Eigenmann).

Loricaria panamensis, EIGENMANN, S. A. Nematognathi, 365, 1890, Panama.

Subgenus STURISOMA, Swainson.

252. LORICARIA ROSTRATA, Spix.

Head 4½. D. 8; A. 6. Scales 34. Body little depressed anteriorly; head without keels or ridges; its surfaces and plates evenly hispid; nuchal plates weakly bicarinate. Orbit without notch, 4½ in snout, 7½ in head. Anterior profile very concave; the snout long and narrow; upper lip granular; lower lip entire and rounded, elongate, papillose; free part of barbel shorter than eye. Belly with 5 series of plates; lateral keels moderate, coalescing into one at the twentieth scale; breast and lower surface with many irregular plates. First dorsal ray longer than head; outer caudal rays 3 in length. Brownish; fins mostly spotted. (Eigenmann.) Rivers of eastern South America from Panama to the Paraguay, widely distributed and abundant. (*rostratus*, long-nosed.)

Loricaria rostrata, SPIX, Pisc. Brazil, 5, 1829, Rio Branco; GÜNTHER, Cat., v, 256, 1864; EIGENMANN, S. A. Nematognathi, 366, 1890.

Loricaria acuta, CUVIER & VALENCIENNES, XV, 472, pl. 452, 1840, Barra do Rio Negro.

Loricaria barbata, KNER, Panzerwelse, 87, 1853, Rio Cujaba.

Loricaria barbata, GÜNTHER, Cat., v, 257, 1864.

Subgenus RINELORICARIA, Bleeker.

253. LORICARIA LIMA, Kner.

Head $4\frac{3}{5}$. D. 8; A. 6. Scales 27. Body depressed and elongate, the depth $\frac{1}{2}$ the width. Head long, tapering; the cheeks in the male thickly covered with fine bristles; slightly rough in the female. Superciliary margins raised; nape with 2 ridges, which widen backward. Orbit with a large notch behind; anterior profile convex. Teeth few; lips well developed, the surface covered with short cirri; barbels about as long as eye. Head naked below; belly with 3 to 5 series of scutes; lateral keels coalescing at the sixteenth scute. Upper caudal ray $2\frac{1}{2}$ in length; ventral short. Marbled above, with about 4 faint forked cross-bars. Vertical fins more or less spotted. Coastwise streams of Brazil, from the Parahyba northward to Panama, widely distributed and abundant in rocky brooks. (Eigenmann.) (*lima*, a file.)

Loricaria lima, KNER, Panzerwelse, 89, 1853, Brazil; GÜNTHER, Cat., v, 260, 1864; EIGENMANN, S. A. Nematognathi, 368, 1890.

Loricaria strigilata, HENSEL, Wiegm. Arch., 1868, 368, Santa Cruz.

254. LORICARIA BRANSFORDI, Gill.

Allied to *L. lima*. Scales 28. Eye small, $\frac{1}{2}$ interorbital width, which is flat, bounded by slight crests; orbit with a slight notch (snout and jaws lost in typical example); lower part of head naked; opercle and marginal scutes of head with a broad dense band of erectile bristles. Scutes of neck with 2 obsolete carinæ. Scutes of thorax polygonal, those of belly scale-like; lateral ridges coalescing on eighteenth shield. Caudal fin slightly emarginate, the upper spine swollen at its basal half, the lower lobe truncated. Yellowish brown, the fin rays spotted. Isthmus of Panama. (Gill.) (Named for Dr. J. F. Bransford, its discoverer.)

Loricaria bransfordi, GILL, Proc. Ac. Nat. Sci. Phila., 1876, 338, Empire Station, Isthmus Railway.

Subgenus PARAHEMIODON, Bleeker.

255. LORICARIA URACANTHA, Kner & Steindachner.

D. 8; A. 6. Uppermost caudal ray spinous; vertical diameter of eye 2 in interorbital width; belly with about 6 series of plates. No keels on occipital or nuchal plates; lower lip emarginate, fringed with short cirri; each jaw with 8 to 10 teeth. None of the caudal rays produced; barbels very short. Rio Chagres. (Eigenmann.) (οὐρά, tail; ἄκανθα, spine.)

Loricaria uracantha, KNER & STEINDACHNER, Abh. Bayr. Ac. Wiss., 56, 1865, Rio Chagres.

Subgenus LORICARIA.

256. LORICARIA VARIEGATA, Steindachner.

Head 5. D. I, 7; P. I, 6; V. I, 5; A. I, 5. Lat. line, 30. Body and head strongly depressed, the head triangular, blunt forward; teeth very few, 2 on each side above, 5 or 6 below; underside of head naked. Eye 9 in head, 5 in snout; upper lobe of caudal produced in a long filament. Upper parts with many brownish streaks; fins all, except the anal, spotted with violet. Rio Mamoni, Panama. (Steindachner.) (*variegatus*, variegated.)

Loricaria variegata, STEINDACHNER, Flussfische Südamer., I. 15, 1879, Rio Mamoni.

85. HEMIANCISTRUS, Bleeker.

Hemiancistrus, BLEEKER, Tijdschr. Dierk., I, 78, 1863, (*medians*).
Pseudocanthicus, BLEEKER, *l. c.*, 79, 1863, (*serratus*).

Lips entire; tail short, compressed. Adipose fin entire; remote from the dorsal fin. Body covered with bony plates; teeth small; snout with the margin granular; temporal plate not perforate; interopercle erectile and bearing spines. The numerous species are not well known and do not seem to be abundant; they are chiefly Brazilian. (*ημι-*, half; *ἄγκιστρος*, *Ancistrus*, a related genus.)

a. Interopercle with about 20 erectile spines; the longest ⅓ head. GUACHAROTE, 257.
aa. Interopercle with very few short, setiform spines, the longest shorter than eye, not more than $\frac{1}{10}$ head. ASPIDOLEPIS, 258.

257. HEMIANCISTRUS GUACHAROTE, (Cuvier & Valenciennes).

D. I, 7; A. I, 5; P. I, 6; V. I, 5. Interopercle with about 20 compressed, erectile spines, the longest ⅓ head; head depressed; snout semi-oval; bones of head rough, without keels; eye 5 in head; teeth very fine, doubly curved. Pectoral spine reaching first fourth of ventral; dorsal spine slender and rough. Caudal 4 in total length, forked, with pointed lobes. Belly smooth to the anal. Brownish. L. 5 inches. Porto Rico. (Cuvier & Valenciennes.) (*guacharote*, the Spanish name.)

Hypostomus guacharote, CUVIER & VALENCIENNES, XV, 508, 1840, Porto Rico.
Chætostomus guacharote, GÜNTHER, Cat., V, 245, 1864.

258. HEMIANCISTRUS ASPIDOLEPIS, (Günther).

Head 3⅛. D. I, 7; A. 5; P. I, 6. Lat. line, 25. Head depressed, a little longer than broad; snout very broad, rounded in front; interorbital space nearly flat, 3 times diameter of the small eye; interopercle with very few, short, setiform spines, the longest ½ eye. Thorax and belly granulated, with naked patches. Seven scales between dorsals. Pectoral spine strong, longer than head, with setiform spinules; 12 scutes between anal and caudal. Scutes of body with prominent keel, each keel with 4 to 7 short, setiform spines. Each scale variegated with dirty yellow and dark brown. Veragua. (Günther.) (*ἀσπίς*, shield; *λεπίς*, scale.)

Chætostomus aspidolepis, GÜNTHER, Fishes Central Amer., 478, 1869, Veragua.

86. CHÆTOSTOMUS, Kner.

Chætostomus, KNER, Hypostomiden, 272, 1853, (*loborhynchus*).

This genus, as understood by Dr. Eigenmann, includes all the forms allied to *Hypostomus* and *Hemiancistrus* in which the snout is naked. The numerous species are chiefly confined to mountain brooks in South America. (*χαίτη*, bristle; *στόμα*, mouth.)

a. Pectoral spine longer than head; eye 8¼ in head, 3 in snout; interopercular spines short and stout, 1 or 2 on each side. FISCHERI, 259.

259. CHÆTOSTOMUS FISCHERI, Steindachner.

(COUCHU.)

Head 3⅓; depth 5¾. D. I, 8; A. I, 5; V. I, 5; P. I, 6. Interopercle with 1 or 2 short but very strong curved teeth on each side. Mouth broad. Eye 8¼ in head, about 3 in snout. Pectoral spine very strong, longer than head by 1 or 2 diameters of the eye; ventral spine 1½ to 2 diameters of eye shorter than head; longest ray of caudal slightly longer than head. Scales 23 or 24. Yellowish, with very many yellow dots; fins with some faint dark spots. Rio Mamoni, near Panama. (Steindachner.) (Named for W. Fischer, who collected the type.)

Chætostomus fischeri, STEINDACHNER, Flussfische Südamer., I, 14, 1879, Rio Mamoni.

87. ANCISTRUS, Kner.

Ancistrus, KNER, Hypostomiden, 272, 1853, (*cirrhosus*).

This genus includes numerous species of catfishes, allied to *Hypostomus*, with the snout provided with tentacles. These tentacles are usually present in both sexes, even in the very young. (*ἄγκιστρος*, a fishhook.)

260. ANCISTRUS CHAGRESI, Eigenmann & Eigenmann.

Eye 6 to 7½ in head. D. I, 7; A. 4 or 5. Scales 24. Margin of the snout naked, provided with tentacles. Females with a narrow naked margin and a series of simple tentacles; male with a much wider naked area and simple marginal tentacles; thorax and belly naked; scutes of the body not keeled; region between eyes and gill openings partly naked. Opercle erectile; head broad, depressed, with keels. Lower caudal lobe scarcely longer than upper; margin of the caudal obliquely truncate. Preopercular spines 11 to 15. Breast with a small granular patch of spines. Rio Chagres. (Eigenmann.)

Ancistrus chagresi, EIGENMANN, Proc. Cal. Ac. Sci., 1889, 47, Rio Chagres, Panama.

Order N. PLECTOSPONDYLI.

(THE CARP-LIKE FISHES.)

Soft-rayed or physostomous fishes with the parietals broad, distinct; pterotic normal; symplectic present; opercular bones all present; mesocoracoid present; no interclavicles; the 4 anterior vertebræ much modified and joined together, provided with the Weberian apparatus or ossicula auditus. Branchiostegals few, usually 3 or 4; shoulder girdle attached to the skull. This group consists entirely of fresh-water fishes, and includes about 8 families, to which belong the majority of all the fresh-water fishes of the world. The essential character of the order lies in the modification of the anterior vertebræ, as in the NEMATOGNATHI, but without the character of the rudimentary subopercle and maxillary and the scaleless skin which distinguish the catfishes. Three strongly marked suborders are included in it—each of which has been sometimes regarded as a distinct order. There is no room for doubt that the EVENTOGNATHI and HETEROGNATHI, as well as the GYMNONOTI, sprang from the same stock as the catfishes, as it is not likely that the singular modification of the vertebræ, producing the Weberian apparatus has separately developed in the different groups. (*πλεκτός*, woven together; *σπόνδυλος*, vertebra.)

ANALYSIS OF SUBORDERS OF PLECTOSPONDYLI.

a. Lower pharyngeals falciform, parallel with the gill arches; jaws toothless; brain case produced between orbits; basis cranii simple; only 2 superior pharyngeal bones. EVENTOGNATHI.

aa. Lower pharyngeals not falciform; 3 basal branchihyals; teeth in jaws often present; brain case not produced between orbits; basis cranii double, sometimes with muscular canal; 1 to 4 superior pharyngeal bones.

  b. Anus submedian; body not eel-shaped; dorsal fin present; ventrals abdominal. HETEROGNATHI.

  bb. Anus at throat; body elongate, more or less eel-shaped; dorsal obsolete; ventrals wanting. GYMNONOTI.

Suborder EVENTOGNATHI.

(THE CARPS.)

Plectospondylous fishes with the lower pharyngeals falciform, parallel with the gill arches; 2 upper pharyngeal bones; brain case produced between orbits; jaws without teeth; dorsal fin present; no adipose fin; ventrals abdominal. Gill openings restricted, the gill membranes attached to the isthmus. Streams and lakes of northern regions, the species excessively numerous. (*εὐ*, well; *ἐντός*, within; *γνάθος*, jaw.)

ANALYSIS OF FAMILIES OF EVENTOGNATHI.

a. Pharyngeal teeth numerous, pectinate; maxillaries forming part of the margin of the upper jaw; basal branchihyals 2. CATOSTOMIDÆ, XXXVI.

aa. Pharyngeal teeth few; margin of upper jaw formed by premaxillaries alone; basal branchihyals 3. CYPRINIDÆ, XXXVII.

Family XXXVI. CATOSTOMIDÆ.

(THE SUCKERS.)

Body oblong or elongate, usually more or less compressed. Head more or less conical. Opercles normally developed. Nostrils double; no barbels; mouth large or small, usually protractile and with fleshy lips. Margin of upper jaw formed in the middle by the small premaxillaries, and on the side by the maxillaries; jaws toothless. Lower pharyngeal bones falciform, armed with a single row of numerous comb-like teeth.

Branchiostegals 3; gill membranes more or less united to the isthmus, restricting the gill openings to the sides; gills 4, a slit behind the fourth; pseudobranchiæ present. Scales cycloid, large or small. Lateral line decurved, sometimes wanting. Head naked; fins not scaly. Dorsal fin comparatively long (of 10 to 50 rays), without true spine; anal fin short; caudal fin more or less forked; ventrals abdominal, with about 10 rays; pectoral fins placed low, without spine; no adipose fin; belly not serrated. Alimentary canal long. Stomach simple; no pyloric cœca. Air bladder large, divided into 2 or 3 parts by transverse constrictions, not surrounded by a bony capsule. Genera 14; species about 60; inhabiting the fresh waters of North America; 2 species in Eastern Asia; ascending streams in large numbers in the spring. They are not much valued as food fishes, the flesh being flavorless and full of small bones. (Cyprinidæ, group Catostomina, Günther, Cat., VII, 12–24.)

a. Dorsal fin elongate, its developed rays 25 to 50 in number; air bladder in 2 parts.
Ictiobinæ:
b. Fontanelle present; body ovate; scales large.
c. Dorsal rays 24 to 33.
d. Mouth large, more or less terminal, protractile forward; lips thin; pharyngeal bones and teeth moderate; large species, dark in color. Ictiobus, 88.
dd. Mouth smaller, inferior, protractile downward. Pharyngeal bones narrow, with the teeth thin and weak; smaller species of pale coloration.
Cycleptinæ: Carpiodes, 89.
bb. Fontanelle obliterated by the union of the parietal bones; body elongate.
e. Mouth small, inferior, with thick, papillose lips; scales rather small.
Catostominæ: Cycleptus, 90.
aa. Dorsal fin short, with 10 to 18 developed rays.
f. Air bladder in 2 parts.
g. Lateral line complete and continuous; scales small, 55 to 115 in the lateral line.
h. Fontanelle nearly or quite obliterated in the adult by the union of the parietal bones; jaws with hard sheaths; posterior division of air bladder slender. Pantosteus, 91.
hh. Fontanelle broad and evident at all stages of growth; posterior division of air bladder broad.
i. Nuchal region without hump, the interneural spines normally developed.
j. Mouth inferior, small, with thick papillose lips. Catostomus, 92.
jj. Mouth very large, terminal, oblique; lips thin and nearly smooth; pharyngeals weak, with numerous small teeth. Chasmistes, 93.
ii. Nuchal region with high sharp-edged hump, formed by the greatly enlarged and expanded interneural spines. Xyrauchen, 94.
gg. Lateral line interrupted or wanting; scales large (40 to 50 in longitudinal series).
k. Lateral line entirely wanting. Erimyzon, 95.
kk. Lateral line more or less developed, especially in the adult. Minytrema, 96.
ff. Air bladder in 3 parts; fontanelle present; scales large; lateral line complete.
l. Mouth normal, the lower lip entire or merely lobed, the upper protractile.
m. Pharyngeal bones moderate, the teeth compressed, gradually larger downward; mouth moderate or small, the lips usually plicate. Moxostoma, 97.
mm. Pharyngeal bones very strong, with the lower teeth much enlarged, subcylindrical and truncate, the teeth of the upper part of the bone small and compressed; mouth large, somewhat oblique, with very thick lips. Placopharynx, 98.
ll. Mouth singular, the upper lip not protractile, greatly enlarged, the lower lip developed as 2 separate lobes; pharyngeal bones and teeth ordinary. Lagochila, 99.

88. ICTIOBUS, Rafinesque.

(BUFFALO FISHES.)

Ictiobus, RAFINESQUE, Ichth. Oh., 55, 1820, (*bubalus*).
Sclerognathus, CUVIER and VALENCIENNES, XVII, 477, 1844, (*cyprinella*).
Bubalichthys, AGASSIZ, Amer. Jour. Sci. Arts, 192, 1855, (*urus*).
Ichthyobus, AGASSIZ, (corrected orthography).

Body robust; head very large and strong. Eye moderate, anterior. Fontanelle large, well open. Opercular apparatus largely developed; the suboperculum broad; the operculum strongly furrowed. Mouth large for a sucker, terminal, protractile forward, or downward and forward. Mandible strong, oblique. Lips little developed; the upper narrow and smooth; the lower rather full on the sides, but reduced to a narrow rim in front. Jaws without cartilaginous sheath. Muciferous system of head well developed. Isthmus narrow. Pharyngeal bones rather weak; the teeth numerous, moderate or small; the lower ones gradually larger than the upper ones. Gill rakers long and slender above, becoming shorter downward. Scales large, thick, nearly equal over the body; lateral line well developed, slightly decurved anteriorly. Dorsal fin elongate, its rays 25 to 30; anterior rays somewhat elevated, their length about ½ that of the base of the fin; caudal not much forked; anal fin not much elevated, its rays about 9; pectorals and ventrals moderate, the latter with about 10 rays. Sexual differences slight. Coloration dark, not silvery. Air bladder with 2 chambers. Fishes of very large size, inhabiting deep rivers, chiefly in the Mississippi basin. (*ἰχθύς*, fish; *βοῦς*, bull.)

SCLEROGNATHUS, (σκληρός, hard; γνάθος, jaw):
- *a.* Mouth large, terminal, protractile forward; lips very thin; lower pharyngeals and teeth weak. CYPRINELLA, 261.

ICTIOBUS:
- *aa.* Mouth smaller, more or less inferior, protractile downward, and with thicker lips; lower pharyngeal bones stronger; the teeth comparatively coarse and large, increasing in size downward.
  - *b.* Back scarcely elevated, the depth 3 to 3¼ in length.
    - *c.* Mouth rather large and oblique, approaching that of *I. cyprinella*, more oblique than in the next. URUS, 262.
    - *cc.* Mouth small, inferior. MERIDIONALIS, 263.
  - *bb.* Back elevated and compressed, the depth 2½ to 2¾ in length; mouth small, inferior. BUBALUS, 264.

Subgenus SCLEROGNATHUS, Cuvier & Valenciennes.

261. ICTIOBUS CYPRINELLA, (Cuvier & Valenciennes).

(RED MOUTH BUFFALO FISH; COMMON BUFFALO FISH.)

Head very large and thick, 3½ in length; depth 2½ to 3½ in length. Developed rays of the dorsal 27 to 29; anal rays 9; ventrals 10. Scales 7–37 to 41–6. Body robust, moderately compressed, the outline somewhat elliptical, but the back rather more curved than the belly. Opercular apparatus very strong, the operculum itself forming nearly ½ the length of the head. Coloration dull brownish olive, not silvery; fins dusky. Size very large; reaches a length of nearly 3 feet and a weight of 20 to 30 pounds. Mississippi Valley; generally abundant in the larger streams. (Diminutive of *cyprinus*, carp.)

Sclerognathus cyprinella, CUVIER & VALENCIENNES, XVII, 477, 1844, Lake Pontchartrain.
Ichthyobus bubalus, AGASSIZ, Amer. Jour. Sci. Arts, 1854, 196, not of Rafinesque.
Ichthyobus cyanellus, NELSON, Bull. Ill. Mus. Nat. Hist., I, 49, 1876, Illinois River.
Ichthyobus bubalus, Jordan, Bull. U. S. Nat. Mus., XII, 214, 1878.
Sclerognathus cyprinella, GÜNTHER, Cat., VII, 24, 1868; JORDAN & GILBERT, Synopsis, 883, 1883.

Subgenus ICTIOBUS.

262. ICTIOBUS URUS, (Agassiz).

(MONGREL BUFFALO.)

Scales 8–41–7. D. 30; A. 10. Body much less elevated and less compressed than in *I. bubalus*, the back not at all carinated; axis of body above ventrals about at the lateral line, and but very little farther from the dorsal outline than from the ventral; depth 3 to 3¼ in length. Head very stout, strongly transversely convex, thicker, larger, and less pointed than in *I. bubalus*, about 4 in length. Eye about equal to snout, 5½ in head, much smaller than in *I. bubalus*. Mouth large, considerably oblique, opening well forward, approaching that of *I. cyprinella*. Mandible longer than eye. Premaxillary somewhat below suborbital. Dorsal fin lower and less rapidly depressed than in the next, the longest ray scarcely ½ the length of the base of the fin. Anal fin rounded; its rays not rapidly shortened; the middle ones not much shorter than the longest. Colors very dark; fins all black. Mississippi Valley; in the larger streams, less common than the others; certainly distinct from *I. bubalus*, but we can not always separate it from *I. cyprinella*, and perhaps it is not really different. (*urus*, a wild bull.)

Carpiodes urus, AGASSIZ, Amer. Jour. Sci. Arts, 1854, 355, Tennessee River, Huntsville, Ala.
Bubalichthys urus, *niger*, Ohio River, *and bonasus*, Osage River, AGASSIZ, Amer. Jour. Sci. Arts, 1855, 193, 195.
Bubalichthys urus, JORDAN, *l. c.*, 209; JORDAN & GILBERT, Synopsis, 883, 1883.

263. ICTIOBUS MERIDIONALIS, (Günther).

Scales 7–38–7. D. 29; A. 10. Mouth small, inferior, slightly corrugated. Depth 3⅓ to 3¼ in length. Head 4 to 4⅓, not much longer than high. Eye rather small, ⅕ of the length of the head and ⅚ that of the snout. Suborbitals narrow. Anterior dorsal rays not much produced, shorter than the head; caudal forked; origin of ventral vertically below the fourth dorsal ray; pectoral not extending to ventrals. Coloration uniform. Rio Usumacinta, Guatemala. (Günther.) (*meridionalis*, southern.)

Sclerognathus meridionalis, GÜNTHER, Cat., VII, 23, 1868, Rio Usumacinta, Guatemala.

264. ICTIOBUS BUBALUS, (Rafinesque).

(SMALL-MOUTHED BUFFALO; RAZOR-BACKED BUFFALO; SUCKER-MOUTHED BUFFALO.)

Scales 8–39–6. D. 29; A. 10; V. 10. Body considerably elevated and compressed above; the dorsal region subcarinate; belly thicker; depth 2½ to 2⅘ in length; axis of body above the ventrals, below the lateral line, and nearly twice as far from the back as from the belly. Head moderate, triangular in outline when viewed from the side, 4 in length. Eye equal to snout, 4 to 5 in length of head, much larger than in *I. urus*. Mouth quite small, notably smaller and more inferior than in *I. urus;* mandible about equal to eye. Dorsal fin elevated in front and rapidly declined, the highest ray reaching much beyond the middle of the fin, the seventh ray about ½ the length of the third or longest. Anal rays rapidly shortened behind, the middle rays much shorter than the first long ones. Coloration paler; the lower fins slightly dusky. Mississippi Valley and southward; generally abundant. (*βούβαλος*, buffalo.)

Bubalichthys bubalinus, JORDAN, Bull. U. S. Nat. Mus., IX, 50, 1877, Ohio River.

89. CARPIODES, Rafinesque.

(CARP SUCKERS.)

Carpiodes, RAFINESQUE, Ichth. Oh., 56, 1820, (*cyprinus*).

Head comparatively short and deep; its length 3½ to 5 times in that of the body; its upper surface always rounded. Eye moderate, median or anterior. Suborbital bones well developed. Fontanelle always well developed. Mouth small, horizontal and inferior; the mandible less than ⅓ length of head; lips thin, the upper protractile, narrow, the lower quite narrow, ∩-shaped behind; both lips feebly plicate or nearly smooth. Jaws without cartilaginous sheath. Muciferous system moderately developed. Opercular apparatus well developed; the subopercle broad. Isthmus moderate. Pharyngeal bones remarkably thin, laterally compressed, with a shallow furrow along the anterior margin on the inside, and another more central one on the outline of the enlarged surfaces; teeth very small, compressed, nearly equally thin along the whole inner edge of the bone, forming a fine, comb-like crest of minute serratures; their cutting edge rises above the inner margin into a prominent point. Gill rakers slender and stiff above, becoming reduced downward. Body oblong; the dorsal outline more or less arched; the ventral outline nearly straight; the depth from ½ to ⅓ the length; sides compressed, the back notably so. Caudal peduncle short and deep. Scales large, about equal over the body; lateral line well developed, nearly straight, with 34 to 41 scales; 12 to 15 scales in a cross-row from dorsal to ventrals. Dorsal fin beginning near middle of body, somewhat in advance of ventrals, falcate; its anterior rays elevated, often filamentous, their height ranging from ½ to 1⅓ the length of the base of the fin; the number of developed rays ranging from 23 to 30; caudal fin well forked, the lobes equal; anal fin comparatively long and low, emarginate (in males), its number of developed rays usually 8; ventrals shortish, with usually 10 rays; pectorals short. Sexual peculiarities little marked; in some species, the males in spring have the snout minutely tuberculate. Coloration always plain; pale olivaceous above, white below, but hardly silvery, the fins plain. Air bladder with two chambers. Size medium or rather large. This genus is very close to *Ictiobus* and its species are even more difficult to determine. Compared with *Ictiobus*, the *Carpiodes* are smaller in size and paler in color, with weaker dentition, but no technical character of importance separates the 2 groups. (*Carpio*, ειδος, carp-like.)

a. Body subfusiform, the depth about 3 in length; lips thin, silvery white in life, the halves of the lower lip meeting at a wide angle. CARPIO, 265.
aa. Body ovate oblong, the back elevated, the depth about 2½ in length.
  b. Opercle strongly striate.
    c. Lips thin, silver-white in life, the halves of the lower lip meeting in a wide angle, as in *C. carpio*.
      d. Head large, with blunt snout, the nostril near its tip; eye large, 3½ to 4 in head. DIFFORMIS, 266.
      dd. Head small and pointed, the snout projecting; eye small, 5 to 5½ in head. THOMPSONI, 267.
    cc. Lips full, thick, reddish in life, the halves of lower lip meeting in an acute angle; first ray of dorsal usually very long. VELIFER, 268.
  bb. Opercle nearly smooth; otherwise essentially as in *C. velifer*. CYPRINUS, 269.

265. CARPIODES CARPIO, (Rafinesque).

(CARP SUCKER.)

Head comparatively short, its length 4 to 5 times in length of body. Body more fusiform than in the others, compressed, but not much arched, the depth 2⅔ to 3 times in length. Anterior rays of dorsal short, notably thickened and osseous at base, especially in the adult; the first ray nearer the end of the muzzle than the base of the caudal fin, the longest ray a little more than ½ the base of the fin; caudal moderately forked. Eye medium, anterior, 4½ in head. Muzzle short but projecting beyond mouth. D. 30. Lat. line 36. Size largest of the genus. Ohio Valley; southwest to central Texas, generally abundant, apparently a valid species but variable, and its synonymy uncertain. Perhaps more than one species is here included. (*carpio*, carp.)

? Catostomus carpio,* RAFINESQUE, Ichth. Oh., 56, 1820, Falls of Ohio River.
Carpiodes nummifer, COPE, Proc. Am. Phil. Soc. Phila., 1870, 484, Wabash River.
Carpiodes carpio, JORDAN & GILBERT; Synopsis, 118, 1883; JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1886, 20; Texas specimens.
? Carpiodes bison,† AGASSIZ, Am. Jour. Sci. Arts, 1854, 356, Osage River.

266. CARPIODES DIFFORMIS, Cope.

Snout very blunt, the maxillary reaching to front of the pupil. Nostrils very near tip of snout, above or below upper lip; lips thin, silvery colored in life, the lower ∩-shaped. Head 4¼ in length; depth 2¼ to 2¾. Eye quite large, 3½ to 4 in head. First ray of dorsal nearer muzzle than base of caudal, the anterior rays of dorsal usually very high. Scales 6–35–4. D. 24; A. 8; V. 9. Ohio Valley and westward, generally common. (*difformis*, deformed.)

---

*The following is Rafinesque's description: "Diameter ¼ of the length; olivaceous above, pale beneath, chin white; abdomen bluish; lateral line straight; dorsal fin somewhat falcated with 36 rays; anal trapezoidal with 10 rays; head sloping, rounded. Seen at the Falls of the Ohio, commonly called Carp. Length from 1 to 2 feet. Eyes very small and black; fins olivaceous brown, the pectorals olivaceous, trapezoidal, short, and with 16 rays; tail with 24. Dorsal beginning before the abdominal and reaching the end of the anal fin. Not so good to eat as the Buffalo fish."

†The following is Agassiz's description: "More elongated than *C. taurus*. The head is smaller; the opercle also smaller and the subopercle triangular. The dorsal has its anterior rays longer, hence its hinder border is more deeply emarginate. Anal more lunate. Horizontal diameter of scales greater."

Carpiodes difformis, COPE, Proc. Am. Phil. Soc. Phila., 1870, 480, Wabash River; JORDAN, *l. c.*, 195; JORDAN & GILBERT, Synopsis, 120, 1883.

Carpiodes cutisanserinus, COPE, *l. c.*, 481, 1870, Kiskiminitas River, Pennsylvania.

267. CARPIODES THOMPSONI, Agassiz.

(LAKE CARP.)

Body stout, short, the back much arched, the depth 2½ in length. Head small, 4 to 4¼ in length, the snout pointed; lips thin, white, meeting at a wide angle. Dorsal rays considerably elevated, ⅔ as long as base of fin. Eye small, 5 to 5½ in head. Tip of lower jaw much in advance of nostrils; maxillary reaching line of orbit. Origin of dorsal about midway of body. Scales rather closely imbricated, 8–39 to 41–6. D. 27; A. 7; V. 10. Great Lake region; abundant; our specimens from Lake Erie at Toledo, Ohio. (Named for Rev. Zadock Thompson, who found the species in Lake Champlain.)

Carpiodes thompsoni, AGASSIZ, Am. Jour. Sci. Arts, 1855, 191, Lake Champlain, JORDAN, *l. c.*, 198; JORDAN & GILBERT, Synopsis, 119, 1883.

? *Carpiodes selene*,[*] COPE, Proc. Am. Phil. Soc. 1870, 481, supposed to be from Root River, Michigan.

268. CARPIODES VELIFER, (Rafinesque).

(QUILLBACK; SPEARFISH; SAILFISH; SKIMBACK.)

Muzzle conic, projecting, obtusely pointed; tip of the mandible reaching to opposite nostrils; maxillary reaching to opposite front of orbit. Lips full, thick, flesh-colored in life, the lower lip ∧-shaped, the halves meeting in an acute angle. Anterior suborbital as deep as long. Head 3¾ to 4 in length. Eye moderate or small, 4 to 5 in head. Body much arched above, the depth 2½ to 3 in length. First ray of dorsal usually nearer muzzle than base of caudal; anterior rays of dorsal always elevated or filamentous, sometimes as long as base of fin. Caudal deeply forked, its lobes slender, the upper the longer. Scales 7-35–5. D. 26 or 27. Mississippi Valley and southwestward to Rio Grande and upper Missouri, generally abundant and very variable. Much of the following synonymy is doubtful, some of the names perhaps belonging to *C. carpio* or *C. difformis*. (*velum*, sail; *fero*, I bear.)

Catostomus velifer, RAFINESQUE, Ichth. Oh., 56, 1820, Ohio River.

Carpiodes tumidus, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 28, Rio Grande at Fort Brown, Texas. (Type, No. 178.)

Carpiodes damalis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 170, Milk River, Montana.

Carpiodes grayi, COPE, Proc. Am. Phil. Soc. Phila., 1870, 482, Western States.

---

[*] Eye 3⅜ in head; color silvery white. D. 26. This may be identical with *C. difformis*

269. CARPIODES CYPRINUS, (Le Sueur).

(EASTERN CARP SUCKER.)

Very similar to *C. velifer*, the mouth similar but the opercle nearly smooth with scarcely any wrinkles or furrows. Body rather elongate. Eye quite small; dorsal fin high, color silvery, dorsal dusky; paired fins edged with white. Streams about Chesapeake Bay, common in the Chesapeake and Potomac, rare in the Delaware. (*cyprinus*, carp.)

Catostomus cyprinus, LE SUEUR, Jour. Ac. Nat. Sci. Phila., I, 1817. 91, Elk River and other tributaries of Chesapeake Bay; GÜNTHER, Cat., VII, 19, 1868.
Carpiodes vacca, AGASSIZ, Am. Jour. Sci. Arts, 1854, 256, Susquehanna River.

90. CYCLEPTUS, Rafinesque.

(BLACK HORSE.)

Cycleptus, RAFINESQUE, Jour. Phys. Chymie. Hist. Nat. Paris, 1819, 421, (*nigrescens*).
Rhytidostomus, HECKEL, Russeggers Reisen Syrien, 1023, 1842, (*elongatus*).

Head very small, short and slender, 6 to 7 times in body; its upper surface rounded. Eye small, behind middle of head, not very high up. Suborbital bones small and narrow. Fontanelle entirely obliterated by the union of the parietal bones. Mouth small, entirely inferior, overlapped by the projecting snout; upper lip thick, pendent, covered with several rows of tubercles; lower lip moderate, formed somewhat as in *Catostomus*, but less full, incised behind. Jaws with rudimentary cartilaginous sheath. Muciferous system not greatly developed. Operculum smooth and narrow. Isthmus moderate. Gill rakers moderate, soft. Pharyngeal bones strong; the teeth stout, increasing in size downward, rather wide apart. Body elongate, moderately compressed, not much elevated; the caudal peduncle long; scales moderate, about equal over the body, with wide, exposed surfaces, the number in the lateral line from 55 to 60. Lateral line well developed, nearly straight. Fins rather large; dorsal fin beginning in front of ventrals and ending just before anal, of about 30 rays, strongly falcate in front, the first and second developed rays in length more than ½ length of base of fin, the rays rapidly shortened to about the eighth, the remaining rays being all short; caudal fin large, widely forked, the lobes about equal. Anal fin quite small, low, of 7 or 8 developed rays, scaly at base. Ventrals moderate, with 10 rays. Pectorals elongate, somewhat falcate. Sexual peculiarities marked; the males in spring with black pigment; the head then covered with small tubercles. Air bladder with 2 chambers, the anterior short, the posterior elongate. One species known. (κύκλος, round; λεπτός, slender; "the name means small round mouth."—*Rafinesque.*)

270. CYCLEPTUS ELONGATUS, (Le Sueur).

(BLACK HORSE; GOURD-SEED SUCKER; MISSOURI SUCKER; SUCKEREL.)

Depth 4 to 5 in length; head 6 to 8½; eye small, 6 to 7 in head. Dorsal rays 30; anal 7 or 8; scales 9–56–7. Longest dorsal rays a little longer than head; pectorals rather longer than head. Coloration very dark, the males in spring almost black. Size large. Length 2½ feet. Mississippi Valley; rather common in large streams. A singular and interesting fish. (*elongatus*, elongate).

Catostomus elongatus, Le Sueur, Jour. Ac. Nat. Sci. Phila., I, 1817, 103, Ohio River.
Sclerognathus elongatus, Günther, Cat., VII, 23, 1868.
Cycleptus elongatus, Jordan & Gilbert, Synopsis, 121, 1883.
Cycleptus nigrescens, Rafinesque, Jour. Phys., 1819, 421, Ohio River.
Amblodon niger, Rafinesque, *l. c.*, 421, (description insufficient; at second hand), Ohio River.

91. PANTOSTEUS, Cope.

(Mountain Suckers.)

Pantosteus, Cope, Lieut. Wheeler's Expl. W. 100th Mer., v, 673, 1876, (*platyrhynchus*).

Head rather small, 4 to 5 times in length of body, flattish and rather broad above, anteriorly somewhat pointed. Eye rather small, usually behind the middle of the head. Suborbital bones narrow. Bones of head rather thick, the 2 parietal bones in the adult more or less united, partly or wholly obliterating the fontanelle, which, however, is evident in the young. Mouth rather large, entirely inferior; each jaw with a more or less developed cartilaginous sheath. Upper lip broad, papillose, with a rather broad free margin and 2 or more series of tubercles. Lower lip largely developed, with a broad free margin deeply incised behind. Pharyngeal bones and teeth essentially as in *Catostomus*. Isthmus broad. Body elongate, subterete, little compressed. Scales quite small, 80 to 105 in the course of the lateral line, and 30 to 35 in a cross series between dorsal and ventrals, usually more or less reduced in size and crowded forward, as in *Catostomus*. Lateral line well developed, straightish. Fins generally rather small. First ray of dorsal usually about midway of body, its rays few, 9 to 12 in number. Ventrals inserted under posterior part of dorsal, the rays 10 or 9; anal short and high, with 7 developed rays. Caudal rather shallow emarginate. Pectorals well developed. Air bladder with 2 chambers, the posterior chamber very slender. Size rather small. Rocky Mountain region, mostly in rocky brooks in the arid district. The genus is close to *Catostomus* and may be inseparable from it, as in 3 species of *Pantosteus* the fontanelle never quite disappears, retaining through life the characters of the young of other species of *Pantosteus*. This indicates the probability that *Pantosteus* is a modified descendant of species of *Catostomus*. (πᾶνς, all; ὀστέον, bone.)

a. Fontanelle entirely obliterated in the adult.

b. Scales of back very much enlarged, there being less than 20 between dorsal fin and nape, along the median line; about 75 scales in lateral line. Head very broad, and flattish above. Gila basin. ARIZONÆ, 271.

bb. Scales of back not notably enlarged, there being 30 to 50 before dorsal.

c. Scales moderate, 80 to 90; mouth and lips moderate; dorsal rays usually 9.

d. Head short and small, nearly 5 in length; body slender. Utah basin. GENEROSUS, 272.

dd. Head rather large, about 4⅔ in length; body stout. Rio Grande. PLEBEIUS, 273.

cc. Scales very small, 90 to 100 in lateral line, usually about 95; mouth large, with very full lips; head short; tail slender; dorsal rays 9 to 12.

e. Caudal moderate, shallow-forked, its lobes shorter than head; fins low. Colorado basin. DELPHINUS, 274.

ee. Caudal long, deeply forked, its lobes pointed, longer than head. Head short, 5 in length. Coahuila basin. GUZMANIENSIS, 275.

aa. Fontanelle remaining partly open in the adult; scales small, crowded anteriorly; dorsal short (transition species, approaching *Catostomus*).

f. Scales in lateral line 90 to 100; head short, $4\frac{1}{2}$ to 5 in length. Upper Missouri and Columbia basins. JORDANI, 276.

ff. Scales in lateral line about 70; lower lip more incised.

g. Scales before dorsal 42, the scales of the body being much crowded forward. Nevada basin. ARÆOPUS, 277.

gg. Scales before dorsal 23, the scales of body little crowded forward. Gila basin. CLARKI, 278.

271. PANTOSTEUS ARIZONÆ, Gilbert, new species.

Head $4\frac{3}{5}$; depth $4\frac{3}{4}$. D. 12; A. 7. Scales 8–75–11 to 17; unusually large scales before dorsal. Body rather robust, the caudal peduncle stoutish, compressed. Head shortish, unusually broad and flat, the interorbital very wide, flattened or even slightly concave, the orbital rim being somewhat raised; eye moderate, posterior, the snout very long, considerably longer than rest of head; eye 3 in snout, $1\frac{2}{3}$ in postorbital part of head, $5\frac{1}{2}$ in head; mouth very wide, with wide papillose lips and well-developed cartilaginous sheath to the jaws; fontanelle obliterated, the bone above it very thin; isthmus broad. Fins all comparatively large, the pectoral $1\frac{1}{10}$ in head; caudal well forked, $1\frac{1}{10}$ in head, with numerous basal rudimentary rays; edge of dorsal straight. Scales peculiar, those on back very large, those along lateral line moderate, those on belly very small, becoming minute below; scales posteriorly along lateral line much larger than anteriorly. Dark brown above, pale below. L. 9 inches. Gila basin.

Pantosteus arizonæ, GILBERT, MS., Salt River, Tempe, Arizona.

272. PANTOSTEUS GENEROSUS, (Girard).

(MOUNTAIN SUCKER.)

Body moderately elongate, the depth 5 to $5\frac{2}{3}$ in length. Head short and small, $4\frac{5}{6}$ to 5 in length. Dorsal rays 9 (rarely 10); ventral rays 10 (rarely 9); scales 15-81–14. Lower lip full, with 4 or 5 rows of tubercles; upper with 2. Isthmus very broad. Head with conspicuous mucous tubes. Lower fins large. Light brown above, with dusky spots and clouds; males with the chin and fins red, and a crimson lateral band. L. 8 inches. Great Basin of Utah; very abundant in streams about Great Salt Lake and southwest through the Sevier basin and the desert. (*Generosus*, generous.)

Catostomus generosus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 174, Cottonwood Creek, Utah. (Type, No. 256.)

Minomus jarrovii, COPE, Proc. Am. Phil. Soc. Phila., 1874, 129-139, Provo River, Utah. (Type, No. 18008.)

Pantosteus generosus, JORDAN & GILBERT; Synopsis, 123, 1883.

Minomus platyrhynchus, COPE, Proc. Am. Phil. Soc. Phila., 1874, 134, Utah Lake at Provo. (Type, No. 15763.)

Pantosteus platyrhynchus, JORDAN & GILBERT, Synopsis, 124, 1883.

273. PANTOSTEUS PLEBEIUS, (Baird & Girard).

Head comparatively large, $4\frac{3}{5}$ to $4\frac{2}{3}$ in length; depth $4\frac{3}{4}$; eye 5 in head. Ventrals reaching nearly to vent. Scales moderate, scarcely crowded anteriorly, 80 in the lateral line, 25 to 30 in a cross series. Body rather stout, subfusiform. Dorsal inserted midway between snout and upper caudal rays; caudal short, emarginate. Color dark brown, faintly mottled, sides with orange in the males. L. 1 foot. Basin of the Rio Grande, Colorado to Chihuahua; very common. (*plebeius*, commonplace.)

Catostomus plebeius, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1854, 28, Rio Mimbres, a tributary of Lake Guzman, Chihuahua. (Type, No. 168.)

Catostomus plebeius, Günther, Cat., vii, 15, 1868; *Pantosteus plebeius*, Jordan, *l. c.*, 184, 1878; Jordan & Gilbert, Synopsis, 122, 1883.

Pantosteus jarrovii, Cope & Yarrow, but not *Minomus jarrovii*, Cope.

274. PANTOSTEUS DELPHINUS, (Cope).

(Blueheaded Sucker.)

Head rather short, 4⅗to 4¾ in length; upper lip broad and pendant; lower lip very broad, more deeply incised than in *P. jordani*, the lobes pointed; tail very slender, the caudal long; mouth large, with very full lips; depth about 5 in length; scales 16–96 to 105–14. D. 10. Color dusky bluish above, males with sides more or less rosy, the snout and fins tuberculate. A curved yellowish streak extending from belly behind, and above pectoral axil. L. 12 inches. Mountain streams tributary to the Colorado River in Western Colorado and Wyoming; very abundant. (*delphinus*, dolphin.)

Minomus delphinus, Cope, Hayden's Geol. Sur. Wyoming for 1870, 435, 1872, probably Henry Fork of Green River, Wyoming.

Minomus bardus, Cope, *l. c.*, 436; locality not certain, but probably Henry Fork of Green River, Wyoming.

Pantosteus virescens, Cope, Wheeler Survey, Zoöl., 675, 1876, wrongly ascribed to Arkansas River at Pueblo; Jordan & Gilbert, Synopsis, 124, 1883. (Type, No. 16758.)

Pantosteus delphinus, Jordan, Bull. U. S. Fish Com., 1889, 19.

275. PANTOSTEUS GUZMANIENSIS, (Girard).

Head 5; depth 5. D. 9; A. 8. Scales 14–90–14. Body stout, little compressed. Head nearly as broad as eye; eye small, about ½ snout; mouth small; lips with considerable free margin. Dorsal inserted midway between snout and caudal; caudal deeply notched; anterior rays of dorsal longest. (Garman, description of *C. nebuliferus.)* Streams of Coahuila and Chihuahua, tributary to the Rio Grande. Possibly identical with *P. plebeius*, but the small scales and short head approach nearer *P. delphinus*, which is in a different river system.

Catostomus guzmaniensis,* Girard, Proc. Ac. Nat. Sci. Phila., 1856, 173; Rio Janos, a tributary of Lake Guzman, Chihuahua. (Type, No. 260.)

Catostomus nebuliferus, Garman, Bull. Mus. Comp. Zoöl.. viii, 89, 1881, Rio Nazas, Coahuila.

Catostomus nebulifer, Jordan & Gilbert, Synopsis, 883, 1883.

276. PANTOSTEUS JORDANI, Evermann.

Head 4½ to 5½; depth 4½ to 5. Eye 4½ to 5 in head. D. 10 or 11; A. 7. Scales 16–90 to 100–14, 48 before dorsal. Body rather stout; subterete; head short, conic; interorbital space broad, little convex; snout long, 2 in head; mouth large; lower lip broad, little incised, covered with moderate

---

*The type of *Catostomus guzmaniensis* is a *Pantosteus*. It has 100 scales in the lateral line, 48 scales before dorsal, the fins high. Dorsal rays 11; head 5 in length, eyes small; an orange lateral band. It is probably identical with *C. nebulifer*, from the same faunal area.

tubercles; upper lip broad, extending well down on sides of mouth, its tubercles in 3 or 4 rows; lower lip thin; more deeply incised than in *P. generosus*, the lobes rounded; the cartilaginous sheath well developed; caudal peduncle stout; scales small, much crowded forward; dorsal small, its height $1\frac{1}{5}$ in head, a little more than base of fin; pectorals long, as long as head, reaching halfway to ventrals; ventrals short, not to vent; fontanelle a very narrow slit, or quite obliterated in old individuals; air bladder small, the posterior part very long and slender. Dark greenish, finely speckled, males with an orange lateral band; peritoneum very black. L. about a foot. Clear streams of upper Missouri and Columbia river basins, Black Hills, and northwestward. (Named for David Starr Jordan.)

Pantosteus jordani, EVERMANN, Bull. U. S. Fish Com., 1892 (Jan. 27, 1893), 51, with plate, Whitewood Creek and other streams of the Black Hills, South Dakota; Red Rock River, Red Rock, Montana, and numerous other localities. (Type, No. 43963.)

Catostomus discobolus, EVERMANN, Bull. U. S. Fish Com., 1891 (1892), 41, plate 18, fig. 1.

Pantosteus virescens, JORDAN, Bull. 4, U. S. Nat. Mus., 1878, 780.

*Pantosteus columbianus**, EIGENMANN & EIGENMANN, American Naturalist, February 4, 1893, 151, Boise River, Caldwell, Idaho. (Types in Indiana University and British Museum.)

Catostomus discobolus, JORDAN & GILBERT, Synopsis, 125, 1883; not of COPE.

277. PANTOSTEUS ARÆOPUS, (Jordan).

Fins moderate; dorsal higher than long, with 10, rarely 11, rays; ventral rays 10. Scales small, crowded forward, 10 or 9–70–8. Body elongate, fusiform, subterete, the greatest depth $4\frac{1}{4}$ to $4\frac{1}{2}$ in length. Head small, conical, $4\frac{2}{3}$ in length. Mouth quite large, with full, thick lips, the upper very wide and pendant, with about 6 rows of very strong papillæ; lower lip two-lobed, similarly papillose. Interorbital space wide, convex; eye elevated, posterior, quite small. Color dark; scales with dark punctulations. Kern River, California; Carson River and Reese River, Nevada. (*ἀραιός*, slender; *ὠπή*, aperture.)

Catostomus aræopus, JORDAN, Bull. U. S. Nat. Mus., XII, 1878, 173, Kern River, California. (Type, No. 31228.)

Catostomus aræopus, JORDAN & HENSHAW, Rept. Chief Engin., App. nn., 1878, 188; JORDAN & GILBERT, Synopsis, 127, 1883; GILBERT, Death Valley Expedition, 228, 1893.

278. PANTOSTEUS CLARKI, (Baird & Girard).

Closely related to *P. aræopus*, with restricted fontanelle and cartilaginous sheath to jaws, but with the scales less crowded anteriorly, there being but 23 before dorsal. D. 11. Scales 70; fins all small. Rio Gila and tributaries in Arizona. (Named for John H. Clark, who first collected it.)

Catostomus clarki, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 27, Rio Santa Cruz, Gila Basin, Arizona; JORDAN & GILBERT, Synopsis, 130, 1883. (Type, No. 166.)

---

*Head $4\frac{2}{5}$ to $4\frac{3}{5}$. D. 11 or 12; A. 8. Scales 16 to 19-80 to 100-15. Eye $1\frac{1}{2}$ to 2 in snout, $1\frac{1}{5}$ to $1\frac{3}{5}$ in interorbital, $3\frac{3}{4}$ to 4 in head. All the fins pointed, the caudal lobes considerably longer than the head. Light brown with indistinct clouds of darker. Three specimens, 92 to 100 mm. in length. Boise River, Idaho, a tributary of the Columbia. Related to *P. generosus*, the eye larger, the caudal longer. (Eigenmann.) (Named for the Columbia River.) An examination of numerous specimens from the Columbia basin shows this to be the young of *P. jordani*.

92. CATOSTOMUS, Le Sueur.

(Fine-scaled Suckers.)

Catostomus, Le Sueur, Jour. Ac. Nat. Sci. Phila., i, 1817, 89, (*catostomus*).
Hypentelium, Rafinesque, Jour. Ac. Nat. Sci. Phila., 1818, 421, (*macropterum* = *nigricans*).
Eurystomus, Rafinesque, Ich. Oh., 59, 1820, (*megastomus*, based on an incorrect drawing).
Decactylus, Rafinesque, Ich. Oh., 60, 1820, (*bostoniensis* = *commersonii*).
Hylomyzon, Agassiz, Am. Jour. Sci. Arts, 1855, 205, (*nigricans*).
Minomus, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 173, (*insignis*).
Acomus, Girard, *l. c.*, 173, 1856, (*forsterianus*).

Head more or less elongate; eye rather small, high up; suborbital bones narrow, fontanelle always present, widely open. Mouth rather large, always inferior, upper lip thick, protractile, papillose; lower lip greatly developed, with a broad free margin, usually deeply incised behind, so that it forms 2 lobes which are often more or less separated. Mandible horizontal, short, not ⅓ the length of the head and not reaching to opposite the eye. Opercles moderate. Pharyngeal bones moderate; the teeth shortish, vertically compressed, rapidly diminishing in size upward. Body elongate, more or less fusiform, subterete. Scales comparatively small, typically much smaller and crowded anteriorly, the number in the lateral line from 50 to 115, the number in a transverse series between dorsal and ventrals from 15 to 40. Lateral line well developed, straightish. Dorsal with its first ray nearly midway of the body, with from 9 to 14 developed rays. Anal fin short and high, with 7 developed rays; ventrals inserted under the middle or posterior part of the dorsal, with 9 or 10 rays; caudal fin forked, the lobes nearly equal. Sexual peculiarities not much marked; the fins higher in the male and the anal somewhat swollen and tuberculate in the spring. Breeding males in most species with a rosy or orange lateral band. Air bladder with 2 chambers, the posterior chamber large. Vertebræ 45 to 47. Species very numerous, all belonging to the United States, except the Siberian *C. rostratus* Tilesius. Many of the western species are imperfectly known, and the following key is far from complete. (*κάτω*, inferior; *στόμα*, mouth.)

a. Head transversely convex above, the orbital rim not elevated; scales in lateral line 60 or more.

Catostomus:

- *b.* Scales very small, much reduced and crowded anteriorly, the number in the lateral line 80 to 115.
  - *c.* Upper lip very broad, with several (5 or 6) rows of papillæ.
    - *d.* Dorsal fin of 11 to 13 rays, very high, especially in the male, the free edge of dorsal deeply incised; caudal very strong; the rudimentary rays at its base largely developed in the adult, the caudal peduncle slender; these characters all most strongly marked in adult males; lips very full. LATIPINNIS, 279.
    - *dd.* Dorsal fin of 10 to 12 rays, moderately developed; caudal fin moderate, its rudimentary rays few, the peduncle rather stout; lips full; lower lip split to base. GRISEUS, 280.
  - *cc.* Upper lip thick but narrow, with 3 rows of papillæ. D. 9 or 10. POCATELLO, 281.
  - *ccc.* Upper lip comparatively thin and narrow with 2 to 4 rows of papillæ; dorsal rays 10 or 11.
    - *e.* Scales in lateral line 95 to 115; body slender, the head long-conical; mouth narrow, lower lip split to base, but the lobes short. CATOSTOMUS, 282.
    - *ee.* Scales in lateral line 83 to 87; body and head stouter. TAHOENSIS, 283.
    - *eee.* Scales in lateral line 80; lower jaw strong. REX, 284.

DECACTYLUS, (δέκα, ten; δάκτυλος, toe, *i. e.*, ventral rays):

bb. Scales small, but larger than in the preceding group, the number in the lateral line 56 to 75.

f. Scales in lateral line 70 to 75; lower lip broad.

g. Dorsal fin moderate, of 11 to 13 rays.

h. Dorsal fin short, higher than long; head rather bluntish, $4\frac{1}{8}$ in length. LABIATUS, 285.

hh. Dorsal fin longer than high.

i. Scales before dorsal about 40; head conical, small, $4\frac{1}{2}$ in length. OCCIDENTALIS, 286.

ii. Scales before dorsal 31; head larger, $4\frac{1}{3}$ in length. BERNARDINI, 287.

gg. Dorsal fin long, of about 15 rays, head large, the lips very full. MACROCHEILUS, 288.

ff. Scales in lateral line 58 to 70; lips with about 4 rows of papillæ.

j. "Nose" little developed, not projecting much beyond the moderate mouth; mandible nearly horizontal.

k. Dorsal moderate, scarcely higher than long, its base $1\frac{1}{2}$ to $1\frac{2}{5}$ in head; the rays 11 to 13.

l. Mandible $3\frac{1}{2}$ to $3\frac{2}{3}$ in head; upper lip narrow, with usually but 3 to 5 rows of papillæ, the number greater in western specimens (var. *sucklii*); scales 10–64 to 68–9, crowded anteriorly. COMMERSONII, 289.

ll. Mandible 3 to $3\frac{1}{3}$ in head; upper lip broader, with 4 to 6 rows of papillæ; scales 9–63 to 71–9, crowded anteriorly. ARDENS, 290.

kk. Dorsal short, distinctly higher than long, its base $1\frac{1}{3}$ in head, its rays 11 or 12; upper lip with 4 to 6 rows of papillæ.

m. Scales small and crowded anteriorly, 59 in lateral line; fontanelle large. GILA, 291.

mm. Scales larger, little crowded anteriorly, about 56 in the lateral line, each with a dark spot at base; fontanelle small. INSIGNIS, 292.

jj. "Nose" largely developed, slender and projecting at an angle beyond the profile, its length $2\frac{1}{6}$ in head; mouth small, inferior, the lips smoothish; D. 11 or 12; scales 64. (Approaches *Chasmistes.*) FECUNDUS, 293.

HYPENTELIUM, (ὑπό, below; πέντε, five; *labium*, lip, "lower lip five-lobed"):

aa. Head broad, depressed, and transversely concave between orbits; scales nearly equal over the body, not crowded anteriorly 48 to 55 in the lateral line; lips very thick; lower fins large.

n. Head large, 4 to $4\frac{1}{2}$ in length; interorbital space concave. NIGRICANS, 294.

nn. Head very small, 5 in length; interorbital space flattish. RHOTHŒCUS, 295.

Subgenus CATOSTOMUS.

279. CATOSTOMUS LATIPINNIS, Baird & Girard.

(FLANNEL-MOUTHED SUCKER.)

Depth $5\frac{1}{4}$ in the length. Head moderate, $4\frac{4}{5}$ in length, rather slender, with prominent snout and rather contracted, inferior mouth; outline of the mouth triangular, the apex forward; lips very thick, greatly developed; lower lip incised to the base; its posterior margin extending backward to opposite the eye; tubercles on lower lip smaller behind; jaws with a slight cartilaginous pellicle. Eye small, high up; the head flattish above. Scales long and low; posteriorly rounded, their horizontal diameter greater than the vertical, 17–98 to 105–17. Body slender and elongate; the caudal peduncle long and slender. Fins excessively developed, especially in the old males; the free border of the dorsal deeply incised. Height of each of the 3 vertical fins in the males greater than the length of the head. Dorsal usually 11, sometimes 12 or 13, inserted nearer snout than base of caudal. Caudal very strong, the rudimentary rays at its base unusually developed; least depth of tail less than ⅓ the head in males, stouter in females. Dark olive, abruptly paler below; sides and fins largely orange in both sexes, the anal and lower lobe of caudal tuberculate in males. Herbivorous. L. 2 feet. Rio Colorado and Rio Gila and their tributaries, very abundant, ascending the rivers in spring. Variable. (*latus*, broad; *pinna*, fin.)

Catostomus latipinnis, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 388, Rio San Pedro, Gila Basin; Günther, Cat., VII, 14, 1868; Jordan, *l. c.*, 178, 1878; Jordan & Gilbert, Synopsis, 125, 1883. (Type, No. 20078.)

Catostomus discobolus, Cope, Hayden's Geol. Surv. Wyo., 435, 1870, (young), Green River, Wyoming.

280. CATOSTOMUS GRISEUS, (Girard).

Body long and slender, subterete, compressed behind, the form essentially that of *C. catostomus*, the depth contained 5½ times in the length. Head large, 4 in length of body; the interorbital space broad and flat, 2½ in length of head. Scales 16–90 to 110–14. Eye small, high up, and rather posterior. Mouth large, about as in *C. latipinnis*, the upper lip pendant, very large, with 5 to 8 series of tubercles; lower lip incised to base, lobes long; sheath pretty well developed. Dorsal fin not elongated, nor especially elevated, its rays 10 to 12, usually 11, the beginning of the dorsal rather nearer base of caudal than snout, much nearer in type of *C. retropinnis*. Caudal fin long and strongly forked; anal fin long and high, reaching base of caudal; ventrals not reaching vent. Caudal peduncle stout and deep, its least depth more than ⅓ length of head; its length about ⅔ that of head. Scales quite small, about as in *C. catostomus*, the exposed portion not notably lengthened. Coloration dusky brown, sometimes with a dusky lateral band, sometimes irregularly mottled or barred. Snout quite dark. Size large. Platte River and upper Missouri regions, very similar to *C. catostomus*, and perhaps not separated from it, apparently differing chiefly in the larger mouth and broader upper lip. Specimens from Gardiner River (Yellowstone Park) have larger scales, 88 to 90, representing a possible var. *lactarius*. (*griseus*, gray.)

Acomus griseus, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 174, Sweetwater Fork of Platte River; Günther, Cat., VII, 14, 1868. (Type, No. 20257.)

? *Catostomus lactarius*, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 174, Milk River, Montana; may be *C. catostomus*.

Catostomus retropinnis,* Jordan, Bull. U. S. Nat. Mus., XII, 178, 1878, Milk River, Montana; may possibly be a distinct species, distinguished by the fuller lips and more backward dorsal; it is probably an adult *griseus*. (Type, No. 21197.)

281. CATOSTOMUS POCATELLO, Gilbert & Evermann.

Head 4; depth 5 to 5⅙; eye 4½ to 5 (about 4 in young); snout 2⅓ to 2⅔ (2½ in young); interorbital width 2⅗. D. 10 (rarely 9); A. 7. Scales

---

*The type of *C. retropinnis* has very much larger lips than in any other specimens we have examined, and the scales are smaller. It may be a good species.

about 96 (90 to 108 in 8 examples counted), very much reduced in size and crowded anteriorly, about 46 before the dorsal. Lateral line imperfect, often undeveloped for as much as ½ its length.

Body moderately slender; head heavy; snout not very pointed; eye rather large, high up, middle of pupil a little nearer posterior edge of opercle than tip of snout. Upper lip thick and narrow, but not pendant, 3 rows of papillæ; lower lip incised to base, the two lobes short and rounded, with about 6 rows of strong papillæ. Cartilaginous sheath of jaws not much developed. Origin of dorsal about midway between tip of snout and base of middle caudal rays; greatest height of dorsal fin 1⅗ in head, its free edge straight. Anal fin pointed, its height usually greater than that of dorsal, reaching base of caudal, 1⅓ in head; pectorals about equal to anal in length; ventrals shorter, 1⅘ in head. Least depth of caudal peduncle 2⅘ to 3 in head. Peritoneum pale, with dark punctulations. Air bladder large. This species is related to *C. griseus* (Girard), from which it may be distinguished by its heavier head, larger eye, rather narrower mouth, shorter lobes of lower lip, and the less development of the cartilaginous sheaths of the jaws. L. 8 inches. Snake River basin; the types from near Pocatello, Idaho.

Catostomus pocatello, Gilbert & Evermann, Bull. U. S. Fish Com., 1894, 159, with plate, Ross Fork of Snake River, near Pocatello, Idaho. (Type, No. 45385.)

282. CATOSTOMUS CATOSTOMUS, (Forster).

(Long-nosed Sucker; Northern Sucker; Red Sucker.)

Body elongate, subterete, the depth 4¼ to 4¾ in length. Head quite long and slender, 4¼ to 4⅔ in length, depressed and flattened above, broad at base, but tapering into a long snout, which considerably overhangs the large mouth. Lips thick, coarsely tuberculate, the upper lip narrow, with 2 or 3, rarely 4, rows of tubercles; lower lip deeply incised, the lobes shorter than in *C. griseus*, and the mouth narrower. Lower jaw with a slight cartilaginous sheath. Eye rather small, behind the middle of the head. Scales very small, much crowded forward, 95 to 114 in the lateral line, and about 29 (26 to 31) in a crossrow from dorsal to ventrals. Dorsal rays 10 to 11. Males in spring with the head and anal fin profusely tuberculate, the tubercles on the head small; the sides at that season with a broad rosy band. Size large. L. 2½ feet. Great Lakes, upper Missouri River, upper Columbia, and northwestward to Alaska; very abundant northward, but not coming south of lat. 40°. The most widely distributed species. (*κάτω*, below; *στόμα*, mouth.)

Cyprinus catostomus, Forster, Phil. Trans., 1773, 155, Streams about Hudson Bay.

Catostomus longirostrum, and *hudsonius*, after Forster, Le Sueur, Jour. Ac. Nat. Sci. Phila., 1817, 102, 107, Vermont.

Catostomus forsterianus, Richardson, Franklin's Journal, 1823, 720, Lake Huron; Great Slave Lake.

Catostomus aurora, Agassiz, Lake Superior, 360, 1850, Lake Superior.

Catostomus hudsonius, Günther, Cat., vii, 13, 1868; Jordan, *l. c.*, 175, 1878.

Catostomus longirostris, Jordan & Gilbert, Synopsis, 126, 1883.

Catostomus nanomyzon,[*] MATHER, Twelfth Rept. N. Y. Fish Com., Survey Adirondack Region, 1884, 36, Big Moose Lake, northern New York. (Type, No. 33917.)

283. CATOSTOMUS TAHOENSIS, Gill & Jordan.

(TAHOE SUCKER.)

Rather stouter than *C. catostomus*, the depth 4½ to 5 in length. Head very large and long acuminate, the muzzle nearly ½ its length, overhanging the rather large mouth. Lips moderate, the upper pendant, with about 3 rows of small papillæ; the lower rather full, similarly papillose. Eye nearly median, rather small, 8½ in head. Scales small and crowded forward, closely imbricated, 85 to 90 in the course of the lateral line, and about 28 in a cross series from dorsal to ventrals. Dorsal short, but longer than high, its rays 10. Coloration very dark; fins dusky; scales everywhere finely punctate. Breeding males profusely tuberculate. Size large. Lake Tahoe, very abundant. We have specimens also from Humboldt River, at Winnemucca, Nevada.

Catostomus tahoensis, JORDAN, *l. c.*, 173, 1878, Lake Tahoe, California (Type, No. 31226); JORDAN & HENSHAW, Rept. Chief Engin., app. nn, 1878, 188; JORDAN & GILBERT, Synopsis, 127, 1883.

284. CATOSTOMUS REX, R. S. Eigenmann.

Head 4; depth 4. D. 11; A. 6. Scales 13-80-8, 35 before dorsal. Head broad, flattish, the cheeks very long. Mouth small; lower jaw strong, the premaxillaries forming a hump on the snout; 2 rows of papillæ on upper lip; eye 8 in head, little behind the middle; snout 2¼ in head. Scales peculiar, covered with skin at base. Ventrals not reaching halfway to vent. Dorsal as high as long, its last rays almost as long as the first; pectorals reaching halfway to ventrals. Caudal peduncle long, terete. Lateral line interrupted behind. Teeth moderate. Blackish above, paler below; scales of belly dark-dotted; fins dark. Length of type 32 inches. Lost River, Tule Lake, Oregon. (Eigenmann.) (*rex*, king.)

Catostomus rex, ROSA SMITH EIGENMANN, American Naturalist, July, 1891, 667, Lost River, Oregon.

Subgenus DECACTYLUS, Rafinesque.

285. CATOSTOMUS LABIATUS, Ayres.

Head 4⅛ in length, rather bluntish; mouth moderate, the labial papillæ largely developed; the upper lip full, with about 5 rows of large but rather sparse papillæ. Scales 12-74-10. Dorsal fin short, higher than long, of about 11 rays. Color dark above; sides clouded with black and yellow. Klamath Lake, Oregon; only one specimen yet known. (*labiatus*, large-lipped.)

Catostomus labiatus, AYRES, Proc. Cal. Ac. Sci., 1855, 32, Klamath Lake, Oregon; JORDAN, *l. c.*, 173; JORDAN & GILBERT, Synopsis, 128, 1883.

---

[*] Thus described by Mr. Mather: "Brown; male with a red lateral band in the breeding season; head slender, flattened above, the snout shorter than in *C. catostomus;* lips thick, the lower with 3 or 4 rows of tubercles; eye large, 4 in head, 1½ in snout. Scales smaller anteriorly, but little crowded; dorsal higher than long; pectorals reaching front of dorsal; head 4; depth 5. D. I, 10. A. 7. V. 9. Scales 14-99-11; L. (spawning specimens) 4¼ inches. Big Moose Lake, Adirondack region. Apparently a dwarfed brook variety of *C. catostomus*, but inhabiting the same region and spawning at a much smaller size."

286. CATOSTOMUS OCCIDENTALIS, Ayres.

(SACRAMENTO SUCKER.)

Body rather slender, little elevated. Mouth comparatively small, smaller than in *C. commersonii;* the upper lip with 5 or 6 rows of smallish papillæ; lips rather thin. Head quite small, rounded above, 4½ in length, the profile steeper than in *C. commersonii;* the snout more pointed, the two sides of the head more convergent forward. Eye small. Dorsal fin longer than high, its rays 12 to 14; caudal well forked, the upper lobe the longer. Scale 13–75–10, 40 before dorsal. Dark above, gradually paler below. Streams of California; abundant in the Sacramento and San Joaquin rivers. (*occidentalis,* western.)

Catostomus occidentalis, AYRES, Proc. Cal. Ac. Sci., 1854, 18, San Francisco; AGASSIZ, Am. Jour. Sci. Arts, 1855, 209, San Francisco; JORDAN, *l. c.*, 172, 1878; GÜNTHER, Cat., VII, 17, 1868; JORDAN & GILBERT, Synopsis, 128, 1883.

287. CATOSTOMUS BERNARDINI, Girard.

Closely allied to *C. occidentalis*, but with the head less conic and the lower fins larger. Scales much crowded forward, 31 before dorsal, 75 in lateral line; fontanelle large; lips broad, without sheath, formed as in *C. occidentalis*, the lower deeply incised; fins high, the dorsal longer than high, with 12 rays; caudal lobes equal; head 4⅓ in length. San Bernardino Creek, a tributary of Rio Yaqui, on the boundary of Arizona and Sonora.

Catostomus bernardini, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 175, San Bernardino Creek; JORDAN & GILBERT, Synopsis, 128, 1883; JORDAN, Cat., 18, 1885. (Type, No. 174.)

288. CATOSTOMUS MACROCHEILUS, Girard.

(COLUMBIA RIVER SUCKER.)

Head 4 in length, depth 5. Scales 12–72 to 75–10, 40 before dorsal. Body heavy forward; snout blunt, much overlapping the horizontal mouth; mouth quite large, with very large lips, the upper full and pendant, with 6 to 8 rows of moderate papillæ. Head large, 4¼ in length, rather narrow, quadrangular, the snout projecting. Eye large, 6 in head. Dorsal fin much longer than high, its rays about 15; pectorals long and narrow; caudal well forked. Coloration rather dark; a dusky lateral stripe; below abruptly pale. Columbia River as far as Flathead Lake, Montana; not rare. (*μακρός*, large; *χεῖλος*, lip.)

Catostomus macrocheilus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 175, Astoria, Oregon; JORDAN, *l. c.*, 171, 1878; JORDAN & GILBERT, Synopsis, 128, 1883; EVERMANN, Bull. U. S. Fish Com., 1891, (1892), 40, plate 18, fig. 2. (Type, No. 240.)

289. CATOSTOMUS COMMERSONII, (Lacépède).

(COMMON SUCKER; WHITE SUCKER; BROOK SUCKER; FINE-SCALED SUCKER.)

Body moderately stout, varying with age, subterete, heavy at the shoulders, the depth 4 to 4⅔ in length. Head rather large and stout, conical, flattish above, its length 4 to 4½ in body (3½ to 4¼ in young). Snout moderately prominent, scarcely overpassing the mouth. Mouth rather large; the lips strongly papillose, the upper moderate, with 2 or 3 rows of papillæ; 4 to 6 in specimens from eastern Colorado, (var. *sucklii*). Scales crowded anteriorly, much larger on the sides than below; scales 10–64 to 70–9. Coloration olivaceous; males in spring with a faint rosy lateral band; young brownish, more or less mottled, often with confluent blackish lateral blotches or a lateral band. Lateral line imperfect in the very young. D. usually 12. L. 18 inches. Streams and ponds from Quebec and the Great Lakes to Montana, Colorado, and southward to Missouri and Georgia; the commonest of the suckers, excessively abundant from Massachusetts west to Kansas. Variable; western specimens (*sucklii*) have broader lips and approach *C. Ardens.* (To Philebert Commerson, an able early French naturalist and traveler, whose collections were studied by Lacépède.)

Cyprinus commersonii,* Lacépède, Hist. Nat. Poiss., v, 502, 1803, locality unknown.

Cyprinus teres, Mitchill, Trans. Lit. and Phil. Soc. N. Y. 1815, 458, New York.

Catostomus teres, Günther, Cat., vii, 15, 1868; Jordan, *l. c.*, 166, 1878.

Catostomus communis, Delaware River, and *bostonensis*, Boston, Le Sueur, Jour. Ac. Nat. Sci. Phila., i, 1817, 95, 106, etc.

Catostomus commersonii, Jordan & Gilbert, Synopsis, 129, 1883.

Catostomus flexuosus, Rafinesque, Ich. Oh., 59, 1820, Ohio River.

Catostomus reticulatus, Richardson, Fauna Bor. Am: Fishes, 303, 1836, Albany River, (Scales 70 to 77).

Catostomus gracilis, Kirtland, Rept. Zoöl. Ohio, 168, 1838, Cleveland, Ohio, etc.

Catostomus pallidus, De Kay, New York Fauna: Fishes, 200, 1842, New York.

Catostomus sucklii, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 175, Milk River, Montana.

Catostomus chloropteron, Abbott, Proc. Ac. Nat. Sci. Phila., 1860, 473, Kansas.

Catostomus alticolus, Cope & Yarrow, Wheeler Survey, Zoöl., v, 677, 1876, Twin Lakes, Colorado. (Type, Nos. 15777 and 12915.)

Moxostoma trisignatum, Cope, *l. c.*, 679, 1876, Arkansas River, Pueblo, Colorado.

Catostomus utawana,† Mather, Twelfth Report N. Y. Fish. Com., Survey of Adirondacks, 1884, 36, a dwarf form from Blue Mountain Lakes, New York. (Type, No. 33918.)

290. CATOSTOMUS ARDENS, Jordan & Gilbert.

(Mullet of Utah Lake.)

Head 3⅔; depth 4½. D. 12 or 13. A. 7. Scales 12–70 to 72–12. Body rather elongate, little compressed, the back broad. Head broad, conical. Mouth entirely inferior, the mandible nearly horizontal; upper lip very

---

*The *Cyprinus commersonii* of Lacépède is a sucker and probably this species rather than *C. catostomus.* The description is, however, very imperfect and the type said to have been observed by Commerson in the East Indies; a statement apparently derived from a confusion of manuscripts and specimens of Commerson with those of Bosc, who collected at Charleston. Lacépède was indebted to Bosc for the next species he mentions, *Cyprinus sucetta.* Lacépède's description is as follows: "Onze rayons à la dorsale; sept à la nageoire de l'anus; neuf a chaque ventrale; huit a neuf à'chaque pectorale; la nageoire du dos et celle de l'anus quadrilatères; l'anale étroite; l'angle de l'extremité de cette derniere nageoire tres aigu; la caudale en croissant; la ligne laterale droitè; la machoire supérieure, un peu plus avancée que celle d'en bas; les écailles arrondies et très petites. Le Commersonnien dont nous publions les premiers la description, et que le savant Commerson a observé, presente un double orifice pour chaque narine; sa tête est denouée de petites écailles; ses ventrales et ses pectorales sont arrondies à leur extremité; la dorsale s'élève vers le milieu de la longueur totale du poisson."

†The small "Juno sucker" of the Adirondacks thus described by Mather: "Olivaceous, white below; males without red in the breeding season; body slender; head not small, flattened above; snout little prominent; upper lip with 2 rows of papillæ; eye 4 in head, 2 in snout; dorsal as long as high; pectorals nearly reaching front of dorsal; head 4. D. I, 11; A. 5; V. 9. Scales 9–6 7–8; length of adult 4½ inches. Blue Mountain Lakes, Adirondack region. This small fish I was at first disposed to consider as a dwarfed mountain form of *C. teres*, but the fact that the latter fish is found in waters inhabited by this species, and while it grows to a length of 12 or more inches there, this little sucker barely reaches 5. Added to this the fact that the larger species had finished spawning in the inlets in May, while this fish was found in masses in the swift mountain streams which tumble rapidly over rocks in the latter part of June, depositing their eggs, thereby showing that they are adult fish."

wide, full, pendant, with 4 to 8 rows of coarse, irregular papillæ, lower lip very broad, coarsely papillose, cut to the base by a sharp incision. Eye small, 7 in head, 3½ in interorbital width; snout 2¼ in head. Dorsal fin long and low, its anterior rays ½ longer than the last rays; pectorals and ventrals short; caudal short; anal long. Pharyngeal bones rather weak, with smallish teeth. Blackish above; males with the sides rosy; fins dark. L. 18 inches. Close to *C. commersonii*, differing chiefly in the rather larger mouth and lips. Lakes and streams of great basin of Utah, swarming in myriads in Utah Lake. Also abundant in upper waters of Snake River in Idaho. In Heart Lake, in the Yellowstone Park, it is infested by a very large parasitic worm (*Ligula catostomi*, Linton), larger than its own viscera. (*ardens*, burning, from the red shades of the male.)

Catostomus ardens, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 464, Utah Lake, Provo; JORDAN & GILBERT, Synopsis, 128; JORDAN, Bull. U. S. Fish Com., 1889, 65, 77, etc; LINTON, Bull. U. S. Fish Com., 1889, 66. (Type, No. 27363.)

291. CATOSTOMUS GILA, Kirsch.

Head 4½; depth 4½. D. 11 or 12. Scales 11–58 to 60–10. Close to *C. ardens*, but the nape lower, the tail shorter. Dorsal shorter and higher, its longest ray nearly twice the last, and longer than base of fin; free margin incised. Snout 2¼ in head; eye small; lips large, the upper with 4 rows of papillæ, the lower split nearly to base. L. 14 inches. Dark brown, scales darker at base. Rio Gila.

Catostomus gila, KIRSCH, Proc. U. S. Nat. Mus., 1888, 555, Rio Gila, Fort Thomas, Arizona.

292. CATOSTOMUS INSIGNIS, Baird & Girard.

Body rather elongate, subterete, heavy at the shoulders, tapering backward, the depth about 5 in length. Head moderate, about 4½ in length. Fontanelle rather small; mouth comparatively small; lips moderate, the upper narrow, with several rows of large tubercles; no sheaths on jaws. Scales subequal, about 56 in the lateral line, 19 in a cross series, 27 before dorsal; scales on back large, those on belly small. A series of dusky spots along each row of scales; the spots often obscure. D. 11. Very close to *C. commersonii*, the scales less crowded, the upper lip broader, the color somewhat different. Gila basin; not rare. (*insignis*, notable.)

Catostomus insignis, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 28, Rio San Pedro, Arizona; COPE & YARROW, Wheeler Survey, Zoöl., v, 676, 1876; JORDAN, *l. c.*, 165, 1878; JORDAN & GILBERT, Synopsis, 130, 1883. (Type, No. 169.)

293. CATOSTOMUS FECUNDUS, Cope & Yarrow.

(WEBUG SUCKER.)

Head 4; depth 4½. D. 11 or 12; A. 7; V. 9. Scales 8–64–8. Body moderately stout, little compressed, the tail slender. Head subconic, the profile decurved from the nape to the base of the premaxillary spines, which abruptly protrude, forming a distinct "nose," as in *Chasmistes liorus;* premaxillaries in front scarcely below the preorbital. Mandible large, oblique, placed at an angle of 30° when the mouth is closed, its length 2¾ in head. Upper lip full, pendant, smoothish, with about 4 rows of papillæ; lower lip moderate, divided by a broad notch, each lobe with about 6 rows of papillæ. Eye a little behind middle of head. Dorsal shorter and higher than in *C. ardens.* First ray of dorsal twice height of the last, its length greater than that of the base of the fin; caudal forked, the lower lobe longest; pectorals long; anal high. Dusky above, pale below. L. a foot. Utah lake, rather scarce, and not yet seen elsewhere. This species resembles *Chasmistes liorus.* (*fecundus*, fertile, in allusion to its supposed abundance, but the "fecund" species which has made Utah Lake the "greatest sucker pond in the world" is really *C. ardens.*)

Catostomus fecundus, Cope & Yarrow, Zoöl. Wheeler Survey, v, 678, 1876, Utah Lake; Jordan & Gilbert, Proc. U. S. Nat. Mus., 1880, 463; Jordan & Gilbert, Synopsis, 129, 1883; Jordan, Bull. U. S. Fish Com., 1889, 31. (Type, No. 16930.)

Subgenus HYPENTELIUM, Rafinesque.

294. CATOSTOMUS NIGRICANS, Le Sueur.

(Hog Sucker; Stone Roller; Toter; Crawl-a-bottom; Hammer Head; Stone Lugger; Hog Molly.)

D. 10 or 11; V. 9. Lat. line 48 to 55, 12 to 15 scales in a cross series. Deph 4½ to 5 in length; head 4 to 4½. Eye rather small, 4½ to 5 in head. Head flattened above, transversely concave between orbits, the frontal bone thick, broad, and short, the physiognomy being therefore peculiar. Upper lip very thick, strongly papillose, with a broad free margin, which has upward of 8 to 10 series of papillæ upon it; lower lip greatly developed, strongly papillose, considerably incised behind, but less so than in *Catostomus* proper. Fontanelle shorter and smaller than in *C. commersonii.* Pectoral fins unusually larger. Color olivaceous; sides with brassy luster; belly white; back brown, with several dark cross blotches, irregularly arranged, these becoming obsolete in old individuals; lower fins dull red, with some dusky shading; young considerably variegated, the sides spotted. Size large; length about 2 feet. New York to Minnesota and Kansas, Arkansas, and the Carolinas; abundant in swift or rocky streams, which it ascends to spawn; never found in muddy or warm waters; less tenacious of life than the other species of *Catostomus.* (*nigricans*, blackish.)

Catostomus nigricans, Le Sueur, Jour. Ac. Nat. Sci. Phila., 1817, 102, Lake Erie; Günther, Cat., vii, 17, 1868; Jordan, *l. c.*, 162, 1878; Jordan & Gilbert, Synopsis, 130, 1882.
Hylomyzon nigricans, Agassiz, Am. Jour. Sci. Arts, 1855, 205.
Catostomus maculosus, Le Sueur, *l. c.*, 103, 1817, Pipe Creek, Maryland.
Hypentelium macropterum, Rafinesque, Jour. Ac. Nat. Sci. Phila., i, 1817, 420, Ohio River.
Catostomus xanthopus, Rafinesque, Ich. Oh., 57, 1820, Ohio River.
Catostomus planiceps, Cuvier & Valenciennes, xvii, 450, 1844, Wabash River.
Catostomus nigricans etowanus, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1877, 345, Etowah River, Rome, Ga.; a brightly colored variety from the Alabama basin.
Catostomus megastomus, Rafinesque, Ich. Oh., 59, 1820; based on an incorrect drawing; belongs here if anywhere.

295. CATOSTOMUS RHOTHŒCUS, Thoburn.

Head 5; depth 5. D. 11; A. 8 or 9. Scales 7–48–5, 19 rows in front of dorsal. Allied to *Catostomus nigricans* but with much smaller head, which is less depressed between eyes. Head very small, flattened above but not concave between the orbits; somewhat pointed in front, the snout projecting beyond the mouth. Width of head equal to its depth. Mouth large, its width 2¾ in head, its opening nearly a straight line. Each jaw with a strong cartilaginous sheath. Upper lip thin, with about 20 lines of minute papillæ. Lower lip broad, each lobe with 8 or 9 broken plicæ, each with minute papillæ on edges. Lobes of lower lip separated by a notch from which a strong frenum reaches to the chin. Fontanelle short, its length about ½ eye. Eye 4 in head. Pectorals large, 1⅕ length of head and reaching to the sixteenth line of scales. Dorsal inserted slightly in front of middle of body. Anal reaching beyond base of caudal. Caudal forked. Air bladder very small, with 2 chambers. Color dark olivaceous above; a darker narrow lateral band from snout below eye straight to base of caudal; the upper edge of the band obscure, the belly below the band abruptly silvery; 5 or 6 obscure dark cross bars on back and side, most distinct on the dark longitudinal stripe; base of caudal with a light band, edged behind with brown. Six specimens, 3½ to 5 inches in length, collected by Dr. Charles H. Gilbert, at some point in eastern Tennessee or southwestern Virginia, thought to be from French Broad River at Wolf Creek, Tennessee. It closely resembles *Moxostoma cervinum*, but the mouth is different. (*ῥόθος*, torrent; *οἰκέω*, to inhabit.)

Cotostomus rhothœcus, THOBURN, Proc. U. S. Nat. Mus., 1894; supposed to be from French Broad River. (Type, No. 44846.)

93. CHASMISTES, Jordan.

Chasmistes, JORDAN, Bull. Hayden's Geol. Surv. Terr., IV, No. 2, 417, 1878, (*liorus*).
Lipomyzon, COPE, American Naturalist, January, 1881, 59, (*brevirostris*).

Head large, broad and flattish above, the sides vertical. Eyes small, high up, rather posterior. Mouth extremely large, terminal, the lower jaw in the closed mouth being very oblique, placed at an angle of about 45°; lower jaw very long and strong, its length more than ⅓ length of head, its tip, when the mouth is closed, about on a level with the eye; upper jaw very protractile; upper lip thin and nearly smooth. Snout usually elevated above the rest of head, the premaxillary spines generally forming a conspicuous nose. Lower lip moderate, consisting of a broad flap on each side of the mandible, in front reduced to a narrow rim, the surface of the lip nearly smooth, without papillæ; nostrils large. Suborbital bones narrow, but rather broader than in *Catostomus;* preorbital large; mucous channels moderately developed; fontanelle well developed. Pharyngeal bones weaker than usual in *Catostomus*, the teeth generally smaller. Fins moderate; pectorals rather long; dorsal rays 11 or 12; anal 7; anal fin high, reaching caudal; caudal fin rather long, its lobes equal. Scales moderate, large on caudal peduncle, smaller and crowded anteriorly, 60 to 80 in lateral line. Sexual peculiarities not marked. Coloration as in *Catostomus*. Air bladder in 2 parts. Size rather large. Species confined to the Great Basin. (*χασμάω*, to yawn; one who yawns.)

a. Scales moderate, 60 to 65 in the lateral line.
  b. Scales 9-63-8; dorsal rays usually 11; nose prominent. LIORUS, 296
  bb. Scales 13-65-11; dorsal rays 12. CUJUS, 2.

aa. Scales small, 70 to 80 in the lateral line.
  c. Snout short, the premaxillary spines not forming a distinct projecting nose; dorsal rays 11; Scales 12–74–11. BREVIROSTRIS, 298.
  cc. Snout long, the premaxillary spines forming a distinct projecting nose, as in *C. liorus.* Scales 12–80–9. LUXATUS, 299.

296. CHASMISTES LIORUS, Jordan.

(JUNE SUCKER OF UTAH LAKE.)

Head large, 3⅔ in length; depth about 5. Scales 9–63–8. Interorbital space broad, 2¼ in head; eye 6 to 7 in head; width of the open mouth 3½ in head. D. 11, the fin elevated in front, its longest ray twice the height of the last and about equal to the base of the fin. A. 7. Caudal deeply forked, the lower lobe long; lower fins small. Color dusky above, pale below; the scales of the back and sides profusely covered with dark punctulations. L. 18 inches. Utah Lake; very abundant. (λεῖος, smooth; ὅρος, margin, referring to the lips.)

Chasmistes liorus, JORDAN, Bull. U. S. Nat. Mus., XII, 219, 1878; Utah Lake at Provo, Utah; JORDAN & GILBERT, Synopsis, 132, 1883. (Type, No. 27361.)

297. CHASMISTES CUJUS, Cope.

(COUIA.)

Head broad and flat; upper lip very thin; lower lip represented by folds on each side, which do not connect around the symphysis; eye 8½ in head; interorbital space 4½. D. 12; A. 8. Scales 13–65–11. Color pale olive. Pyramid Lake, Nevada, in deep water. (Cope.) (*couia*, the Indian name.)

Chasmistes cujus, COPE,* Proc. Ac. Nat. Sci. Phila., 1883, 149, Pyramid Lake, Nevada.

298. CHASMISTES BREVIROSTRIS, Cope.

Scales 12–74–11. D. 11; A. 9. Shorter than *C. luxatus*, especially the muzzle, and the latter is without the hump produced by the protuberant premaxillary spines. Parietal fontanelle small. Lower lip fold present only on the sides of the mandible. Body nearly cylindric. Color dusky above, silvery below; fins colorless. (Cope.) L. 16 inches. Klamath Lake, Oregon. (*brevis*, short; *rostrum*, snout.)

Chasmistes brevirostris, COPE, American Naturalist, 1879, 785, Klamath Lake, Oregon; JORDAN & GILBERT, Synopsis, 132, 1883.

299. CHASMISTES LUXATUS, Cope.

Scales 12–80–9. D. 11; A. 9. Form elongate. Head long, flat above with a large fontanelle. Mouth terminal, the spines of the premaxillary projecting so as to form a hump on the top of the snout. Lower lip a very thin dermal fold, extending entirely around the chin. Color clouded above, with black punctulations, below paler, with red shades in some specimens; fins uncolored. (Cope.) L. 3 feet. Klamath Lake and River, Oregon. (*luxatus*, put out of joint, referring to the nose.)

Chasmistes luxatus, COPE, American Naturalist, 1879, 784, Klamath Lake, Oregon; JORDAN & GILBERT, Synopsis, 132, 1883.

---

*This paper "On the Fishes of the Recent and Pliocene Lakes of the Western Part of the Great Basin and of the Idaho Pliocene Lake" contains an important discussion of the fish fauna of Nevada, Oregon, and Idaho, with description of numerous fossil forms not long extinct and closely allied to recent *Cyprinidæ* and *Catostomidæ*.

94. XYRAUCHEN, Eigenmann & Kirsch.

(RAZOR-BACK SUCKER.)

Xyrauchen, EIGENMANN & KIRSCH, Proc. U. S. Nat. Mus., 1888, 556, (*cypho*).

Characters of the genus *Catostomus* in all respects except that behind the occiput is a sharp-edged hump produced by the singularly developed interneural bones. The anterior portion of the hump is supported by a large interneural formed by a thick central pillar with anterior and posterior wings, the former coming to a point on the medial projecting plate of the supraoccipital, forming a large opening beneath it; the latter wing is somewhat smaller and articulates with the second interneural. This interneural is a thin, flat, subrectangular plate; the next is an irregular, flat plate about ½ as large as the second, while the next 3 are small, flat plates above and bent forward. Other bones of the anterior part of the skeleton are somewhat modified in form, but the essential character of the genus is in the great development of the bones at the nape, showing externally as a sharp-edged hump. Two species known; large suckers of the Colorado basin. (*ξυρός*, razor · *αὐχήν*, nape.)

a. Scales about 13–73–13; dorsal rays 13 or 14. Body deep, the back high, the hump commencing at the nape with no scales before it or on its edge. CYPHO, 300.

aa. Scales 16–81–13; dorsal rays 12; body more slender, the hump much lower; scales present before it and on its edge. UNCOMPAHGRE, 301.

300. XYRAUCHEN CYPHO, (Lockington).

(RAZOR-BACK SUCKER; HUMP-BACKED SUCKER.)

Head 4; depth 4. D. 13 or 14; A. 7. Scales 13 to 15–72 to 77–13. Body stout, compressed, the head low, the profile ascending to the prominent hump, which is largest in adult specimens and usually begins at the nape with no scales before it, its anterior edge straight, sharp, and scaleless; mouth wide, inferior; upper lip with 2 rows of papillæ; lower lip deeply divided, with 8 rows. Dorsal long and low, with concave edge; caudal broad and strong, with numerous rudimentary rays; pectorals moderate. Scales loosely imbricated. Pharyngeal teeth small, numerous; peritoneum black. Coloration plain olivaceous. Basin of the Colorado and Gila rivers; very abundant where the water is not too cold; reaching a weight of 8 to 10 pounds. (*cypho*, hunchback.)

Catostomus cypho, LOCKINGTON, Proc. Ac. Nat. Sci. Phila., 1880, 237, Colorado River at mouth of Gila, Arizona.

Catostomus cypho, JORDAN & GILBERT, Synopsis, 129, 1883.

Xyrauchen cypho, KIRSCH, Proc. U. S. Nat. Mus., 1888, 556; JORDAN, Bull. U. S. Fish Com., 1889, 26.

301. XYRAUCHEN UNCOMPAHGRE, Jordan & Evermann.

Head 4; depth 4½. D. 12; A. 7. Scales 16–81–13. Body more elongate than in *X. cypho* of the same size, the form resembling that of a *Gila;* head flatter, narrower, and less depressed than in *X. cypho*, the small lips rather larger and more coarsely tuberculate. Nuchal hump much lower than in *X. cypho,* but forming a sharp keel which does not extend forward to the nape, there being 13 scales before it, its surface also scaly.

Snout 2¼ in head; breast naked; caudal peduncle much slenderer than in *X. cypho*, dorsal fin lower; caudal large. Coloration plain olivaceous. Known from a single specimen, 7 inches long, taken in Uncompahgre River (Colorado basin); possibly a variation of *X. cypho*, but quite unlike all known examples of the latter.

Xyrauchen uncompahgre, Jordan & Evermann, Bull. U. S. Fish Com., 1889, 26, published 1891, Uncompahgre River, Delta, Colorado.

95. ERIMYZON, Jordan.

(Chub Suckers.)

Moxostoma, Agassiz, Am. Jour. Sci. Arts, 1854, 200, (*oblongus*), not of Rafinesque.

Erimyzon, Jordan, Bull. Buffalo Soc. Nat. Hist., 1876, 95, (*oblongus*).

Body oblong, compressed. Head moderate. Mouth moderate, somewhat inferior; the upper lip well developed, freely protractile; the lower moderate, infolded, Λ-shaped in outline, plicate, with 12 to 20 folds on each side. Lower jaw without cartilaginous sheath, rather stronger than usual, and oblique when the mouth is closed. Eye moderate. Suborbital bones well developed, not much narrower than the fleshy portion of the cheek below them; opercular bones moderately developed, not rugose. Fontanelle rather large. Gill rakers rather long. Pharyngeal bones weak; the teeth quite small, slender, and weak, rapidly diminishing in length upward, each tooth narrowly compressed, with a cusp on the inner margin of the cutting surface. Scales rather large, more or less crowded forward. Lateral line entirely wanting at all ages. Dorsal fin rather short and high, rays usually 11 or 12. Pectoral fins moderate. Anal fin high and short, more or less emarginate or bilobed in adult males. Caudal fin moderately forked or merely lunate, its 2 lobes about equal. Air bladder with 2 chambers. One species; widely distributed. (*ἐρι-*, an intensive particle; *μυζάω*, to suck.)

302. ERIMYZON SUCETTA, (Lacépède).

(Creek Fish; Chub Sucker.)

Body oblong, compressed, becoming gibbous with age, the antedorsal region more or less elevated in the adults, the depth about 3 in length, ranging from 2½ in adults to 4 in young. Head stout, short, about 4¼ in length, the interorbital space wide. Eye rather large, 4¼ head. Scales usually closely imbricated and more or less crowded forward, but often showing various irregularities in arrangement, the usual number 36–15. D. usually 12; A. 7; V. 9. Coloration varying with age; usually showing pale streaks along the rows of scales; young with a broad black lateral band, bordered above by paler; in some specimens from clear water this band is of a jet black color and very distinct; in others it is duller; later this band becomes broken into a series of blotches, which often assume the form of broad transverse bars; in adult specimens these bars disappear, and the color is nearly uniform brown, dusky above, paler below, everywhere with a coppery or brassy, never silvery, luster; the fins dusky or smoky brown, often reddish tinged. Sexual difference strong; males in spring usually with 3 large tubercles on each side of the snout, and with the anal fin more or less swollen and emarginate. Length about 10 inches. Great Lakes, Mississippi Valley, and eastward in lakes and lowland streams; very abundant; the typical form, *sucetta*, occurring coastwise from Virginia to Texas. (French *sucet*, sucker.)

Cyprinus sucetta, LACÉPÈDE, Hist. Nat. Poiss., v, 606, 1803, South Carolina.
Moxostoma kennerlyi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 171, Dry Creek, Victoria, Texas. (Type, No. 161.)

Erimyzon goodei, JORDAN & GILBERT, Synopsis, 134, 1883.

Represented northward by

302a. ERIMYZON SUCETTA OBLONGUS, (Mitchill).

Body more elongate and less compressed than in typical *sucetta*, the greatest depth being contained about 3¼ times in the length. Nape more gibbous than in *E sucetta*. Head quite small and short, the eye smaller, about 4¾ in head, being almost exactly midway in its length, which is 4½ in that of the body. Scales smaller and less uniform in their imbrication than in *E. sucetta*, the usual number 43–15. Color dark olivaceous above; the adult nearly plain, the young with a distinct black lateral band which breaks up into bars with age. Great Lake region to Maine and the Dakotas, south to Virginia and Indian Territory, everywhere abundant in northern upland streams, gradually passing southward into the typical *sucetta*. (*oblongus*, oblong.)

Cyprinus oblongus, MITCHILL, Trans. Lit. and Phil. Soc. N. Y., 1815, 1, 459, New York.
Moxostoma oblongum, GÜNTHER, Cat., VII, 21, 1868.
Catostomus gibbosus, Connecticut River, Northampton; *tuberculatus*, Germantown, Pa.; and *vittatus*, Wissahickon River, Pennsylvania, LE SUEUR, Jour. Ac. Nat. Sci. Phila., I, 1817, 92, 93, 104.
Catostomus fasciolaris, RAFINESQUE, Ichth. Oh., 58, 1820, Ohio River.

Moxostoma claviformis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 171, Coal Creek, Canadian River, Indian Territory. (Type, No. 165.)
Erimyzon sucetta, JORDAN & GILBERT, Synopsis, 134, 1883.

96. MINYTREMA, Jordan.

(SPOTTED SUCKERS.)

Minytrema, JORDAN, Man. Vert. E. U. S., Ed. 2, 318, 1878, (*melanops*).

Head moderate, rather broad above; mouth moderate, inferior, horizontal; the upper lip well developed, freely protractile; the lower rather small, infolded, Λ-shaped in outline, plicate. Lower jaw without cartilaginous sheath. Eye moderate, rather high, placed about midway of the head. Suborbital bones well developed. Opercular bones well developed, not much rugose. Fontanelle rather large. Gill rakers rather long. Isthmus moderate. Pharyngeal bones essentially as in *Moxostoma*. Body rather elongate, subterete, becoming deep and rather compressed with age. Scales rather large, nearly equal over the body. Lateral line interrupted in the adult, but with perfect tubes, imperfect in partly grown specimens, entirely obsolete in the young. Scales in a longitudinal series, 44 to 47 in number, 12 to 14 in a transverse series. Dorsal fin rather short and high, with about 12 rays beginning rather nearer snout than base of caudal. Pectoral fins moderate. Anal high and short, more or less emarginate in males. Caudal fin moderately forked, the lobes about equal. Air bladder with 2 chambers. Males in spring with the head covered with many small tubercles. This genus is intermediate between *Erimyzon* and *Moxostoma*, differing from the latter mainly in the structure of its air bladder. (*μινύς*, reduced; *τρῆμα*, aperture; in allusion to the imperfections of the lateral line.)

a. Dark streaks along rows of scales evident; scales 7–46–6. MELANOPS, 303.

303. MINYTREMA MELANOPS, (Rafinesque).

(WINTER SUCKER; SPOTTED SUCKER.)

Body oblong, little compressed, the young nearly terete, the adults deeper; depth about 4 in length, varying from about 3 in adults to 4½ in the young. Head not very large, 4⅓ in length of body (4¼ to 4½), not specially depressed. Mucous pores rather strong. Eye small, 5 to 6 in head. Scales large, firm, regularly and smoothly imbricated, in 46 (44 to 47) longitudinal series, and 13 (12 to 14) transverse series, the scales not crowded forward. Fin rays usually, D. 12; A. 7; V. 9. Coloration dusky above, with usually a black blotch behind the dorsal fin; each scale along the sides with a small, more or less distinct blackish spot at its base, these spots forming interrupted longitudinal lines along the rows of scales; these lines are usually very distinct, especially in the adult, but young specimens often show them faintly; sides and belly silvery, with a coppery luster. Sexual peculiarities moderately marked; very old males with the head covered with small tubercles in spring; no great change with age, either in form or coloration. Size large; maximum length about 18 inches. Great Lake region to North Carolina (Cape Fear River) and west to Texas; rather common westward. (*μέλας*, black; *ὤψ*, appearance.)

Catostomus melanops, RAFINESQUE, Ichth. Oh., 57, 1820, Ohio River.
Catostomus fasciatus LE SUEUR, in Cuvier & Valenciennes, XVII, 449, 1844, Mississippi River.
Catostomus fasciatus, GÜNTHER, Cat., VII, 19, 1868; JORDAN, Bull. U. S. Nat. Mus. XII, 138, 1878.

Moxostoma victoriæ, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 171, Dry Creek, Victoria, Texas.
Ptychostomus haydeni, GIRARD, *l. c.*, 1856, 172, Yellowstone River; Missouri River at Fort Pierre, Nebraska. (Type, No. 20263.)

97. MOXOSTOMA, Rafinesque.

(RED HORSE.)

Moxostoma, RAFINESQUE, Ichth. Oh., 54, 1820, (*anisurus*).
Teretulus, RAFINESQUE, *l. c.*, 57, 1820, (*aureolus*).
Ptychostomus, AGASSIZ, Am. Jour. Sci. Arts, 1855, 203, (*aureolus*).

Body more or less elongate, sometimes nearly terete, usually more or less compressed. Head variously long or short, its length 3½ to 5½ in that of the body. Eye usually rather large, from 3 to 6 times in the length of the head. Suborbital bones very narrow. Fontanelle always well open. Mouth varying much in size, always inferior in position, the mandible being horizontal or nearly so. Lips usually well developed, the form of the lower varying, usually with a slight median fissure, but never deeply incised; the lips with transverse plicæ, the folds rarely so broken up as to form papillæ. Jaws without cartilaginous sheath. Muciferous system considerably developed. Opercular bones moderately developed, nearly smooth. Isthmus broad. Gill rakers weak, moderately long. Pharyngeal bones rather weak, much as in *Erimyzon* and *Catostomus*, the teeth rather coarser, strongly compressed, the lower 5 or 6 stronger than the others, which rapidly diminish in size upward, each with a prominent internal cusp. Scales large, more or less quadrate in form, nearly equal in size over the body, and not specially crowded anywhere, usually about 44 in the lateral line and about 12 series between dorsal and ventrals. Lateral line well developed, straight or anteriorly curved. Fins well developed, the dorsal inserted about midway of body, its first rays usually rather nearer snout than caudal, the number of developed rays usually about 13, but varying from 11 to 17. Anal fin short and high, usually emarginate in the male, with 7 developed rays. Caudal fin deeply forked. Air bladder with 3 chambers. Skeleton essentially as in *Catostomus*, the vertebræ (in *M. anisurum*) 27 + 14 = 41. Sexual peculiarities little marked, the males in the spawning season with the lower fins reddened, and the anal rays swollen and somewhat tuberculate. Species very numerous in the United States east of the Rocky Mountains. They spawn in spring, running up from the rivers into the smaller streams for that purpose. They are difficult to distinguish and have been unduly multiplied by authors. They are less tenacious of life than the species of *Catostomus*. (*μυζάω*, to suck; *στόμα*, mouth; hence, more properly *Myzostoma*.)

a. Lips full, the folds broken up into evident papillæ; mouth very small, the snout projecting. D. 12 to 14. PAPILLOSUM, 304.

aa. Lips plicate, the folds not forming distinct papillæ.

b. Dorsal fin large, of 15 to 18 rays; lower lip V-shaped, somewhat papillose.

c. Mouth moderate; lower fin pale. ANISURUM, 305.

cc. Mouth quite small; lower fin reddish. COLLAPSUM, 306

bb. Dorsal fin smaller, of 10 to 14 rays.

d. Lower lip narrow, infolded, V-shaped when seen from below, with a distinct median crease in which the halves meet, forming an acute angle.

e. Body stout, with broad, bluntish head, which is flattened above; dorsal rays 12. BUCCO, 307.

ee. Body elongate, subcylindrical, little compressed; snout truncate. PIDIENSE, 308.

eee. Body compressed, the back elevated; muzzle projecting beyond the very small mouth. COREGONUS, 309.

dd. Lower lip thin, forming a narrow, crescent-shaped border around the mandible.

f. Head small, 5 in length; snout prominent; dorsal rays 12 to 14. ALBUM, 310.

ff. Head stout, 4 in length; snout not projecting; dorsal rays 14 or 15. THALASSINUM, 311.

ddd. Lower lip full, truncate behind, not evidently V-shaped or U-shaped.

g. Dorsal fin moderate, its rays 12 to 14, usually 13 in number; body more or less compressed.

h. Caudal fin normal, the 2 lobes similarly colored.

i. Caudal fin with the upper lobe not conspicuously longer than the lower.

j. Head rather large, stout, broad above, 4 to nearly 5 in body; snout little projecting beyond the mouth.

k. Dorsal fin low and small, its first ray when depressed reaching middle of last, the number of rays 12; mouth small. CONGESTUM, 312.

kk. Dorsal fin rather high and pointed, its first ray about reaching tip of last, its rays but 11; mouth rather small. AUSTRINUM, 313.

kkk. Dorsal fin larger and longer, its rays usually 13.

l. Dorsal fin with its free margin nearly straight; lower fin always red in life.

m. Body oblong or rather elongate, the back little elevated. AUREOLUM, 314.

mm. Body stout, the back much elevated. ROBUSTUM, 315.

ll. Dorsal fin with its free margin always more or less incised or concave; lower fins pale.

n. Head moderate, $4\frac{3}{5}$ in body; back not elevated. MACROLEPIDOTUM, 316.

nn. Head very short and blunt, 5 in body; back elevated. CRASSILABRE, 317.

j. Head short, low and small, conic, 5 to $5\frac{1}{2}$ in body; mouth very small, the snout much projecting beyond it; caudal lobes apparently equal. LESUEURI, 318.

ii. Caudal fin with the upper lobe more or less produced and falcate; snout much projecting beyond the small mouth; head small and conic, about $5\frac{1}{4}$ in length; dorsal fin with the free border incised, the first rays produced.

o. Lower fins red in life; eye small, 5 in head. BREVICEPS, 319.

oo. Lower fins pale; eye larger. CONUS, 320.

hh. Caudal with the lower lobe distinctly longer than the upper, and jet black, the 2 lower rays abruptly pale; upper lobe red; body elongate; mouth moderate. PŒCILURUM, 321.

gg. Dorsal fin small, its rays 10 to 12 in number; body elongate, subterete, or slightly compressed; head shortish; mouth moderate.

p. Scales 6–50–6, 18 before dorsal; dorsal with its free edge concave; color nearly plain brownish, tips of dorsal and caudal somewhat dusky. RUPISCARTES, 322.

pp. Scales 6–43–5, 15 before dorsal; series of pale streaks along rows of scales; tips of dorsal and caudal inky black. CERVINUM, 323.

304. MOXOSTOMA PAPILLOSUM, (Cope).

(WHITE MULLET.)

Body comparatively stout, the dorsal region somewhat elevated and rounded, the depth 4 to $4\frac{1}{2}$ in length, the head about the same. Eye rather large, high up and well back, the preorbital space being longer than in most species; top of head flat. Dorsal rays 12 to 14. Scales rather large, 6–42–5. Lips moderate, deeply incised, the folds more broken up than in other species. Caudal lobes equal. Color silvery; back with smoky shading; lower fins more or less reddish. Size moderate, length 1 to 2 feet. Coastwise streams from the Dismal Swamp in Virginia to the Ocmulgee River, Georgia; common. (*Papillosus*, bearing papillæ.)

Ptychostomus papillosus, COPE, Proc. Am. Phil. Soc. Phila., 1870, 470, Catawba and Yadkin rivers, North Carolina.

Moxostoma papillosum, JORDAN, Bull. U. S. Nat. Mus., XII, 134, 1878; JORDAN & GILBERT, Synopsis, 137, 1883.

305. MOXOSTOMA ANISURUM, (Rafinesque).

(White-nosed Sucker.)

Body stout, deep, compressed, the back elevated, the depth 3 to 4 in length. Head short, heavy, flattish and broad above, 3¾ to 4¼ in length; depth of cheeks ½ length of head. Eye rather large, midway in head, 4 to 5 in its length. Muzzle rather prominent, bluntish, overhanging the rather large mouth; upper lip thin, lower strongly V-shaped; fins very large. Dorsal long and high, its height ⅚ the length of head, its free border straight, the first ray about as long as fin. Pectorals nearly reaching ventrals; upper lobe of caudal narrow, longer than lower. D. 15 to 18. Color very pale and silvery; smoky above; lower fins white or pale red. Size large. Ohio River and Great Lake region; not very common, but widely distributed. (*ἄνισος*, unequal; *οὐρά* tail.)

Catostomus anisurus, Rafinesque, Ichth. Oh., 54, 1820, Ohio River.

Catostomus carpio, Cuvier & Valenciennes, xvii, 457, 1844, Lake Ontario, not of Rafinesque.

Catostomus carpio, Günther, Cat., vii, 20, 1868.

Moxostoma carpio, Jordan & Gilbert, Synopsis, 139, 1883.

Ptychostomus velatus, Cope, Proc. Am. Phil. Soc. Phila., 1870, 471, Youghiogheny River, Pennsylvania.

Moxostoma velatum, Jordan & Gilbert, Synopsis, 138, 1883.

Moxostoma valenciennesi, Jordan, Proc. U. S. Nat. Mus., 1885, 73, substitute for *carpio*, preoccupied.

Moxostoma anisurum, Jordan, Man. Vert., Ed. 5, 47, 1890.

306. MOXOSTOMA COLLAPSUM, (Cope).

Head 4; depth 3⅓. D. 15. Scales 6–42–5. Body rather stout, compressed, the back elevated. Head short, small, conic, broad and flat above. Mouth small, the lips plicate, the lower lip Λ-shaped. Muzzle truncate, overhanging the mouth. Eye in middle of side of head, 4 in its length (in specimen of 8 inches), ½ in snout, 1½ in interorbital. Depth of cheek, ½ length of head back to preopercle. Dorsal long, its free edge straight, its first ray as long as its base, ⅚ length of head. Caudal lobes subequal. Silvery, dusky above, without dark spots on bases of scales; dorsal and caudal membranes blackish; other fins plain, said to be orange in life. (H. M. Smith.) Lowland streams of North Carolina (Neuse, Catawba, Yadkin, and Roanoke); said to be very abundant. Apparently very close to *M. anisurum*, but with the mouth smaller; perhaps not distinct. (*collapsus*, flattened sidewise.)

Ptychostomus collapsus, Cope, Proc. Am. Phil. Soc., 1870, 471, Neuse, Yadkin, and Catawba rivers, North Carolina.

Moxostoma collapsum, Smith, Bull. U. S. Fish Com., 1891, 198.

307. MOXOSTOMA BUCCO, (Cope).

Head short and very wide through the opercles; front and vertex flat. Body stout, the back somewhat elevated; depth 4 in length. Muzzle subtruncate, slightly projecting. Lips thin, the lower with lateral lobes inclosing a Λ-shaped interval. Eye large, 3½ in head, width of head behind orbits 1¾ in its length. Scales 6–40–5. D. 12; A. 7; V. 9. Olivaceous, silvery below; dorsal fin dusky. (Cope.) Missouri River at St. Joseph. Type about 4 inches long; a doubtful species said to be allied to *Moxostoma collapsum,* but the dorsal has fewer rays. It is possible that this is a valid species between *anisurum* and *pidiense,* but no species with the Λ-shaped lips of *anisurum* have been found in the Missouri River by other collectors. It will not unlikely prove to be a young red horse or possibly the young of *Minytrema melanops.* (*bucco,* thick cheeks, from the interopercular width of the head.)

Ptychostomus bucco, Cope, Hayden's Geol. Surv. Wyoming, 1872, 437, St. Joseph, Missouri.
Moxostoma bucco, Jordan & Gilbert, Synopsis, 138, 1883.

308. MOXOSTOMA PIDIENSE, (Cope).

Head rather long, 4½ in length, flattish above. Body elongate, more nearly cylindrical, little compressed. Muzzle truncate. Olivaceous, sometimes with rows of faint spots along the series of scales; dorsal and caudal fins black-edged. Size quite small. Resembles *M. cervinum* but the mouth entirely different. Great Pedee Basin. (Cope.) (Name from Pedee.)

Ptychostomus pidiensis, Cope, Proc. Am. Phil. Soc. Phila., 1870, 471, Yadkin River, North Carolina.
Moxostoma pidiense, Jordan, Bull. U.S. Nat. Mus., xii, 133, 1878; Jordan & Gilbert, Synopsis, 138, 1883.

309. MOXOSTOMA COREGONUS, (Cope).

(Blue Mullet.)

Muzzle conic, much projecting beyond the very small mouth; body much compressed, broadly fusiform, the back elevated and arched. Dorsal rays 14. Color silvery, with plumbeous shades above; lower fins white. Size small. Catawba and Yadkin rivers, North Corolina. (Cope.) (*coregonus,* the white fish, from the form.)

Ptychostomus coregonus, Cope, Proc. Am. Phil. Soc. Phila., 1870, 472, Catawba and Yadkin rivers.
Moxostoma coregonus, Jordan, Bull. U.S. Nat. Mus., xii, 134, 1878; Jordan & Gilbert, Synopsis, 139, 1883.

310. MOXOSTOMA ALBUM, (Cope).

Head small, 5 in length. Muzzle prominent, but less so than in *M. coregonus.* Mouth moderate. Back a little elevated. Depth about 3⅓ in length. Dorsal rays 12 to 14, its free border often incised. Scales 6–45–5. Coloration very pale; lower fins white. Size large; reaches a weight of 4 pounds or more. Catawba and other rivers of North Carolina. (*albus,* white.)

Ptychostomus albus, Cope, Proc. Am. Phil. Soc. Phila., 1870, 472, Catawba River, North Carolina.
Moxostoma album, Jordan, Bull. U.S. Nat. Mus., xii, 130, 1878; Jordan & Gilbert, Synopsis, 139, 1883.

311. MOXOSTOMA THALASSINUM, (Cope).

Head stout, as in *M. anisurum,* rather long, 4 in length, flattish above, muzzle truncate, not very prominent. Mouth moderate. Back elevated.

Dorsal fin long, of 14 or 15 rays. Green above, white below; lower fins white. Yadkin River. (Cope.) (*thalassinus*, sea green.)

Ptychostomus thalassinus, Cope, Proc. Am. Phil. Soc. Phila., 1870, 472, Yadkin River, North Carolina.

Moxostoma thalassinus, Jordan, Bull. U. S. Nat. Mus., XII, 131, 1878; Jordan & Gilbert, Synopsis, 139, 1883.

312. MOXOSTOMA CONGESTUM, (Baird & Girard).

(Texas Red Horse.)

Head 4½ to 4¾; depth 4. D. 12. Scales 6–45–5. General form of *M. aureolum*, rather robust, moderately compressed, the back somewhat elevated. Head comparatively short, rather broad above and pointed anteriorly; the snout a little projecting, mouth rather small, the lower lip full, formed as in *M. aureolum;* eye small, about 5 in head; dorsal fin unusually low and small, little elevated in front, its first ray, when depressed, reaching about to middle of last ray; caudal not deeply forked, the lobes equal; lower fins moderate. Smoky yellowish brown above, yellowish silvery below; lower fins whitish; none of the fins red in life; the membranes of the dorsal always dusky. Teeth as in *M. aureolum*. Streams of Texas (our specimens from Lampasas River), said to have been taken in Ash Creek, Arizona, but this is doubtful. The types of *congestum* and *albidum* belong to this species, which is close to *macrolepidotum*. (*congestus*, swollen.)

Catostomus congestus, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1854, 27, Rio Salado, Texas.

Ptychostomus albidus,* Girard, Proc. Ac. Nat. Sci. Phila., 1856, 172, Rio San Juan, Monterey, New Leon. (Type, No. 170.)

Moxostoma albidum, Jordan & Gilbert, Synopsis, 141, 1883; Jordan, Proc. U. S. Nat. Mus., 1886, 18.

Catostomus texanus, Abbott, Proc. Ac. Nat. Sci. Phila., 1860, 473, Colorado and New rivers, Texas.

313. MOXOSTOMA AUSTRINUM, Bean.

Head 4⅓; depth 4. D. 11; A. 6. Scales 6–44–6. Body rather stout; lips plicate, truncate behind. Fontanelle very small. Eye small, nearly 6 in head. Dorsal rather high, its margin concave, its first ray when depressed nearly reaching end of last ray. Air bladder in 3 parts. Light brown above, yellowish below, some scales brownish at base; paired fins with dark blotches in the adult, these markings wanting in the young, which is nearly plain silvery. Basin of Rio de Santiago, Michoacan, Mexico (west of Sierra Madre). Our specimen from Rio Lerma, at Salamanca. (*aus*(*trinus*, southern.)

Myxostoma austrina, Bean, Proc. U. S. Nat. Mus., 1879, 302, Piedad in Morelia, (Michoacan), Mexico. (Type, Nos. 23120 and 23121.)

Minytrema austrinum, Jordan & Gilbert, Synopsis, 136, 1883.

314. MOXOSTOMA AUREOLUM, (Le Sueur).

(Common Red Horse; Mullet; White Sucker; Large-scaled Sucker.)

Head comparatively elongate, bluntish, rather broad and flattened above, 4 to 5 in length, its size somewhat variable. Body stoutish, varying to moderately elongate. Lips rather full, the bluntish muzzle projecting beyond the large mouth; greatest depth of cheeks more than $\frac{1}{2}$ distance from snout to preopercle. Eye rather large. Dorsal fin medium, its developed rays 12 to 14, usually 13 in number, its free edge nearly straight, its longest ray shorter than head. Scales large, about 45 in the lateral line. Olivaceous; sides silvery; lower fins in the adult red or orange. Lake Ontario and Lake Michigan to the Missouri River, south to Arkansas and Georgia; everywhere abundant west of the Allegheny mountains. This perhaps may vary into *M. macrolepidotum*, of which it has been considered a variety, but for the present at least we think it best to regard it as distinct. (*aureolus*, gilded.)

---

* The type specimen of *Ptychostomus albidus* has 44 scales in the lateral line, instead of 56, as represented in Girard's figure.

Catostomus aureolus,[*] Le Sueur, Jour. Ac. Nat. Sci. Phila., I, 95. 1817, Lake Erie, near Buffalo.
Catostomus erythrurus, Rafinesque, Am. Month. Mag., 1818,354, Ohio River.
Catostomus duquesni, Günther, Cat., VII, 18, 1868.
Catostomus oneida,[†] De Kay, N. Y. Fauna: Fishes, 198, 1842, Oneida Lake.
Rutilus melanurus, Rafinesque, Ich. Oh., 51, 1820, Ohio River.
Ptychostomus duquesnei,[‡] *erythrurus*, *oneida*, etc., Cope, Proc. Am. Phil. Soc. Phila, 1870.
Myxostoma euryops, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1876, 348, Oostanaula River, Rome, Georgia, is probably a monstrosity of this species.

315. MOXOSTOMA ROBUSTUM, (Cope).

Body stout, the back elevated. Head short and deep; the snout not prominent, truncate in profile. Eye 4 to 5 in head. Dorsal short, its upper margin straight. D. 12. Head 4 to $4\frac{1}{2}$ in length. Color smoky or clouded above, with golden reflections, yellowish below; dorsal, anal, and caudal dark crimson. Size large, weight 6 pounds or more. Yadkin River, North Carolina. (Cope). A doubtful species, apparently resembling *M. aureolum*, and perhaps identical with it. (*robustus*, robust.)

Ptychostomus robustus, Cope, Proc. Am. Phil. Soc. Phila., 1870, 473, Yadkin River, North Carolina.

316. MOXOSTOMA MACROLEPIDOTUM, (Le Sueur).

Head moderate, rather stout, its length $4\frac{3}{5}$ in body, eye $1\frac{2}{3}$ in snout; dorsal fin with its free edge concave. Scales usually with dusky shade at base; lower fins pale. Streams about Chesapeake and Delaware bays, and southward to North Carolina. It seems in some respects intermediate between *M. aureolum* and *M. crassilabre*, but we can not at present identify it with either. (*μακρολεπιδοτός*, large-scaled.)

---

[*] *C. aureolus.*—"Anal fin long, pointed and passing considerably beyond the base of the caudal fin, which is forked, with pointed lobes, the inferior of which is the largest; abdominal fin truncated. Body subcylindric, elevated at the nape; head quadrangular, gibbous above the eye, almost as high as long; the rays of the anal fin are very strong and large; scales rhomboidal, equal; body of a beautiful orange color, which is deepest on the back, the bases of the scales dark red; the sides are heightened with golden reflections; pectoral, ventral and anal fins of a fine red orange, caudal fin of a deep carmine color—the dorsal fin is paler than the rest; the lateral line is nearly straight, and commences in a line with the eye. Length of individual described 16 inches, its depth 3 inches and its thickness $2\frac{1}{3}$ inches. P. 18. D. 14. V. 9. A. 8. C. 18. This beautiful species I discovered near Buffalo on Lake Erie."—*Le Sueur.*

There is no reason for supposing this to be anything other than the common Red Horse. The name *Moxostoma aureolum* has been applied by us to short-headed specimens of Red Horse, but we have never felt sure that these were specifically distinct from the ordinary sort. Some specimens thus named probably belong to *Moxostoma breviceps.*

[†] *Moxostoma oneida* (De Kay), a species with the back much arched, the head small, nearly 5 in total length with caudal; eye small, 6 in head; mouth inferior. Bluish above, paler below. D. 13. Oneida Lake (De Kay). This is probably identical with *M. aureolum.*

[‡] *C. duquesnei*, Le Sueur has been usually identified with this species. It seems, however, more likely to have been what has usually been called *Placopharynx carinatus.*

Catostomus macrolepidotus,* LE SUEUR, Jour. Ac. Nat. Sci. Phila., 1, 94, 1817, Delaware River.
Ptychostomus lachrymalis,† COPE, Proc. Am. Phil. Soc. Phlia., 1870, 474, Neuse River, at Newbern, N. C.

317. MOXOSTOMA CRASSILABRE, (Cope).

Body robust, the back elevated and compressed. Head short, broad, flattish above, mouth moderate, the lips full; lower, truncate behind; snout short, little projecting. Scales large, 5–44–5. Dorsal rays usually 13. Head 5; depth $3\frac{1}{3}$; dorsal fin elevated in front, its edge much incised; its first soft ray longer than the base of the fin and about as long as head. Caudal lobes equal. Color silvery, with smoky shading above, some of the scales blackish at their bases; anal and caudal with some red; top of head, humeral bar, and a broad shade across dorsal fin, dusky. Streams of eastern North Carolina, our specimens from Little River at Goldsboro, a tributary of the Neuse. (*crassus*, thick; *labrum*, lip.)

Ptychostomus crassilabris, COPE, Proc. Am. Phil. Soc. Phila., 1870, 477, Neuse River, Raleigh.
Moxostoma crassilabre, JORDAN & GILBERT, Synopsis, 140, 1883.
Moxostoma crassilabre, JORDAN, Bull. U. S. Fish Com. for 1888, 128.

318. MOXOSTOMA LESUEURI, (Richardson).

(PICCONOU.)

A species from the far north, allied to *M. breviceps*, with short head and small mouth. As it is unknown to us, we copy from Richardson the following "description of recent specimens at Cumberland House, April, 1820:

"Color: Back, sides, and gill covers wood brown, reflecting when opposed to the light many brilliant tints, in which emerald green and gold yellow predominate; bases of the scales bluish gray, producing an appearance of reticulation; belly reddish white. The dorsal has the hue of the back with a reddish margin, the other fins are almost entirely red.

"Scales large, quadrangular with parallel sides and irregularly curved ends; their length and breadth nearly equal. Except in the pectoral region, where they are small, their size when *in situ* appears nearly the same over the whole body; the vertical height of their uncovered portion considerably exceeds its length. A linear inch measured longitudinally on the sides includes 3 scales, but vertically only 2. There are 47 scales on the lateral line, and about 10 in a vertical line under the dorsal. A scale detached from near the lateral line above the ventals measures 8½ lines in length, and 7½ in width. The lateral line turns up decidedly at the anal as in *C. hudsonius* (*Catostomus catostomus*).

---

* *C. macrolepidotus.* "Dorsal fin short, greatly hollowed, upper lobe elevated and pointed, lower lobe rounded. Body a little compressed and fusiform, elevated on its anterior part, rounded near the nape; head somewhat declivous and longer than deep; anal fin straight, long, and passing the base of the caudal; pectoral and abdominal fins small; caudal fin forked, with pointed lobes, and of a gray color; dorsal, anal, and ventral fins tinted with blue and yellow; scales large and disposed in a lozenge form; color of the back dark blue, base of the scales brown; sides whitish, with yellow reflections; opercula yellowish; head reddish brown; the lateral line rises at the nape of the neck, descends along the gill cover, and thence to the tail in a line with the center of the eye. Found in the river Delaware. P. 18. D. 16. V. 9. A. 9. C. 18 $\frac{5}{5}$ rays."—*Le Sueur.*

† *M. lachrymale* is said to resemble the common Red Horse. The cranium, with oblique superopercular region and elevated vertex, with a ridge on each side as in *M. macrolepidotum.* Premaxillary spines forming a distinct projecting nose; mouth inferior, but large, the lips large and thick. Eye small, 2 in interorbital space. Back gently arched. Depth $3\frac{3}{4}$ in length. D. 12 or 13. Olivaceous, scales pale or smoky at base; lower fins white. Neuse River. (Cope.) It is probably identical with *M. macrolepidotum.*

"Form more compressed than in the preceding species, (*forsterianus*). Profile oblong, having the greatest height (which is about ¼ of the total length, including the caudal) at the beginning of the dorsal. The head is smaller than in either of the preceding species, forming scarcely ⅙ of the total length. The very small mouth is farther back than in *C. hudsonius*, being, when the jaws are retracted, an inch behind the tip of the rather narrow snout, and just even with it when they are protruded. The lips, instead of being papillated, are furrowed vertically in a very regular and beautiful manner. The palate and gullet resemble the same parts in *C. hudsonius*, but are smaller, the comminuting apparatus being more delicate, and the œsophagus remarkably contracted at its origin.

"Fins. Br. 3–3. P. 16. D. 14. V. 9 or 10. A. 9. C. 18 $\frac{3}{3}$.

"The dorsal fin is larger than in the foregoing 2 species, and is nearly in the middle of the fish. The pectorals measure rather less than ⅕ of the distance between the gill openings and caudal fin. The ventrals are under the middle of the dorsal. The tip of the anal, when turned back, rather overlaps the base of the caudal; its last ray is very small, and its first one short and applied to the base of the second. The caudal is more forked than in the preceding species. The rays of all the fins are thick, particularly those of the anal.

"Intestines: Lining of the abdomen white. There is no distinction between the stomach and rest of the gut. The alimentary canal makes 4 convolutions between the gullet and anus, and bears a proportion to the total length of the fish, excluding the caudal, of 41 to 16. The lining of the intestines has the same minute longitudinal rugæ as that of the preceding 2 species. The air bladder is divided into 3 portions, the central one being the largest, and communicating with the œsophagus. The upper one alone has a thick shining capsule.

"This handsome species was observed by us only in Pine Island Lake, lat. 54°, long. 110°; but it is not unknown in other parts of the fur countries, though much more rare than the 2 preceding species."

Elsewhere (p. 303), Richardson gives measurements of a specimen from Albany River. From these we take the following, reducing the dimensions to proportions of the length: Total length 19½ inches. Head 5½ in length; eye 4¼ in head; caudal lobes 1¼ times length of head; caudal fork 1⅘ in head. Height of dorsal equal to length of head. (Named for Charles A. Le Sueur, artist and naturalist, the first to study the fishes of the Great Lakes and author of the first review of the *Catostomidæ*.)

Catostomus lesueurii, RICHARDSON, Franklin's Journal, 1823, 772, Pine Island Lake, British America.

Cyprinus (*Catostomus*) *sueurii*, RICHARDSON, Fauna Bor. Am., III, 1836, 119, 303.

319. MOXOSTOMA BREVICEPS, (Cope).

Form of a *Coregonus*, with deep compressed body, small head and sharply conic snout, which overhangs the very small mouth. Caudal fin with the upper lobe falcate, much longer than the lower, at least in the adult, the lobes similarly colored. Dorsal fin short and high, falcate, the anterior rays 1⅓ to 1½ times base of fin, the free border much concave. Depth 3½ in length. Head 5 to 5¼ in length. Eye small, 5 in head. D. 12 or 13; anal long falcate, reaching beyond front of caudal. Scales 6–45–5. Lower fins bright red. Ohio Valley and Great Lake region, abundant in Lake Erie; our specimens from Toledo, Sandusky, and Cincinnati. This may prove identical with *M. lesueuri*, but the species of the far north has never been critically examined. (*brevis*, short; *-ceps*, head.)

Ptychostomus breviceps, Cope, Proc. Am. Phil. Soc. Phila., 1870, 478, Youghiogheny River, Pennsylvania.

Moxostoma anisurum, Jordan & Gilbert, Synopsis, 141, 1883, not of Rafinesque.

Moxostoma crassilabre, Jordan, Man. Vert., Ed. v., 48, 1890, not of Cope.

Cotostomus aureolus, De Kay, and probably of Cope also, not of Le Sueur.

320. MOXOSTOMA CONUS, (Cope).

Body flattish, the dorsal outline elevated, the form like that of *M. coregonus*. Head small and conic; mouth exceedingly small, the snout far overpassing it, the muzzle being much longer than in *M. aureolum*. Dorsal rays 14, the fin high, its free border concave. Caudal deeply forked, the upper lobe the longer. Eye large. Coloration smoky above, some scales dusky at their bases; sides pale; lower fins white. Neuse and Yadkin rivers, North Carolina. Perhaps inseparable from *M. breviceps*. (*conus*, cone, from the form of the snout.)

Ptychostomus conus, Cope, Proc. Am. Phil. Soc. Phila., 1870, 478, Yadkin River, North, Carolina.

Moxostoma conus, Jordan, Bull. U. S. Nat. Mus. xii, 126, 1878; Jordan & Gilbert, Synopsis, 141, 1883.

321. MOXOSTOMA PŒCILURUM, (Jordan).

Body elongate, moderately compressed, somewhat elevated forward. Depth 4⅓ in length; head 4⅓. Mouth medium, the lips full. Dorsal rays 13. Scales large, 5–44–4. Coloration usual, except that caudal fin is red, the lower lobe jet black, the lower margin abruptly white; other fins all red, with blackish shadings. Size small. Southern Mississippi to Eastern Texas (Pearl, Tangipahoa, and Sabine rivers); not rare in sandy streams of the pine woods. (ποικίλος, variegated; οὐρά tail.)

Myxostoma pœcilura, Jordan, Bull. U. S. Nat. Mus., x, 66, 1877, Tangipahoa River, Louisiana. (Type, No. 21096.)

Moxostoma pœcilurum, Jordan, Bull. U. S. Nat. Mus., xii, 129, 1878; Jordan & Gilbert, Synopsis, 141, 1883.

322. MOXOSTOMA RUPISCARTES, Jordan & Jenkins.

(Jump-rocks.)

Body long and low, subterete; head very short, broad, flat above; snout bluntish, projecting beyond mouth, 2⅓ in head; eye moderate, 4½ in head. Lips full, the folds somewhat broken into papillæ. Scales smaller than in related species, 6–50–6, 18 before dorsal. Dorsal low and small, its free edge concave, its first ray 1½ in head. Caudal short, lunate, its lobes bluntish and equal, pectorals long, ventrals short. Dark olive brown, gradually paler below, young with pale streaks along the rows of scales; a faint dark spot above pectoral; tips of dorsal and caudal more or less dusky. Head 4⅘; depth 5½ to 6. D. 11; A. 8. L. 12 inches. Rivers of Carolina and Georgia from the Catawba to the Chattahoochee: abundant about rocks and rapids, representing the next species from the Catawba southward. (*rupiscartes*, *rupis*, rock; *σκάρτης*, jumper, a word used by Swainson for a blenny which jumps on rocks like a lizard.)

Moxostoma rupiscartes, JORDAN & JENKINS, Proc. U. S. Nat. Mus., 1888, 353, Catawba River, at Morganton, N. C.; Buck's Creek, at Pleasant Garden, N. C.; Pacollet River, at Clifton, S. C.; Tiger River, near Spartanburg, S. C.; Saluda River; Chattahoochee River; Ocmulgee River. (Type, No. 39927.)

323. MOXOSTOMA CERVINUM, (Cope).

(JUMPING MULLET.)

Head very short, roundish above, rather pointed forward, about 5 in length. Cheeks subvertical, their depth less than ½ the distance from snout to preopercle. Mouth rather large, with thick lips, which are strongly plicate, the folds somewhat broken up. Eye small. Fins very small; the dorsal rays 10 to 12; free edge of dorsal straight, its longest ray less than head. Scales rather large, 6–43–5, 13 before dorsal. Color greenish brown; a pale blotch on each scale, these forming continuous streaks along the rows of scales, back with more or less distinct brownish cross blotches; fins brownish, not much red, the dorsal and caudal inky black at tip. Size smallest in the genus, length 8 to 10 inches. Rivers of the South Atlantic States from the James to the Neuse, abundant in rapids and pools among rocks. (*cervinus*, fawn color.)

Teretulus cervinus, COPE, Jour. Ac. Nat. Sci. Phila., 1868, 236, headwaters of Roanoke and James rivers, Virginia. (Type, No, 14994.)

Ptychostomus cervinus, COPE, Proc. Am. Phil. Soc. Phila., 1870, 478.

Moxostoma cervinum, JORDAN, Bull. U. S. Nat. Mus., XII, 129, 1878; JORDAN & GILBERT, Synopsis, 142, 1883, where specimens of *M. rupiscartes* are included with it.

98. PLACOPHARYNX, Cope.

Placopharynx, COPE, Proc. Am. Phil. Soc. Phila., 1870, 467, (*carinatus*).

Suckers like *Moxostoma* in all respects, except that the pharyngeal bones are much more developed and the teeth reduced in number, those on the lower half of the bone very large, 6 to 10 in number, nearly cylindric in form, being but little compressed and with a broad, rounded, or flattened grinding surface.* Mouth larger and more oblique than usual in *Moxostoma*, the lips thicker. Size large. (*πλάξ*, a broad surface; *φάρυγξ*, pharynx.)

---

* The forms and position of these enlarged teeth vary considerably; in a specimen before us the first tooth is the highest and most compressed, its summit being rounded and then abruptly truncate; the second tooth is notably shorter and thicker, much larger, and rounded on top, the body of the tooth serving as a peduncle for the swollen grinding surface; the third tooth is still shorter and similar in form; the fourth tooth is similar to the first, being much higher than the second and third, and flat on top; the others seem to be irregularly alternated or arranged in pairs, a long one and a short one, the long teeth in all cases being the most truncated, as if their surfaces had been most worn off.

324. PLACOPHARYNX DUQUESNII, (Le Sueur).

Head 4; depth $3\frac{4}{5}$. Scales 6–45–6. Dorsal rays 12 or 13; ventral 9. Body oblong, moderately compressed, heavy at the shoulders. Head large, broad, and flattish above, its upper surface somewhat uneven. Eye small, behind the middle of the head. Mouth large, the lower jaw oblique when the mouth is closed, the mouth, therefore, protractile forward as well as downward. Lips very thick, coarsely plicate, the lower lip full and heavy, truncate behind. Free edge of dorsal concave, the longest ray longer than base of fin, $1\frac{1}{5}$ in head; upper lobe of caudal narrower than lower and somewhat longer. Color dark olive green, the sides brassy, not silvery; lower fins and caudal orange red. L. 30 inches. Michigan (Detroit) to Tennessee, Georgia, and Arkansas; abundant in the larger streams, especially in the French Broad and in the Ozark region. (Named for Fort Duquesne, now Pittsburg.)

Catostomus duquesnii,* LE SUEUR, Jour. Ac. Nat. Sci. Phila., I, 1817, 105, Ohio River at Pittsburg, Pennsylvania.

Placopharynx carinatus, COPE, Proc. Am. Phil. Soc. Phila., 1870, 467, Wabash River.

Placopharynx carinatus, JORDAN, Bull. U. S. Nat. Mus., XII, 108, 1878.

Placopharynx carinatus, JORDAN & GILBERT, Synopsis, 142, 1883.

99. LAGOCHILA,† Jordan & Brayton.

(RABBIT-MOUTH SUCKER.)

Lagochila, JORDAN & BRAYTON, Proc. Ac. Nat. Sci. Phila., 1877, 280, (*lacera*); name similar to *Lagocheilus*, a genus of mollusks.

Quassilabia, JORDAN & BRAYTON, Man. Vert. E. U. S., Ed. 2, 1878, 401, (*lacera*); substitute for *Lagochila*, regarded as preoccupied.

Suckers like *Moxostoma* in every respect excepting the structure of the mouth. Head shortish, conical, with lengthened snout; the opercular region short, so that the eye is well backward. Suborbital bones narrow. Fontanelle large, widely open. Mouth large, singular in structure, inferior, the upper lip not protractile, greatly prolonged, closely plicate; lower lip much reduced, divided into 2 distinct elongate lobes, which are weakly papillose; the split between these lobes extends backward to the edge of the dentary bones, which are provided with a rather hard, horny plate; the lower lip is entirely separated from the upper at the angles by a deep fissure; the skin of the cheeks forms a sort of cloak over this fissure, the crease separating this skin from the mouth extending up on the sides of the muzzle; the crease between the lips extends down on the under side of the head. System of muciferous tubes well developed. Pharyngeal bones about as in *Moxostoma*, rather weak, with numerous small teeth. Body elongate, not much compressed, not elevated. Fins moderate, formed as in *Moxostoma*. Scales large, as in *Moxostoma*, the lateral line well developed and nearly straight, with about 45 scales in its course. Air bladder in 3 parts. Sexual peculiarities little marked. (*λαγώχειλος*, hare-lipped.)

---

* *C. Duquesnii.*—"Head large and long; mouth wide; scales large, subtrilobate; dorsal fin quadrangular; the anal fin extends as far as the base of the caudal fin, which is greatly forked; lateral line arched at the center of the body. Body long, a little compressed; snout strong; the mouth is furnished with thick, plicated, and very large lips; pectoral fins pretty large; the scales are strong, greatly radiated, and as wide again as long—they are of nearly an equal size on the whole body; the lateral line forms a long curvature toward the back; lobes of the caudal fin pointed, the upper lobe somewhat the largest; length from the snout to the extremity of the caudal fin 19 inches; depth $3\frac{1}{2}$ inches; thickness 2 inches; the head measures about $\frac{1}{5}$ part of the whole fish. P. 17. D. 14. V. 10. A. 9. C. $18\frac{4}{4}$ rays. This new species is so strongly marked that it will be easily distinguished from the foregoing. It inhabits the Ohio, and was discovered at Pittsburg, the ancient Fort Duquesne, by Mr. Thomas Say."—*Le Sueur.*

The name *duquesnii* has been usually applied to the common red horse, but the description applies much better to the species *of Placopharynx.*

† By the rules of the American Ornithologists' Union, *Quassilabia* would be preferred to *Lagochila*, on account of the similarity of the latter to *Lagocheilus.* As the two words are spelled differently, we regard them as distinct.

325. LAGOCHILA LACERA, Jordan & Brayton.

(Hare-lip Sucker; Cut-lips; Split-mouth Sucker; May Sucker; Rabbit-mouth Sucker; Pea-lip Sucker.)

Head short, conical, with lengthened snout, the region between the eyes flattened and with prominent mucous ridges. Cheeks and lower part of head rather swollen. Opercle much reduced, its greatest length scarcely greater than the diameter of the eye. Head about 4⅔ in length. Eye 4⅓ in length of head, about 2 in length of the snout, its situation thus quite posterior. Length of the top of the head 2⅔ in the distance from the snout to the base of the dorsal. Body rather slender, the form much as in *Moxostoma cervinum*, the depth 4⅔ in the length. Dorsal fin rather low, its rays 12. A. 7; V. 9. Scales 5–45–5. Color olive or bluish, brown above; sides and belly silvery; lower fins faintly orange. Clear streams of the Mississippi Valley, abundant only in the Ozark Mountains, thus far known from the Scioto, Wabash, Clinch, Cumberland and Chickamauga rivers, and the White River of Arkansas. (*lacer*, torn.)

Lagochila lacera, Jordan & Brayton, Proc. Ac. Nat. Sci. Phila., 1877, 280, Chickamauga River, Ringgold, Georgia. (Type, No. 31129. Coll. Jordan & Brayton.)
Quassilabia lacera, Jordan, Man. Vert., Ed. 2, 406, 1878; Jordan & Gilbert, Synopsis, 144, 1883.

Supplemental Note on Catostomidæ.

Chasmistes brevirostris, Cope, should apparently be transferred to the genus *Catostomus*, standing next to *Catostomus fecundus*, Cope and Yarrow. The two seem to constitute a distinct section, or subgenus (*Lipomyzon*, Cope), intermediate between *Catostomus* and *Chasmistes*.

Family XXXVII. CYPRINIDÆ.

(The Carps.)

Cyprinoid fishes with the margin of the upper jaw formed by the premaxillaries alone and the lower pharyngeal bones well developed, falciform, nearly parallel with the gill arches, each provided with 1 to 3 series of teeth in small number, 4 to 7 in the main row, and a less number in the others, if more are present. Head naked; body scaly (except in *Meda* and *Plagopterus*, of North America, *Phoxinellus* and *Aulopyge*, of Europe, and a few others). Barbels 2 or 4; absent in most of our genera, and not large in any. Belly usually rounded, rarely compressed, never serrated. Gill openings moderate, the membranes broadly joined to the isthmus. Branchiostegals always 3. Gills 4, a slit behind the fourth. Pseudobranchiæ usually present. No adipose fin. Dorsal fin short in all the American species, elongate in many Old World forms. Ventral fins abdominal. Air bladder usually large, commonly divided into an anterior and a posterior lobe, not inclosed in a bony capsule, rarely wanting. Stomach without appendages, appearing as a simple enlargement of the intestines. Fishes mostly of moderate or small size, inhabiting the fresh waters of the Old World and of North America. Genera about 200; species nearly 1,000; excessively abundant where found, both in individuals and species, and, from their great uniformity in size, form, and coloration, constituting one of the most difficult groups in natural history in which to distinguish genera and species. Our genera are mostly very closely related, and are separated by characters which, although reasonably constant, are often of slight structural importance. The spring, or breeding dress, of the male fishes is often peculiar. The top of the head, and often the fins or various portions of the body, are covered with small tubercles, outgrowths from the epidermis. The fins and lower parts of the body in the spring males are often charged with bright pigment, the prevailing color of which is red, although in some genera it is satin-white, yellowish, or black.

It is not easy to arrange the genera of *Cyprinidæ* in accordance with possible lines of descent. The herbivorous species with straight teeth in one series (as *Orthodon*), are doubtless nearest the primitive type, which has degenerated into weak forms like *Hybognathus*. In like manner *Notropis* seems to have degenerated from *Leuciscus*, and perhaps *Hybopsis* from *Gobio*. Such forms as *Mylocheilus* and *Ptychocheilus* doubtless approach the original line of descent. The Old World *Cyprinidæ* are at once more primitive and more highly organized than American forms. The Pacific Coast species approach the European types. (CYPRINIDÆ, part, Günther, Cat., VII, 25-339.)

NOTE.—Young *Cyprinidæ* are usually more slender than adults of the same species, and the eye is always much larger; they also frequently show a black lateral stripe and caudal spot, which the adults may not possess. In the following descriptions the rudimentary rays of dorsal and anal are not counted. The fins and scales are often, especially in specimens living in small brooks, covered with round black specks, immature trematodes. These should not be mistaken for true color markings.

No progress can be made in the study of these fishes without careful attention to the teeth, as the genera are largely based on dental characters. The pharyngeal bones in the smaller species can be removed by inserting a pin (or, better, a small hook) through the gill opening, under the shoulder girdle. The teeth should be carefully cleaned with a toothbrush, or, better, a jet of water, and when dry may be examined by any small lens. In most cases a principal row of 4 or 5 larger teeth will be found, in front of which is a set of 1 or 2 smaller ones. The two sides are usually, but not always, symmetrical. Thus, "teeth 2, 4-5, 1," indicates two rows of teeth on each side, on the one side 4 in the principal row and 2 in the lesser; on the other side 5 in the main row and 1 in the other. "Teeth 4-4" indicates a single row of 4 on each pharyngeal bone, and so on.

In the *Leuciscine* genera, these teeth, or the principal ones, are "raptatorial," that is, hooked inward at the tips. A grinding or masticatory surface is an excavated space or groove, usually at the base of the hook. Sometimes the grinding surface is very narrow and confined to one or two teeth. Sometimes a beveled or flattened edge looks so much like a grinding surface as to mislead a superficial observer. In some cases the edge of the tooth is crenate or serrate.

Besides the native species here mentioned, representatives of several other genera have been introduced from Europe, and two of these have become common inhabitants of many streams, east and west. These are *Cyprinus**, Linnæus, and *Carassius*, Nilsson. The first is distinguished by the very long dorsal, which, like the anal, is preceded by a strong spine serrated behind. About the mouth are 4 long barbels, and the teeth are molar, 1, 3–3, 1. This genus is represented by the carp (*Cyprinus carpio*, L.). The carp is normally covered with large scales. In domestication, however, variations have arisen, prominent ones being the "Leather Carp," naked, and the "Mirror Carp," with a few series of very large scales.

Carassius, Nilsson, differs from *Cyprinus* chiefly in the absence of barbels and in having the teeth compressed, 4–4. The goldfish (*Carassius auratus*, Linnæus), is originally olivaceous, but only the orange-red variety is valued for aquaria. Both *Carassius* and *Cyprinus* are native in China.

**Cyprininæ*. Dorsal fin elongate; dorsal and anal fins each preceded by a serrated spine; teeth molar. Species introduced from Europe and Asia.
a. Barbels 4; teeth 1, 1, 3–3, 1, 1. . CYPRINUS.
aa. Barbels none; teeth 4–4. CARASSIUS.

CYPRINUS (Artedi) Linnæus. THE CARPS.

Cyprinus, (Artedi), LINNÆUS, Syst. Nat., Ed. x, 1758, 320, (*carpio*).

Body robust, compressed, resembling that of the buffalo-fish. Mouth moderate, anterior, with 4 long barbels. Snout blunt, rounded. Teeth molar, broad and truncate, 1, 1, 3–3, 1, 1. Scales large. Lateral line continuous. Dorsal fin very long, with a stout spine, serrated behind; anal fin short, also with a spine. Large fishes of the fresh waters of Asia; introduced into Europe and America as food-fishes. It has been generally introduced into private ponds in nearly all parts of the United States; from there it has escaped into the streams and lakes, and is now an abundant fish in most of our larger, warmer rivers and in the ponds and bayous of the Mississippi Valley. On the south shore of Lake Erie it has become well established and is of considerable commercial importance. (κυπρτνος, the ancient name of the carp.)

CYPRINUS CARPIO, Linnæus. CARP.

Dorsal III, 20; A. III, 5; scales 5–38–5; teeth 1, 1, 3–3, 1, 1. Body stout, more or less compressed, heavy anteriorly. L. 18 inches or more. Fresh waters of Central Asia; introduced as a food-fish into Europe and America. In domestication it has run into many varieties, distinguished by differences in form, squamation, and development of fins. (*Carpio*, carp.)

Cyprinus carpio, LINNÆUS, Syst. Nat., Ed. x, 1758, 320; GÜNTHER, Cat., VII, 25.

CARASSIUS, Nilsson. THE CRUCIAN CARPS.

Carassius, NILSSON, Prodromus, Ichthy. Scand., 1832, (*carassius*).

Body oblong, compressed, and elevated. Mouth terminal, without barbels. Teeth 4–4, molar, but compressed. Scales large. Lateral line continuous. Dorsal fins very long, with the third ray developed into a stout spine, which is serrated behind; anal short with a similar spine. Ventrals well forward. Large species of the fresh waters of Europe and Asia; often domesticated. (*Carassius*, a Latinization of the vernacular names Karass or Karausche, applied to the European Crucian carp, *C. carassius*.)

CARASSIUS AURATUS (Linnæus). GOLDFISH.

D. II, 18; A. II, 7; Lat. 1, 26; teeth, 4–4. Body stout, covered with large scales. Dorsal and anal fins with the spines strong, coarsely serrated. Coloration olivaceous, usually orange, or variegated in domestication. Length, 12 inches. China and Japan; introduced everywhere as an aquarium fish, and now naturalized in many of our eastern streams. The variations are innumerable. (*auratus*, gilded.)

Cyprinus auratus, LINNÆUS, Syst. Nat., Ed. x, 1758, 323.
Carassius auratus, GÜNTHER, Cat., VII, 32.

Other European species, as the Tench (*Tinca tinca* (Linnæus)) and the Ide (*Idus idus* (Linnæus)), have been introduced into America, but none of these are yet well established anywhere.

A. Dorsal fin short, without developed spine; no anal spine.

CAMPOSTOMINÆ:

- *a.* Air bladder surrounded by many convolutions of the very long alimentary canal; herbivorous.
  - *b.* Teeth 4–4, or 1, 4–4, 0, with oblique grinding surface and slight hook; peritoneum black. CAMPOSTOMA, 100.
- *aa.* Air bladder above the alimentary canal, as usual in fishes.

  CHONDROSTOMINÆ.*
  - *c.* Intestinal canal elongate, usually more than twice the length of the body; teeth 1-rowed, with grinding surface well developed; peritoneum usually black; herbivorous.
    - *d.* Teeth 6–6, strongly compressed, knife-shaped; pseudobranchiæ none; rudimentary caudal rays greatly developed; scales very small. ORTHODON, 101.
    - *dd.* Teeth 5–5 or 4–5; dorsal fin inserted posteriorly; scales small.
      - *e.* Pseudobranchiæ none; lower jaw thin, with hard, sharp edge; upper jaw protractile, with fleshy covering; body elongate, subterete. OXYGENEUM, 102.
      - *ee.* Pseudobranchiæ present.
        - *f.* Jaws each with a conspicuous, broad, straight-edged, horny plate; teeth 4–5, stout, bluntish, hooked, and short. ACROCHEILUS, 103.
        - *ff.* Jaws without horny plate.
          - *g.* Lateral line complete; rudimentary caudal rays numerous; anal basis elongate. LAVINIA, 104.
          - *gg.* Lateral line incomplete; anal basis short; scales minute. CHROSOMUS, 105.
    - *ddd.* Teeth 4–4; dorsal fin nearly median; jaws without horny plate.
      - *h.* First (rudimentary) ray of dorsal slender, firmly attached to the first developed ray, as usual among fishes.
        - *i.* Scales very small, 55 to 72 in the lateral line, which is complete. ALGANSEA, 106.
        - *ii.* Scales larger, 35 to 45 in the lateral line. HYBOGNATHUS, 107.
      - *hh.* First (rudimentary) ray of dorsal somewhat enlarged and blunt, connected by membrane with the first developed ray. PIMEPHALES, 108.
  - *cc.* Intestinal canal short, less than twice the length of the body; peritoneum usually pale; teeth 1 or 2-rowed; carnivorous or partly so.

    MYLOPHARODONTINÆ:
    - *j.* Teeth scarcely hooked, some or all of them molar, blunt, or stump-shaped, much enlarged and obtusely truncate; large, coarse fishes.
      - *k.* Teeth 2, 4–5 or 5–5, 2.
        - *l.* Upper jaw not protractile; no barbels. MYLOPHARODON, 109.
        - *ll.* Upper jaw protractile; maxillary with a barbel. MYLOCHEILUS, 110.
      - *kk.* Teeth 3–3; upper jaw protractile. STYPODON, 111.
    - *jj.* Teeth hooked, slender, none of them molar, the grinding surface, if present, narrow or rudimentary.

      LEUCISCINÆ:
      - *m.* Lower jaw normally formed, the dentary bones curved, free from each other, except at the symphysis.
        - *n.* Teeth in the main row, 5–5 or 4–5.
          - *o.* Abdomen behind ventral fins transversely rounded, the scales passing over it; the edge not forming a scaleless ridge; anal base generally, but not always, short.
            - *p.* Maxillary with a barbel; premaxillaries protractile.
              - *q.* Barbel minute, not quite terminal; teeth without grinding surface; caudal fin symmetrical, its rudimentary basal rays not greatly developed. SEMOTILUS, 112.

---

* This subfamily, as here recognized, is extremely heterogeneous. Some of the American genera of herbivorous minnows and chubs, as *Orthodon*, *Acrocheilus*, and perhaps *Oxygeneum* and *Lavinia*, are allied to the European *Chondrostoma*. The others may be descended from Leuciscine types, or they may have degenerated from other herbivorous forms.

qq. Barbel terminal; teeth with grinding surface; caudal fin unsymmetrical; the upper lobe much the longer in the adult, the basal caudal rays greatly developed. Pogonichthys, 113.

pp. Maxillary without barbel.

r. Teeth 2-rowed; usually 2 teeth in the lesser row.

s. Teeth subconical, scarcely hooked, sharp-edged, wide apart, the long limb of the pharyngeal bone elongate; body elongate; mouth large; lateral line complete. Ptychocheilus, 114.

ss. Teeth compressed, close-set, strongly hooked; the pharyngeal bone of the usual form.

t. Caudal peduncle slender and elongate, the caudal fin widely forked, its basal rudiments much developed; scales very small; head depressed in the adult. Gila, 115.

tt. Caudal peduncle stout; basal rudiments of caudal little developed. Leuciscus, 116.

rr. Teeth 1-rowed, 4–5 or 5–5.

u. Mouth of moderate size; teeth entire.

v. Gill rakers short and small; body not much compressed; anal fin short in American species. Rutilus, 117.

vv. Gill rakers slender; body much compressed; anal fin rather long. Luxilinus, 118.

uu. Mouth extremely small; teeth serrate. Opsopœodus, 119.

oo. Abdomen behind ventral fins compressed to a sharp edge over which the scales do not pass; abdomen in front of ventrals, rounded; anal basis elongate; dorsal posterior; teeth 5–5, serrate or entire. Abramis, 120.

nn. Teeth in the main row, 4–4, the lesser row often absent; anal basis usually short.

w. Maxillary without barbels.

x. Upper jaw distinctly protractile.

y. Scales comparatively large, 30 to 60 in lateral line.

z. Jaws each with a hardened bony sheath; first ray of dorsal spine like, connected by membrane with the first developed ray; teeth 4–4. Cochlognathus, 121.

zz. Jaws without bony sheath.

a′. Lower jaw with the lip thin or obsolete, not developed as a fleshy lobe on each side at base; scales large, 30 to 50.

b′. Mandible, interopercle, and subopercle not cavernous.

c′. First (rudimentary) ray of dorsal simple, detached from the first developed ray, to which it is connected by membrane (precisely as in *Pimephales* and *Cochlognathus*); a conspicuous black spot on front of dorsal and on base of caudal. Cliola, 122.

cc′. First simple ray of dorsal rudimentary and closely adnate to the first branched ray (as usual in the family). Notropis, 123.

bb′. Mandible, interopercle, and suborbital with conspicuous, externally visible, cavernous chambers; teeth 1, 4–4, 0; scales large. Ericymba, 124.

aa'. Lower jaw with the lip developed as a fleshy lobe on each side; teeth 4–4; dorsal anterior; scales rather small, 40 to 60. PHENACOBIUS, 125.

yy. Scales very small, 85 to 90 in lateral line; body long and low, subterete; mouth small, the upper jaw little protractile; teeth 4–4. EVARRA, 126.

xx. Upper jaw not protractile; lips fleshy; body elongate, covered with minute scales; teeth small, 1, 4–4, 1. TIAROGA, 127.

ww. Maxillary with a small barbel at or near its extremity.

d'. Premaxillaries not protractile; the frenum very broad; teeth 2, 4–4, 2; scales small, dorsal posterior. RHINICHTHYS, 128.

dd'. Premaxillaries protractile (rarely joined to the forehead by a narrow frenum).

e'. Scales very small, 60 to 90 in lateral line; lateral line often incomplete; dorsal posterior. AGOSIA, 129.

ee'. Scales large, 35 to 55; dorsal median; lateral line complete.

f'. Teeth 4–4, or 1, 4–4, 1 or 0, the lesser row with never more than 1. HYBOPSIS, 130.

ff'. Teeth usually 2, 4–4, 2, the lesser row rarely with less than 2.

g'. Head convex above; teeth without grinding surface; barbel not quite terminal. COUESIUS, 131.

gg'. Head more or less flattened above; teeth with grinding surface; barbel terminal. PLATYGOBIO, 132.

EXOGLOSSINÆ:

mm. Lower jaw singularly formed, the dentary bones parallel, united for their whole length.

h'. Premaxillaries not protractile; mandible with a conspicuous fleshy lobe on each side at the base; teeth 1, 4–4, 0 or 1; no barbel; scales moderate. EXOGLOSSUM, 133.

PLAGOPTERINÆ:

AA. Dorsal fin short, posterior, with a strong spine, composed of 2, the posterior received into a longitudinal groove of the anterior; inner border of the ventral fins adherent to the body; teeth hooked, without grinding surface, in 2 rows.

i'. Body with small scales; teeth 2, 4–4, 2; no barbels. LEPIDOMEDA, 134.

ii'. Body scaleless; teeth 2, 4–5, 2.

j'. Maxillary without barbel. MEDA, 135.

jj'. Maxillary with a barbel. PLAGOPTERUS, 136.

100. CAMPOSTOMA, Agassiz.

(STONE ROLLERS.)

Campostoma, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 218, (*anomalum*).

Body moderately elongate, little compressed. Mouth normal, the jaws with thick lips and rudiment of a hard sheath. Premaxillaries protractile; no barbel. Teeth 4–4, or 1, 4–4, 0, with oblique grinding surface, and a slight hook on 1 or 2 teeth. Air bladder suspended in the abdominal cavity, and entirely surrounded by many convolutions of the long alimentary canal, which is 6 to 9 times the total length of the body; ovaries similarly inclosed by the alimentary canal. Peritoneum black. Pseudobranchiæ present. Scales moderate. Lateral line present. Dorsal nearly over ventrals. Anal short. No spines. Herbivorous. Sexual differences very great, the males being covered with large tubercles in spring. The singular arrangement of the intestines in relation to the air bladder is peculiar to *Campostoma* among all known fishes. Size moderate. (καμπή, curve; στόμα, mouth)

a. Scales in lateral line about 73.
  b. Length of top of head ⅖ distance to origin of dorsal fin; mouth rather large, maxillary not quite reaching the eye. ORNATUM, 326.
  bb. Length of top of head ½ distance to origin of dorsal fin; mouth smaller, maxillary reaching vertical from anterior nostril. PRICEI, 327.
aa. Scales in lateral line 49 to 55. ANOMALUM, 328.
aaa. Scales larger, 45 to 47 in lateral line. FORMOSULUM, 329.

326. CAMPOSTOMA ORNATUM, Girard.

Head 3¾; depth 4; eye 4. D. 8; A. 8; lateral line 72; 41 before dorsal. Body rather stout; head moderate, the snout projecting and somewhat acute; mouth small, the maxillary not reaching to front of eye. Coloration of male, brilliant, precisely as in *C. anomalum*, the scales of back mottled. Like *C. anomalum* in all respects except the much smaller scales. Chihuahua River, Mexico. Our specimens obtained recently by A. J. Woolman. (*ornatus*, adorned.)

Campostoma ornatum, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 176, Chihuahua River, Mexico. (Type, No. 77. Coll. J. Potts.) GÜNTHER, Cat., VII, 183, 1868; JORDAN & GILBERT, Synopsis, 149, 1883.

327. CAMPOSTOMA PRICEI, Jordan & Thoburn, new species.

Head 3½ in adult male; depth 4; eye 5½; D. 8; A. 8; scales 10–75–9, 32 before dorsal; teeth 4–4. Body stout, moderately compressed; head large, conical, with large tubercles, each with a central spine; mouth small, maxillary reaching vertical from anterior nostril, ⅔ distance to eye, or 3⅓ in head. Dorsal fin opposite ventrals, its first ray ½ distance from snout to base of caudal; anal basis short, 3 in head. Length of top of head nearly half distance from tip of snout to origin of dorsal (⅖ in *ornatum*). Scales rather small, deep, somewhat crowded anteriorly. Color as in *C. anomalum*; brownish, with brassy luster on back and sides; scales above profusely speckled with black, the color arranged in longitudinal bands, quite evident back of the dorsal; less black below; a vertical black band behind opercle; a distinct black spot at base of caudal; a broad band of black across dorsal fin, and traces of a similar band on anal; fins all flushed with red (in spring males). Very close to *C. ornatum* of the Chihuahua River; the head longer, the snout longer, and the mouth and eye smaller. Springs in the Chiricahua Mountains in Southern Arizona, tributary to the Rio Yaqui, locally very abundant. The waters of these springs are lost on the desert, very rarely overflowing into the river. The type a single specimen, 3½ inches long, taken by Mr. W. W. Price, in Rucker Cañon, Chiricahua Mountains, in southern Arizona. (Named for William Wightman Price.) (Type, No. 1552, L. S. Jr. Univ. Mus.)

328. CAMPOSTOMA ANOMALUM (Rafinesque).

(STONE-ROLLER; STONE-LUGGER; STEEL-BACKED CHUB; MAMMY; DOUGH-BELLY.)

Head 4⅕; depth 4⅗. D. 8; A. 7; scales 7–53–8; teeth 4–4, or 1, 4–4, 0. Body stoutish, moderately compressed, the antedorsal region becoming swollen and prominent in the adult. Snout moderately decurved. Scales deep, rather small, and crowded anteriorly; maxillary not reaching to opposite the front of the eye. Color brownish, with a brassy luster above, the scales more or less mottled with dark; a dusky vertical bar behind the opercle; dorsal and anal fins each with a dusky crossbar about half way up, the rest of the fin olivaceous in females, fiery red in the males in the spring; iris orange in males. Males in the spring with the head and often the whole body covered with large rounded tubercles. In no other *Cyprinoid* are these nuptial appendages so extensively developed. Extremely variable, the young very different in appearance from the old males. Length 6 to 8 inches. Central New York to Tennessee, Wyoming, and Texas; everywhere abundant in deep or still places in small streams, running up small brooks to spawn in spring. Herbivorous. One of the most interesting and curious of our fishes. (*anomalus*, extraordinary.)

Rutilus anomalus, RAFINESQUE, Ichth. Oh., 52, 1820, Licking River, Kentucky.

Catostomus melanotus, RAFINESQUE, Ichth. Oh., 58, 1820, Ohio River.

Exoglossum spinicephalum, CUVIER & VALENCIENNES, XVII, 489, 1844, Wabash River.

Leuciscus prolixus, STORER, Proc. Bost. Soc. Nat. Hist., July, 1845, Alabama.

Exoglossum dubium, KIRTLAND, Journ. Bost. Soc. Nat. Hist., v, 1845, 272, Yellow Creek, Ohio.

Chondrostoma pullum, AGASSIZ, Amer. Journ. Sci. Arts, 1854, 357, Burlington, Iowa. (Coll. Dr. J. H. Rausch.)

Campostoma nasutum, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 176, Cadereita, and near Monterey, New Leon. (Type, No. 75. Coll. Lieut. Couch.)

Campostoma callipteryx, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 284, Flint River, Michigan. (Coll. Prof. Manly Miles.)

Campostoma mormyrus, COPE, *l. c.*, 284, Bruce, Michigan. (Coll. Miles.)

Campostoma gobioninum, COPE, *l. c.*, 284, Bruce and Grosse Isle, Michigan. (Coll. Miles.)

Campostoma hippops, COPE, *l. c.*, 284, Platte River, Nebraska. (Coll. Dr. W. A. Hammond.)

Campostoma anomalum, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 218; JORDAN & GILBERT, Synopsis, 149, 1883.

Campostoma dubium, GÜNTHER, Cat., VII, 183, 1868.

Campostoma prolixum, JORDAN & GILBERT, Synopsis, 150, 1883; this name applied to southern specimens in which the teeth are usually 1, 4–4, 0.

329. CAMPOSTOMA FORMOSULUM, Girard.

Head 4; depth 4½. D. 8; A. 7; scales 46. Head short and blunt, with broad, projecting snout. Grayish above, whitish below; sides more or less marmorate; a black patch at base of caudal fin and one on the dorsal. San Antonio River to the Rio Grande. (*formosulum*, diminutive of *formosus*, pretty.)

Campostoma formosulum, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 176, Rio Sabinal, near San Antonio, Texas. (Type, No. 76. Coll. Dr. Kennerly.) GIRARD, U. S. & Mex. Bound. Surv., Zoöl., 41, pl. XXV, figs. 5–8, 1859; JORDAN & GILBERT, Synopsis, 150, 1883.

101. ORTHODON, Girard.

Orthodon, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 182, (*microlepidota*).

Body elongate. Jaws normal, the upper protractile, the lower sharp-edged, with a knob at the symphysis; no barbel. Teeth 6–6 or 6–5, much compressed, lancet-shaped, erect, nearly straight. Upper limb of the pharyngeal bone very broad and concave, separated by a deep notch from the dentigerous portion, the bone thin and brittle. Intestinal canal elongate, about 7 times the length of the fish; peritoneum black; scales small; lateral line present. Dorsal fin opposite ventrals. Basal rays of caudal largely developed. Anal basis short. Pseudobranchiæ none. Gill rakers moderate, clavate, the inner edge fringed. Size large. This genus is related to the European genus, *Chondrostoma*, differing chiefly in the absence of pseudobranchiæ and of the horny mandibular plate. (*ὀρθός*, straight; *ὀδούς*, tooth.)

330. ORTHODON MICROLEPIDOTUS (Ayres).

(BLACK-FISH.)

Head 4; depth 4½. D. 9; A. 8; scales 21–105–12; Vert. 24+20. Teeth 6–6 or 6–5, very long. Body elongate, not much compressed. Head moderate, flattish above, with two bony ridges; snout very broad; eye small, about half length of snout. Mouth terminal, somewhat oblique, broad, the maxillary not extending to the eye. Fins rather large; the caudal strong. Lateral line decurved. Coloration plain olivaceous, paler below. Size large. Length 12 to 16 inches. Lower Sacramento and San Joaquin rivers and neighboring streams; locally abundant in quiet waters. (*μικρολεπιδοτός*, small-scaled.)

Gila microlepidota, AYRES, Proc. Cal. Ac. Nat. Sci., I, 21, 1855, Sacramento and San Joaquin rivers, California. (Coll. W. O. Ayres.)

Orthodon microlepidotus, GIRARD, Pac. R. R. Surv., Fish., 237, pl, LIII, fig. 1-4, 1858; GÜNTHER, Cat., VII, 275, 1868; JORDAN & GILBERT, Synopsis, 152, 1883.

102. OXYGENEUM, Forbes.

Oxygeneum, FORBES, Bull. Ill. Lab. Nat. Hist., 1855, 136, (*pulverulentum*).

Body elongate, subterete; head small, conical; mouth large, terminal; upper jaw protractile, with fleshy lips; lower jaw thin, with sharp, hard edge; no pseudobranchiæ; scales rather small; lateral line complete. Alimentary canal elongate, more than twice length of body; teeth 4–5 or 5–5, in one row, not strongly hooked; peritoneum black. Herbivorous species of small size. (*ὀξύς*, sharp; *γένυς*, chin.)

331. OXYGENEUM PULVERULENTUM, Forbes.

Head 4⅙; depth 5; eye 4. D. 8; A. 7. Lateral line 63; 31 scales before the dorsal. Form of *Moxostoma;* head small, conical; mouth large, terminal; gill rakers slender. Breast scaly. Dorsal fin high. Color pale, the back and sides dusted with dark specks. Length 2½ inches. Illinois River. (Forbes.) (*pulverulentus*, dusted.)

Oxygeneum pulverulentum, FORBES, Bull. Ill. Lab. Nat. Hist., 1885, 136, Illinois River. (Coll. Forbes.) JORDAN, Man. Vertebrates, Ed. V, 52, 1890.

103. ACROCHEILUS, Agassiz.

(CHISEL-MOUTHS.)

Acrocheilus, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 211, (*alutaceus*).

Body elongate, little compressed. Each jaw with a large, straight, horny plate, sharp externally and very conspicuous. Upper jaw protractile; no barbel. Teeth 4–5, stout, hooked, with broad masticatory surface. Intestinal canal elongate; peritoneum black. Pseudobranchiæ present. Scales small, loosely imbricated. Lateral line present. Dorsal fin slightly behind ventrals. Anal basis moderate. Caudal fin broad, its rudimentary rays recurrent on the caudal peduncle. Size rather large. A single species, American. (*ἄκρος*, sharp; *χεῖλος*, lip.)

332. **ACROCHEILUS ALUTACEUS**, Agassiz & Pickering.

(CHISEL-MOUTH; SQUARE-MOUTH; HARD-MOUTH.)

Head 4¼; depth 4; eye 5½. D. 10; A. 9; scales 20–85–16. Teeth 4–5, hooked, somewhat club-shaped, with a broad grinding surface. Body elongate, not much compressed; caudal peduncle very long and slender, nearly terete. Head moderate, bluntish, the profile rounded, the interorbital space strongly convex. Mouth horizontal, subinferior, overlapped by the broad, blunt snout, its breadth considerable, but the maxillary not extending far back, to opposite the front of the eye. Upper jaw protractile, covered with a fleshy lip, inside of which is a small, straight, cartilaginous plate, similar to that on the lower jaw, but much smaller and not evident externally; lower lip covered with a firm cartilaginous plate, sharp externally, the upper surface being formed by its beveled edge. The transverse width of this plate is between 4 and 5 times its (longitudinal) breadth; the plate extends in nearly a straight line from one angle of the mouth to the other; its transverse width is contained 2¾ times in length of head. Eye rather large, 1¾ in snout, its position anterior and not high up, 2¼ in interorbital space. Dorsal long, rather low, its first ray just behind first ray of ventrals, midway between snout and middle of base of caudal; caudal fin very long, the lobes about equal, longer than head, widely forked, the accessory rays at its base very numerous and recurrent on the caudal peduncle; about 8 of these may be distinguished on each side of the fin. Anal fin rather large; ventrals broad, reaching vent. Pectorals moderate, not reaching two-thirds of the distance to the ventrals. Scales quite small, somewhat embedded in the skin, very loosely imbricated, the exposed surfaces longer than high profusely punctate; squamation quite irregular. The scales smaller on back and belly than on sides, most exposed on caudal peduncle. Lateral line much decurved. Coloration very dark; belly paler, but nearly all parts of the body studded with minute dark points. Peritoneum black; intestines much elongate, usually filled with vegetable substance. Length 12 inches. Lower Columbia River and tributaries, as far up as Spokane and Shoshone Falls; locally abundant. (*alutaceus*, leathery.)

Acrocheilus alutaceus, AGASSIZ and PICKERING, Amer. Journ. Sci. Arts, XIX, 214, 1855, Willamette Falls and Walla Walla River; GÜNTHER, Cat., VII, 276; JORDAN, Proc. U. S. Nat. Mus., 1878, 83; JORDAN & GILBERT, Synopsis, 150, 1883.

104. LAVINIA, Girard.

Lavinia, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 137, (*exilicauda*).

Body elliptical, elevated, moderately compressed, rapidly contracted to the slender caudal peduncle. Head small, conical. Mouth moderate, terminal, oblique; the lower jaw included. Scales moderate, not closely imbricated, the exposed surfaces somewhat hexagonal. Lateral line decurved, complete. Belly behind ventrals entirely scaled. Dorsal fin well behind ventrals, its last ray just in front of beginning of anal, which is rather elongate. Caudal fin little forked, its rudimentary basal rays much increased in number and very strong. Intestinal canal elongate, 3 times the total length of the fish; peritoneum dark. Teeth 4–5 or

5-5, scarcely hooked, cultriform, with rather broad but shallow grinding surface, the largest standing up well above the surface of the bone. Gill rakers rather long and slender; pseudobranchiæ large. Size large One species. American. (*Lavinia*, a classical name, without special application to these fishes.)

333. LAVINIA EXILICAUDA, Baird & Girard.

(HITCH; CHI OR CHIGH.)

Head 4$\frac{2}{3}$; depth 3$\frac{1}{3}$; eye 4. D. 10; A. 12; scales 13–64–8; teeth 4–5 or 5–5. Body deep, compressed, tapering to the caudal peduncle, which is very slender. Upper lip on the level of the lower part of the pupil, the maxillary falling short of the eye. Preorbital short and deep; suborbital moderate. Eye rather large, anterior. Scales rather large, 42 in front of dorsal. Dorsal fin rather small; pectorals short; anal high and long; caudal well forked, its rudimentary rays strong, about ten in number. Color dark above, sides somewhat silvery; scales with dark specks. Length 12 inches. Streams of the Coast Range about San Francisco and Monterey, locally common as far north as Clear Lake. (*exilis*, slender; *cauda*, tail.)

Lavinia exilicauda, BAIRD and GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 137, Sacramento River, California. (Type, Nos. 207 and 209. Coll. Heermann.) GIRARD, Pac. R. R. Surv., x, 241, 1858. JORDAN & GILBERT, Synopsis, 153, 1883.

Lavinia harengus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 184, Monterey, California. (Type, No. 210. Coll. A. S Taylor.)

Leuciscus exilicauda, GÜNTHER, Cat., VII, 248, 1868.

105. CHROSOMUS, Rafinesque.

Chrosomus, RAFINESQUE, Ichth. Oh., 47, 1820, (*erythrogaster*).

Body moderately elongate, little compressed. Jaws normal; no barbel; teeth 5-5 or 4–5, moderately hooked, with well-marked grinding surface. Alimentary canal elongate, about twice as long as body; peritoneum black. Scales very small. Lateral line short or wanting. Dorsal behind ventrals; anal basis short. Size small. Colors in spring brilliant, the pigment bright red. This genus is of somewhat doubtful relationship, and shows many analogies with the subgenus *Phoxinus* under *Leuciscus*. (*χρώς*, color; *σῶμα*, body.)

a. Lower black lateral band extending backward to base of caudal.
  b. Lower black band ending in a black spot. . ERYTHROGASTER, 334.
  bb. Lower black band broader, and not ending in a black spot. DAKOTENSIS, 335.
aa. Lower black lateral band extending downward and backward, ending above base of anal, the upper band forming the black caudal spot. OREAS, 336.

334. CHROSOMUS ERYTHROGASTER, Rafinesque.

(RED-BELLIED DACE.)

Head 4; depth 4. D. 7; A. 8; scales 16–85–10; teeth usually 5–5. Body oblong, little compressed, tapering each way from the middle. Head moderate, rather pointed. Mouth moderate, terminal, oblique, the jaws about equal. Fins rather small; the dorsal and anal high and short;

caudal long. Scales quite small, firmly attached, but not much imbricated. Lateral line developed less than half the length of the body. Color brownish olive, with a dusky dorsal line and often some blackish spots; two black lateral bands nearly parallel, the one from the upper angle of the opercle straight to the caudal, sometimes broken into spots behind, the lower broader, extending from snout through eye, curved downward along the belly and extending to the caudal, where it ends in a black spot; between these bands a bright, silvery area; belly below the lower band abruptly silvery; females obscurely marked. Males in spring with the belly and the interspace between the lateral bands bright scarlet; bases of the vertical fins also scarlet; in high coloration the body is everywhere minutely tuberculate and the fins are bright yellow. Length 2 to 3 inches. Ohio and Michigan to Iowa and Northern Alabama; also common at Freeport, Maine, (Kendall and Smith.) Abundant in small clear streams; one of the most beautiful of our fishes, especially attractive in aquaria. (*ἐρυθρός*, red; *γαστήρ*, belly.)

Luxilus or *Chrosomus erythrogaster*, RAFINESQUE, Ichth. Oh., 47, 1820, Ohio River.

Chrosomus pyrrhogaster, JORDAN, Man. Vert., Ed. 1, 284, 1876, White River, Indiana. (Coll. Jordan.)

Luxilus erythrogaster, KIRTLAND, Bost. Journ. Nat. Hist., IV, 23, 1844.

Leuciscus erythrogaster, GÜNTHER, Cat., VII, 247, 1868.

Chrosomus erythrogaster, JORDAN & GILBERT, Synopsis, 153, 1883; COPE, Cypr. Penn., 391, 1868.

Represented in the Susquehanna River by

334a. CHROSOMUS ERYTHROGASTER EOS (Cope).

Head 4; depth 5. D. 8; A. 8. Lateral line 77; teeth 5–5. Body slenderer than the preceding; the lateral line less distinct, often entirely wanting. Male with the two black lateral bands uniting on the caudal peduncle, the lower broader and decurved, the upper narrow and straight. Length $2\frac{1}{2}$ inches. Susquehanna River. (*ηώς*, sunrise.)

Chrosomus eos, COPE, Proc. Ac. Nat. Sci. Phila., 1861, 523, Meshoppen Creek, Susquehanna County, Pennsylvania; COPE, Cypr. Penn., 391, 1868; JORDAN & GILBERT, Synopsis, 154, 1883. (Coll. Cope.)

335. CHROSOMUS DAKOTENSIS, Evermann & Cox.

Head $3\frac{8}{9}$; depth $4\frac{1}{2}$; eye $3\frac{1}{2}$; snout $4\frac{1}{2}$. D. 8; A. 8; scales about 80, 24 in a cross series; teeth 4–4, with slight grinding surface. Body moderately stout, head heavy, caudal peduncle shorter than in related species. Eye moderate; interorbital width 3 in head. Mouth small and oblique; maxillary short, not nearly reaching vertical at front of eye, its length $1\frac{1}{2}$ in eye; lower jaw projecting; fins moderate; height of dorsal $1\frac{1}{2}$ in head, its origin behind the base of ventrals a distance greater than length of snout; anal similar to dorsal; pectorals short, $1\frac{1}{2}$ in head; ventrals very short, not reaching anal. Color as in *C. erythrogaster*, except that the back is darker and the upper dark line is continuous and not at all broken up into spots; the lower black line is more distinct, broader, and does not end in a black spot. Length 2 inches. Missouri River basin, in Nebraska and South Dakota.

Chrosomus dakotensis, EVERMANN & COX, Rept. U. S. Fish Comm., XIX, 1895, Crow Creek, Chamberlain, South Dakota. (Type, No. 45680. Coll. Evermann, Rutter, & Cox.)

336. CHROSOMUS OREAS, Cope.

Head 4; depth 4¼. D. 8; A. 8. Lateral line 67; teeth 5–5. Snout, preorbital, and maxillary a little longer than in *C. erythrogaster*. Coloration similar to that of *Chrosomus erythrogaster*, except for the difference in pattern, the upper band beginning opposite the vent and extending backward to middle of caudal, ending in a black spot; lower band extending from snout through eye downward and backward, ceasing at base of anal; back clear olive-green, with dark spots and crossbars; belly, interspace between the lateral bands, and bases of vertical fins bright crimson; fins otherwise yellow. Length 2½ inches. Head waters of Roanoke River. The most brilliant of the genus, locally abundant in mountain streams. Specimens of *erythrogaster* approaching *oreas* in coloration are also found in clear tributaries of the Tennessee River, in Alabama. (*oreas*, ὀρειάς, a mountain nymph.)

Chrosomus oreas, COPE, Journ. Ac. Nat. Sci. Phila., 1868, 233. Head of Roanoke River, Montgomery County, Virginia; (Coll. Cope); JORDAN & GILBERT, Synopsis, 154, 1883; JORDAN, Bull. U. S. Fish Comm., VIII, 1888, 121.

106. ALGANSEA, Girard.

Algansea, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 184, (*tincella*).

This genus is very closely related to *Hybognathus*, differing chiefly in the small size of the scales, there being 55 to 70 in the course of the lateral line; preorbital bones very wide, as in *Hybognathus;* teeth 4–4, scarcely hooked, with rather broad grinding surface; intestinal canal elongate; peritoneum black. Mountains of Mexico. (A coined name.)

a. Scales very small, about 70 in the lateral line; body and head robust.
  b. Dorsal inserted over ventrals; maxillary not reaching eye. TINCELLA, 337.
  bb. Dorsal inserted rather before ventrals; maxillary reaching front of eye. DUGESI, 338.
aa. Scales moderate, 55 to 60 in the lateral line; eye small. SALLÆI, 339.

337. ALGANSEA TINCELLA (Cuvier & Valenciennes).

Head 3¾; depth 3⅗; scales 17–70–9; teeth 4–4. Body stoutish, the head heavy. Mouth moderate, oblique, the maxillary not reaching to the eye; jaws about equal; eye rather small; fins small, the caudal short. Dorsal inserted just over ventrals. Scales quite small, firmly attached and not closely imbricated, as in *Mylocheilus* and *Gila*. Coloration dark, plain; fins unspotted. Length 6 inches. Lakes about the City of Mexico. (diminutive of *tinca*, a tench.)

Leuciscus tincella, CUVIER & VALENCIENNES, XVII, 323, 1844, City of Mexico; GÜNTHER, Cat., VII, 244, 1868. (Specimens, No. 2753, U. S. N. M.; original type in Museum of Paris. Coll. Maj. Wm. Rich.)

Leucus tincella, JORDAN & GILBERT, Synopsis, 245, 1883.

338. ALGANSEA DUGESI, Bean.

Head 4; depth 4; eye 5½. D. 7; A. 6; scales 18–69 to 72–13. Teeth 4–4, slightly hooked, with well-developed grinding surface. Gill rakers 4+15. Body robust. Lower jaw slightly included, with a small knob at the symphysis; maxillary reaching opposite front of eye. Dorsal inserted somewhat before ventrals at a point midway between snout and base of caudal; lower fins short; caudal large. Scales very small and crowded anteriorly, larger behind; lateral line sharply decurved over pectoral. Dusky brown; sides of head silvery, a very faint dusky spot at base of caudal; upper fins dusky, unmarked. Length 6½ inches. Central Mexico, in streams tributary to Rio de Lerma; our specimens collected by Mr. Woolman, at Salamanca. Very close to *A. tincella*, but probably distinct. (Named for Professor Alfredo Dugès, who collected the types.)

Algansea dugèsi, Bean, Proc. U. S. Nat. Mus., 1892, 283, Guanajuato, Lake Yuriria. (Type, Nos. 41818 and 43764.)

339. ALGANSEA SALLEI (Günther).

Head 4; depth 3⅔; eye 5. D. 7; A. 6. Lateral line 54; teeth 4–4, long, curved, with grinding surface. Caudal peduncle not quite twice as long as deep. No barbels. Snout obtusely conical, longer than the eye. Upper jaw slightly overlapping the lower. Maxillary not extending to the eye. Dorsal immediately behind ventrals. Fins short. Intestinal canal with few convolutions. Brownish, green above, minutely dotted with black along the sides. Length 3½ inches. Streams of central Mexico. (Günther.) (Named for M. Sallé, a collector in Mexico, who obtained the types.)

Ceratichthys sallæi, Günther, Cat., vii, 484, 1868, Cuernavaca, Mexico.

Zophendum australe,* Jordan, Proc. U. S. Nat. Mus., 1870, 300, Lake Tupataro. (Type, Nos. 23130 and 23131. Coll. Prof. A. Dugès.) Jordan & Gilbert, Synopsis, 154, 1883.

Hudsonius sallæi, Jordan, Proc. U. S. Nat. Mus., 1879, 226.

Cliola sallæi, Jordan & Gilbert, Synopsis, 164, 1883.

107. HYBOGNATHUS, Agassiz

Hybognathus, Agassiz, Amer. Journ. Sci. Arts, 1855, 223, (*nuchalis*).

Dionda, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 177, (*episcopa*).

Algoma, Girard, *l. c.*, 180, (*amara*).

Body elongate, somewhat compressed. Mouth horizontal, the jaws normal, sharp-edged; lower jaw with a slight, hard protuberance in front; no barbel; upper jaw protractile. Teeth 4–4, cultriform, with oblique grinding surface and little if any hook. Alimentary canal elongate, 3 to 10 times the length of the body. Peritoneum black. Scales large; lateral line continuous. Dorsal inserted before ventrals. Anal basis short. Size moderate. Sexual changes very slight, no red or black pigment distinguishing the males in spring. Species numerous; mostly southwestern, and not well known. (*ὑβός*, gibbous; *γνάθος*, jaw.)

Hybognathus:

a. Teeth comparatively long and scarcely hooked; silvery species, usually more than 3½ inches in length when adult; scales about 38.
  b. Suborbitals broad, the anterior not more than twice as long as deep.
    c. Mouth narrow, its cleft not reaching nearly to eye; lower jaw shorter than upper, obtuse at tip. nuchalis, 340.
    cc. Mouth wide, its cleft about reaching eye; jaws subequal, the lower acutish at tip. argyritis, 341.
  bb. Suborbitals narrow, the anterior about 3 times as long as deep; mouth rather small. hayi, 342.

**Algansea australis*, (Jordan). Head 4; depth 4¼. D. 8; A. 7. Scales 10–56–8. Teeth 4–4. Body rather elongate, formed as in *Campostoma anomalum*, somewhat compressed, the back somewhat elevated and rounded anteriorly. Head rather large, slightly depressed above. Mouth moderate, low; the lower jaw slightly included; the premaxillary below the level of the eye; maxillary just reaching the front of the eye. Lower jaw thin-edged, with a slight symphyseal knob. Eye small, 6 in head. Scales small. Lateral line complete, decurved. Dorsal slightly behind ventrals. Dusky bluish above; everywhere with dark points; a black spot at base of caudal. Length 7 inches. Lake Tupataro, Guanajuato, Mexico, a tributary of Rio Lerma, west of the Sierra Madre. Doubtless the adult of *Algansea sallæi*.

DIONDA (a coined name):

aa. Teeth comparatively short, distinctly hooked; suborbitals moderate; plumbeous species, usually with dark lateral band, the adult less than 3 inches long.
- *d.* Scales in lateral line 32 to 43.
  - *e.* Body rather slender, the depth 4 to 4½ in length.
    - *f.* Scales large, 32 to 34 in lateral line. SERENA, 343.
    - *ff.* Scales smaller, usually 37 to 40 in the lateral line.
      - *g.* Sides with a dark lateral band, ending in a more or less distinct dark spot at base of caudal.
        - *h.* Cleft of mouth about 5 in head; snout bluntish. EPISCOPA, 344.
        - *hh.* Cleft of mouth about 4 in head, the snout more acute. NUBILA, 345.
      - *gg.* Sides without distinct dark lateral band or caudal spot; body elliptical in outline; eye 3⅓ in head, rather longer than snout. AMARA, 346.
  - *ee.* Body rather stout, the depth 3½ to 3¾ in length; scales about 37; sides with dusky band and caudal spot. MELANOPS, 347.
- *dd.* Scales in lateral line 50 to 60; body rather slender, the depth 4⅓ in length. PLUMBEA, 348.

Subgenus HYBOGNATHUS.

340. HYBOGNATHUS NUCHALIS, Agassiz.

(SILVERY MINNOW.)

Head 4½ to 5; depth 4⅓; eye 4. D. 8; A. 7. Teeth 4–4; scales 5–38–4. Body elongate, comparatively slender. Head moderate, rather short, the profile evenly curved; suborbitals broad, the anterior about twice as long as deep. Eye moderate, rather longer than muzzle. Upper jaw heavy; lower jaw thin. Scales large and silvery. Lateral line decurved; 12 to 14 large scales in front of dorsal. Intestines very long, 7 to 10 times length of body. Olivaceous green above, translucent in life; sides clear silvery, with bright reflections; fins unspotted, coloration becoming dusky in specimens living in dark waters. Length 4 to 7 inches. A graceful minnow, abundant in clear streams from the Delaware and Neuse to the Upper Missouri and southward to Georgia and Texas; common in or near large rivers. Variable; tangible varieties are: subspecies *placita*, (Girard), from the Arkansas and Missouri rivers, the eye smaller, 5 in head; the snout depressed and blunt, with very small mouth; subspecies *regia*, (Girard), Potomac River, more than 6 inches long (western forms are usually less), with deeper body and larger eye, 3¾ in head; the form called *osmerinus*, from Delaware River, is not evidently different from *nuchalis*, which is the common form of the Missouri Valley. (*nuchalis*, pertaining to the nape.)

Hybognathus nuchalis, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 224, Quincy, Illinois. (Coll. Dr. Watson.) GÜNTHER, Cat., VII, 184, 1868; JORDAN & GILBERT, Synopsis, 156, 1883.

Hybognathus placitus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 182, sluices of the Arkansas River, Fort Makee, Arkansas. (Type, No. 87. Coll. Dr. Suckley.)

Hybognathus evansi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 182, Fort Pierre, Nebraska. (Coll. Dr. Evans.)

Hybognathus regius, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 209, Potomac River. (Coll. Girard.) GÜNTHER, Cat., VII, 185, 1868.

Hybognathus osmerinus, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 466, Raritan River, New Jersey. (Coll. C. C. Abbott.)

341. HYBOGNATHUS ARGYRITIS, Girard.

Mouth wider than in *H. nuchalis*, its cleft reaching to opposite front of eye; jaws subequal, the lower acutish at tip; suborbitals broad, the anterior about twice as long as deep. Silvery. Length 4 inches. Very close to *H. nuchalis* into which it may intergrade. Upper Missouri region and Red River of the North. (*argyritis*, *ἀργυρῖτις*, silvery.)

Hybognathus argyritis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 182, Milk River.

342. HYBOGNATHUS HAYI, Jordan.

Head $4\frac{2}{5}$; depth $4\frac{3}{7}$; eye $3\frac{2}{3}$; snout $4\frac{1}{3}$. D. 8; A. 8; scales 5–36–3; teeth 4–4. Body rather slenderer than in *H. nuchalis*, the profile more rapidly declined. Head small and low; snout short, less obtuse than in *nuchalis*; eye large; maxillary $5\frac{1}{2}$ in head, not quite reaching eye; suborbital bones very narrow, the anterior 3 times as long as deep. Scales and fins essentially as in *H. nuchalis*; color the same; intestine shorter, $4\frac{1}{2}$ to $7\frac{1}{2}$ times body. Length 4 inches. Lower Mississippi and neighboring rivers, known from Pearl River, from Memphis, Tennessee, and from streams in Mississippi. Perhaps a variety of *H. nuchalis*. (Named for Dr. Oliver P. Hay, discoverer of the species.)

Hybognathus argyritis, HAY, Bull. U. S. Fish Comm., II, 1882, 68, not of GIRARD; JORDAN & GILBERT, Synopsis, 968, 1883.

Hybognathus hayi, JORDAN, Proc. U. S. Nat. Mus., 1884, 548, Pearl River, Jackson, Mississippi. (Type, No. 32306. Coll. Hay.)

Subgenus DIONDA, Girard.

343. HYBOGNATHUS SERENA (Girard).

Head $4\frac{2}{3}$; depth $4\frac{1}{2}$; eye $3\frac{1}{3}$. D. 8; A. 8; scales 5–32 to 34–3. Eye large, a little less than interorbital width. Ventral fin nearly reaching vent. Color dusky, with a black lateral band; fins plain. Length $2\frac{1}{2}$ inches. Rivers of Western Texas; with the next, from which it may be known by the larger scales. (*serenus*, serene.)

Dionda serena, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 177, Sabinal River, Texas. (Type, No. 43. Coll. Kennerly.)

Dionda papalis, GIRARD, Proc. Ac. Nat Sci. Phila., 1856, 178, Delaware Creek, a tributary of Pecos River, Texas. (Coll. Capt. Pope.)

Dionda chrysitis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 178, Live Oak Creek, a tributary of Pecos River. (Coll. Clark.)

Hybognathus nigrotæniata, COPE, Bull. U. S. Nat. Mus., XVII, 37, 1881, Wallace Creek, a tributary of Medina River, Texas; JORDAN & GILBERT, Synopsis, 156, 1883.

344. HYBOGNATHUS EPISCOPA (Girard).

Head $4\frac{1}{2}$; depth $4\frac{1}{3}$ to $4\frac{1}{2}$; eye large, $2\frac{2}{3}$ to $3\frac{1}{2}$. D. 8; A. 8; scales 9-37 to 41-4. Slender, fusiform in profile, and compressed, with the back slightly arched. Head large, the snout decurved to the small, terminal mouth, the maxillary reaching about half way to the eye. Dusky above, a blackish band along the sides, ending in a dusky blotch at base of caudal; fins yellowish, unmarked; scales with fine black dots. Length 3 inches. Rivers of Western Texas and Northeastern Mexico from Rio Comal to Rio

Grande; abundant. (*ἐπισκόπος*, bishop or pope, a remote allusion to Captain, afterwards General, John Pope, in charge of the party by which the species was collected.)

Dionda episcopa, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 177, headwaters of Pecos River, and Comanche Spring, tributary to Rio Grande. (Type, No. 45. Coll. Capt. Pope.)
Dionda texensis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 177, Nueces River, Texas. (Type, No. 44. Coll. Clark.)
?*Dionda argentosa*[1], GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 178, San Felipe Creek and Devil River, tributaries of the Rio Grande, in Texas. (Type, No. 32. Coll. Clark.)
Hybognathus flavipinnis, COPE, Bull. U. S. Nat. Mus., XVII, 36, 1880, Johnson's Fork of Llano River, in Kimble County, Texas; JORDAN & GILBERT, Synopsis, 156, 1883.
? *Hybognathus* (*Dionda*) *punctifer*[2], GARMAN, Bull. Mus. Comp. Zoöl., VIII, 89, 1881, Parras, and spring near Saltillo, Coahuila, Mexico; JORDAN & GILBERT, Synopsis, 884, 1883.
Hybognathus civilis[3], COPE, Trans. Amer. Philo. Soc., 1884, 167, Monterey, New Leon.
Hybognathus episcopus, JORDAN & GILBERT, Synopsis, 156, 1883.
Dionda punctifer and *episcopa*, EVERMANN & KENDALL, Bull. U. S. Fish Comm., XII, 1892, 99.

345. HYBOGNATHUS NUBILA (Forbes).

Head $4\frac{1}{2}$; depth 4; eye 3. D. 8; A. 9; scales 5-37-3; teeth 4-4, little hooked. Head narrow; mouth inferior and horizontal. Lateral line anteriorly deflexed. Eye large, rather longer than muzzle. 14 scales before dorsal. Color very dark; a dark lateral band from muzzle to base of caudal; fins all plain. Length $2\frac{1}{4}$ inches. Western Illinois, west to Wyoming, and southwest to the Ozark region, abundant. Close to *H. episcopa*, but differing in the more pointed snout and larger mouth, the cleft 4 in head, not 5 as in *H. episcopa.* (*nubilus*, dusky.)

Alburnops nubilus, FORBES, Bull. Ill. Lab. Nat. Hist., II, 56, 1878, Rock River, Ogle County, Illinois. (Type, No. 28410. Coll. Forbes.)
Cliola nubila, JORDAN & GILBERT, Synopsis, 167, 1883.

346. HYBOGNATHUS AMARA (Girard).

Head 4; depth 4; eye $3\frac{1}{3}$. Dorsal 8; A. 7; lateral line 35 to 38; teeth 4-4. Body elliptical, rather chubby. Head short and blunt; front convex. Suborbital bones rather narrow. Eye moderate, about as long as snout. Scales moderate, 16 in front of the dorsal. Silvery; no dark lateral band, nor caudal spot. Rio Grande. Possibly the young of *H. nuchalis* or some similar species; perhaps identical with *H. argentosa.* (*amarus*, bitter, the type being found in brackish water.)

Algoma amara, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 180, Lagoon near Fort Brown, Texas. (Type, No. 149. Coll. Clark.)
Algoma fluviatilis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 181, near Monterey, New Leon; GIRARD, U. S. & Mex. Bound. Surv., Zoöl., 45, pl. XXVII, figs. 17-20, 1859. (Coll. Couch.)
Hybognathus fluviatilis, JORDAN & GILBERT, Synopsis, 157. In Girard's figure, *fluviatilis* has smaller scales than *amara*, about 40 in lateral line, but the plates of the Mexican Boundary Survey are very untrustworthy.
Hybognathus amarus, JORDAN & GILBERT, Synopsis, 156, 1883.

---

[1] One of the types of *D. argentosa*, recently examined, gives: Head $3\frac{1}{5}$; depth $3\frac{3}{4}$; eye $3\frac{2}{3}$, and is heavier and stouter than typical *episcopa*; the dorsal is less anterior. Possibly a distinct species.

[2] *Hybognathus punctifer*, GARMAN, from Laguna del Muerte, Coahuila is not evidently different. Scales 5-40-3. Head 4; depth 4; the form stouter than in *H. episcopa.*

[3] *Hybognathus civilis*, COPE, from Monterey, New Leon, is also not appreciably different. Lateral stripe faint or obsolete; depth of body equal to length of head, $5\frac{1}{4}$ in total with caudal; eye $3\frac{2}{3}$ in head; pectorals not reaching ventrals.

All these last (*argentosa*, *punctifer*, *civilis*) may belong to a distinct species, (*Hybognathus argentosa*), allied to *H. episcopa*, but stouter, with smaller eye, and the lateral band faint or obsolete, the "sides silvery as if painted with quicksilver."

347. HYBOGNATHUS MELANOPS (Girard).

Head 4 to 4¼; depth 3½ to 3¾. D. 8; A. 7; scales 7–36 to 38–4; teeth 4-4. Body deeper than in related species; snout rounded; eye medium. Blackish above, sides smoky, with black dots; a black spot at base of caudal. Length 2½ inches. Streams of Coahuila, Chihuahua, and Nuevo Leon. Two specimens collected by Mr. Woolman in Chihuahua River agree with *H. episcopa* in all respects except that the depth is 3¾ and the scales 42 or 43. It is doubtful whether the two species are really distinct. (*μέλας*, black; *ὤψ*, eye.)

Dionda melanops, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 178, Buena Vista, Coahuila. (Type, No. 41. Coll. Couch.)

Dionda couchi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 178, Guajuco, Monterey, and Cadereita, New Leon. (Type, No. 103, (20227). Coll. Möllhausen.)

Hybognathus melanops, JORDAN, Bull. U. S. Geol. Surv., IV, No. 2, 402, 1878.

348. HYBOGNATHUS PLUMBEA* (Girard).

Head 4⅓; depth 4⅓. D. 8; A. 7; lateral line 53 to 58. Body rather slender. Head moderate, rounded in front. Lower jaw included. Dorsal inserted before ventrals. Color uniform, sometimes a black spot at the base of the caudal. Tributaries of Arkansas River in Indian Territory. (Girard.) (*plumbeus*, lead-colored.)

Dionda plumbea, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 178, Canadian River. (Coll. Möllhausen.

Dionda spadicea, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 178, Fort Smith, Arkansas. (Coll. Möllhausen.)

Dionda grisea, GIRARD, Pacific R. R. Surv., X, 230, pl. LII, figs. 6–10, 1858, 20 miles west of Choctaw Agency. (Coll. Möllhausen.)

Zophendum plumbeum, JORDAN & GILBERT, Synopsis, 155, 1883.

108. PIMEPHALES, Rafinesque.

(FAT-HEADS.)

Pimephales, RAFINESQUE, Ichth. Oh., 52, 1820, (*promelas*).

Hyborhynchus, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 22, (*notatus*).

Coliscus, COPE, Hayden's Rept. Geol. Surv. of Wyoming, 1872, 437, (*parietalis* = young of *promelas*).

Body rather robust, little compressed. Head short and rounded. Mouth small, inferior; upper jaw protractile; no barbel. Teeth 4-4, with oblique grinding surface, usually but one of the teeth hooked. Dorsal over ventrals, its first (rudimentary) ray separated from the rest by membrane, not adnate to it, as usual in minnows; this character is most distinct in adult males, in which the skin of the first ray is thickened. Anal basis short. Intestinal canal elongate. Peritoneum black. Pseudobranchiæ present. Scales rather small. Lateral line complete or variously incomplete. Size small. Breeding males with much black pigment and with large warts on the head. (*πιμελής*, fat; *κεφαλή*, head.)

a. Lateral line more or less incomplete; body very short and stout. PROMELAS, 349.
aa. Lateral line complete; body moderately elongate. NOTATUS, 350.

---

*The nominal species here united as *Hybognathus plumbea* are all unknown to us. Girard figures all of them as having small scales, some 53 to 58 in the lateral line. In general appearance these figures seem to agree, and except for the scales, they seem to be close to the other species called *Dionda*. It is possible that their relations are with *Algansea* rather than *Dionda*. It may also be that the scales are erroneously figured by Girard.

349. PIMEPHALES PROMELAS, Rafinesque.

(FAT-HEAD; BLACK-HEAD MINNOW.)

Head 4; depth 4; D. I, 7; A. 7; scales 7–43 to 47–6; teeth 4–4. Body very short and deep. Head short, everywhere convex, almost gobular in adult males. Mouth small, inferior, horizontal. Scales deep, closely imbricated. Lateral line extremely variable, sometimes nearly complete (*confertus*), sometimes almost wanting,(typical *promelas*). Olivaceous, the dorsal with a large black bar across it, nearly half way up, most distinct anteriorly, appearing as a simple dusky shade in the young. Male fish dusky, the head jet-black, with several large tubercles on the snout in spring; a dusky shade along sides of caudal peduncle. Length 2½ inches. Lake Champlain to Kentucky, Dakota, and the Rio Grande; abundant in sluggish brooks, especially in the Missouri Basin. Varies greatly with age, sex, and season. (πρό, before; μέλας, black.)

Pimephales promelas, RAFINESQUE, Ichth. Oh., 53, 1820, pond near Lexington, Kentucky; (Coll. Wm. M. Clifford); GÜNTHER, Cat., VII, 181, 1868; JORDAN & GILBERT, Synopsis, 158, 1883.

Pimephales fasciatus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 180, Yellowstone River. (Coll. Hayden.)

Plargyrus melanocephalus, ABBOTT, Proc. Ac. Nat. Sci. Phila., 1860, 325, Lake Whittlesey, Minnesota. (Type, No. 3374. Coll. Abbott.)

Pimephales milesi,* COPE, Proc. Ac. Nat. Sci. Phila., 1864, 282, Grosse Isle, Detroit River, Michigan. (Coll. Miles.) GÜNTHER, Cat., VII, 181, 1868.

Pimephales agassizii, COPE, Cypr. Penn.,. 394, 1866, Miami River, tributary near Richmond, Indiana.

Coliscus parietalis, COPE, Hayden's Report for 1870, Geolog. Surv. of Wyoming, 437, 1871, Saint Joseph, Missouri. (Coll. Hayden.) JORDAN & GILBERT, Synopsis, 158, 1883.

Represented in Arkansas and Indian Territory by the closely related

349a. PIMEPHALES PROMELAS MACULOSUS (Girard).

Differs only in having the lateral line better developed; the pores wanting on less than half the scales. Coloration, so far as known, as in *P. promelas*. Arkansas River, locally abundant, probably in other streams from Kansas to Texas. (*maculosus*, spotted.)

Pimephales maculosus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 180, Sluices of Arkansas River, Fort Makee, Arkansas; (Type, No. 153, (2729). Coll. Beckwith.) GIRARD, Pac. R. R. Surv., x, 234, 1858.

Hyborhynchus nigellus, COPE, Zoöl. Wheeler Surv., v, 671, 1875, (1876), Arkansas River, Pueblo, Colorado. (Type, Nos. 15793 and 15784. Coll. Aiken.)

Hyborhynchus confertus, JORDAN & GILBERT, in part, Synopsis, 159, 1883.

Represented in the Rio Grande basin by

349b. PIMEPHALES PROMELAS CONFERTUS (Girard).

Similar to the variety *maculosus*, but more chubby, and the male apparently differently colored. An adult male from the Chihuahua River, collected by Mr. Woolman, is black, with two broad white cross bands, the one across the gill opening, including edge of opercle and shoulder girdle; the other under front of dorsal. Another band, less distinct, across base of caudal; pectoral fins white, except the black outer edge, which is followed by a narrow, sharply-defined streak of bright silvery; other fins white, the middle portions black; head all black. Lateral line complete. (*confertus*, compact.)

---

* *Pimephales milesi* may be a tangible variety; the scales are said to be 40, with only 3 series between the lateral line and the ventrals, while there are usually 5 to 7 in *P. promelas*.

Hyborhynchus confertus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 179, (♀), **Hurrah Creek, a tributary of Pecos River, Texas.** (Coll. Möllhausen.) JORDAN & GILBERT, in part, Synopsis, 159, 1883.

350. PIMEPHALES NOTATUS* (Rafinesque).

(BLUNT-NOSED MINNOW.)

Head $4\frac{1}{2}$; depth 5; D. I, 8; A. 7; scales 6–45–4; teeth 4–4. Body rather elongate, not elevated, moderately compressed. Head moderate; the muzzle blunt and convex; top of the head depressed. Cheeks vertical. Mouth small, inferior, horizontal. Fins small; the dorsal moderate, the first ray distinct and spine-like in the male, slender in the female; anal small, caudal fin short. Scales moderate, deep, closely imbricated; scales in front of dorsal small and crowded, in 23 rows. Eye moderate. Color olivaceous, little silvery; sides bluish; a black spot on the dorsal fin in front, near the base, less distinct than in *Cliola vigilax*; a dusky shade at base of caudal; fins often reddish; males in spring with the black on the dorsal more extended and the head wholly black; snout with about 14 disproportionately large tubercles. Length 4 inches. Quebec to Delaware, Kentucky, Alabama, Arkansas, and northward to the Dakotas; generally very abundant in small streams west of the Alleghanies. (*notatus*, noted or spotted.)

Minnilus notatus, RAFINESQUE, Ichth. Oh., 47, 1820, **Ohio River.**

Catostomus melanotus, RAFINESQUE, Ichth. Oh., 58, 1820, **Ohio River.**

Hyborhynchus perspicuus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 185, **Arkansas River, Fort Smith.** (Type, No. 144. Coll. Shumard.)

Hyborhynchus tenellus, GIRARD, *l. c.*, 179, **Choctaw Agency.** (Coll. Möllhausen.)

Hyborhynchus puniceus, GIRARD, *l. c.*, 179, **Antelope Creek, Canadian River.** (Coll. Kennerly.)

Hybopsis hæmaturus, COPE, Cypr. Penn., 382, 1866, **St. Joseph River, Michigan; Michigan City, Indiana.**

Hyborhynchus superciliosus, COPE, Journ. Ac. Nat. Sci. Phila., 1868, 234; **Kanawha River.** (Breeding males with the lips thickened). (Type, No. 20532. Coll. Cope.) JORDAN & GILBERT, Synopsis, 160, 1883.

Hyborhynchus notatus, GÜNTHER, Cat., VII, 182, 1868; JORDAN & GILBERT, Synopsis, 159, 1883.

Hybognathus perspicuus, GÜNTHER, Cat., VII, 185, 1868.

Leuciscus hæmaturus, GÜNTHER, Cat., VII, 259, 1868.

Cliola hæmatura, JORDAN & GILBERT, Synopsis, 166, 1883.

109. MYLOPHARODON, Ayres. V

Mylopharodon, AYRES, Proc. Cal. Ac. Nat. Sci., 1855, 33, (*robustus*).

Body elongate; head large, pike-like, the upper jaw not protractile; no barbel. Teeth 2, 4–5, 2; 2 or 3 of the teeth in the main row molar,

---

*The following nominal species is probably the young of *Pimephales notatus: Hybopsis hæmaturus*, COPE. Head 4; depth $4\frac{4}{5}$; eye $3\frac{1}{2}$. D. 8; A. 7; scales 7–44–4; teeth 4–4, little hooked. Head moderate, the muzzle little obtuse. Mouth moderate, terminal, oblique, the maxillary reaching orbit; temporal region rounded. Scales rather small, 21 rows in front of dorsal. Lateral line slightly decurved. Plumbeous above; head blackish; a faint dusky lateral band, ending in a dusky spot at root of caudal fin; caudal fin dull red; fins otherwise plain. Length 3 inches. Streams about the head of Lake Michigan. Said to be abundant. (Cope.) (ἅιμα, blood; οὐρά, tail.)

truncate or bluntly rounded at the apex, much enlarged. Mouth terminal, rather large, with thickened lips. Scales rather small; lateral line continuous. Dorsal fin inserted behind the ventrals. Anal basis short. Size very large. Pacific slope. This genus resembles *Mylocheilus*, from which it differs in the nonprotractility of the upper jaw. Both represent a comparatively primitive type of *Cyprinidæ*, allied to Asiatic forms. (Shortened from *Mylopharyngodon*—*μύλος*, grinder; *φάρυγξ*, pharynx; *ὀδούς*, tooth.)

351. MYLOPHARODON CONOCEPHALUS (Baird & Girard).

Head 3½; depth 4⅔; eye 7. D. 8; A. 8; scales 17–74–7. Body elongate, subfusiform, compressed. Head broad and depressed, the snout tapering. Mouth horizontal, the jaws about equal, the maxillary extending to eye. Eye small, 2½ in snout; preorbital elongate. Interorbital space as long as maxillary, 3 in head. Scales rather small, loosely imbricated. Dorsal fin a little behind ventrals. Caudal fin 1½ in head, the lower lobe very long, longer than upper; caudal peduncle very long, 4½ in length. Color dark, paler below, no red. Length 2 to 3 feet. Sacramento and San Joaquin rivers; not very common; next to the species of *Ptychocheilus*, the largest of our *Cyprinidæ*. (*κῶνος*, cone; *κεφαλή*, head.)

Gila conocephala, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1854, 134, San Joaquin River. (Coll. Heermann.)

Mylopharodon robustus, Ayres, Proc. Cal. Ac. Nat. Sci., 1855, 33, San Francisco. (Coll. Ayres.)

Mylopharodon conocephalus and *robustus*, Girard, Pac. R. R. Surv., x, 216, 1858.

Mylopharodon conocephalus, Günther, Cat., vii, 262; Jordan & Gilbert, Synopsis, 225, 1883.

110. MYLOCHEILUS, Agassiz.

Mylocheilus, Agassiz, Amer. Journ. Sci. Arts., 1855, 229, (*lateralis*).

Body elongate, not elevated, little compressed. Head rather short, conic, somewhat pointed. Mouth rather small, little oblique, the lower jaw included; maxillary with a small barbel at its end; upper jaw protractile. Scales moderate, not closely imbricated. Lateral line decurved. Dorsal fin beginning nearly opposite ventrals. Caudal fin with the rudimentary rays little developed. Anal basis short. Intestinal canal about as long as body. Teeth 2, 5–5, 2, or 2, 5–4, 2, those in the main row hooked in the young; 2 or 3 of these becoming molar with age, much enlarged, blunt and truncate above. (A third deciduous row sometimes present, according to Girard, in this genus and in *Mylopharodon*; we have seen nothing of the kind.) Size large. Pacific Slope. (*μύλος*, grinder; *χεῖλος*, lip.)

352. MYLOCHEILUS CAURINUS (Richardson).

(Columbia Chub.)

Head 4⅖; depth 4½; eye 5; snout 3½. D. 8; A. 8; scales 12–77–7; teeth 1, or 2, 5–5, 2 or 1. Interorbital space broad, convex. Mouth horizontal or nearly so, the maxillary not reaching the front of the eye; suborbital bones wide; preorbital elongate. Teeth hooked in the young, some of them becoming stump-like with age. Color dark above; sides silvery, a dark lateral band; below this a pale stripe, under which is a dark stripe, which extends about to the vent; fins plain; belly and pale stripe red in spring males. Length 12 inches. Streams of Oregon and Washington, from Frazer River, southward, ascending Clark's Fork of the Columbia as far as Flathead Lake, (Evermann), and Snake River to Shoshone Falls, (Gilbert & Evermann); often entering the sea; abundant northward; frequents the spawning beds of the salmon where it devours their eggs. Specimens from Nanaimo sent us by Mr. Ashdown H. Green, who says that this is the only *Cyprinoid* found in Vancouver Island. (*caurus*, the northwest wind, hence *caurinus*, north western.)

Cyprinus (*Leuciscus*) *caurinus*, RICHARDSON, Fauna Boreali Amer., III, 304, 1836, Columbia River at Fort Vancouver.

Mylocheilus fraterculus,[*] GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 158, said to be from Monterey, California, probably erroneously. (Type, No. 211 (2768). Coll. Trowbridge.)

Mylocheilus lateralis, AGASSIZ & PICKERING, Amer. Journ. Sci. Arts, 1855, 299, Columbia River at Fort Vancouver. (Type, No. 212. Coll. Suckley.)

Leucosomus caurinus, GÜNTHER, Cat., VII, 270, 1868.

Mylocheilus caurinus, JORDAN & GILBERT, Synopsis, 224, 1883; EVERMANN, Bull. U. S. Fish Comm., XI, 1891, 43, pl. 19, fig. 2.

111. STYPODON, Garman.

Stypodon, GARMAN, Bull. Mus. Comp. Zoöl., VIII, 90, 1881, (*signifer*).

Body oblong, compressed, covered with large, deciduous scales. Lateral line complete, decurved. Dorsal and anal fins short. Mouth small, anterior; premaxillaries protractile; fold of lower lip not crossing the symphysis; lower jaw trenchant, without horny covering; no barbels. Gill rakers short. Pharyngeals strong. Teeth 3-3, of the *Mylocheilus* type, more or less cylindrical, with rounded grinding surfaces; posterior, more slender and subconical. (*στύπος*, stump; *ὀδούς*, tooth.)

353. STYPODON SIGNIFER, Garman.

Head 3⅔; depth 3⅔. D. 8; A. 8. Scales 6–35–2. "Teeth 3-3, stout, stump-like, with convex summits." Dorsal and ventral outlines similar; eye large, longer than snout. Mouth oblique, the maxillary not reaching front of eye; lower jaw the longer. Pectorals not reaching ventrals, the latter to anal. Brown; silvery below; a broad, brown lateral band, bordered above by a narrow silvery line. Lago de Parras, an isolated lagoon in Coahuila, Mexico. (Garman.) A singular fish of uncertain relations, known only from the original type. (*signum*, sign; *fero*, I bear.)

Stypodon signifer, GARMAN, Bull. Mus. Comp. Zoöl., VIII, 90, 1881, Lago de Parras, Coahuila, Mexico; JORDAN & GILBERT, Synopsis, 224, 1883.

112. SEMOTILUS, Rafinesque.

(FALL-FISHES.)

Semotilus, RAFINESQUE, Ichth. Oh., 49, 1820, (*dorsalis* = *atromaculatus*).

Leucosomus, HECKEL, Russeggers Reisen, I, 1843, 1042, ("*chrysoleucus*" = *corporalis*).

Cheilonemus, BAIRD, in Storer's Hist. Fishes Mass., 285, 1855, (*pulchellus* = *corporalis*).

Body robust; head large; mouth terminal, wide, the upper jaw protractile; a small barbel on the maxillary just above its extremity, not at its tip as in most other American minnows. (In young examples the barbel can not always be found.) Intestinal canal short; teeth 2, 5–4, 2, hooked, without grinding surface. Scales moderate. Lateral line continuous. Dorsal more or less posterior to ventrals. Anal basis short. Vertebræ 22+20=42. Species of large size, the largest of the chubs found in Eastern America, differing from *Leuciscus* in the presence of a maxillary barbel. (*σῆμα*, banner, i. e., dorsal fin; the second part of the word was elsewhere used by Rafinesque to mean "spotted.")

---

[*] *Mylocheilus fraterculus*, GIRARD. According to Girard's description and figure this species is slenderer than *Mylocheilus caurinus*, with shorter head and smaller scales. Head 4⅕ in length; scales in lateral line about 85. D. 8; A. 9. Monterey, California, (Girard). No recent collector has found any *Mylocheilus* in California and this locality needs confirmation. (*fraterculus*, a little brother.)

LEUCOSOMUS: (λευκός, white; σῶμα, body):
- *a.* Origin of dorsal midway between nostril and base of caudal, between 13th and 14th vertebræ; scales not much crowded anteriorly.
  - *b.* Dorsal without black spot; scales large, silvery, about 45 in lateral line. CORPORALIS, 354.

SEMOTILUS:
- *aa.* Origin of dorsal midway between middle of orbit and base of caudal, between 15th and 16th vertebræ. Scales crowded anteriorly.
  - *c.* Dorsal with a black spot at base of its anterior rays; scales smaller, little silvery, 45 to 65 in lateral line. ATROMACULATUS, 355.

Subgenus LEUCOSOMUS, Heckel.

354. SEMOTILUS CORPORALIS (Mitchill).

(FALL-FISH; SILVER CHUB; WIND-FISH; CORPORAL.)

Head 4; depth 4; eye 4½. D. 8; A. 8; scales 8–45–4; teeth 2, 5–4, 2. Body oblong, robust, little compressed. Head large, convex, the snout bluntly conic; mouth large, terminal, somewhat oblique, the lower jaw included; premaxillary below the level of the eye, the maxillary barely reaching front of orbit. Eye moderate, rather high up and anterior. Barbel shorter than pupil, not evident in young specimens. Scales large, 22 in front of dorsal, not much crowded anteriorly. Dorsal fin slightly behind middle of body, just behind ventrals, inserted behind 13th vertebra. Fins moderate. Coloration brilliant; steel-blue above; sides and belly silvery; males in spring with the belly and lower fins rosy or crimson; no spots on the fins. Length 18 inches. Abundant from the St. Lawrence to the James, east of the Alleghanies, in clear, swift streams, rock pools, below cataracts, and in clear lakes; not found west of the Alleghanies. It is much the largest of the eastern *Cyprinidæ*, ranking with the western and some European forms. "The chub is a soft fish and tastes like brown paper, salted." (Thoreau.) (*corporalis*, pertaining to the body; Mitchill calls the fish *Corporal* or *Corporaalen*.)

Cyprinus corporalis,* MITCHILL, Amer. Monthly Mag., I, July, 1817, 289, preliminary notice, Wallkill River; MITCHILL, *l. c.*, ii, February, 1818, 324, detailed description.
Cyprinus bullaris, RAFINESQUE, Amer. Monthly Mag., I, December, 1817, 120, Hudson River and Wood Creek.
Leuciscus argenteus, STORER, Fishes Mass., 90, 1839, Worcester County, Mass.
Leuciscus pulchellus, STORER, Fishes Mass., 90, 1839, Walpole, Mass.
Leuciscus nitidus, DEKAY, N. Y. Fauna: Fishes, 209, 1842, Lake Champlain.
Leuciscus chrysopterus, DEKAY, N. Y. Fauna: Fishes, 211, 1842, N. Y. Harbor.
Leuciscus rotengulus, CUVIER & VALENCIENNES, XVII, 318, 1844, Carolina.
Leuciscus pulchellus, STORER, Synopsis, 412, 1845, Massachusetts.
Leucosomus cataractus,† BAIRD in Iconog. Encycl., II, 216, and in COPE, Proc. Ac. Nat. Sci. Phila., 1861, 523, Susquehanna River.

---

* As to the priority of the names of Mitchill and Rafinesque, see note under *Notropis cornutus*. This species is evidently Mitchill's *Cyprinus corporalis*, and the transfer of the name *Semotilus corporalis* to the next species by Abbott, Putnam, and Cope, has been an unfortunate and confusing error.

† According to Cope, the nominal species, *cataractus* and *rhotheus*, differ from the northern form, *pulchellus* (or *corporalis*), in the smaller scales, these having 47 in the lateral line, while *pulchellus* in Massachusetts has 42. This difference has not been verified by later writers, who place all under one head. Günther counts 45 to 48 in specimens mostly from Maine and Canada.

Leucosomus rhotheus, COPE, Proc. Ac. Nat. Sci. Phila., 1861, 523, Brandywine Creek and Rancocos Creek, tributaries of the Delaware River.

Squalius hyalope, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 280, Conestoga River, Pa.; young.

Cheilonemus pulchellus, STORER, Fishes Mass., 286, 1867.

Leucosomus pulchellus, GÜNTHER, Cat., VII, 268, 1868.

Semotilus bullaris, JORDAN & GILBERT, Synopsis, 222, 1883.

Subgenus SEMOTILUS.

355. SEMOTILUS ATROMACULATUS (Mitchill).

(HORNED-DACE; CREEK-CHUB.)

Head 3¾; depth 4; eye about 5. D. 7; A. 8: scales 9-55-6, those in lateral line varying from 50 to 60 or even more, the number greatest in northern examples; teeth 2, 5-4, 2. Body stout, the dorsal outline arched in front of the dorsal, the body tapering backwards from a point considerably in advance of the dorsal, so that the base of that fin is oblique. Head large and heavy, broad and rounded above; snout broad; mouth broad, oblique, lower jaw slightly included, the upper lip just below level of pupil; maxillary barely reaching front of pupil; maxillary barbel small, not evident in specimens of less than 2 or 3 inches in length. Eye rather small. Scales small, considerably crowded, and reduced anteriorly; about 30 series in front of the dorsal fin. Lateral line considerably decurved. Fins small; the dorsal well behind ventrals, inserted behind fifteenth vertebra, its last ray well in advance of base of anal. Color dusky bluish above; sides with a vague, dusky band, black in the young, disappearing in the adult; belly creamy, rosy-tinted in males in spring; dorsal fin always with a conspicuous black spot at the base in front, which is bordered with red in the male; a dark vertebral line; scales everywhere edged with dark punctulations; a dusky bar behind opercle; males with snout coarsely tuberculate in spring. Young with a small black caudal spot. Length 10 inches. Maine (Freeport; Kendall Smith) and western Massachusetts (Housatonic River, Jordan), to southern Missouri, Wyoming, and Canada; everywhere abundant; chiefly in small brooks, where it is often the largest and most voracious inhabitant. (*ater*, black; *macula*, spot.)

Cyprinus atromaculatus, MITCHILL, Amer. Monthly Mag., II, 1818, 324, Wallkill River.

Semotilus dorsalis, RAFINESQUE, Ichth. Oh., 49, 1820, Kentucky River.

Semotilus cephalus, RAFINESQUE, Ichth. Oh., 49, 1820, Ohio River.

Semotilus diplemius, RAFINESQUE, Ichth. Oh., 49, 1820, Ohio River.

Leuciscus iris, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XVII, 255, 1844, New York and Carolina.

Leuciscus storeri, CUVIER & VALENCIENNES, XVII, 255, 1844, New York.

Leuciscus pulchelloides, AYRES, Proc. Bost. Soc. Nat. Hist., 1849, 157, Connecticut.

Leucosomus pallidus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 190, (lateral line 52), Antelope Creek, Arkansas. (Coll. Kennerly.)

Leucosomus incrassatus, GIRARD, *l. c.*, 1856, 190, (lateral line 64), Choctaw Agency. (Coll. Möllhausen.)

Semotilus macrocephalus, GIRARD, *l. c.*, 1856, 204, Fort Pierre, Nebraska. (Coll. Evans.)

Semotilus speciosus, GIRARD, *l. c.*, 1856, 204, Sweetwater River, Nebraska. (Coll. Bowman.)

Semotilus hammondi, ABBOTT, Proc. Ac. Nat. Sci. Phila., 1860, 474, Kansas. (Coll. Hammond.)

Semotilus corporalis, JORDAN & GILBERT, Synopsis, 221, 1883; COPE, Cyp. Penn., 363, 1866; not *Cyprinus corporalis*, MITCHILL.

Leucosomus corporalis, GÜNTHER, Cat., VII, 269, 1868.

Semotilus atromaculatus, BICKNELL & DRESSLAR, Proc. Ac. Nat. Sci. Phila., 1885, 16.

Represented south of Virginia and Tennessee by

355 a. SEMOTILUS ATROMACULATUS THOREAUIANUS (Jordan).

Head 4; depth 4. D. 8; A. 7; scales 9–46[*]–5; teeth 2, 5–4, 2. Rather stouter, with larger scales, less crowded forwards, 45 to 48 in lateral line; the head short and thick, almost round. Barbel well developed. Coloration of *S. atromaculatus*, the black dorsal spot distinct. Length 7 inches. Streams of Georgia and Alabama; the extremes quite unlike *atromaculatus*; intermediate specimens with scales 48 to 50 occurring in Cape Fear River and elsewhere. (Named for Henry David Thoreau,[†] naturalist and poet.)

Semotilus thoreauianus, JORDAN, Bull. U. S. Nat. Mus., x, 63, 1877, Flint River, Georgia. (Type, No. 9296. Coll. Hugh M. Neisler.)

113. POGONICHTHYS, Girard.

Pogonichthys, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 136, (*inæquilobus*).
Symmetrurus, JORDAN, Bull. Hayden Geol. Surv. Terr., IV, 788, 1878, (*argyreiosus*=young).

Body elongate; head small, conical; mouth moderate, terminal, normal; maxillary with a well-developed barbel at its end; premaxillaries protractile. Teeth 2, 4–5, 2, or 2, 5–5, 2, hooked, with well-marked grinding surface. Scales rather large; lateral line continuous, decurved. Dorsal fin beginning rather in advance of ventrals; anal basis short. Caudal fin with its rudimentary rays numerous and greatly developed, supported by strong apophyses of the caudal vertebræ, the upper lobe of the fin considerably longer than the lower, this character not evident in the young, appearing by degrees. Intestinal canal short; skeleton not peculiar, except in the great development of the apophyses of last caudal vertebræ. Chubs of large size, replacing on the Pacific Slope, the eastern *Semotilus*. (πώγων, beard; *ἰχθύς*, fish.)

356. POGONICHTHYS MACROLEPIDOTUS (Ayres).

(SPLIT-TAIL.)

Head $4\frac{1}{5}$; depth $3\frac{3}{4}$; eye large, $4\frac{1}{4}$ in head. D. 9; A. 8; scales 10–66–6; vertebræ 26+15; teeth 2, 5–5, 2, rarely 2, 6–5, 2. Body elongate, somewhat compressed, back a little elevated. Head short, slender. Mouth moderate, nearly horizontal, maxillary reaching orbit; lower jaw included; preorbital longer than deep. Interorbital space convex. Dorsal fin midway of body, rather in front of ventrals. Scales rather large, moderately imbricated. Lateral line decurved. Fins rather large; upper lobe of caudal half longer than head in adult, the lobes subequal in young. Coloration uniform; sides bright silvery, especially in young; no red. Length 12 inches. Lowland streams of central California; very common in the Sacramento and San Joaquin. Singularly distinguished from our other *Cyprinidæ* by the great development of the upper lobe of the caudal and its rudimentary rays. (*μακρολεπιδοτός*, large-scaled.)

---

[*] Scales 46 to 48 in the types from Flint River; 51 in specimen from Augusta, Georgia; 52 in one from Black Warrior River.

[†] "The first to say a good word for the study of Cyprinidæ." "I am the wiser in respect to all knowledge and the better qualified for all fortunes for knowing that there is a minnow in the brook. Methinks I have need even of his sympathy and to be his fellow in a degree. I would know even the number of their fin rays and how many scales compose the lateral line." (*Thoreau.*)

Leuciscus macrolepidotus, AYRES, Placer Times and Transcript, 1854, May 30, San Francisco.

Pogonichthys inæquilobus, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 136, (August), San Joaquin River, California; and GIRARD, Pac. R. R. Surv., x, 245, 1858.

Pogonichthys argyreiosus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 153, Presidio, California.

Leucosomus argyreiosus, GÜNTHER, Cat., VII, 267, 1868.

Leucosomus inæquilobus, GÜNTHER, Cat., VII, 271, 1868.

Pogonichthys macrolepidotus, JORDAN, Proc. U. S. Nat. Mus., 1880, 326; JORDAN & GILBERT, Synopsis, 223, 1883.

Symmetrurus argyreiosus, JORDAN & GILBERT, Synopsis, 222, 1883; young specimens, 4 inches long.

114. PTYCHOCHEILUS, Agassiz.

Ptychocheilus, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 229, (*gracilis*).

Body elongate, little elevated, the caudal peduncle not contracted. Head long, slender, pike-like; mouth nearly horizontal, widely cleft, the maxillary extending to below the eye, the upper lip rather below the level of the eye; lower jaw included, both anteriorly and laterally; no barbel; lips thick. Scales small, little imbricated, mostly longer than deep. Lateral line decurved. Gill rakers very short. Dorsal fin well back, somewhat behind ventrals. Anal basis short. Caudal fin strong, its rudimentary rays not greatly developed. Intestinal canal short. Teeth 2, 5–4, 2; the straight limb of the pharyngeal bone extremely long and slender, its teeth wide apart, subconical, scarcely compressed, and but slightly curved at tip, the hook being turned in the direction of the angle of the bone; no trace of grinding surface. Fishes of very large size, reaching a length of more than 4 feet, the largest of the *Leuciscine Cyprinidæ*. With a general resemblance to *Leuciscus* and *Gila*, this genus differs strongly in the form of the pharyngeal bones and teeth. In this genus, as in *Gila*, the vertebræ are more numerous than usual in *Leuciscus*, 45 or 46 instead of 42 to 45. (*πτύξ*, fold; *χεῖλος*, lip; the skin of the mouth behind the jaws being folded.)

a. Scales of the lateral line 73 to 86, those before dorsal about 55. OREGONENSIS, 357.
aa. Scales in the lateral line about 90.
  b. Head 4 in length; cleft of mouth $3\frac{2}{3}$ in head. HARFORDI, 358.
  bb. Head $3\frac{1}{2}$ in length; cleft of mouth $3\frac{3}{5}$ in head. LUCIUS, 359.

357. PTYCHOCHEILUS OREGONENSIS (Richardson).

(SQUAW-FISH; CHAPPAUL; SACRAMENTO PIKE.)

Head $3\frac{3}{4}$; depth $4\frac{2}{3}$ to 5; eye small, $7\frac{1}{2}$ in head, $2\frac{1}{2}$ in snout; snout 3. D. 10; A. 8; scales 9–73 to 86–7, 42 to 60 before the dorsal; teeth 2, 4–5, 2. Body comparatively robust, with stout caudal peduncle. Mouth large, the maxillary reaching front of pupil. Eye small, in young specimens proportionately much larger. Lateral line strongly decurved, much nearer belly than back. Coloration muddy greenish, with a few silvery scales; belly silvery; the fins, in spring, with red or orange; scales dusted with dark dots; young with black caudal spot. Length 2 to 4 feet. Rivers from Vancouver Island south to the San Joaquin; abundant in Columbia

River, Fraser River, etc.; ascending the Columbia and tributaries as far as Missoula, Montana, and the Great Shoshone Falls in the Snake, (Evermann), also everywhere in the Sacramento, San Joaquin, Salinas, and other lowland rivers of California. Common; used as food.

Cyprinus (Leuciscus) oregonensis, RICHARDSON, Fauna Bor.-Amer., III, 305, 1836, Columbia River.
Gila grandis, AYRES, Proc. Ac. Nat. Sci. Cal., 1854, 18, San Francisco.
Ptychocheilus major, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 229, San Francisco.
Ptychocheilus gracilis, AGASSIZ, Amer. Journ. Sci. Arts, 1855, 229, Willamette Falls.
Ptychocheilus oregonensis, GIRARD, Pac. R. R. Surv., 298, 1858; JORDAN & GILBERT, Synopsis, 236, 1883; EVERMANN, Bull. U. S. Fish Comm., XI, 1891, 43, pl. 19, fig. 3.
Ptychocheilus rapax, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 209, Monterey, California. (Coll. Trowbridge.) Large specimens with deep body (depth 4⅔) and scales before dorsal crowded, 49 in number GIRARD, Pac. R. R. Surv., X, 300, 1858; JORDAN & GILBERT, Synopsis, 226, 1883.
Leuciscus oregonensis, GÜNTHER, Cat., VII, 239, 1868.
Ptychocheilus grandis, GIRARD, Pac. R. R. Surv., X, 300, 1858.
Leuciscus grandis, GÜNTHER, Cat., VII, 239, 1868; in part; perhaps mixed with *P. harfordi.*

358. PTYCHOCHEILUS HARFORDI, Jordan & Gilbert.

Head 4; depth 5¾. D. 8; A. 7; scales 17–90 to 95–9; teeth 2, 5–4, 2. Form of *P. oregonensis*, but more slender, the lateral line similarly much decurved, but scales smaller. Caudal less deeply forked; pectoral longer, reaching ⅗ distance to ventrals. Maxillary 2⅔ in head, reaching just past front of eye. Length 18 inches or more. Lower Sacramento River, with *P. oregonensis*, but much less common in the markets; possibly only the extreme variation of that species. (Named for W. G. W. Harford, curator of the museum of the California Academy of Sciences, now of the University of California.)

Ptychochilus harfordi, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 72, Sacramento River. (Type, No. 27246. Coll. Jordan & Gilbert.) JORDAN & GILBERT, Synopsis, 226, 1883.

359. PTYCHOCHEILUS LUCIUS, Girard.

("WHITE SALMON" OF THE COLORADO.)

Head 3½; depth 5½; eye small, 2¼ in snout, 7 in head. D. 9; A. 9; lateral line 83 to 87; teeth 2, 4–5, 2. Vertebræ 45 or 46. Body slender, elongate, with long, slender, depressed head; the form and general appearance being that of *P. oregonensis*. Maxillary reaching past anterior margin of the eye, 2⅗ in head. Lateral line very strongly decurved. Fins moderate. Scales very small. Coloration plain, darker above, the young always with a black caudal spot and with a faint pale lateral band below a darker one. Length 5 feet. Colorado basin, very abundant in the river channels as far north as the base of the Rocky Mountains in Colorado. (Uncompahgre River at Delta.) The largest of the American *Cyprinidæ*, reaching a weight of 80 pounds, and having considerable value as a food-fish. Known locally as "*Salmon.*" (*lucius*, pike.)

Ptychocheilus lucius, GIRARD, Proc. Ac. Nat. Sci. Phil., 1856, 209, Rio Colorado. (Coll. A. Schott.) Mex. Bound. Surv., Ichth., 65, 1859; JORDAN & GILBERT, Synopsis, 227, 1883.

115. GILA,* Baird & Girard.

Gila, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 368, (*robusta*).

Body elongate, little compressed, the back arched, especially in the adult; the caudal peduncle typically extremely long, slender, contracted, much narrower than the base of the caudal fin, which is widely forked, with its basal fulcra very much developed. Head in typical species broad, depressed, its profile concave. Mouth large, horizontal, and overlapped by the broad snout. Dorsal fin behind the middle of the body, slightly behind ventrals. Anal basis short. Intestinal canal short. Scales very small, little imbricated, sometimes scarcely imbricate at all, longer than deep, especially posteriorly. No barbel. Pseudobranchiæ present. Teeth 2, 5-4, 2, close set, compressed and hooked, without grinding surface. Vertebræ 42 to 46. Peritoneum dusky. Species of large size, the typical form remarkably unlike the usual Cyprinoid type, but varying through a series of intermediate forms directly into *Leuciscus*, so that the genus has no very satisfactory technical character. (*Gila*, the name of the river where the typical species was first obtained.)

a. Belly more or less fully scaled.
  b. Caudal peduncle very slender, its least depth 1⅔ in maxillary; scales of back and belly much reduced. ELEGANS, 360.
  bb. Caudal peduncle not very slender, its least depth 1¼ in maxillary; scales of back and belly moderately reduced. ROBUSTA, 361.
aa. Belly naked; caudal peduncle slender; anterior profile scarcely concave. SEMINUDA, 362.

360. GILA ELEGANS, Baird & Girard.

(Bony-tail; "Gila Trout.")

Head 5; depth 5; eye 5. D. 9; A. 10; scales 23-85-10; teeth 2, 4-5, 2. The extreme species of this type. Body elongate, somewhat compressed, the region before the dorsal elevated, forming a sort of hump, the dorsal fin inserted on the downward slope of the back, so that its base is quite oblique. Caudal peduncle extremely long and slender, as broad as deep, and nearly terete, its length (from end of anal to middle of base of caudal) 1½ times the length of the head, its least depth 1⅔ in maxillary; its extremity dilated and compressed. Head short, broad, the snout depressed and broadly rounded; the anterior part of the head from behind the eyes broad and depressed; the posterior part high so that the profile forms a concave arc. All these traits of form more marked in old examples; young specimens (*emorii*) having the anterior profile scarcely concave. Mouth rather larger than in *G. robusta*, nearly horizontal, the upper lip on the level of the lower part of orbit, the maxillary extending to the front of orbit, the lower jaw on all sides included; skin

---

*"The food of *Gila elegans* consists almost entirely of Gasteropods and caddis worms, which they crush with their powerful pharyngeals. The young differ greatly from the old, the cranium probably not becoming depressed until the second year. They are very tenacious of life. They have revived after being several hours out of the water and having become perfectly dry and stiff. They take the hook freely." (W. L. Carpenter, in Kirsch, Proc. U. S. Nat. Mus., 1888, 558.)

of the lower jaw hard. Eye small, anterior, placed low. Isthmus narrow. Gill rakers rather weak. Fins all long and falcate, larger than in *G. robusta.* Pectorals reaching ventrals; caudal fin deeply forked, its lobes long and pointed, the upper somewhat the longer; the rudimental basal rays strong, about 12 in number on each side. Scales scarcely imbricated at all, those on the caudal peduncle hardly touching each other, on the sides of the body much longer than deep; their texture thin and membranaceous; scales on back and belly much smaller than on sides and smaller than in other species, those on middle line of back obsolete or nearly so. Coloration bluish above, pale below. Length 12 inches. Colorado and Gila rivers, abundant in the channels, but not ascending so far as *G. robusta.* (*elegans*, elegant.)

Gila elegans, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 369, Zuñi, Colorado, and Gila rivers. (Type, Nos. 935 and 20265. Coll. Maj. Thomas.) Girard, Pac. R. R. Surv., x, 286, 1858; Jordan & Gilbert, Synopsis, 227, 1883; Jordan, Bull. U. S. Fish Comm., ix, 1889, 27; Kirsch, Proc. U. S. Nat. Mus., 1888, 558.

Gila emoryi, Baird & Girard, Proc. Ac. Nat. Sci. Phil., 1853, 388, Gila River. (Type, No. 247. Coll. John Le Conte.) Jordan & Gilbert, synopsis, 229, 1883.

Leuciscus elegans, Günther, Cat., vii, 241, 1868.

Leuciscus emorii, Günther, Cat., vii, 242, 1868.

361. GILA ROBUSTA, Baird & Girard.

(Round-tail.)

Head 4; depth 5; eye 5 to 8. D. 9; A. 9; scales 17–80–10; teeth 2, 5–4, 2. Body elongate, the back elevated and the head depressed as in *Gila elegans*, but the caudal peduncle notably stouter, its least depth about one-third its length, 3¾ in length of head and 1¼ in maxillary; young with the head less depressed and the profile scarcely concave. Mouth large, the upper lip on the level of lower part of orbit. Fins rather lower than in *G. elegans*, the pectorals in the male reaching ventrals, but falling short in the female. Eye small, low, anterior. Lateral line much decurved. Coloration plain; males in life with lower fins and lower side of head red, and a vertical red dash on cheeks. Length 16 inches. Tributaries of the Rio Colorado and Rio Gila, very common up to the foot of the mountains in Colorado (Uncompahgre River at Delta); the flesh full of small bones and nearly worthless as food. (*robustus*, stout.)

Gila robusta, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 368, Zuñi River. (Type, Nos. 276 and 277. Coll. Woodhouse.) Girard, Pac. R. R. Surv., x, 285, 1858; Jordan & Gilbert, Synopsis, 228, 1883; Jordan, Bull. U. S. Fish Comm., ix, 1889, 27.

Gila gracilis, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 369, Zuñi River. (Type, No. 245. Coll. Capt. Sitgreaves.) Girard, Pac. R. R. Surv., x, 287, 1858; Jordan & Gilbert, Synopsis, 229, 1883.

Gila grahami, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 389, Rio San Pedro, tributary to Rio Gila. (Type, No. 252. Coll. Clark.) Girard, U. S. & Mex. Bound. Surv., Ichth., 61, 1859; Jordan & Gilbert, Synopsis, 228, 1883.

Ptychocheilus vorax, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 209, and Pac. R. R. Surv., x, 301, 1858, locality unknown The type of "*vorax*," examined by us is a true *Gila*. (Coll. Kreuzfeld.)

Leuciscus zunnensis, Günther, Cat., vii, 241, 1868, Zuñi River; substitute for *gracilis*, preoccupied in *Leuciscus*.

Gila affinis, Abbott, Proc. Ac. Nat. Sci. Phila., 1860, 474; type erroneously ascribed to Kansas River. (Type, No. 21088, Coll. Abbott.) Jordan & Gilbert, Synopsis, 229, 1883.

Gila nacrea, Cope, Hayden's Geol. Surv. Wyom. for 1870, 441, 1872; tributary of Green River, Fort Bridger, Wyoming; young, perhaps, of *G. elegans*; Jordan & Gilbert, Synopsis, 230, 1883.

Leuciscus robustus, Günther, Cat., vii, 241, 1868.

Leuciscus grahami, Günther, Cat., vii, 242, 1868.

362. GILA SEMINUDA, Cope & Yarrow.

Head 5; depth 5¾; eye 4. D. 10; A. 10; scales 21–98–12; teeth 2, 5–4, 2. Body moderately deep, with slender and tapering caudal peduncle, the least depth of which is about one-third its length. Back little elevated, not arched in front of dorsal. Head small, transversely convex, its profile continuous with that of the back and not concave. Mouth rather small, oblique, terminal, upper lip opposite the middle of orbit, the maxillary not reaching line of orbit. Eye large, rather anterior, but not very low. Fins moderate. Dorsal slightly behind ventrals. Brownish above, lower fins pink. Length 6 inches. Rio Virgen, in Utah, (Cope). Not seen by us. This species forms a transition to *Leuciscus* and other normally formed *Cyprinidæ*. (*seminudus*, half naked.)

Gila seminuda, Cope & Yarrow, Zoöl. Wheeler's Expl. W. 100th Mer., v, 666, 1875, (1876), Rio Virgen. (Type, No. 16975. Coll. Yarrow.) Jordan & Gilbert, Synopsis, 230, 1883.

116. LEUCISCUS, Cuvier.

(Dace.)

Leuciscus, (Klein) Cuvier, Règne Animal, Ed. i, 194, 1817, (*dobula*, *rutilus*, *leuciscus*, *alburnus*, and *phoxinus*).

Phoxinus, Rafinesque, Ich. Oh., 45, 1820. (No type stated; *phoxinus* understood.)

Dobula, Rafinesque, Ich. Oh., 45, 1820. (No type mentioned; *dobula* understood.)

Leuciscus, Rafinesque, *l. c.* 45. (No type mentioned; *leuciscus* understood.)

Phoxinus, Agassiz, Mém. Soc. Sci. Nat. Neufchâtel, 1835, 37, (*phoxinus*).

Leuciscus, Agassiz, Mém. Soc. Sci. Nat. Neufchâtel, 1835, 38, (*leuciscus*), (not *Leuciscus*, Heckel, and of Günther, which is *Rutilus* of Rafinesque, the type being *rutilus*).

Squalius, Bonaparte, Fauna Italica, 1837, ¶ 6, (*tyberinus*).

Leuciscus, Bonaparte, *l. c.*, (*argenteus* = *leuciscus*).

Telestes, Bonaparte, *l. c.*, (*muticellus*).

Cephalus, Bonaparte, Catol. Metod., 1846, 39, (*cephalus;* no diagnosis).

Microlepis, Bonaparte, *l. c.*, (*turskyi;* no diagnosis).

Richardsonius,* Girard, Proc. Ac. Nat. Sci. Phila., 1856, 201, (*balteatus*).

Tigoma, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 205, (*pulchella*).

Cheonda, Girard, *l. c.*, 207, (*cooperi*).

Siboma, Girard, *l. c.*, 208, (*crassicauda*).

Clinostomus, Girard, *l. c.*, 211, (*elongatus*).

Hemitremia, Cope, Proc. Amer. Philos. Soc., 1870, 462, (*vittata*).

Protoporus, Cope, Hayden's Geol. Surv. Montana for 1871, 473, 1872, (*domninus*).

Iotichthys, Jordan & Evermann, new subgenus (*phlegethontis*).

Body oblong, compressed or robust, covered with moderate or small scales. Lateral line decurved, complete, or variously imperfect. Mouth usually large and terminal, the lips normal, without barbel. Teeth mostly 2, 5-4, 2, (in American species sometimes 1, 5–4, 2, or even by atrophy, 1, 4–4, 1), usually 2, 5–5, 2 in the European type; hooked, with rather narrow grinding surface or none. Anal basis short or more or less elongate. Dorsal fin posterior, usually behind ventrals. Intestinal canal short. Size generally large, some species very small. A very large group, one of the largest current genera in ichthyology, represented by numerous species in the rivers of Europe, Asia, and North America. Most of our species have been poorly defined. As the species are extremely variable in form, the number of nominal ones has been very greatly multiplied. Much larger series of each form are necessary before the species can be properly discriminated. Individual irregularities in dentition are common in this genus.

---

* The ventral carination, used in the Synopsis as the distinctive character of *Richardsonius*, has no real existence except in specimens shrunken by alcohol; the narrow belly is rounded in cross section, fully scaled over, and without keel.

The typical species of the genus, *Leuciscus leuciscus*, is the common Dace or Vandoise of Europe, and differs greatly from any of the American forms. The presence of various intermediate species, however, makes it impossible for us to draw any satisfactory line between the Dace (*Leuciscus*) on the one hand, and such extreme forms as the long-mouthed minnows (*Clinostomus*) on the other.

In the subgenus *Leuciscus* the pharyngeal teeth are 2, 5–5, 2, rarely varying to 3, 5–6, 2, and the scales are rather large (about 50 in lateral line), closely imbricated and along the sides distinctly silvery. The anal fin is also long, of 11 to 12 rays, and the lateral line complete. The genus *Squalius*, as understood by us, is strictly synonymous with *Leuciscus*. In southeastern Europe and western Asia *Leuciscus* is replaced by the subgenus *Telestes*, which has the teeth 2, 5–4, 2, the scales much smaller (70 to 80), and not silvery, the anal fin still remaining long, and the lateral line complete. The American species called *Tigoma* and *Cheonda* are very close to *Telestes*, from which they differ only in the less closely imbricated scales, most of them, but not all, having the short anal fin generally characteristic of American *Cyprinidæ*. *Tigoma* can not be generically separated from *Telestes*, though it may be a question whether either should be united to *Leuciscus*. *Cheonda* differs from *Tigoma* in having the long anal fin of *Leuciscus*. *Richardsonius* is simply an extreme form of *Cheonda*. *Siboma* is founded on a *Tigoma* with very deep body and the scales less loosely imbricated than usual. *Clinostomus* is a peculiar group of small, fine-scaled minnows, with the gape of the mouth larger than in any other *Cyprinidæ* whatever. The relationship of the species to those called *Richardsonius* is, however, very close. The type of *Phoxinus* differs from *Leuciscus* in its incomplete lateral line and very small scales. In the latter respect the subgenus *Hemitremia* forms a complete transition to *Leuciscus*, and some of its species (as *margarita*) have the lateral line scarcely defective. Considering all the known species, *Phoxinus* can not be separated from *Leuciscus*. It may even be necessary to merge *Rutilus* and its American representatives, *Leucus* and *Mylolencus*, in the same great group. (*Leuciscus*, old name of the Dace, from λευκός, white.)

I. Lateral line complete in the adult.
  a. Mouth moderate, terminal, or subinferior, the lower jaw included, or scarcely projecting; teeth normally 2, 4–5, 2; scales rather small.
    b. Anal basis short, its rays 7 or 8, rarely 9; fins low; males not brilliantly colored.
      SIBOMA, (a coined name without meaning*):

---

*Like many other of Girard's generic names; drawn ostensibly from "words taken from the North American Indians as more euphonic than any I might have framed from the Greek."

c. Caudal peduncle very deep and compressed, its least depth nearly equal to depth of head; dorsal inserted above ventrals; scales comparatively large and well imbricated, about 56. CRASSICAUDA, 363.

Tigoma, (a coined name):

cc. Caudal peduncle not very stout, its least depth not 2/5 depth of head; scales small, not closely imbricated; dorsal usually inserted behind ventrals.

d. Scales of medium size, 50 to 75 in the lateral line; young with the head more or less conical; adults with the head flattened and the back elevated.

e. Species from the Sacramento Basin; scales large, about 52. CONFORMIS, 364.

ee. Species from the great basins of Utah, Nevada, Idaho, and Oregon; scales rather large, 53 to 63.

f. Sides of body abruptly silvery from a line just above lateral line; scales 13–60–7. BICOLOR, 365.

ff. Sides of body scarcely silvery, the scales everywhere much dotted; head subconical; eye small; form extremely variable. LINEATUS, 366.

eee. Species from the basin of the Rio Grande; mouth large; head large; teeth extremely variable; scales 60 to 67. NIGRESCENS, 367.

eeee. Species from the basin of Rio Yaqui; scales 62; body robust. PURPUREUS, 368.

eeeee. Species from the Gila basin; head more blunt; scales 73 to 75; body rather elongate. INTERMEDIUS, 369.

dd. Scales very small, 80 in the lateral line.

g. Head depressed above; back elevated with age; species of large size; from the Gila Basin. NIGER, 370.

gg. Head not depressed; the back not elevated; species of small size, from the Great Basin of Utah. ALICIÆ, 371.

bb. Anal basis long, of 9 to 22 rays, the fins all high; body more or less compressed; head bluntish, with large eye; scales moderate, not closely imbricated, 55 to 65 in lateral line.

Cheonda, (a coined name):

h. Anal rays 9 to 13, usually 11.

i. Coloration plain; body not much compressed. COOPERI, 372.

ii. Coloration not plain; sides with a dark lateral band, or with two dark bands; the interspace and the belly bright red in spring males.

j. Body very deep, the depth 3 in length. HUMBOLDTI, 373.

jj. Body moderately elongate, the depth 4 to 4½ in length; cheek with a silvery or golden crescent; a pale streak from gill opening above eye.

k. Anal rays usually 9 or 10; two dark lateral stripes. EGREGIUS, 374.

kk. Anal rays usually 11 or 12; one dark lateral stripe, forking anteriorly. HYDROPHLOX, 375.

Richardsonius, (named for Sir John Richardson):

hh. Anal rays 14 to 22, usually 16; body much compressed; a dark lateral stripe; crescent on cheek very distinct. BALTEATUS, 376.

Clinostomus, (κλίνω, to incline; στόμα, mouth):

aa. Mouth very wide, the lower jaw much projecting beyond upper; upper lip on the level of the middle of the pupil; maxillary reaching to below the pupil; body elongate, compressed; dorsal well back; males with red pigment, often brilliantly colored.

l. Scales moderate, 50 to 55 in lateral line. VANDOISULUS, 377.

ll. Scales minute, 63 to 70 in lateral line. ELONGATUS, 378.

II. Lateral line more or less incomplete; small species, the males usually brilliantly colored, the sides and belly red in spring.

Phoxinus, (φοξῖνος, minnow; from φοξός, tapering; the old name of the European "minnow," *Leuciscus phoxinus*):

m. Scales minute, 80 to 100 in a longitudinal series; lateral line very short; snout blunt. NEOGÆUS, 379.

Hemitremia, (ἡμι-, half; τρῆμα, aperture = lateral line):

mm. Scales moderate or large, 40 to 60 in a longitudinal series; lateral line variously developed, sometimes almost complete.

n. Scales in a longitudinal series 52 to 60; lateral line well developed, nearly complete.
o. Snout short and very blunt; mouth small, not reaching orbit. MARGARITA, 380.
oo. Snout subconical; maxillary about reaching front of eye. ORCUTTI, 381.
nn. Scales in a longitudinal series 40 to 45; lateral line more or less developed.
p. Caudal with a distinct black spot. MILNERIANUS, 382.
pp. Caudal without distinct black spot. FLAMMEUS, 383.
IOTICHTHYS,, (ἰῶτα, the smallest letter; ἰχθύς, fish; from the small size.)
mmm. Scales in a longitudinal series about 36; no caudal spot; no trace of lateral line. PHLEGETHONTIS, 384.

Subgenus SIBOMA, Girard.

363. LEUCISCUS CRASSICAUDA (Baird & Girard).

(SACRAMENTO CHUB.)

Head 4⅛; depth 3; eye 5. D. 8; A. 8; scales 9–56–7; teeth 2, 5–4, 2, usually without grinding surface. Body short, deep, compressed, the antedorsal region arched, the caudal peduncle nearly as deep as long, about as deep as the head. Head conic, the profile steep, the muzzle short and rather pointed. Mouth small, oblique, the jaws nearly equal; upper lip on the level of lower part of pupil; maxillary scarcely reaching front of eye; isthmus very narrow; preorbital nearly as deep as long. Eye small, anterior. Fins low. Dorsal fin opposite ventrals, nearer caudal than snout; caudal fin short, little forked, scarcely broader than the very deep caudal peduncle, the spines of the caudal vertebræ very strong. Scales large, rather closely imbricated, their exposed surfaces rather deeper than long; 26 scales before dorsal. Lateral line decurved. Color brownish; sides white; young spotted above; scales everywhere with dark dots; fins plain. Length 12 inches. Rivers of California; generally abundant in the Sacramento and San Joaquin. (*crassus*, fat; *cauda*, tail.)

Leuciscus gibbosus, AYRES, Daily Placer Times and Transcript, May 30, 1854, San Francisco, not of Storer, 1845.

Lavinia crassicauda, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 137, San Joaquin River.

Tigoma crassa,* GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 207, Sacramento River.

Siboma crassicauda, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 208, and Pac. R. R. Surv., x, 296, 1858.

Leuciscus crassicauda, GÜNTHER, Cat., VII, 243, 1868.

Squalius gibbosus, JORDAN & GILBERT, Synopsis, 239, 1883.

Squalius crassus, JORDAN & GILBERT, Synopsis, 241, 1883.

Subgenus TIGOMA, Girard.

364. LEUCISCUS CONFORMIS (Baird & Girard).

Head 3½; depth 3½; eye 5. D. 8; A. 8; scales 9–52–5. Body robust, rather elevated. Head moderate, the mouth rather small, oblique; maxillary not quite reaching eye. Eye moderate. Dorsal fin considerably behind ventrals. Scales large; lateral line decurved. Purplish brown above, yellowish below. Length 4 inches. Tulare Valley, California; only the types known; apparently close to *L. crassicauda*, but with larger scales; perhaps the young of the same species. (*conformis*, uniform.)

Lavinia conformis, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 137; Poso Creek, Tulare County, California. (Coll. Heermann.)

Tigoma conformis, GIRARD, Pac. R. R. Surv., x, 289, 1858.

Squalius conformis, JORDAN & GILBERT, Synopsis, 237, 1883.

---

*Teeth with narrow grinding surface; scales 10–57–7; head 4; depth 3½, in Girard's type, which was 10 inches long. (Coll. Dr. J S. Newberry.)

365. LEUCISCUS BICOLOR* (Girard).

Head 3¾; depth 3¾; eye small, 6. D. 8; A. 8; scales 13–60–7; teeth 2, 5–5, 2. Body robust, heavy anteriorly, tapering backward. Head long, mouth large, the maxillary reaching eye. Lateral line decurved. Dorsal fin inserted almost directly over ventrals; fins rather small. Dusky above, sides and below silvery, the color contrasting with that of the back. Length 12 inches. Klamath Lake, Oregon. (*bicolor*, two-colored.)

Tigoma bicolor, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 206, Klamath Lake, Oregon; and Pac. R. R. Surv., x, 289, 1858. (Type, No. 234. Coll. J. S. Newberry.)

Cheonda cærulea,† GIRARD, *l. c.*, 1856, 207, Lost River, Oregon. (Type, No. 237 (2790). Coll. J. S. Newberry.)

Squalius cæruleus, COPE, Proc. Ac. Nat. Sci. Phila., 1883, 146; JORDAN & GILBER, Synopsis, 241, 1883.

Squalius bicolor, JORDAN & GILBERT, Synopsis, 237, 1883.

366. LEUCISCUS LINEATUS (Girard).

(GREAT CHUB. CHUB OF UTAH LAKE.)

Head 3½; depth 3½; eye 7. D. 9; A. 8; scales 10–55 to 63–5;‡ teeth 2,5–4,2, short and stout, one of them with grinding surface. Body robust, elevated anteriorly, the sides compressed, although the back is very broad. Head broad, the interorbital space flattish. Adult with the profile concave, the young with profile straight or convex. Snout broad, elevated at tip; premaxillary on level of pupil. Mouth very oblique, the mandible projecting; maxillary reaching front of eye. Eye small, anterior, 1¾ in snout. Isthmus very narrow. Scales large, subequal, broadly exposed, firm. Lateral line decurved. Dorsal nearly median, inserted directly over ventrals; caudal evenly forked, the peduncle long and deep. Pectorals short, extending three-fifths the distance to ventrals; ventrals about to vent. Lower fins short. Color blackish; everywhere dark; the scales much dotted and with darker edges, which often form lines along the rows of scales; males without red. Length 12 to 15 inches. One of the largest and most widely distributed species, found everywhere in the Great Basin of Utah, and also abundant in the Snake River Basin above the Shoshone Falls as far as the Yellowstone Park. Extremely destructive to other

---

*Mr. Barton A. Bean, who has kindly reexamined the types of *Tigoma bicolor*, writes to us: "The types of *Tigoma bicolor* and *Siboma atraria* differ greatly in form, color, and somewhat in size of scales. *Atraria* is more robust than *bicolor*, its scales are larger, and its color quite distinct. The silvery color on the sides of *T. bicolor*, extends from considerably above the lateral line to all the lower parts. The scales of *bicolor* count 13–60–7, while in *S. atraria* of the same size they are but 11–52–53. In younger examples there arise a larger number of scales, the type of *atraria* having 11–55."

†*Leuciscus cæruleus*, (GIRARD). Head 3¾; depth 4¼. D. 9; A. 7; scales 13–61–7 in type; teeth 2, 5–5 2, with narrow grinding surface. Body slender, subfusiform. Head slender, the snout long, conical, rather flattened above. Jaws equal, the maxillary reaching to orbit. Dorsal fin inserted behind ventrals; anal fin quite small. Lateral line decurved. Dusky bluish above, pale below; scales everywhere with fine punctulations. Lost River, Oregon; certainly identical with *L. bicolor*. The original type has the head longer, the snout much longer and pointed, the mouth larger, the maxillary longer and less oblique, the eye somewhat larger, and the top of the head more flat than in *Leuciscus lineatus*.

‡Scales 12–63–7 is the most usual number in the Snake River Basin. The number seems to vary from 53 to 63.

fishes, especially to young trout. Varies greatly with age and surroundings. The present description is taken primarily from Utah Lake specimens, typical of *L. atrarius*. We have examined specimens from Utah Lake, Provo River, Bear River, Jordan River, Sevier River, Heart Lake, and Jackson Lake, Wyoming, and other streams tributary to Snake River.[*] (*lineatus*, streaked, a character usually not conspicuous, and produced by the paler centers of the scales contrasting with the dotted edges.)

Tigoma lineata, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 206; locality unknown, type lost. (Coll. Beckwith.)

Tigoma obesa, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 206, Salt Lake Valley; and Pac. R. R. Surv., x, 290, 1858; the name *obesus* preoccupied in *Leuciscus*. (Type, No. 2773. Coll. Bowman.)

Siboma atraria, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 208, Utah District near the Desert, (Coll. Beckwith); and Pac. R. R. Surv., x, 297, 1858.

Tigoma squamata, Gill, Proc. Bost. Soc. Nat. Hist., 1861, 42; and Ichth. Capt. Simpson's Expl., 1876, 405, Salt Lake Basin; a very deep-bodied example; scales 10–50–3. (Type, No. 2607. Coll. C. S. McCarthy.)

Protoporus domninus, Cope, Hayden's Geol. Surv. Mont. for 1871, 473, 1872, Snake River, Fort Hall, Idaho, (Coll. Carrington); a very young example with incomplete lateral line and teeth 2, 4–4, 1; scales 9–56–6; Jordan & Gilbert, Synopsis, 203, 1883.

Hybopsis bivittatus, Cope, Hayden's Geol. Surv. Mont. for 1871, 1872, 474, Warm Springs, Utah, (Coll. Carrington); young with teeth 2, 4–4, 2; scales 12-53-11.

Hybopsis timpanogensis, Cope, Proc. Amer. Philos. Soc. Phila., 1874, 134, Timpanogos, Utah; young with incomplete lateral line; scales 13-52-2, and teeth 2, 4–4, 2. (Type, No. 15769. Coll. F. Klett); Cope & Yarrow, Zoöl. Wheeler Surv., 654, 1875.

Siboma atraria, and variety *longiceps*,[†] Cope, Zoöl. Wheeler Surv., 667, 1875, (1876), Snake Creek Valley, Nevada, near the Utah line, and near the Sevier Basin, belonging to the drainage of Lake Bonneville. (Type, Nos. 12910, 15770, 15782. Coll. Yarrow; C. G. Newberry.)

Squalius rhomaleus, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1880, 461, very old; scales 10–55–5, Utah Lake. (Coll. Jordan.)

Squalius cruoreus, Jordan & Gilbert, *l. c.*, 460, 1880, Provo River; scales 11–56–6; young. (Type, No. 30806. Coll. Madsen.)

Minnilus bivittatus, Jordan & Gilbert, Synopsis, 195, 1883.

Minnilus timpanogensis, Jordan & Gilbert, Synopsis, 196, 1883.

Squalius cruoreus and *rhomaleus*, Jordan & Gilbert, Synopsis, 234, 240, 1883.

Squalius lineatus, Jordan & Gilbert, Synopsis, 236, 1883.

Squalius obesus, Jordan & Gilbert, Synopsis, 237, 1883.

Squalius atrarius, Jordan & Gilbert, Synopsis, 241, 1883; Jordan, Bull. U. S. Fish Comm., 1889, 33.

Squalius squamatus, Jordan & Gilbert, Synopsis, 241, 1883.

367. LEUCISCUS NIGRESCENS (Girard).

(Pescadito; Chub of the Rio Grande.)

Head $4\frac{1}{5}$; depth $4\frac{2}{5}$; eye about 6. D. 8; A. 8; scales 15–67 (60 to 67)–10; teeth 1, 4–4, 1, or 1, 4–5, 2, usually without grinding surface. Body rather slender, little compressed. Head rather long and pointed. Mouth moderate, oblique, terminal, the jaws about equal, the maxillary about reaching front of eye. Eye rather small. Scales moderate. Lateral line decurved. Fins large; dorsal behind ventrals, its tip when depressed reaching the posterior base of the anal; pectorals nearly reaching ventrals.

---

[*] This species has been attributed to Lake Tahoe, apparently by error, *Rutilus olivaceus* having probably been mistaken for it.

[†] This variety is said to differ from the typical form in having the head longer and the scales larger. Scales 12–56–5.

Coloration dusky above; silvery below; males with the axil red; sides with a vague dusky band; young with a black caudal spot. Length 6 to 12 inches. Rio Grande Basin, from San Luis Park to Mexico, everywhere abundant in eddies and deep places in the river. Variable, the dentition especially so. The present description from specimens taken in the Rio Grande at Alamosa, corresponding to *L. pandora*; further south the species grows larger with the back higher, the head more depressed. Probably all are the same species. (*nigrescens*, blackish.)

Gila pulchella, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 29, Rio Mimbres, Lake Guzman, Chihuahua; scales 66; teeth 2, 5–4, 2; not *Leuciscus pulchellus*, STORER. (Type, No. 233. Coll. Clark.)

Tigoma nigrescens, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 207, Boca Grande and Rio Janos, Chihuahua. (Type, No. 219. Coll. Kennerly.)

Tigoma pulchra, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 207, Chihuahua River: teeth 1, 4–4, 1, without grinding surface; scales 13–67–7; color bright. (Type, Nos. 227 and 228 (2782). Coll. Potts); GIRARD, U. S. Mex. Bound. Surv., Ichth., 65, 1859.

Clinostomus pandora, COPE, Hayden's Geol. Surv. Mont. for 1871, 475, 1872, Tributaries Rio Grande, Sangre de Cristo Pass; scales 17–59–10 to 18–65–11; teeth 1, 4–4, 1 to 2, 4–5, 2, with or without grinding surface. (Type, Nos. 15761, 15984, 15985, 15987, and 18000. Coll. Cope, Aiken, Yarrow.)

Gila gula, COPE, Zoöl. Wheeler's Expl. W. 100th Mer., v, 661, 1875, (1876), Rio de Acama, and near Fort Wingate, New Mexico; large specimens with the scales 16–60–11, and the mouth large; the teeth 2, 5–4, 2. (Type, No. 16979. Coll. Henshaw.)

Cheonda modesta, GARMAN, Bull. Mus. Comp. Zoöl., VIII, 92, 1881, Rio Salinas, Saltillo, Coahuila; scales 14–65–9; head 3½; depth 3¾.

Tigoma conspersa,* GARMAN, Bull. Mus. Comp. Zoöl., VIII, 92, 1881, Rio Nazas, Coahuila.

Squalius pandora, JORDAN & GILBERT, Synopsis, 235, 1883.

Squalius gula, JORDAN & GILBERT, Synopsis, 236, 1883.

Squalius pulcher and *pulchellus*, JORDAN & GILBERT, Synopsis, 236, 238, 1883.

Squalius conspersus, JORDAN & GILBERT, Synopsis, 239, 1883.

Squalius nigrescens, JORDAN & GILBERT, Synopsis, 242, 1883; scales 16–70–10; teeth 2, 4, with grinding surface.

Squalius modestus, JORDAN & GILBERT, Synopsis, 242, 1883.

368. LEUCISCUS PURPUREUS (Girard).

Head 3⅓; depth 3¾. A. 8; scales 13–62–8; teeth 1, 4–?, ?. Stout and compressed; head long. Lateral line decurved. Dorsal fin slightly behind ventrals. Fins all small. Blackish above, pale below. San Bernardino Creek in southern Arizona, a tributary of Rio Yaqui. Only known from Girard's type. It is not impossible that both *intermedius* and *nigrescens* may prove indistinguishable from *purpureus*, and very likely *niger* also may be the same. In view, however, of the general difference in the faunæ of the Rio Grande, Yaqui, and Gila, we admit the three species as distinct. (*purpureus*, purple.)

Tigoma purpurea, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 206, San Bernardino Creek, Arizona. (Coll. Kennerly.)

Squalius purpureus, JORDAN & GILBERT, Synopsis, 238, 1883.

**Tigoma conspersa.* Form of *Leuciscus niger.*—Head 3¾; depth 3¾. D. 8; A. 8; "teeth 4, 1–1, 4, clawed;" scales 13–69–9. Profile of head concave, maxillary reaching front of orbit. Pectorals extending three-fourths distance to ventrals, which reach vent. Brown above; scales of back and sides speckled with darker; an obscure dusky lateral shade. Rio Nazas, Coahuila, a tributary of Laguna del Muerte.

369. LEUCISCUS INTERMEDIUS (Girard).

Head 3¾; depth 4. D. 8; A. 9; scales 15-73–9. Allied to *L. nigrescens*, but from a different river basin. Body elongate, heavy forward, the caudal peduncle slender. Head long, rather pointed, broad above, depressed over the eye; mouth large, oblique, the jaws equal, the maxillary just reaching eye. Fins moderate, the dorsal behind ventrals; pectorals long, nearly reaching ventrals. Color dusky everywhere, with dark dots, the sides soiled silvery; a plumbeous lateral streak; fins plain. Scales 75 in lateral line, in our specimen from Rio Santa Cruz at Tucson. Gila Basin. Very close to *L. purpureus*, but that species has apparently larger scales, and belongs to another river basin. (*intermedius*, intermediate—between *L. pulchellus* and *L. purpureus.*)

Tigoma intermedia, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 206, Rio San Pedro of the Gila. Coloration silvery with dark dots; scales 15–73–9. (Type, No. 232. Coll. Clark.)

Squalius lemmoni,* ROSA SMITH, Proc. Cal. Ac. Sci., 1884, 3, Rillito Creek, near Tucson, Arizona. (Coll. J. G. Lemmon.)

Squalius intermedius, JORDAN & GILBERT, Synopsis, 238, 1883.

370. LEUCISCUS NIGER (Cope).

Head, 3¾; depth, 3¾; eye rather large, 5 in head. D. 8; A, 8; lateral line 80; teeth 2, 4–5, 2, said by Girard to have a developed grinding surface, which, however, we are unable to find. Body robust, the back elevated anteriorly, the caudal peduncle shortened and not very stout. Occiput depressed. Head large. Mouth large, moderately oblique, the lower jaw included, the maxillary extending to pupil. Fins small, the dorsal well backward. Scales small, posteriorly smaller and more crowded. Lateral line little decurved. Color dusky, the scales with black dots. Rio Gila. A large species, perhaps not distinct from *L. intermedius*, the scales apparently a little smaller, the differences in form no doubt due to age. (*niger*, black.)

Gila gibbosa, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 28, Rio Santa Cruz, Arizona; (the name *gibbosa* is twice preoccupied in *Leuciscus*). (Type, No. 222 (2775). (Coll. Clark; Heermann.)

Tigoma gibbosa, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 207, and U. S. Mex. Bound. Surv., Ichth., 64, 1859.

Gila nigra, COPE, Zoöl. Wheeler's Expl. W. 100th Mer., v, 663, 1875, (1876), Ash Creek and San Carlos, Arizona; scales 78 to 87. (Type, No. 16972. Coll. Henshaw.)

Squalius niger, JORDAN & GILBERT, Synopsis, 239, 1883.

---

*The following is the description published by Miss Smith (Mrs. Eigenmann):

Squalius lemmoni: Head 3½ (4⅓); depth 3⅝ (4⅘); length 5½ inches; D. 8; A. 8. Body not much compressed, but rather slender; the dorsal and ventral outlines about equally arched. Head subconical, little compressed, nearly as wide as deep, and flat on top; maxillary oblique, reaching front of eye, lower jaw barely included; diameter of eye not quite equal to snout, 1⅓ inch interorbital space, 4⅓ in head. Teeth 2, 5–4, 2, with evident grinding surface on three in the greater row. Pseudobranchiæ present. Isthmus narrow. Scales 68. Lateral line decurved, but not strongly. Scales largest on sides anteriorly; much smaller on dorsal and ventral surfaces. Scales not very firm, a few rubbed off from each of the four examples studied. Insertion of dorsal fin very slightly behind ventrals, nearer snout than base of caudal. Pectorals 1⅔ in head; ventrals 2 in head, very nearly reaching vent. Depth of caudal peduncle 2 in its length. Color generally smutty. Top of head, from tip of snout to occiput, evenly bluish black, sharply separating the head from the trunk; a median blackish streak from occiput to base of caudal, paler behind dorsal. A leaden band about as wide as eye from upper angle of opercle to base of caudal, running higher than the lateral line except at its posterior fourth, where it is upon the lateral line. Sides of head and body dusky from numerous dark punctulations. Below, plain white from chin to insertion of anal. Fins all dusky. Peritoneum blackish. Described from four specimens (the largest 5½ inches long) collected in Arizona by Mr. J. G. Lemmon, for whom the species is named. These specimens have been donated by the collector to the California Academy of Sciences. Mr. Lemmon states that he found these fishes in Rillito Creek, a small stream of the Santa Catalina Mountains, seven miles north of Tucson, Arizona, and that the largest ones caught were about ten inches in length.

371. LEUCISCUS ALICIÆ (Jouy).

(Leather-sided Minnow.)

Head 4¼; depth 3¾; eye 3½ to 4. D. 8; A. 8; scales about 19–80–12; teeth 2, 5–4, 2, typically without grinding surface, but subject to an unusual amount of irregularity, occasionally 2, 4–4, 1 or 2, and sometimes with grinding surface. Body comparatively elongate and compressed, the caudal peduncle long and rather slender. Head short, rather broad and flattish above, the interorbital space convex and broader than the eye. Eye moderate, as long as snout. Mouth rather small, low, terminal, oblique, the premaxillary just below level of pupil, the maxillary reaching to just beyond front of eye. Dorsal fin inserted somewhat behind ventrals. Pectorals short, not reaching nearly to ventrals, the latter not to vent. Scales very small. Lateral line somewhat decurved. Bluish olive above, with dark points; sides silvery, a dusky lateral shade; fins nearly plain; axils red in the males; coloration in spirits very pale, largely silvery. Length 6 inches. Great Basin of Utah; very abundant in the Bear, Provo, Jordan, and Sevier rivers; not known outside the limits of the old Lake Bonneville, except from Little Wood River, Idaho, where it has recently been found by Gilbert and Evermann, who found that the fauna of the Upper Snake River in Idaho is practically identical with that of Lake Bonneville. (Named for Mrs. Alice Jouy.)

Tigoma gracilis, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 206, locality unknown, (Coll. Beckwith); the type lost; the name *gracilis* preoccupied in *Leuciscus*.

Squalius copei, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1880, 461, Bear River, Evanston, Wyoming; Jordan & Gilbert, Synopsis, 238, 1883; not *Leuciscus copii*, Günther.

Squalius aliciæ, Jouy, Proc. U. S. Nat. Mus., 1881, 19, Provo River near Utah Lake. (Type, No. 27412. Coll. Jordan); Jordan & Gilbert, Synopsis, 238, 1883.

Subgenus CHEONDA, Girard.

372. LEUCISCUS COOPERI (Girard).

Head 4⅓; depth 4¼; eye large, 4½ in head. D. 8; A. 11 or 12; lateral line 63. Body rather elongate, subfusiform, much compressed. Head moderate, the snout thickish, subconical, slightly projecting. Mouth oblique, the maxillary not quite reaching to eye. Fins large, the anal notably so. Dorsal somewhat behind ventrals. Coloration reddish gray; sides and belly silvery. Lower Columbia River. Known only from the original type, above described. (Named for Dr. John G. Cooper, of Oakland, one of the pioneer naturalists of California.)

Cheonda cooperi, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 207, Fort Vancouver; and Pac. R. R. Surv., x, 294, 1858. (Type, No. 238. Coll. Dr. J. G. Cooper.)

Leuciscus cooperi, Günther, Cat., vii, 243, 1868.

Squalius cooperi, Jordan & Gilbert, Synopsis, 242, 1883.

373. LEUCISCUS HUMBOLDTI (Girard).

Head 4; depth 3; eye large, 4. D. 8; A. 12; scales 12–56–8; teeth 2, 4–5, 1. Body short and deep; head moderate; mouth terminal, oblique, the cleft rather short, the maxillary reaching front of eye. Lateral line moderately decurved. Dorsal fin rather behind ventrals; anal fin elongate. Color bluish; sides with two dusky lateral bands. Humboldt

River, Nevada; perhaps identical with *L. egregius*, but the type specimen is much deeper than any *egregius* we have seen. (Named for Alexander von Humboldt.)

Tigoma humboldti, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 206, Humboldt River, Nevada; and Pac. R. R. Surv., x, 291, 1858. (Type, Nos. 225, 226. Coll. Bowman; Beckwith.)
Squalius humboldti, JORDAN & GILBERT, Synopsis, 234, 1883.

374. LEUCISCUS EGREGIUS (Girard).

Head $3\frac{3}{8}$ to $4\frac{1}{4}$; depth $3\frac{4}{5}$ to $4\frac{1}{4}$; eye $4\frac{1}{4}$. D. 8; A. 9; scales 12 or 13-52 to 56-6 to 8. Teeth 2, 4-5, 2, without grinding surface. Eye large. Body rather robust, compressed. Mouth oblique, the jaws equal, the maxillary about reaching front of eye. Fins all high, the anal shorter than in *L. hydrophlox*. Back blackish, with a broad blackish vertebral streak; usually two parallel dark bands along anterior third of sides, separated by a light streak one-half width of pupil. In life this light interspace is flushed with red. Posteriorly the two dark bands merge into a single median one on caudal peduncle and the lower is sometimes wanting; belly golden, with some red in males. A broad red streak nearly as wide as orbit bordering the dark lateral streak and extending to opposite front of anal. Top of head, snout, chin, and an irregular band behind eye blackish; axil scarlet; a golden crescent on cheek; fins unmarked. Length $3\frac{1}{2}$ inches. Nevada to northern California, known from the Humboldt and Truckee basins and from Napa Valley; extremely common in Lake Tahoe and Truckee River. Here described from specimens from the Humboldt River at Winnemucca, sent by Frank Germain. These have been compared with the type of *L. clevelandi*, which seems to be identical with them. This species may ultimately stand as *Leuciscus humboldti*. (*egregius*, surprising.)

Tigoma egregia, GIRARD, Pac. R. R. Surv., x, 291, 1858, locality unknown, but probably Great Basin of Nevada, the drainage of Lake Lahontan. (Coll. Kreuzfeld.)
Gila ardesiaca,* COPE, Zoöl. Wheeler Surv., v, 660, pl. xxx, figs. 1, 1*a*, 1875, (1876), locality unknown, probably Nevada. (Type, No. 16974. Coll. Yarrow & Henshaw.)
Squalius galtiæ,† COPE, Proc. Ac. Nat. Sci. Phila., 1883, 148, Pyramid Lake, Nevada.
Phoxinus clevelandi,‡ C. H. and R. S. EIGENMANN, West American Scientist, 1889, 149, Ætna Springs, Napa County, California.
Squalius ardesiacus, JORDAN & GILBERT, Synopsis, 235, 1883.
Squalius egregius, JORDAN & GILBERT, Synopsis, 236, 1883.

---

[*] *Gila ardesiaca*, COPE. Head $3\frac{1}{2}$; depth $4\frac{1}{5}$; eye 4. D. 8; A. 8. Scales 17-63-8. Teeth 2, 5-4, 2. Body rather stout, compressed; head heavy, muzzle short; mouth short, very oblique, the jaws about equal, the maxillary reaching past front of the large eye. Pectoral fin long, nearly reaching ventrals. Olivaceous above, a narrow plumbeous lateral band concurrent with the back.

[†] *Squalius galtiæ*, COPE. Head 4; depth $4\frac{1}{4}$; eye 3 in head. D. 8; A. (probably) 8. Scales 12-60-5. Teeth 1, 4-5, 1, without grinding surface. Dorsal inserted a little behind front of ventrals; muzzle short; mouth oblique, without prominent chin, the end of the maxillary reaching a little beyond front of orbit. Interorbital region gently and regularly convex, as wide as eye. Olive above, as far as a plumbeous band, which extends from the operculum to base of caudal; below this line, sides and belly silvery, except a broad band of crimson from the gill opening to front of anal; side of head with a dusky band. Pyramid Lake, Nevada; abundant.

[‡] *Phoxinus clevelandi*, EIGENMANN & EIGENMANN, Head $4\frac{1}{4}$; depth $4\frac{1}{4}$; eye $4\frac{1}{4}$. D. 9; A. 9 or 10. Scales 10-59-6. Teeth 2, 4-5, 2. Mouth oblique; jaws equal; maxillary reaching front of eye or slightly beyond; eye $1\frac{1}{2}$ in interorbital space; pectorals reaching ventrals in males, shorter in females. Dark brown above, bordered by a darker stripe; a black band from tip of snout to base of caudal, a pale band between this and dark of back; fins mostly dusky. Length 4 inches. Æt ... Springs, Napa County, California. One of the types received from Dr. Eigenmann seems to agree fully with *L. egregius*. In general, however, the fauna of the Sacramento Valley has little in common with that of the Lake Lahontan drainage to which the Humboltd and Trucrikee vers belong.

375. LEUCISCUS HYDROPHLOX (Cope).

(SILVER-SIDED MINNOW; "PO-HE-WA.")

Head 4⅓; depth 4; eye large, 3⅕ to 3½ in head, equal to interorbital space. D. 9; A. 10 to 13, usually 10 or 11. Scales 12–58–5. Body rather elongate, but deep and compressed, formed as in the section *Clinostomus.* Head rather small, short, compressed, but broad above, the jaws equal. Mouth oblique, short, the maxillary reaching front of orbit, the upper lip opposite middle of orbit. Snout decurved and rather obtuse. Lateral line decurved; 33 scales in front of dorsal fin. Coloration greenish silvery; the back dusky; a dark blue or blackish lateral band between 2 silvery stripes; the lateral band and below bright orange-red in the males, the red usually ceasing at front of anal; a bright silvery or golden crescent on cheeks; a golden streak from snout above eye to gill opening; specimens in alkaline waters are very pale. Length 3 to 5 inches. Salt Lake Basin; excessively abundant in Provo River, Jordan River, and other clear streams; also recorded from the Snake River at Idaho Falls and elsewhere in its upper waters as far as Heart Lake, Wyoming; the fish fauna of this region being mostly identical with that of Lake Bonneville, which was once tributary to Snake River. The species bears some resemblance to *Notropis coccogenis* in form, color, and habits. Our description is drawn primarily from specimens from Provo River, typical of *L. tænia. L. montanus* is exactly the same, but *L. hydrophlox* may prove to have slenderer head and smaller eye. (*ὕδωρ*, water; *φλώξ*, flame.)

Clinostomus hydrophlox, COPE, Hayden's Geol. Surv. Mont. for 1871, 475, 1872, Blackfoot Creek, Idaho.

Clinostomus montanus, COPE, *l. c.*, 476, Grass Creek, Idaho; COPE, Proc. Ac. Nat. Sci. Phila., 1874, 136. (Type, Nos. 15771, 15772, and 12908. Coll. Yarrow.)

Clinostomus tænia, COPE, Proc. Amer. Philos. Soc. Phila., 1874, 133, Utah Lake, Provo, Utah. (Type, No. 16935. Coll. Yarrow.)

Gila montana, COPE, Zoöl. Wheeler Surv., v, 657, 1875, (1876).

Squalius hydrophlox, *tænia*, and *montanus*, JORDAN & GILBERT, Synopsis, 234, 1883.

Leuciscus montanus, JORDAN, Bull. U. S. Fish Comm., IX, 1889, 32.

Leuciscus hydrophlox, JORDAN, *l. c.*, 48.

Subgenus RICHARDSONIUS, Girard.

376. LEUCISCUS BALTEATUS (Richardson).

Head 4½; depth 3¼; eye 3½. D. 10; A. 11 to 22, usually 16; vertebræ 40. Scales 13–55 to 63–6; teeth 2, 5–4, 2, without grinding surface. Body strongly compressed and somewhat elevated. Head small, the snout rather short and conical. Mouth terminal, oblique, the lower jaw slightly projecting. Gill rakers very small. Eye large. Anal and caudal large. Dorsal low, much behind ventrals. Base of anal 4¼ in length. Coloration plain, the sides bright silvery, usually with a dark lateral band; sides and belly silvery; cheek with a silvery crescent; a pale streak above eye and opercle, crimson in males in spring. Length 4 to 6 inches. Columbia River and streams about Puget Sound; generally abundant everywhere in the Columbia Basin, and very variable; the specimens from any single locality usually alike but different localities showing large variations. Also recorded (as *L. gilli*) from the headwaters of Clark's Fork of the Columbia. (*balteatus*, girdled.)

Cyprinus (*Abramis*) *balteatus*, Richardson, Fauna Bor.-Amer., III, 301, 1836, Columbia River.

Richardsonius lateralis,* Girard, Proc. Ac. Nat. Sci. Phila., 1856, 202, Fort Steilacoom, Washington, (Type, No. 64. Coll. Suckley); and Pac. R. R. Surv., x, 279, 1858; Jordan & Gilbert, Synopsis, 251, 1883.

Leuciscus gilli,† Evermann, Bull. U. S. Fish Comm., XI, 1891, 44, Browns Gulch Creek, Silver Bow, Montana. (Type No. 43953. Coll. Evermann & Jenkins.)

Richardsonius balteatus, Girard, Pac. R. R. Surv., x, 278, 1858; Jordan & Gilbert, Synopsis, 251, 1883.

Leuciscus balteatus, Gilbert & Evermann, Investigations Columbia River Basin, 46, 1894.

Subgenus CLINOSTOMUS, Girard.

377. LEUCISCUS VANDOISULUS, Cuvier & Valenciennes.

Head $3\frac{2}{3}$; depth $3\frac{2}{3}$ to $4\frac{1}{4}$, the largest specimens most elongate, the females deeper; eye moderate, $3\frac{1}{2}$. D. 9; A. 8; lateral line 48 to 53; teeth 2, 5–5, or 4, 2. Body oblong, deep, and compressed. Head rather large. Mouth large, oblique, the lower jaw projecting, the mandible extending to the pupil. Lateral line decurved. Color bluish green; some of the scales of the back irregularly darker, producing a mottled appearance; a dark lateral band with a pale streak above it in the adult; young nearly plain; males in spring with the region behind the head and above the pectorals as far back as the anal of a bright rose-red, brightest anteriorily. Length 5 inches. Streams about Chesapeake bay to Georgia; abundant in the clear, swift brooks east of the Alleghany Mountains; also (as *L. estor*) in tributaries of the Tennessee and Cumberland, west of the mountains. (*vandoise*, French name of the Dace, *Leuciscus leuciscus*.)

Leuciscus vandoisulus, Cuvier & Valenciennes, Hist. Nat. Poiss., XVII, 317, 1844, South Carolina; Günther, Cat., VII, 256, 1868.

Clinostomus affinis, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 212, James River, Virginia; (Coll. Baird); Cope, Journ. Ac. Nat. Sci. Phila., 1868, 228.

Clinostomus funduloides, (Potomac River at Washington) and *carolinus*, (Salem, N. C.), Girard, Proc. Ac. Nat. Sci. Phila., 1856, 212; Cope, Cypr. Penn., 376, 1866.

---

* The following characters are assigned to the form called *lateralis*: Body slenderer and less compressed than in *R. balteatus*. Mouth moderate, terminal, oblique; jaws equal. Anal base $5\frac{1}{3}$ in length. Blackish above; a dark lateral band; the interspace and belly pale, crimson in males in summer. Head $4\frac{1}{3}$; depth $3\frac{3}{4}$ to 4. D. 10; A. 14: scales 13–55–6; teeth 2, 5–5, 2. Columbia River and streams about Puget Sound. It apparently fully intergrades with the preceding, the anal rays ranging from 11 to 22. The name *Leuciscus lateralis* is preoccupied, and this form, if distinct, should stand as *Leuciscus gilli*.

† The types of *Leuciscus gilli* are described as follows: Head 4; depth $3\frac{1}{2}$ to $3\frac{3}{4}$. D. 10; A. 14 (13 to 16). Teeth 2, 4–5, 2. Scales 11–66–7, 32 before dorsal. Body deep, compressed, much deeper than in *L. montanus*, the top of head broader, the eye and mouth smaller; eye $3\frac{1}{2}$ to 4 in head, $1\frac{1}{2}$ in interorbital space; maxillary not quite to front of orbit; snout short and blunt, $3\frac{3}{4}$ in head; lower jaw scarcely projecting; mouth oblique; caudal peduncle long. Dorsal small, anal large; caudal large; dark above, a dark lateral band with a yellowish band above it; belly reddish or orange; cheek with a bright yellow crescent; body and fins with black specks; a yellow blotch at base of pectoral. Length $4\frac{1}{4}$ inches. Browns Gulch, Silver Bow, Montana, and Swan Lake, near Flathead Lake, (Columbia Basin). Apparently not distinct from *L. balteatus*.

Gila estor,* Jordan & Brayton, Bull. U. S. Nat. Mus., XII, 66, 1878, Elk River, Estill Springs, Tennessee; Stone River, Murfreesboro, Tennessee.

Leuciscus affinis, Günther, Cat., VII, 257, 1868.

Gila vandoisula, Jordan & Brayton, Bull. U. S. Nat. Mus., XII, 24, 1878.

Squalius estor, Jordan & Gilbert, Synopsis, 232, 1883.

378. LEUCISCUS ELONGATUS (Kirtland).

(Red-sided Shiner.)

Head 4; depth 5; eye about 4. D. 8; A. 9; scales 10–70–5; teeth 2, 4–5, 2. Body elongate, compressed; head long, rather pointed. Mouth very large, oblique; the lower jaw notably projecting, with a small knob at the symphysis beyond tip of upper jaw; upper lip on level of pupil; maxillary extending to middle of orbit; posterior angle of opercle acute. Eye moderate. Scales very small. Fins short and high, the dorsal somewhat behind ventrals. Lateral line decurved. Color dark bluish; the scales mottled with paler; sides with a broad black band; belly more or less silvery; the front half of the lateral band bright crimson in spring males; belly and lower fins more or less reddened; a dark vertebral band. Length 5 inches. Great Lakes and Upper Mississippi Valley, chiefly from Pennsylvania to Minnesota; common in clear streams northward only. (*elongatus*, lengthened.)

Luxilus elongatus, Kirtland, Rept. Zoöl. Ohio, 1836, 169, and in Bost. Journ. Nat. Hist., III, 339, 1841, Mahoning River, Trumbull County, Ohio, and Lake Erie, near Cleveland.

Leuciscus productus, Storer, Synopsis, Fishes N. A., 416, 1846, Wabash River.

Squalius proriger, Cope, Proc. Ac. Nat. Sci. Phila., 1864, 280, Michigan.

Leuciscus elongatus, Cuvier & Valenciennes, XVII, 494, 1844; Günther, Cat., VII, 245.

Clinostomus elongatus, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 212.

Clinostomus proriger, Cope, Cypr. Penn., 375, 1866.

Leuciscus proriger, Günther, Cat., VII, 245; sides more compressed and more silvery; lateral line 63; teeth 2, 4–5, 1.

Squalius elongatus, Jordan & Gilbert, Synopsis, 232, 1883.

Subgenus PHOXINUS, Rafinesque.

379. LEUCISCUS NEOGÆUS (Cope).

Head 4; depth 4¼; eye moderate, 3½ in head. D. 8; A. 8; scales 18–80–10; teeth 2, 4–5, 2. Body short and thick, little compressed, the back little elevated. Head very large and broad, the muzzle blunt, 3 in head. Mouth small, quite oblique, the lower jaw scarcely projecting; maxillary reaching to beyond front of orbit, 2⅘ in head; upper lip on level of middle of pupil. Fins moderate; dorsal well backward, much nearer caudal than snout, somewhat behind ventrals; pectorals long, 1⅕ in head. Scales very small, almost embedded in the skin, covering the body evenly. Lateral line decurved, very short, not extending to ventrals. Back and belly scaly. Color pale or dark; back plain dusky; a black band through snout and eye to caudal; above this a pale band; below this abruptly white; belly and lower fins crimson in spring males; pectorals dusky; no caudal spot. Length 3 inches. Mississippi Valley and neighboring waters; not common; the few specimens known, from Livingston County, Michigan; Baraboo River, Wisconsin; White River, Arkansas; and the Black Hills of South Dakota, (Cox Lake, Chicken Creek, etc). (*νέος*, new; *γῆ*, world; the species is closely allied to the European *Leuciscus phoxinus*.)

---

* *Leuciscus estor*, (Jordan & Brayton): Head 3⅔; depth 4¼; eye 4. D. 8; A. 8; scales 8–50–5 teeth 2, 5–4, 2. Body elongate, compressed, the caudal peduncle rather long, but not so long as head. Head very long and large, flattish, but not broad above. Mouth larger than in any other of our *Cyprinidæ*, very oblique, the upper jaw on the level of the pupil, the maxillaries extending to opposite middle of orbit; length of gape a little more than half length of head; lower jaw considerably the longer. Eye rather large, less than snout. Scales moderate. Lateral line strongly decurved; 23 scales in front of dorsal fin; fins high. Color dark olive above, many scales irregularly darker; sides silvery; no dark lateral band; a broad shade of deep rose color along the sides in spring males, below which most of the belly is bright crimson, these red colors brightest anteriorly; a narrow dark lateral streak like a pencil mark, from head to tail, overlaid by the scales. Length 4 inches. Cumberland and Tennessee rivers; in clear brooks; not very common. Perhaps a distinct species, but we are unable to find constant characters for distinction. (Type, No. 31147. Coll. Jordan & Brayton.)

Phoxinus neogæus, COPE, Cypr. Penn., 375, 1866, New Hudson, Livingston County, Michigan; JORDAN & GILBERT, Synopsis, 243, 1883.

Leuciscus neogæus, GÜNTHER, Cat., VII, 247, 1868; EVREMANN & COX, Bull. U. S. Fish Comm., XV, 1895.

380. LEUCISCUS MARGARITA (Cope).

Head 4; depth 4¼. D. 8; A. 9; scales 11–52 to 58–8; teeth 2, 5–4, 2. Body stout and thick, little compressed, the back somewhat elevated. Caudal peduncle thick. Head blunt, thick, and rounded. Mouth small, terminal, oblique, the upper lip below the orbit; eye rather large; scales rather small. Lateral line decurved, more or less incomplete, the pores usually ceasing behind middle of body. Fins rather large. Dorsal fin posterior. Coloration above dusky olive, dusted with dark specks; sides plumbeous silvery, forming a narrow streak on tail; belly white, crimson in spring males; snout dusky; fins plain; scales punctate. Length 3 inches. Susquehanna River to James River; not common; also taken in the head waters of the Kanawha. A handsome little fish, quite unlike most other American species, resembling most *Leuciscus neogæus*. (*margarita*, *μαργαρίτης*, a pearl.)

Clinostomus margarita, COPE, Cypr. Penn., 377, 1866, Conestoga River, Lancaster, Pennsylvania.

Phoxinus margaritus,* var., JORDAN, Bull. U. S. Fish Comm., VIII, 1888, 141, Reed Creek, Wytheville, Virginia. (Coll. Jordan, Evermann & Jenkins.)

Leuciscus margarita, GÜNTHER, Cat., VII, 246, 1868.

Squalius margaritus, JORDAN & GILBERT, Synopsis, 235, 1883.

381. LEUCISCUS ORCUTTI (Eigenmann & Eigenmann).

Head 3½ to 4; depth 3½ to 4½; eye moderate, 4⅘ in adult, 1½ in interorbital width. D. 8; A. 7; scales 58; teeth 2, 5–4, 1; hooked, their tips black in the adult. Body moderately compressed; head subconical; maxillary scarcely reaching front of eye. Lateral line little decurved, more or less

---

*These specimens seem to belong to *L. margarita*, but they have the scales larger, 52 to 54 in lateral line, 28 before dorsal. Mouth very small, anterior; dorsal quite low, inserted behind ventrals. Color dark; a very distinct caudal spot, and a well-defined black lateral band. Head 4½; depth 4½. Length 2 inches. Reed Creek, head waters of Kanawha River, Wytheville, Virginia.

incomplete, usually extending to caudal peduncle. Dorsal inserted slightly behind ventrals. Peritoneum black; intestine a little longer than body. Dark gray, often a faint plumbeous lateral band. Rivers of Southern California tributary to the Pacific, abundant; described from Temecula River; also found in the Rio San Luis Rey and Rio San Jacinto, (Edward Hyatt), and Santa Ana River, (Gilbert). (Named for Charles Russell Orcutt, the well known botanical collector who first obtained it.)

Phoxinus orcutti, EIGENMANN & EIGENMANN, Proc. Ac. Sci. Cal., 2d series, III, 1890, 2, Temecula River, Riverside County, California. (Type, No. 41925.)

Subgenus HEMITREMIA, Cope.

382. LEUCISCUS MILNERIANUS (Cope).

Head 4; depth 5½; eye 3½. D. 8; A. 8; scales 8–40 to 45–7; teeth 2, 5–4, 2. Body elongate; chin slightly projecting. Scales in 15 longitudinal rows between dorsal and ventral. Orbit equal to length of muzzle. Dorsal inserted behind the entire base of ventrals. Mouth very large, maxillary extending nearly to pupil; head rather flat above. Length of lateral line unknown, the scales posteriorly having been lost in the type. Brownish olive above, below silvery; a black band, not well defined on the borders, extending from the end of the muzzle to the base of the caudal fin, where it ends in a black spot; a reddish spot at base of anterior dorsal rays; muzzle dark. Length 2½ inches. Upper Missouri River. (Cope.) Not seen by us. (Named for James W. Milner, then Asst. U. S. Fish Commissioner, author of important contributions to Economic Ichthyology.)

Phoxinus milnerianus, COPE, Amer. Nat., July, 1879, 440, upper Missouri River, probably Battle Creek, Montana; (Coll. Cope); JORDAN & GILBERT, Synopsis, 243, 1883.

383. LEUCISCUS FLAMMEUS (Jordan & Gilbert).

Head 4; depth 4; eye large, 3½ in head. D. 8; A. 8; scales 7–43–5; teeth 2, 4–5, 2. Body moderately stout, slenderer and more compressed than in *L. neogæus*. Head rather short and deep, the upper outline rounded, the muzzle rather blunt. Mouth small, oblique, the jaws about equal, the upper lip on level of pupil; maxillary extending to front of orbit. Scales much larger and more loosely imbricated than in *L. neogæus*; back and belly scaled. Lateral line short, decurved, on 14 scales, not reaching base of ventrals. Fins small, the dorsal well backward. Back dark; a black lateral band, formed of dark specks; above this a pale band; the belly below this pale; bright scarlet red in the males in spring; a small black spot at base of caudal. Length 2½ inches. In tributaries of Tennessee River, common in clear streams in northern Alabama. (*flammeus*, flaming.)

Hemitremia vittata, COPE, Proc. Am. Philos. Soc. Phila., 1870, 462, Holston River, Knoxville, Tennessee; JORDAN & GILBERT, Synopsis, 162, 1883; the name *vittatus* is preoccupied in *Leuciscus*.

Phoxinus flammeus, JORDAN & GILBERT, in Jordan, Man. Vert. E. U. S., ed. 2, 303, 1878, Elk River, Estill Springs, Tennessee; JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 66 1878; JORDAN & GILBERT Synopsis, 243, 1883.

Subgenus IOTICHTHYS, Jordan & Evermann.

384. LEUCISCUS PHLEGETHONTIS (Cope).

Head 3¾; depth 3⅓. D. 7; A. 8; scales 6–36–4, 17 before dorsal; teeth 1, 5–4, 2. Body short, deep, compressed. Mouth short, very oblique, the lower jaw projecting, the maxillary reaching front of eye, which is rather large. Dorsal behind ventrals; pectorals about reaching ventrals. Lateral line entirely wanting, not a pore developed in the many specimens examined. Olivaceous; a broad plumbeous lateral band; a dusky dorsal line; belly golden, probably red in spring males. Length 1½ inches. Tributaries of Great Salt Lake, and Sevier Lake (Basin of Lake Bonneville); excessively common in ponds and warm pools. One of the smallest of our fishes, and the most aberrant of those here referred to *Leuciscus*. (φλεγέθω, to flame.)

Clinostomus phlegethontis, COPE, Proc. Amer. Philos. Soc. Phila., 1874, 137, Beaver River, Utah. (Type, No. 16983. Coll. Yarrow & Henshaw.)

Gila phlegethontis, COPE, Zoöl. Wheeler's Expl. W. 100th Mer., v, 657, 1875, (1876).

Phoxinus phlegethontis, JORDAN & GILBERT, Synopsis, 244, 1883; JORDAN, Bull. U. S. Fish Comm., IX, 1889, 34.

117. RUTILUS, Rafinesque.

(ROACHES.)

Rutilus, RAFINESQUE, Ich. Oh., 48, 50, 1820. (*rutilus*: no type indicated on page 48; on page 50, *rutilus*[*] mentioned.)

Leucos, HECKEL, Russegger's Reisen, 1, 1038, 1843, (*cisalpinus*). (Not *Leucus*, KAUP, a genus of Gulls.)

Cenisophius, BONAPARTE, Católogo Metódico Pesci Eur., 1846, 29, (*pauperum*; no diagnosis).

Gardonus, BONAPARTE, *l. c.*, (*decipiens*; no diagnosis).

Pigus, BONAPARTE, *l. c.*, (*pigus*; no diagnosis).

Pseudophoxinus, BLEEKER, Prodromus Cyprin., 1860, (*zeregi*).

?*Anchybopsis*, COPE, Proc. Amer. Philos. Soc. Phila., 1870, 543, (*latus*, a fossil species).

Myloleucus, COPE, Bull. Hayden's Geol. Surv. Montana for 1871, 475, 1872, (*pulverulentus*).

Siphateles, COPE, Proc. Ac. Nat. Sci. Phila., 1883, 146, (*vittatus*), young with lateral line imperfect.

Body stout, compressed. Mouth normal, oblique; no barbel. Teeth 4–5, or 5–5, or 6–5, hooked, with moderate grinding surface. Scales moderate or small. Lateral line continuous or incomplete, decurved. Anal basis short or rather long. Abdomen not compressed. Intestinal canal not elongate. Species numerous in Europe, Asia, and America. The American species are certainly closely allied to the European type of *Rutilus*, Rafinesque, (including *Leucos*, Heckel), differing in the presence of teeth 5–5 or 5–4, instead of 6–5 or 5–5, as most of the species of *Rutilus* have. The anal fin is long in *Rutilus*, of 10 to 14 rays as in *Leuciscus* proper, and as in European minnows generally, while in these American Roaches (*Myloleucus*) there are but 8 anal rays. But as this character has not generic value in *Leuciscus* and *Notropis*, it can not be admitted here.

As in the case of *Leuciscus*, the American forms are confined to the western waters. They are dusky in color, and have small, loosely-embedded scales which give an appearance unlike that of their relatives in Europe. As in the other case, Austrian and Asiatic species (subgenus *Pseudophoxinus*, Bleeker) seem to form connecting links. *Rutilus zeregi* has teeth 5–5, anal rays 9, and scales about 63. We are therefore unable to draw any satisfactory line between *Rutilus* on the one extreme and *Myloleucus* at the other. The American species of this genus are very imperfectly known, and some of them are subject to large variations. (*rutilus*, ruddy, the ancient name of the European Roach or Rothauge, *Rutilus rutilus.*)

---

[*] "I call this genus *Rutilus*, in the supposition that the *Cyprinus rutilus* may be the type of it." (*Rafinesque.*)

Leucos, (λευκός, white.):
  a. Teeth 5–5, never 4–5, nor 5–6; anal fin short, of about 8 rays; scales small, sexual differences slight, males with little or no red pigment.
    b. Scales about 58 to 65 in the lateral line. Body slender, the depth 4 in length; color olive, the belly silvery. OLIVACEUS, 385.
Myloleucus, (μύλος, grinder; Leucos):
  aa. Teeth 4–5, with grinding surface; anal fin short, of about 8 rays; scales small. Dusky species, the scales sprinkled with dark dots. Sexual differences moderate, usually some red pigment in spring.
    c. Scales in lateral line 45 to 67.
      d. Scales 8–46 to 50–5; coloration paler and less dotted with black. BICOLOR, 386.
      dd. Scales 10 to 14–50 to 67–5 to 7; coloration dusky, much dusted with dark specks. SYMMETRICUS, 387.
    cc. Scales rather large, 39 in lateral line; about seven rows between lateral line and dorsal; sides with a plumbeous band and a black caudal spot. BOUCARDI, 388.

Subgenus LEUCOS, Heckel.

385. RUTILUS OLIVACEUS (Cope).

Head 4; depth $4\frac{1}{5}$ to $4\frac{1}{3}$. D. 8; A. 8; scales 11–56–6; teeth always 5–5, with grinding surface. Body fusiform, compressed; head narrowed to the muzzle, the mouth opening very obliquely forwards and upwards; maxillary concealed in the closed mouth, its tip scarcely reaching front of eye. Eye $1\frac{1}{3}$ in snout, $1\frac{3}{5}$ in interorbital space, 5 in head; middle of front flat, its edges sloping to the superciliary border; pectoral long, reaching $\frac{2}{3}$ distance to ventrals. Dusky olive, with brassy luster, the belly silvery; body and fins much dotted; no red or yellow; no lateral band; young with lateral line incomplete. Length 1 foot or more. Lake Tahoe, Pyramid Lake, and neighboring waters; excessively abundant; much resembles *Leuciscus lineatus* in appearance and habits; a greedy fish, destructive to young trout. (*olivaceus*, olive-colored.)

Leucus olivaceus, Cope, Proc. Ac. Nat. Sci. Phila., 1883, 145, Pyramid Lake, Nevada.
Leucus dimidiatus,[*] Cope, *l. c.*, 145, Pyramid Lake, Nevada.
Siphateles vittatus,[†] Cope, Proc. Ac. Nat. Sci. Phila., 1883, 146, Pyramid Lake, Nevada.

Subgenus MYLOLEUCUS, Cope.

386. RUTILUS BICOLOR (Girard).

Head 4; depth $4\frac{1}{2}$; eye $4\frac{1}{2}$. D. 8; A. 7; scales 9–48–6; teeth 4–5. Body moderately stout. Head rather heavy, the muzzle short and conical. Mouth moderate, very oblique, the jaws equal, the maxillary reaching line of eye. Scales rather large. Lateral line decurved. Eye rather large. Color transparent olivaceous; a distinct plumbeous lateral band; fins dusky shaded; scales with some brown dots, but not profusely dusted with black specks as in the preceding species. Length 8 inches. Lakes of southeastern Oregon (Klamath, Warner, Goose, etc.), the old Lake Idaho; locally abundant; not found in Lake Lahontan, Lake Bonneville, nor in the Sacramento Valley. Very distinct from *R. symmetricus*, the scales larger, the color less opaque. It is, however, close to *Rutilus olivaceus*, in appearance, but is more slender and has larger scales, besides the difference in the teeth. (*bicolor*, two-colored.)

---

[*] Eye equal to interorbital width, $3\frac{1}{2}$ in head, a little more than length of muzzle. Mouth oblique, the maxillary reaching front of eye. Ventral a little behind front of dorsal. Light brown above, becoming plumbeous lower, the belly pure silver white. Head 4; depth $4\frac{1}{2}$. A. 8. Scales 14–65–8. Teeth 5–5, with grinding surface. Length 4 inches. Pyramid Lake, Nevada; very abundant. (Cope.) Evidently the half-grown of *R. olivaceus.*

[†] Head 4; depth $4\frac{1}{2}$; eye 3. D. 8; A. 8; scales 11–55–5; teeth 5–5, with well-developed grinding surface. Lateral line very imperfect. Eye a little less than interorbital width. Mouth oblique, the maxillary not quite reaching front of eye. Ventral fins beneath anterior part of dorsal. Brownish above, belly and sides silvery; a straight lateral band of lead color, interrupted at base of caudal by a vertical band of straw yellow, which has a dark posterior edge. Length 3 inches. Pyramid Lake, Nevada, evidently the young of *R. olivaceus.* (Cope.) (*vittatus*, striped.)

Algansea bicolor,* GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 183, Klamath Lake. (Type, No. 2750. Coll. Dr. J. S. Newberry.)
? Algansea antica,† COPE, Proc. Ac. Nat. Sci. Phila., 1864, 282, "Texas;" JORDAN, Proc. U. S. Nat. Mus., 1885, 121.
Myloleucus thalassinus,‡ COPE, Proc. Ac. Nat. Sci. Phila., 1883, 143, Goose Lake, Oregon.
Leuciscus bicolor, GÜNTHER, Cat., VII, 245, 1868.
Leucos bicolor, JORDAN & HENSHAW, *l. c.*, 193, 1878.
Leucus bicolor, JORDAN & GILBERT, Synopsis, 246, 1883.
Leucus anticus, JORDAN & GILBERT, Synopsis, 246, 1883.

387. RUTILUS SYMMETRICUS (Baird & Girard).

Head 3¾; depth 4⅕; eye 3 to 4. D. 8; A. 8; scales 10 to 14–52 to 67–5, extremely variable, usually 53 to 56; teeth 5–4. Body rather elongate, moderately compressed, not elevated. Head short, rather slender; mouth small, little oblique, the lower jaw included. Eye large, anterior; snout usually a little convex, a little longer than eye; mouth not quite terminal. Lateral line strongly decurved. Dorsal distinctly behind ventrals. Coloration, dusky above, sides pale, scales more or less dotted with black; bright-colored specimens have a dark lateral band from snout to middle of caudal, a second dark band or series of spots below lateral line ceasing at vent; axils orange; cheeks silvery. Color much brighter in specimens from clear brooks (as Tres Pinos Creek, San Benito County, California). Length 5 inches. Rivers of California and Nevada, probably generally distributed. Originally known from the San Joaquin and Merced rivers and Kern Lake. It is also very common in streams of the coast ranges from San Francisco to Salinas River, being in the brooks of Santa Clara Valley the most abundant fish. Other specimens corresponding rather to *obesus* occur in streams tributary to Owen Lake, Mohave River, Washoe Lake, Truckee River, Humboldt River, etc., (the basin of the Quaternary Lake Lahontan.). Still other records are from western and northern Utah, in the Lake Bonneville basin. If three species are confounded under the name *symmetricus*, they are likely to be *symmetricus* (= *formosus*), from streams west of the Sierra Nevada, *obesus* from the basin

---

[*] The following notes have been made on the types of *Algansea bicolor*: Length 7 inches; head 4, depth 4½; eye 4½ in head. Eye shorter than snout; snout pointed; maxillary not reaching eye. Lower jaw little projecting. D. 9; A. 8; scales 9–48–6. Scales larger than in types of *obesa*, from which it is distinct.

[†] A specimen from unknown locality has been described as *Algansea antica*, COPE: Head acute, subconic; snout rather pointed; insertion of dorsal midway between pupil and base of caudal. Mouth small, the jaws equal; maxillary 4 in head, not reaching orbit. Lateral line decurved. Caudal short, little forked; pectoral short, not reaching ventrals. Eye 5 in head. Purplish slate above, yellow below; sides of head and edges of scales punctulate. Head 3⅖; depth 3⅗; D. 8; A. 8; scales 10–49–6; teeth 4–5, little hooked, with a very broad grinding surface. Length 5 inches. "Texas;" here described from the original type, its exact origin unknown, very likely not from Texas. It is probably identical with *R. bicolor* or *R. symmetricus*.

[‡] *Rutilus thalassinus* possesses the following characters: Slenderer than *R. parovanus*, the color a light translucent green, quite unlike the heavy olivaceous of the latter. Head 3¾; depth 4½; A. 9; scales 9–46–4; teeth 4–5. Length 6 inches. One specimen known, from Goose Lake, Oregon. probably identical with *R. bicolor*.

of Nevada (Lake Lahontan,) and *pulverulentus* (=*parovanus*), from the basin of Utah (Lake Bonneville). In general the fish faunæ of the basins of Nevada and Utah are entirely distinct. But we know of no constant characters on which a division of this species can be maintained. (*symmetricus*, symmetrical; it being supposed to differ from *Pogonichthys macrolepidotus* in the symmetrical tail.)

Pogonichthys symmetricus,* BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 136, **Fort Miller, San Joaquin Valley.** (4½ inches long).

Algansea formosa, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 183, **Merced and Mohave rivers.** (5½ inches). (Type, Nos. 2754 and 2755. Coll. A. L. Heermann.)

Algansea obesa,† GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 183, **Humboldt River**; GIRARD, Pac. R. R. Surv., x, 239, 1858. (Type, No. 2752. Coll. Lieut. Beckwith.)

Myloleucus pulverulentus,‡ COPE, Hayden's Geol. Surv. Montana for 1871, 475, 1872, **Warm Springs, Utah.** (Scales 13–58–9.)

Myloleucus parovanus, COPE, Proc. Amer. Philos. Soc. Phila., 1874, 136, **Beaver River, Utah**; COPE, Zoöl. Wheeler Surv., v, 669, 1875, (1876); COPE, Proc. Ac. Nat. Sci. Phila., 1883, 143.

Leuciscus obesus, GÜNTHER, Cat., VII, 244, 1868.

Leucos obesus, JORDAN & HENSHAW, Report Chief Engineers, App. NN, 192, 1878.

Leucus obesus, JORDAN & GILBERT, Synopsis, 245, 1883.

---

* The type of *Pogonichthys symmetricus* has no barbel; the teeth 4–5; the head 4 in length; the depth 4⅓; scales 9–53–6. It seems to be the same species as *Algansea formosa*, which has scales 10–57–7. The type specimen of *Algansea formosa* (No. 196), from Merced River, is 5½ inches long. Head 3⅝; depth (eviscerated) 4¼. Eye 5, 1⅓ in snout. Snout 4 in head. Mouth terminal, oblique, about as in No. 193, but the lower jaw slightly included. Maxillary not reaching eye. D. 8; A. 8. Scales 10–57–7. Another of these specimens has the snout shorter and a little more pointed. Scales 11–57–7. The type from Mojave River (No. 197), 4½ inches long, has head 3½; depth 4. Eye 4¾, shorter than snout, which is pointed, 4 in head. Mouth oblique; lower jaw slightly projecting. D. 8; A. 8. Scales 11–51–7. This form from Mojave River seems to correspond with specimens from tributaries of Owen Lake, Inyo County, California. These differ from typical *symmetricus* in the form of the head, agreeing in this respect with the types of *obesus* and *parovanus*. The snout in the Inyo County specimens is shorter, barely equal to the eye and not convex as in *symmetricus*; mouth very oblique; dorsal over ventrals. Scales 10–55–6. These may be the same as *R. parovanus*, the figure of which shows this form of mouth. *Rutilus parovanus* is thus described: Body rather stout; muzzle short, conical; mouth very broad, the maxillary reaching front of orbit; profile gently arched; eye large, 3 in head, equal to interorbital width; pectorals reaching little more than half way to ventrals; the latter just to vent. Translucent, with a plumbeous lateral band. Ventrals and pectorals dusky; dorsal and caudal shaded with dark. Head 3½; depth 4¼. D. 9; A. 8. Scales 10-48–5; teeth 4–5. Length 12 inches. (Cope.) Beaver River, Utah, a tributary of Sevier River.

† *R. obesus* is apparently identical with *Rutilus symmetricus*. Body stout; head short; snout 4 in head, moderately pointed, not much convex. Mouth oblique, lower jaw not projecting; maxillary not reaching eye. Head 3½; depth 3½; eye 5, 1⅓ in snout. Scales 12–57–8. Length 6¼ inches. Here described from notes on Girard's type (No. 194, U. S. Nat. Mus.) from Humboldt River.

Another of Girard's specimens (No. 193, U. S. Nat. Mus.) from Humboldt River is 6¾ inches long. Head 3¾; depth 3⅛. Eye 5 in head, 1½ in snout, which is 3⅝ in head. Mouth terminal, oblique, the lower jaw scarcely projecting; maxillary not reaching eye; snout pointed. Scales 14–58–8. D. 9; A. 8.

Another specimen from Nevada, 5 inches long, has snout a little longer than eye; scales 11–56–6; depth 4. Still another, 8½ inches long, from "Camp 21, Nevada," has scales 12–54–6; snout not decurved; eye 1⅓ in snout. Of specimens from Truckee River, one has a convex snout very pronounced; another the snout slightly convex, the two others not convex at all.

‡ *Myloleucus pulverulentus* is thus described: Form stout; head short, muzzle not decurved; mouth terminal, slightly descending, the maxillary bone nearly attaining the anterior line of the orbit. Head 3.75 times in length, exclusive of caudal; depth 3½ times. Eye 4.2 in head, 1 in muzzle. Preorbital bone deeper than long. Scales 13–58–9. Radii: D. I, 9; A. II, 7. Caudal well forked. Length 3½ inches. A dark plumbeous band extends from the origin of the lateral line above to the caudal peduncle and on it to the caudal fin; below this the color is silvery, thickly dusted with black dots; above it is an olive-yellow band, then a dark dorsal region, all dusted; sides of head silvery, dusted; fins unspotted. Numerous specimens from the Warm Springs, Utah.

388. RUTILUS BOUCARDI (Günther).

Head 4; depth 4; eye moderate, 4½. D. 8; A. 9 or 10; scales 7–39–5; teeth 5–4, hooked. Body moderately elongate. Head thick, obtuse; mouth broad, its cleft not extending to the eye; snout convex, the lower jaw included. Caudal fin moderately forked. Origin of dorsal fin close behind that of the ventrals. Pectorals not reaching nearly to ventrals. Brownish; a bluish lateral band, forming a faint caudal spot. Length 3½ inches. Cuernavaca, Mexico. (Günther.) (Named for Alphonse Boucard, an ornithologist who collected largely in Mexico.)

Leuciscus boucardi, GÜNTHER, Cat., VII, 485, 1868, Cuernavaca, Mexico. (Coll. Boucard.)
Leucus boucardi, JORDAN & GILBERT, Synopsis, 246, 1883.

118. LUXILINUS, Jordan.

Luxilinus, JORDAN, Catalogue Fishes N. A., 1885, 33, (*occidentalis*).

Body oblong, strongly compressed. Ventral edge of moderate width; scaled over and not at all carinated; otherwise much as in *Abramis*. No barbels. Gill rakers slender, of moderate length. Teeth 5–5, with entire edges and well-developed grinding surface, their tips little hooked. Intestines of the short type, but longer than in most related genera; anal basis elongate. This genus seems nearest related to *Abramis* or to its section *Notemigonus*, but in its technical characters it stands near *Rutilus*. One species known. (Name, a diminutive of *Luxilus*; from *lux*, light.)

389. LUXILINUS OCCIDENTALIS (Baird & Girard).

Dorsal 10; A. 11; eye large, 4. Body moderately elongate; snout subconical, rather tapering. Mouth oblique, the maxillary not reaching orbit. Brownish above; sides silvery; more or less speckled with gray. San Joaquin Valley, California; not rare about Fresno. (*occidentalis*, western.)

Leucosomus occidentalis, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 137, Poso Creek; Four Creeks, tributaries of Tulare Lake, California. (Type, No. 57. Coll. Heermann.)
Luxilus occidentalis, GIRARD, Pac. R. R. Surv., x, 280, 1858.
Abramis occidentalis, GÜNTHER, Cat., VII, 305, 1868.
Notemigonus occidentalis, JORDAN & GILBERT, Synopsis, 250, 1883.

119. OPSOPŒODUS, Hay.

Opsopœodus, HAY, Proc. U. S. Nat. Mus., 1880, 507, (*emiliæ*).
Trycherodon, FORBES, in JORDAN & GILBERT, Synopsis, 247, 1883, (*megalops*).
Opsopœa, JORDAN & EVERMANN, new subgenus (*bollmani*).

Mouth very small, terminal. Body fusiform. Upper jaw protractile; no barbels. Teeth 5–5 or 4–5, with little or no grinding surface and with serrated edges, the tip strongly hooked. Abdomen not compressed. Dorsal nearly over ventrals. Anal basis short. Lateral line complete, or more or less imperfect. Intestinal canal short. Peritoneum white. Singular fishes, of small size, confined to Eastern America. (*ὀψοποιέω*, to feed daintily; *δούς*, tooth.)

OPSOPŒODUS:
- *a.* Mouth very oblique, terminal, its cleft almost vertical; no distinct caudal spot.
  - *b.* Lateral line complete, or very nearly so.
    - *c.* Dorsal fin plain, without distinct dark markings; head very slender. OSCULUS, 390.

cc. Dorsal with black blotch on its anterior rays, usually none posteriorly; head deeper. EMILIÆ, 391.

bb. Lateral line always incomplete; dorsal usually with a conspicuous black blotch on its posterior portion. MEGALOPS, 392.

OPSOPŒA, (ὀΨοποιέω, to feed daintily):

aa. Mouth scarcely oblique, its cleft almost horizontal; a black caudal spot nearly as large as eye; lateral line imperfect. BOLLMANI, 393.

Subgenus OPSOPŒODUS.

390. OPSOPŒODUS OSCULUS, Evermann.

Head 4½; depth 4⅓ to 5; eye 3. D. 10; A. 8; scales 7–38 to 41–3; teeth 4–5 or 4–4, serrate and hooked. Body slender; head subconic, its depth at eye but half its length; snout blunt, shorter than eye. Mouth very small, almost vertical. Breast naked; scales before dorsal small. Lateral line complete. Pale, with brown specks along edges of scales above; a narrow plumbeous lateral band; sometimes two rows of specks above and one below it; no black caudal spot and no black blotch on dorsal. Peritoneum silvery. Rio Neches, and other streams about Palestine and Houston, Texas. Very close to *O. emiliæ*, but quite different in color markings, possibly a subspecies of *O. emiliæ*. (*osculus*, a small mouth.)

Opsopœodus osculus, EVERMANN, U. S. Fish Comm. Expl. in Texas, 82, 1892, Neches River, near Palestine, Texas. (Type, No. 45560. Coll. Evermann, Scovell & Gurley.)

391. OPSOPŒODUS EMILIÆ, Hay.

Head about 4½; depth 4⅔; eye 3. D. 9; A. 8; scales 5–40–3; teeth 5–5, very slender, strongly hooked, and deeply serrate. Body rather elongate, moderately compressed, not elevated. Head short, slender. Muzzle blunt and rounded. Mouth very small and very oblique, smaller than in any other of our *Cyprinidæ*, with scarcely any lateral cleft; its size, when opened wide, less than that of the eye. Mandible short and deep, strongly curved; jaws equal. Eye longer than snout. Dorsal beginning over posterior rays of ventrals, nearer snout than base of caudal. Pectoral small, not reaching ventrals, the latter to anal. Caudal peduncle long and slender, the caudal long and deeply forked. Anal short and deep. Breast naked; 16 large scales before dorsal. Lateral line complete or very nearly so. Yellowish; sides silvery; scales above dark-edged; usually a dark lateral band from snout to caudal, above and below which are series of black dots; no distinct caudal spot; anterior rays of dorsal dark; no black spot on the posterior rays. Sandy lowland streams, Lake Erie and southern Indiana (New Harmony) to Georgia and Mississippi. Rather scarce, but widely distributed. (Named for Mrs. Emily Hay.)

Opsopœodus emiliæ, HAY, Proc. U. S. Nat. Mus., 1880, 507, Artesia, Macon, and Enterprise, Mississippi. (Type, No. 32222. Coll. Hay.) JORDAN & GILBERT, Synopsis, 247, 1883.

392. OPSOPŒODUS MEGALOPS (Forbes).

Head 4¾; depth 4 to 5; eye 2¾. D. 7 or 8; A. 7 or 8; scales 5–39–4, 15 before dorsal. Teeth 5–5, hooked and crenate. Lateral line always incomplete, sometimes on 4 or 5 scales only, sometimes extending with interruptions to middle of caudal peduncle. Body slender, fusiform;

mouth small, terminal oblique. Eye very large, longer than snout; fins large, the caudal long, deeply forked; pectorals extending $\frac{3}{4}$ distance to ventrals. Breast partly naked. Yellowish brown, sides faintly silvery; scales above dark-edged. Dorsal with a submedian black blotch in front on 4 rays; a second blotch usually present on 3 posterior rays. Length $2\frac{1}{3}$ inches. Western Ohio to Illinois, replacing *O. emiliæ* northward; perhaps not a distinct species. (*μεγαλόψ*, large-eyed.)

Trycherodon megalops, Forbes, in Jordan & Gilbert, Synopsis, 248, 1883, Illinois River at Pekin and Peoria; Mackinaw Creek, Illinois. (Type, No. 28406. Coll. Forbes.)

Subgenus OPSOPŒA, Jordan & Evermann.

393. OPSOPŒODUS BOLLMANI, Gilbert.

Head $4\frac{2}{5}$; depth $4\frac{2}{3}$ to 5; eye $3\frac{2}{3}$. D. 8; A. 8; scales 5-37-4. Head small, snout compressed, slender, somewhat rounded at tip, resembling *Hybopsis labrosus*. Mouth small, subterminal, slightly overhung by the snout, its cleft slightly oblique; maxillary reaching vertical from posterior nostril, shorter than snout, $4\frac{1}{2}$ in head. Eye equal to snout. Teeth 4-5 or 5-5, with well-developed grinding surface, one edge of which is conspicuously serrated, but less so than in *O. emiliæ*. Insertion of dorsal behind ventrals, slightly nearer caudal than snout; caudal deeply forked; lower fins moderate. Lateral line present on 7 or 8 scales only; breast scaled. Dark olive, the scales edged with dusky; a black lateral band through eye to caudal; chin black; a V-shaped pale area on snout; a black spot nearly as large as eye at base of caudal; a dark dorsal streak and one backward from anal; fins dusky; males with a black blotch on first two dorsal rays; marginal third of fin dusky; anal and ventrals bordered with black. Length 2 inches. Lowland swamps, known from Satilla River, Waycross, Georgia, and Obion River, Cypress, Tennessee. (Named for Charles Harvey Bollman, who first obtained the species and who died untimely of fever, taken in the Georgia swamps.)

Opsopœodus bollmani, Gilbert, Bull. U. S. Fish Comm., VIII, 1888, 226, 1890, Buckland Creek, Millen, Georgia. (Coll. Bollman & Fesler.) Woolman, Bull. U. S. Fish Comm., X, 1890, 272, 1892.

120. ABRAMIS, Cuvier.

(Breams.)

Abramis, Cuvier, Règne Animal, Ed. I., 111, 1817, (*brama*).

Notemigonus, Rafinesque, Journ. de Physique, de Chymie, et d'Hist. Nat., Paris, 1819, 421, (*auratus*).

Hemiplus, Rafinesque, Annals Nature, I, 6, 1820, (*lacustris*).

Stilbe, De Kay, New York Fauna: Fishes, 204, 1842, (*chrysoleuca*).

Ballerus, Heckel, Russegger's Reisen, I, 1032, 1843, (*ballerus*).

Stilbius, Gill, Canadian Naturalist, 1865, 18, (*americanus*).

Abramidopsis, Siebold, Süsswasserfische Oesterreichs, 117, 1863, (*leuckarti*; hybrid with *Rutilus*).

Body subelliptical, strongly compressed, both back and belly curved; back narrowly compressed; belly behind ventral fins forming a keel over which the scales do not pass. Head small, conic. Mouth small, oblique or horizontal, without barbels. Scales rather large. Lateral line continuous, strongly decurved. Dorsal fin inserted behind the ventrals.

Anal fin with its base more or less elongate, of from 13 to 40 rays; (9 rays in one species). Teeth 5–5, hooked, with grinding surface, the edges of which, in American species, are more or less crenate. Alimentary canal short, though rather longer than the body. Size rather large. As here understood, the American genus *Notemigonus* is included in *Abramis*, from which it differs in the much shorter anal fin, from 9 to 18 rays instead of 20 to 40. There is much variation in the length of the anal and in the form of the mouth among the species left in *Abramis*, and a reunion or a different division of the group may be necessary. In the American species, *Notemigonus*, the teeth are more or less crenate, in form approaching the serrated teeth of the European genus *Scardinius*. In the European subgenera, *Abramis* and *Ballerus*, the teeth are entire. In *Ballerus* there are 30 to 40 anal rays; in *Abramis* proper 20 to 28. (*Abramis*, an old name of the Bream, *Abramis brama*.)

NOTEMIGONUS (νῶτος, back; ἡμι-, half; γωνία, angle; the back being almost carinated.)

a. Teeth crenate or serrate; mouth terminal; anal shortish, its rays less than 20.

b. Anal fin with 12 to 18 rays; scales in the lateral line 43 to 55. CRYSOLEUCAS, 394.

bb. Anal fin with 9 or 10 rays; scales in lateral line about 40. GARDONEUS, 395.

Subgenus NOTEMIGONUS, Rafinesque.

394. ABRAMIS CRYSOLEUCAS (Mitchill).

(GOLDEN SHINER; ROACH; BREAM.)

Head 4½; depth 3; eye moderate, about 4 in head. D. 8; A. 13, (12 to 14); scales 10–46 to 55–3; teeth 5–5. Body moderately elongate, strongly compressed. Head short, subconic, compressed, the profile somewhat concave. Mouth small, oblique, the upper lip on level of upper part of pupil, the maxillary not reaching front of eye. Fins medium. Color clear greenish above; sides silvery, with bright golden reflections; fins yellowish, the tips of the lower fins sometimes slightly orange in spring males. Length 12 inches. Nova Scotia and Maryland to Dakota and Texas; everywhere abundant in bayous and weedy ponds. One of the most familiar and characteristic of our *Cyprinidæ*. (χρυσός, gold · λευκός, white.

Cyprinus crysoleucas, MITCHILL, Rept. Fish. N. Y., 23, 1814, New York

Cyprinus hemiplus, RAFINESQUE, Amer. Monthly Mag., 1817, 121 Lake George; Saratoga Lake.

Abramis americanus, GÜNTHER, Cat., VII, 305, 1868.

Abramis ? leptosomus, GÜNTHER, Cat., VII, 306, 1868.

Notemigonus chrysoleucus, JORDAN, Bull. U. S. Nat. Mus., X, 65, 1877; JORDAN & GILBERT, Synopsis, 250, 1883.

Notemigonus leptosomus, JORDAN & GILBERT, Synopsis, 250, 1883.

Represented southward by

394a. ABRAMIS CRYSOLEUCAS BOSCI (Cuvier & Valenciennes).

Head 4⅓; depth 3⅓; eye 3. D. 8; A. 15 to 17; scales 8-43 to 50-2; teeth 5-5. Scales larger, the anal fin more elongate, and the male with brighter colors. Body moderately elevated, very strongly compressed; head rather broad and flat between the eyes; mouth small, quite oblique, the maxillary barely reaching the eye; eye very large and prominent, anterior. Dorsal fin short and very high, almost falcate, well back; anal fin high and long. Scales rather large, the lateral line running very low. Color pale olive, with silvery luster; lower fins red in the males in spring. Length 12 inches. Rivers of the South Atlantic States; abundant from the James to the Altamaha and St. Johns; intergrading with the typical form. (Named for M. Bosc, a French naturalist and collector, consul at Charleston toward the end of the eighteenth century.)

Leuciscus bosci, Cuvier & Valenciennes, xvii, 313, 1844, Carolina; Pennsylvania; New York.

Cyprinus americanus, Linnæus, Syst. Nat., Ed. xii, 530, 1766, Charleston; not of Ed. x, 1758, which is *Menticirrhus*.

Notemigonus ischanus, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1876, 364, South Fork Ocmulgee River, Flat Shoals, Georgia. (Type, Nos. 17865 and 20112. Coll. Jordan.)

Notemigonus americanus, Jordan & Gilbert, Synopsis, 250, 1883.

395. ABRAMIS GARDONEUS (Cuvier & Valenciennes).

Head 5½; depth 3¾; eye 4 in head. D. 10; A. 9; teeth 5-5, with grinding surface and serrated edge; scales 7-39-3. Body moderately elongate, compressed. Head obtuse. Isthmus narrow. Mouth small, oblique, the lower jaw included. Dorsal nearly midway of body, little behind ventrals. Olivaceous. South Carolina; one specimen known, perhaps a hybrid between *A. crysoleucas* and some other fish. (*Gardon*, a French name of the Roach, *Rutilus rutilus*.)

Leuciscus gardoneus, Cuvier & Valenciennes, xvii, 316, 1844, Charleston; Günther, Cat., vii, 258, 1868.

Chondrostoma gardoneum, Cope, Trans. Amer. Phil. Soc. Phila., 1866, 395.

Notemigonus gardoneus, Jordan & Gilbert, Synopsis, 250, 1883.

121. COCHLOGNATHUS, Baird & Girard.

Cochlognathus, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1854, 158, (*ornatus*).

This genus has the general character and appearance of *Cliola* and *Pimephales*, the dentition and the structure of the fins being the same; the teeth, however, are rather more strongly hooked and with deeper grinding surface. It differs in the structure of the jaws, which are provided each with a hard cutting plate, in appearance similar to that of *Diodon*, the sharp, bony edge being surrounded by the usual lip. First ray of dorsal separated by membrane, and spine-like, as in *Cliola* and *Pimephales*. Alimentary canal short. Peritoneum white. Pseudobranchiæ present. Lateral line complete. Anal fin small. Spring males with tubercles and dark pigment as in *Pimephales*. We place this genus and *Cliola* in the neighborhood of *Notropis*, on account of the shortness of the intestines, but it is likely that their real relations are with *Pimephales*, and that the reduction in the length of the alimentary canal is a character independently developed. (*κόχλος*, shell; *γνάθος*, jaws; the covering of the jaw being hard, like shell.)

a. Scales moderate, about 40 in the lateral line.	ORNATA, 396.
aa. Scales large, about 34 in lateral line.	BIGUTTATA, 397.

396. COCHLOGNATHUS ORNATA, Baird & Girard.

Head 4; depth 4¼. D. 8; A. 6; lateral line 40; teeth 4–4. Appearance, dorsal fin, and coloration much as in *Pimephales notatus* or *Cliola vigilax*. Body moderately elongate. Head rather long. Dorsal fin over the ventrals, rather high; anal fin quite small; caudal fin short. Dorsal fin with a black spot near the base in front and a dusky blotch behind; caudal fin with a dusky median band, in front and behind which is a pale area; a dusky lateral band. Snout tuberculate in spring males, as in *Pimephales*. Length 3 inches. Rio Grande. A singular little fish, with the mouth resembling that of *Chondrostoma* or *Acrocheilus*, but the structure otherwise different from either. (*ornatus*, adorned.)

Cochlognathus ornatus, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 158, Brownsville, Texas; GÜNTHER, Cat., VII, 187, 1868; JORDAN & GILBERT, Synopsis, 161, 1883.

397. COCHLOGNATHUS BIGUTTATA, Cope.

Head 5 in length, with the caudal fin; depth a little less. Eye large, 3⅗ in head, a little less than muzzle and than interorbital space. D. 8; A. 7; scales 7–34–? Form of *Pimephales notatus*. Head oblong and rather wide above. Muzzle decurved in profile; mouth terminal. Head wide behind and flat above. Maxillary not quite reaching line of orbit. Ventral fins inserted opposite second or third dorsal ray, reaching to vent; anal fin small. Pectorals reaching three-fifths to ventrals. Color silvery, without dark markings, except a black spot at the base of the caudal and on the anterior rays of the dorsal. Length 2½ inches. Trinity River, Texas. Very close to the preceding, from which it may perhaps differ in the larger scales. (Cope.) (*biguttatus*, two-spotted.)

Cochlognathus biguttata, COPE, Bull. U. S. Nat. Mus., XVII, 1880, 37, Trinity River, Fort Worth, Texas. (Coll. Cope.) JORDAN & GILBERT, Synopsis, 161, 1883.

122. CLIOLA, Girard.

Ceratichthys,* BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1853, 390; (name only; no definition; applied to *vigilax*, which was not intended as type).
Cliola, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 192, (*vigilax*).
Hypargyrus, FORBES, Proc. U. S. Nat. Mus., 1884, 200, (*tuditanus*).

Form and appearance of *Pimephales*, the same squamation, fin rays and plan of coloration, and the first ray of the dorsal similarly separated by membrane, the structure of the mouth similar, but with the intestinal canal short, shorter than body, the peritoneum pale and the teeth more hooked, as in *Notropis*. The single species bears a striking resemblance to *Pimephales notatus*, but is distinguishable by the more contrasted coloration and by the generic characters which ally it, with *Cochlognathus*, to the carnivorous species called *Notropis*. The genus is certainly very near *Pimephales* although in its technical characters it approaches nearer to *Notropis*. (A coined name, without meaning, first applied to a railway station in Illinois.)

---

* We do not use the name *Ceratichthys* for this genus, because no explanation of its use was given in the paper when it first appeared. It was at that time a MS. name of Professor Baird for the group typified by *Hybopsis kentuckiensis*, and to this group *C. vigilax* was wrongly referred.

a. Anterior dorsal rays with a black spot.	vigilax, 398.
aa. No black spot on dorsal fin.	smithii, 399.

398. CLIOLA VIGILAX (Baird & Girard).

Head 4¼; depth 4½; eye large, 3½ in head. D. 8; A. 7; scales 8–42–6; teeth 4–4, with grinding surface, and slight hook. Body stout, somewhat compressed, broad and flat above, with deep caudal peduncle. Head broad and flat above, with an angle at the temporal region. Muzzle broad and obtuse, less truncate than in *Pimephales notatus*. Mouth rather small, but larger than in *Pimephales*, horizontal, terminal, the jaws about equal, maxillary not reaching to opposite anterior margin of eye. Dorsal inserted above ventrals, nearer snout than caudal. Scales before dorsal small and crowded, as in *Pimephales*, in about 28 series. Dusky yellowish; sides silvery, with an obsolete dark lateral band, which terminates in a jet-black spot; a very distinct black spot on anterior rays of dorsal about half way up. Length 3 inches. Strongly resembles *Pimephales notatus*, but more silvery, less plumbeous, and the black spots more sharply defined. The spring males have little if any black pigment. Ohio to Georgia, Iowa and Texas, very abundant; southwest as far as the Rio Grande. (*vigilax*, watchful.)

Ceratichthys vigilax, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 390, Otter Creek, North Fork of Red River, Arkansas. (Coll. Capt. Geo. B. McClellan.)

Cliola vigilax, *Cliola velox*, San Pedro Creek, tributary of Rio San Antonio (Type, No. 30. Coll. Lieut. A. W. Whipple), and *Cliola vivax*, Rio Leon, tributary of Rio San Antonio, Texas, Girard, Proc. Ac. Nat. Sci. Phila. 1856, 192; and in Pac. R. R. Surv., x, 257, 258, 1858. *C. vivax* is said to have scales "a good deal smaller," but no data are given; the types of all three are now lost.

Hybopsis tuditanus, Cope, Cypr. Penn., 381, 1866, Detroit, Michigan.

Cliola tuditana, *taurocephala*, and *vigilax*, Jordan & Gilbert, Synopsis, 165, 166, and 169, 1883.

399. CLIOLA SMITHII, Evermann & Cox.

Head 4; depth 3⅔; eye 4; snout 4; interorbital width 3. D. I, 8; A. 7; scales 9–47–6, 27 before the dorsal. Teeth 4–4, not hooked, grinding surface slightly developed. Intestine not long. Body short and stout, compressed; head moderate; mouth small, terminal, slightly oblique; maxillary not reaching eye; preorbital broad. Back considerably arched; caudal peduncle deep, its least depth 2 in head. Origin of dorsal fin over ventrals, nearer snout than base of caudal. Color, above densely covered with fine black specks, giving a general blue-black appearance; sides with a broad plumbeous band ⅔ as broad as eye, darkest and best defined on caudal peduncle; sides below this band with a few scattered specks anteriorly; lower part of caudal peduncle pale; top and upper parts of sides of head bluish-black; dorsal, anal, and pectorals with a few dark specks; other fins plain. Length 2½ inches. Southern South Dakota, known only from Prairie Creek near Scotland. (Named for Dr. Hugh M. Smith, Chief of the Statistical Division of the U. S. Fish Commission.)

Cliola smithii, Evermann & Cox, Rept. U. S. Fish Comm., xix, 1895, Prairie Creek, Scotland, South Dakota. (Type, No. 45681. Coll. Evermann, Rutter, & Cox.)

Azteca, JORDAN & EVERMANN, new subgenus, (*vittata* = *aztecus*).
Orcella, JORDAN & EVERMANN, new subgenus, (*orca*).

Body oblong or elongate, more or less compressed. Mouth normal, mostly terminal and oblique, sometimes subinferior. No barbels. Teeth in one or two rows, those of the larger row always 4–4, hooked, sharp-edged or with a narrow grinding surface. Scales large, often closely imbricated, those before the dorsal rarely very small. Lateral line complete or nearly so, usually decurved. Dorsal fin inserted above, or more usually behind, the ventrals; anal fin short or somewhat elongate. Abdomen rounded, never sharp-edged. Coloration more or less silvery, often brilliant, the males in spring usually with red or white pigment and the head with small tubercles. A very large group of small fishes, especially characteristic of the fresh waters of the Eastern United States.

---

* The following is Rafinesque's original account of *Notropis* and its typical species:

N. G. Notropis: Holobranchial abdominal. Body elongated compressed, back carinated, nearly straight, belly not carinated, scarcely bowed, a lateral line and a longitudinal silver band; vent nearer the tail than the head. Head oval compressed, convex above, mouth diagonal large, jaws without teeth, the lower longer and mobile, the upper extensible; eyes very large; gill cover large, smooth valviform, three branchial rays. One dorsal fin opposed to the interval between the anal and abdominal fins, which have nine rays.

Observations.—The generic name means carinated or keeled back. It forms a remarkable new genus, belonging to the third natural order *Gastripia* or the abdominals, the sixteenth natural family *Cyprinia*, and the second subfamily *Gymnopomia*, (see Analysis of Nature) together with the genera *Cyprinus*, *Atherina*, *Hydrargyra*, *etc.* It differs from the first by the compressed body, carinated back, lateral band, large mouth. deep-cleft gill cover, etc., and from the two last genera by the three branchial rays, nine rays to the abdominal fins, want of teeth, etc..

Notropis atherinoides: Head silvery, brown above; body pale fulvous, transparent, with a broad silver band; lateral line in the band; fins whitish, dorsal, and anal with eleven rays, the first very short, tail slightly forked.

History.—This new fish was discovered in Lake Erie by Gov. De Witt Clinton, who had the kindness to present me with many specimens; they are now deposited in the Lyceum of Natural History. I have ascertained that they belonged to a new genus, next to *Atherina*, and the specific name which I have adopted implies such an affinity. These fishes come on the shores of Lake Erie, and even in the river of Niagara, in the spring, in great shoals; but they are so small that they are scarcely noticed, and escape through the common nets; their usual size being from one to two inches, and very thin and slender; they are called *Minny* or *Minnow*, together with twenty different other species of fish, and often considered as the young of other fishes. They live in the depth of the lake at other seasons, and are probably common all over the great lakes. Their eyes are exceedingly large, occupying nearly the whole foreside of the head, the lips are very thin and membranaceous, the nostrils large, the gill cover is nearly round, and split above to the eyes; they have small, thin, broad scales, the rays of the fins are scarcely articulated, simple and brittle; the pectoral fins have about fifteen rays, and the caudal fin about twenty-four.—*Rafinesque.*

As here understood, *Notropis* contains about 100 species of small Cyprinoids, all of them confined to the streams of North America east of the Rocky Mountains. They are in some respects a degenerate type—probably of comparatively recent origin and perhaps descended from such forms as the European *Alburnus* and *Leuciscus*. They are feeble fishes of small size, none of them of value as food for man, but of great importance as food for the larger predatory fishes, particularly the *Centrarchidæ*. The species are highly variable, readily affected by surrounding conditions while the really distinctive characters are very few. The identification of species is very difficult and in the case of young specimens often impossible. The following analytical key must be used with great caution as all characters are subject to individual variations. Even the dentition is subject to variations, the ancestors of the group having probably originally had grinding surfaces to the teeth, this becoming rudimentary in some forms and disappearing altogether in others closely related. Various attempts have been made to break up this group into smaller genera, by subdivision according to the dentition. The various groups heretofore proposed by Girard, Cope, and Jordan seem at the most to indicate sections of slight systematic value. The most practicable division is that made in the Synopsis of Fishes of North America, by which the name *Notropis (Minnilus)* is retained for the species having the teeth 2, 4–4, 2, while those with but one tooth in the inner row, or with the inner row wanting, would stand as *Alburnops*. The frequent presence of two teeth in one or both inner rows in two species (*heterodon*, *hudsonius*) belonging to *Alburnops*, renders this division of the genus unsatisfactory. (*νῶτος*, back; *τρόπις*, keel, but the supposed keel of Rafinesque's type was due to shriveling in drying.)

a. Teeth 4–4; 1, 4–4, 0; or 1, 4–4, 1, (sometimes two teeth in one or both inner rows in *N. hudsonius* and *N. heterodon*).

b. Scales not very closely imbricated, not notably deeper than long; dorsal inserted nearly over the ventrals; anal short, its rays 7 or 8; no black spot on dorsal fin.

c. Teeth one-rowed, 4–4, the grinding surface more or less developed at least on one or two teeth. (Teeth sometimes 2, 4–4, 2 in *N. heterodon.*)

AZTECA, (Aztec, the ancient rulers in Mexico):

d. Scales small, about 50 in lateral line; body compressed; scales before the dorsal small; head blunt, nearly round; coloration plain. AZTECUS, 400.

dd. Scales moderately large, 31 to 45 in lateral line.

CHRIOPE, (*χρεία*, want; *ὤπη*, aperture):

e. Lateral line usually (but not always) more or less incomplete; scales before the dorsal large. Small species, usually with a dusky lateral band.

f. Snout very obtuse; lower jaw not projecting.

g. Mouth moderate, the maxillary extending to opposite front of eye or nearly so.

h. Chin black. BIFRENATUS, 401.

hh. Chin pale. JORDANI, 402.

gg. Mouth very small, the maxillary not nearly reaching front of eye.

i. Chin pale. MACULATUS, 403.

ii. Chin black. ANOGENUS, 404.

ff. Snout rather pointed; lower jaw projecting.

j. Mouth very small; chin pale. CAYUGA, 405.

jj. Mouth moderate; chin black. HETERODON, 406.

Alburnops, (*alburnus*, the bleak; from *albus*, white; ὤψ, appearance):

ee. Lateral line always complete; scales large, fewer than 40 in lateral line; teeth 4–4, well hooked. Small, weak species.

k. Body rather elongate, the depth not more than ¼ the length.

l. Scales before the dorsal 17 in number; aspect of *N. heterodon.*
FRETENSIS, 407.

ll. Scales before the dorsal 12 to 15 in number.

m. Body not marked with distinct round dark spots; the spots, if any, mere punctulations.

n. Base of caudal without distinct black spot, (except in the very young).
BLENNIUS; SABINÆ; VOLUCELLUS; SCYLLA; PROCNE; NIGROTÆNIATUS; and KANAWHA, 408–414.

nn. Base of caudal with a small black spot more or less distinct.
BRAYTONI; SPECTRUNCULUS; OZARCANUS, 415–417.

mm. Body with many irregular round black spots and dots, the largest often nearly as large as pupil; form rather stout.
CHIHUAHUA, 418.

kk. Body short and chubby, the depth more than ¼ the length.
TOPEKA, 419.

Hudsonius, (from Hudson River):

cc. Teeth two-rowed, 1, 4–4, 0 or 1, 4–4, 1 or 2; the grinding surface more or less developed.

o. Head comparatively large, 3½ to 4¼ in body; teeth, 1, 4–4, 1; small, slender species, without distinct dark spot at base of caudal.

p. Eye moderate, 3½ to 4 in head in adult.
GILBERTI; PIPTOLEPIS; SIMUS; LONGIROSTRIS, 420–423.

pp. Eye very large, 3 to 3½ in head in adult.
NUX; NOCOMIS; SHUMARDI; ILLECEBROSUS, 424–427.

oo. Head short, bluntish, 4 to 5 in body in adult; species of large size and silvery coloration, usually with a distinct black spot at base of caudal fin.
HUDSONIUS, 428.

bb. Scales deeper than long, more or less closely imbricated along sides of body; teeth with the edges often crenate, the grinding surface sometimes narrow or obsolete.

q. Teeth one-rowed, 4–4, the young sometimes 1, 4–4, 1.

Codoma, (a coined name):

r. Head very thick, bluntly rounded on every side; mouth small, oblique, its cleft chiefly anterior; scales large, about 40 in lateral line. ORNATUS, 429.

Moniana, (a coined name):

rr. Head compressed, not bluntly rounded.

s. Dorsal without distinct black blotch on its upper posterior portion; body more or less deep and compressed.

t. Scales small, 43 in lateral line; a dusky spot at base of caudal.
FORMOSUS, 430.

tt. Scales moderate, 33 to 38 in lateral line; adult without caudal spot.
FRIGIDUS; LUTRENSIS; PROSERPINA, 431–433.

ss. Dorsal with a black spot on its last rays above, the fin very high.
CALLISEMA, 434.

Cyprinella, (diminutive of *Cyprinus*, carp):

qq. Teeth two-rowed, 1, 4–4, 1.

u. Anal fin moderate, of 7 to 9 rays.

v. Dorsal fin without large black blotch on its upper posterior rays in adult.

w. Caudal fin without black spot at its base in adult.

x. Body deep, compressed, broadly elliptical in outline.
BUBALINUS, 435.

xx. Body subfusiform in outline.
LUDIBUNDUS; MACROSTOMUS, 436; 437.

ww. Caudal fin with a distinct black spot at base in all ages.

TEXANUS; NOTATUS; VENUSTUS, 438–440.

vv. Dorsal fin with a large black blotch on its upper posterior rays in adult (often obsolete in young), always conspicuous in old males; the fins in males with satin-white, and often with red, pigment.

y. Base of caudal with a conspicuous black spot.

z. Fins in males with white or orange pigment, but no red.

CERCOSTIGMA; STIGMATURUS, 441; 442.

zz. Fins in males with red pigment.

TRICHROISTIUS; CALLISTIUS; EURYSTOMUS, 443–445.

yy. Base of caudal without a conspicuous black spot; no red pigment.

CÆRULEUS; NIVEUS; WHIPPLII; ANALOSTANUS;
GALACTURUS; CAMURUS, 446–451.

uu. Anal fin long, of 10 or 11 rays; fins high; breeding colors brilliant, the males largely red.

a′. Dorsal fin with a conspicuous black blotch on its last rays.

b′. Caudal with a dark spot at base. XÆNURUS; HYPSELOPTERUS, 452; 453.

bb′. Caudal with a dusky cross-band, but without dark spot at base.

PYRRHOMELAS, 454.

aa′. Dorsal fin in males without black blotch. GARMANI, 455.

aa. Teeth 2, 4–4, 2.

c′. Anal fin short, its developed rays 7 to 9, sometimes 10 in *N. zonistius*.

d′. Teeth with the grinding surface developed.

Luxilus (from *lux*, light):

e′. Species attaining a large size, with the scales along the sides very closely imbricated so that the exposed surfaces are very narrow; lower jaw included; dorsal over ventrals; adult with neither dorsal nor caudal spot.

CORNUTUS; CERASINUS; ALBEOLUS; LACERTOSUS, 456–459.

Hydrophlox, (ὕδωρ, water; φλώξ, flame):

ee′. Species of moderate or small size, the colors generally brilliant in spring males; dorsal inserted more or less behind ventrals; no black spot at base of dorsal.

f′. Lower jaw projecting. MACDONALDI; COCCOGENIS, 460; 461.

ff′. Lower jaw included or scarcely projecting.

g′. Base of caudal without dark spot.

ZONATUS; ZONISTIUS; RUBRICROCEUS; CHLOROCEPHALUS;
LUTIPINNIS, 462–466.

gg′. Base of caudal with a more or less evident dark spot, at least in young.

(HETERODON; HUDSONIUS.) CHILITICUS; ALTIPINNIS; ROSEUS;
CHALYBÆUS; CHROSOMUS; XÆNOCEPHALUS, 467–472.

dd′. Teeth without evident grinding surface; scales not closely imbricated; no black spot at base of dorsal in front; sexes usually colored alike.

Orcella (diminutive of Orca):

h′. Top of head elevated, transversely convex, so that the small eye is as near ventral as dorsal surface; body little compressed; color pale, no markings.

ORCA, 473.

Notropis (part):

hh′. Top of head not especially elevated, the eye nearer dorsal than ventral outline of head.

i′. Dorsal fin inserted nearly over ventrals; no distinct black caudal spot.

ARIOMMUS; SCABRICEPS; JEJUNUS, 474–476.

ii′. Dorsal fin inserted more or less behind ventrals.

j′. Base of caudal without spot. SWAINI, 477.

jj′. Base of caudal with a faint spot. AMABILIS, 478.

jjj′. Base of caudal with a jet-black spot. LEUCIODUS; SCOPIFER, 479; 480.

cc′. Anal fin long, its rays 11 or 12, rarely 9; dorsal inserted behind ventrals.

NOTROPIS, (part):

k'. Scales loosely imbricated, not crowded along sides; teeth mostly without grinding surface; no black spot at base of dorsal; caudal spot faint or wanting; fins mostly plain or with red; scales above lateral line usually large, in 5 to 7 series.

TELESCOPUS; SOCIUS; NOTEMIGONOIDES; STILBIUS; ATHERINOIDES;
ARGE; DILECTUS; FUMEUS; RUBRIFRONS; PHOTOGENIS;
AMŒNUS; SCEPTICUS; MICROPTERYX; METALLICUS, 481–494.

LYTHRURUS, (λύθον, gore; ὀυρά, tail):

kk'. Scales more or less closely imbricated so that the exposed surfaces are deeper than long; teeth with a narrow grinding surface; scales above lateral line small, in 7 to 10 series, those before the dorsal reduced; usually a dark spot on dorsal, rarely one at base of caudal; males largely red.

- *l'*. Dorsal fin without distinct dark spot, or at the most only a few punctulations.
    - *m'*. Body short and deep. BELLUS, 495
    - *mm'*. Body slender and elongate. LIRUS, 496.
- *ll'*. Dorsal fin with a black spot on its anterior rays, more or less distinct.
    - *n'*. Black dorsal spot above the middle of the fin. ROSEIPINNIS, 497.
    - *nn'*. Black dorsal spot at the base of the fin. UMBRATILIS, 498.

Subgenus AZTECA, Jordan & Evermann.

400. NOTROPIS AZTECUS, Woolman.

Head 4; depth 3½ to 4; eye 5; snout 3. D. 8; A. 8; scales 7–50–4, about 23 before dorsal, small; teeth 4–4, hooked. Body rather stout, heavy anteriorly, with long but strong caudal peduncle; back moderately arched; head blunt and heavy, but less gibbous than in *N. ornatus*; snout short, not much longer than eye; jaws subequal; mouth moderate, quite oblique, the maxillary not quite reaching eye, the cleft of the mouth chiefly anterior; eye small; scales very small for the genus, not closely imbricated. Fins all low; dorsal small, inserted behind ventrals; pectorals short, not nearly reaching ventrals. Lateral line decurved. Color, dark above, below this a silvery band, and still lower a dusky or plumbeous lateral band; young with a faint plumbeous caudal spot; fins all plain; cheeks silvery; sexes alike in color. Length 3 inches. This species has the head formed much as in *Notropis ornatus*, but in form of body, color, and in size of scales the two differ widely. Valley of Mexico. Our specimens collected by Mr. A. J. Woolman, at the City of Mexico, where it abounds in the canals. (*Aztecus*, Aztec.)

Codoma vittata, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 195, Valley of Mexico, (Coll. Potts.); and U. S. & Mex. Bound. Surv., Ichth., 53, pl. 29, figs. 18–21, 1859.

Notropis aztecus, WOOLMAN, Bull. U. S. Fish Comm., XIV, 1894, May 3, 1894, 63, plate 2, City of Mexico. (Type, No. 45569. Coll. Woolman.)

Cliola vittata, JORDAN & GILBERT, Synopsis, 172, 1883, (not *Leuciscus vittatus*, DE KAY, 1842, which is also a *Notropis*).

Subgenus CHRIOPE, Jordan.

401. NOTROPIS BIFRENATUS (Cope).

Head 4⅕; depth 4⅕; eye 3. D. 8; A 7; scales 5–36–3; teeth 4–4. Body rather slender, the caudal peduncle somewhat contracted. Head moderate, the muzzle very obtuse. Mouth oblique, the jaws about equal; upper lip opposite lower part of pupil. Eye large, longer than snout. Lateral line developed for a very short distance. 13 scales before dorsal.

Straw-colored, the scales brown-edged above; a shining black band from snout through eye to caudal; this includes the edge of the lower jaw; an orange band above this on the snout; regions below the black band silvery. Length 1½ to 2 inches. Massachusetts to Maryland, coastwise, not common. A small but handsomely colored species. (*bis*, two; *frenatus*, bridled.)

Hybopsis bifrenatus, Cope, Cypr. Penn., 384, 1866, Schuylkill River, Conshohocken, Pennsylvania. (Coll. Cope.)
Hemitremia bifrenata, Jordan & Gilbert, Synopsis, 162, 1883.

402. NOTROPIS JORDANI,* Eigenmann & Eigenmann.

Allied to *N. heterodon*. D. 9; A. 8; scales 4-35-4, 15 before dorsal. Slender; fins all small; origin of dorsal over ventral, equidistant from base of middle caudal rays and nares; scales closely imbricated, the exposed edges little higher than long. Lateral line decurved, the tubes developed on fewer than 10 scales. A plumbeous lateral band overlaid with silvery; a dark vertebral line from occiput to caudal; sides with a few dark specks, dorsal surface more densely specked, the margins of the scales darker. South Saskatchewan River, Medicine Hat, Assiniboia. (Eigenmann.) (Named for David Starr Jordan.) (Coll. Eigenmann.)

Notropis albeolus, Eigenmann & Eigenmann, Amer. Nat., February, 1893, 152, Medicine Hat.
Notropis jordani, Eigenmann & Eigenmann, *l. c.*, June, 1893, 592, substitute for *albeolus*, preoccupied in *Notropis*.

403. NOTROPIS MACULATUS (Hay).

Head 4½; depth 5; eye equal to snout, 3½ in head. D. 8; A. 8; scales 5-38-3; teeth 4-4, with grinding surface. Body long and slender, slightly elevated at the dorsal, somewhat compressed. Head flattened above; snout rounded. Mouth small, terminal, slightly oblique, maxillary not reaching to opposite eye. Dorsal slightly behind ventrals, nearer snout than base of caudal. Lateral line with pores on 8 to 10 scales only. Straw color; a narrow dark dorsal band, and a dark streak on each side of anal; a plumbeous lateral band, and black specks on each scale; a black spot as large as eye at base of caudal. Length 2½ inches. Chickasawha River, Mississippi. (Hay.) (*maculatus*, spotted.)

Hemitremia maculata, Hay, Proc. U. S. Nat. Mus., 1880, 505, Chickasawha River, Enterprise, Mississippi, (Type, Nos. 32245 and 27438. Coll. Hay.) Jordan & Gilbert, Synopsis, 162, 1883.

404. NOTROPIS ANOGENUS, Forbes.

Head 4¼; depth 4⅗; eye 3¼. D. 8; A. 7. Lateral line 34 to 37, 13 before dorsal. Teeth 4-4. Very similar to *N. heterodon*, but with the lateral line usually complete; the mouth very small and very oblique, almost wholly anterior; the lower jaw included, the upper lip above level of pupil; snout very short, blunt, shorter than eye. Dusky; a dusky lateral band through eye, ending in a faint black spot at base of caudal; a black speck above each pore of lateral line; chin black. Length 1½ inches. Western New York, (Cayuga Lake; Meek) to Northern Illinois; rather scarce. (*ἀ*, without; γένυς, chin.)

---

*The types of this species are now in the British Museum. Our friend, Dr. Boulenger, writes us the mouth is of moderate size, the premaxillary extending to below front of eye; lower jaw not included, as long as the upper, which is somewhat convex, about as long as the moderate eye. Chin not black.

Notropis anogenus, Forbes, Bull. Ill. Lab. Nat. Hist., 1885, 138, Fox River, McHenry, Illinois. (Coll. Forbes.)

405. NOTROPIS CAYUGA, Meek.

Head 4⅙; depth 4½; eye 3½. Scales 36, 14 before dorsal. Teeth 4–4. Allied to *N. heterodon*, from which it may be best known by the absence of black on the chin. Lateral line wanting on some scales; mouth very small, anterior, the maxillary not reaching the eye; jaws subequal; eye large, equal to snout. Scales above dark-edged, the outlines very sharply defined; chin not black; a black stripe through snout and eye, a dusky lateral shade and a small caudal spot. Length 2½ inches. Cayuga Lake and northern New York, westward to Assiniboina, South Dakota, Nebraska, Kansas, and Arkansas, (Arkansas River at Wichita, Kansas). Not rare, but hitherto usually confounded with *N. heterodon*.

Notropis cayuga, Meek, Ann. Ac. Nat. Hist. N. Y., 1888, 305, Cayuga Lake, New York, (Coll. Meek); Jordan, Bull. U. S. Fish. Comm., IX, 1889, 17.

Notropis heterolepis,* Eigenmann & Eigenmann, American Naturalist, February, 1893, 152, Qu'Appelle River, Fort Qu'Appelle, Canada. (Coll. Eigenmann.)

Represented southwestward by

405a. NOTROPIS CAYUGA ATROCAUDALIS, Evermann.

Head 4⅖; depth 4⅔; eye 3⅕. D. 8; A. 7; scales 7-36–4, 13 before dorsal. Snout somewhat longer; lateral line complete. Body moderately elongate; head short and bluntly conic; snout slightly shorter than eye; caudal peduncle short and deep; origin of dorsal slightly behind ventrals; anal small. Olivaceous, dotted above, not crosshatched; a black lateral band half width of eye, ending in a black caudal spot, this band extending through eye and snout. Rio Neches, Palestine, Texas. Also in Rio Comal at New Braunfels, Texas. (*ater*, black; *cauda*, tail.)

Notropis cayuga atrocaudalis, Evermann, Bull. U. S. Fish Comm., XI, 1891, 76, (May 25, 1892,) Neches River, Palestine, Texas. (Type, No. 45557. Coll. Evermann, Scovell, & Gurley.)

---

*The following is the description given of *Notropis heterolepis*: D. 9; A. 9. Scales 5–35–4, 15 scales before the dorsal. Teeth 4–4. Dorsal inserted equidistant between base of upper caudal rays and anterior margin of eye, behind last ray of dorsal; scales loosely imbricated, almost embedded in front of dorsal; scales along the median line with a deep notch near middle of posterior margin; the line nearly straight; a few black specks along base of anal, a dark line from anal to caudal; a dark band from tip of snout along sides to caudal; a conspicuous black curved line at base of each scale of lateral line; all the scales above lateral band dotted with black; a narrow vertebral line from occiput to dorsal, a broad dusky band on back between dorsal and caudal, between this and lateral band a lighter band; scales of back with dark markings; series of minute black dots along each ray of dorsal, anal, and anterior portion of pectoral; dorsal and caudal quite dark.—*Eigenmann.*

Dr. Eigenmann has omitted to describe the mouth of this species. According to Dr. G. A. Boulenger, who has kindly examined the type in the British Museum, the mouth is quite small, moderately oblique, the lower jaw not included; premaxillary extending to below anterior nostril; chin not black. Eye very large, longer than the short, convex snout. Only one specimen (35 mm. long) known. Apparently not different from *Notropis cayuga*. (ἑτερός, various; λεπίς, scale.)

406. NOTROPIS HETERODON* (Cope).

Head 4; depth 4; eye 3 in head. D. 8; A. 8; scales 5–36–3, the lateral line extending about half length of body; teeth 4–4, (sometimes 2, 4–4, 2, see below), often crenate. Body moderately stout, the back somewhat elevated. Head rather pointed, the muzzle acuminate. Mouth oblique; lower jaw projecting; upper lip opposite upper rim of pupil. Maxillary extending to opposite front of orbit. Thirteen scales in front of dorsal. Lateral line usually more or less imperfect. Color olivaceous; chin black; a blackish rostral band; sides with a leaden or dusky band. Length 2½ inches. New York to Michigan and Kansas, common. Variable. (*ἕτερος*, varying; *ὀδούς*, tooth.)

Alburnops heterodon, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 281, Lansing; Grosse Isle, Michigan.

Notropis germanus, HAY, Proc. U. S. Nat. Mus., 1887, 252, Smoky Hill River, Wallace, Kansas. (Type, No. 37949. Coll. Hay.)

Notropis heterodon, var., GILBERT, Proc. U. S. Nat. Mus., 1884, 207, Switz City, Indiana, tributary of White River. (Coll. Gilbert.)

Hybopsis heterodon, COPE, Cypr. Penn., 382, 1866.

Leuciscus heterodon, GÜNTHER, Cat., VII, 261, 1868.

Hemitremia heterodon, JORDAN & GILBERT, Synopsis, 163, 1883.

Subgenus ALBURNOPS, Girard.

407. NOTROPIS FRETENSIS (Cope).

Head 4; depth 5; eye 3½ in head, as long as snout. D. 8; A. 8; scales 6–35–3; teeth 4–4. Body slender and compressed. Mouth quite oblique, the middle of the premaxillary being opposite line of pupil; maxillary not reaching to orbit. Seventeen rows of scales in front of dorsal. Lateral line decurved. Olivaceous; a dark median dorsal band; a plumbeous silvery lateral shade; cheeks silvery; a dark spot at base of caudal; fins plain. Length 2½ inches. Detroit River, Michigan. (Cope.) A doubtful species, perhaps identical with *Notropis cayuga*. (*fretensis*, inhabiting fretum or straits, i. e. Detroit River.)

Hybopsis fretensis, COPE, Cypr. Penn., 382, 1866, Detroit.

Cliola fretensis, JORDAN & GILBERT, Synopsis, 167, 1883.

408. NOTROPIS BLENNIUS (Girard).

(STRAW-COLORED MINNOW.)

Head 4; depth 5; eye large, 3 in head. Scales 5–36 (32 to 38)–4; teeth 4–4. Body moderately stout, little compressed. Head rather broad, with rounded angles. Mouth small, inferior, horizontal; snout very obtuse;

---

* *Notropis heterodon* is apparently subject to large variations. The following description is taken from specimens referred by Dr. Gilbert to this species, although there is a possibility that the form in question is really distinct and allied to *N. xænocephalus*:

Head 4; depth 4⅔. D. 8; A. 7; lateral line 37, 13 scales before dorsal; teeth 2, 4–4, 2, with strong grinding surface, the edge of some teeth denticulate. Body slender, compressed, the form and appearance as in *N. heterodon*. Head small, the snout short and rather sharp, slightly decurved. Mouth small, oblique, the maxillary barely reaching front of eye, 4 in head; snout 4; eye very large, 3 in head. Dorsal inserted just before ventrals; pectorals not reaching ventrals. Lateral line complete, little decurved; scales not crowded. Dark olive above, the scales with dark edges; a dusky streak along sides, ending in a spot at base of caudal, this streak extending forward around snout; dark specks along pores of lateral line; a row of specks along base of anal; fins unmarked. Length 2 inches. Sluggish streams of Indiana and Illinois. This description taken by Dr. Gilbert from specimens from Switz City Swamp, Indiana. Differs from the ordinary *heterodon* in the number of teeth and in the complete lateral line.

15 rows of scales in front of dorsal. Dorsal low, its longest ray ¾ head. Pale olivaceous; sides usually pale; usually a darker dorsal band and a small dark blotch before dorsal, sometimes a plumbeous lateral stripe but no caudal spot; fins all plain. Length 2 to 2½ inches. Ohio and Michigan to Tennessee, Dakota, and Kansas, thence southwestward to Texas; generally abundant in small streams; an insignificant little fish. Very variable and running into several varieties, the typical *blennius* (= *deliciosus* = *missuriensis*), Missouri to Texas, having the scales usually 32 to 35; var. *stramineus*, from Ohio to Iowa and southward with scales 34 to 38, usually 36. We follow Dr. Meek in identifying Girard's *Alburnops blennius* with this species. (*blennius*, blenny, from the convex profile.)

?Minnilus microstomus,* RAFINESQUE, Ichth. Oh., 47, 1820, Ohio River; not certainly identifiable.

?Hybopsis dorsalis,† AGASSIZ, Amer. Journ. Sci. Arts, 1854, 358, Burlington, Iowa; unidentifiable.

Alburnops blennius, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 194, Arkansas River near Fort Smith, Arkansas. (Coll. Shumard.) GIRARD, Pac. R. R. Surv., x, 261, pl. 57, figs. 13–16, 1858.

Minnilus blennius, JORDAN & GILBERT, Synopsis, 193, 1883.

409. NOTROPIS SABINÆ, Jordan & Gilbert.

Head 3⅘; depth 4⅔; snout 3⅖ in head, as long as eye. D. 8; A. 7; scales 4–33–2; teeth 4–4, hooked, with some grinding surface. Allied to *Notropis blennius*, but quite different in form, resembling a young *Moxostoma*. Body robust, the tail long and thick, the back elevated, the sides little compressed. Head long, broad and flattish above. Mouth rather large, nearly horizontal, the maxillary reaching past front of pupil. Scales very large, those on back not reduced, 14 before dorsal. Dorsal inserted nearly over

---

*"Thirty-eighth species, Little-mouthed Minny, *Minnilus microstomus*, Minny microstomus. Diameter one-seventh of total length; silvery, olivaceous on the back and head, sides with a few black dots, lateral line straight, pectoral fins reaching the abdominal fins. Dorsal and anal fins with 8 rays. A small species found in the Kentucky River. Mouth very small, nostrils large, iris silvery, fins fulvous, the pectoral with 12 and the caudal with 24 rays. Head elongated."—*Rafinesque.*

†"While these pages were setting in type, I have received another pretty species of this interesting genus, through the attention of Dr. I. H. Rauch, from Burlington, Iowa. The large number of specimens obtained enables me to make some additions to the characteristics of the genus:

The mouth is protractile downwards, after the fashion of Catostomus, so much so that had I not ample opportunity to examine young Catostomi, and to study the changes they undergo with age, I might have supposed my *Hybopsis* to be the young of some species of that genus. Moreover the lips are not swollen nor thickened. The pharyngeal teeth differ also greatly from those of Catostomi, there being only 4 or 5 compressed and hooked ones in each main row, and 1 or 2 in a second row.

This new species differs from that of Huntsville by its smaller size, its more pointed snout, and the peculiar coloration. A deep black narrow band extends from the neck to the base of the caudal along the whole back, dividing in advance of the dorsal to encircle that fin, and uniting again behind it upon the middle line. General color olive, silvery upon the sides, the dorsal and caudal faintly tinged with rose color and a deeper rose-colored spot upon the base of the first ray of the dorsal. I shall call this species *H. dorsalis*, Ag."—*Agassiz.*

ventrals, the fin short and small; anal small; pectorals long, 1¼ in head. Color very pale olive, scarcely silvery; edges of scales with dark points; fins pale. Length 2 inches. Sabine River, Texas.

Notropis sabinæ, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1886, 15, Sabine River, at Longview, Texas. (Type, No. 36484. Coll. Jordan & Gilbert.)

410. NOTROPIS VOLUCELLUS (Cope).

Head 3¾; depth 4; eye 3⅓ in head. D. 8; A. 8; scales 4–34–3; teeth 4–4. Body moderately stout. Head depressed, the snout rather long. Fins more elongate than in most related species, the pectorals reaching ventrals. Caudal peduncle slender. Olivaceous, a slight dusky lateral shade; no dorsal stripe; fins plain. Length 2½ inches. Michigan, Wisconsin, and Northern Indiana; rare. Similar to *N. blennius*, but with notably higher fins, and probably a distinct species. (*volucella*, a diminutive, from *volucer*, winged or swift.)

Hybognathus volucellus, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 283, Grosse Isle, Detroit River.
Hybopsis volucellus, COPE, Cypr. Penn., 381, 1866.
Leuciscus volucellus, GÜNTHER, Cat., VII, 260, 1868.

411. NOTROPIS SCYLLA (Cope).

Head 4; depth 4¼; eye large, about 3⅓ in head, longer than snout, which is 4. D. 7; A. 7; lateral line 31 to 33; teeth 4–4, with narrow grinding surface. Allied to *N. blennius*, but with stouter body and shorter, blunter head; mouth small, with subequal jaws, the cleft somewhat oblique; lips rather thick. Scales larger than in *N. blennius*, those before dorsal smaller and more crowded, 14 or 15 in number. Maxillary as long as eye. Dorsal fin beginning directly over ventrals. Color pale; back greenish; side with a silvery band; no spots on fins; a dusky shade on each side of dorsal and before it; some dark dots on snout; often a faint dark lateral shade. Length 2¾ inches. Illinois River to Western Kansas and Montana, abundant in the shallow sandy streams of the plains. (Reference unexplained.)

Hybopsis scylla, COPE, Hayden's Geol. Surv. Wyom. for 1870, 1871, 438, Red Cloud Creek, tributary of Platte River.

---

[*] "*Alburnus lineolatus*, AGASSIZ, MS. 1854. Body light brown with a broad silvery band having dark points, extending from the head to the caudal fin. Average length, 2½ inches. From the Osage River. Collected by Mr. G. Stolley."—*Putnam.*

[†] The following description of this species is given by Prof. Forbes:

Notropis phenacobius.—This fish unites with a strong general resemblance to *Phenacobius* the characters of *Notropis*. The body of the adult is short and deep, the head square, the nose long, and the eye unusually large. Length 2.5 inches, depth 3.5 to 4; caudal peduncle 4 to 4.75. Color in alcohol indefinite; sides somewhat silvery, scales along and above the lateral line slightly specked with black. The head is quadrate in transverse section, flat above, 3.75 to 4; nose decurved, 3.4 to 3.5; interorbital space 2.9 to 3.1. The mouth is inferior, horizontal, rather small, lips fleshy, not lobed, lower jaw much the shorter, 2.75 to 3.1 in head, upper lip opposite the lower margin of the pupil, upper jaw to posterior margin of nostrils, 3.33 to 3.9 in head. Teeth 4–4. Intestine about equal to head and body, 0.97 to 1.17. Eye very large, circular, placed high up, 3.4 to 3.5 in head. Branchiostegals free from isthmus. Dorsal I–8, decidedly before ventrals, its length 7 to 8 in body; anal low, I–8; paired fins rather broad and short; ventrals not reaching vent, and pectorals falling far short of ventrals, the former 6.25 to 6.4 in head and body. The scales are thin, large, crowded anteriorly upon the sides, breast wholly naked in all the specimens seen. Lateral line 35 to 36, longitudinal rows 7 to 9, 13 to 14 before dorsal. Described from 10 specimens, the only ones seen, all taken at Peoria.

412. NOTROPIS PROCNE (Cope).

Head 4¾; depth 5¼. Scales 5–32 to 34–3; teeth 4–4; A. 7. Body slender, with long caudal peduncle; the back higher and the tail slenderer than in *N. blennius*, the profile steeper. Snout obtuse, the mouth horizontal, inferior, small. 13 rows of scales in front of dorsal. Dorsal higher than in *N. blennius*, its first ray as long as head. Eye large. Olivaceous; a dark dorsal line and a plumbeous lateral band overlying black pigment; fins unspotted, sometimes very pale. Length 2½ inches. Delaware River and southward, in coastwise streams, as far as the Neuse; very common. One of the smallest of the *Cyprinidæ*. (πρόκνη, a kind of swallow.)

Hybognathus procne, Cope, Proc. Ac. Nat. Sci. Phila., 1864, 279, Delaware River, Schuylkill River, Conestoga River, White Clay Creek, Pennsylvania.

Hybopsis longiceps, Cope, Journ. Ac. Nat. Sci. Phila., 1868, 231, Head waters of James River and Roanoke River, Virginia. (Coll. Cope.)

Hybopsis procne, Cope, Cypr. Penn., 385, 1866.

Leuciscus procne, Günther, Cat., VII, 260, 1868.

Cliola microstoma and *C. procne*, Jordan & Gilbert, Synopsis, 168, 169, 1883.

413. NOTROPIS NIGROTÆNIATUS (Günther).

Head 4⅓; depth 5; eye 4½. D. 8; A. 8; scales 6–35–3; teeth probably 4–4, although only 2-2 are present in one of the typical examples, and no teeth at all in the others; no evident grinding surface. Body oblong; snout obtuse, convex, longer than the eye. Mouth subinferior, small, the upper jaw the longer; maxillary not reaching front of orbit. Silvery, with black lateral band; no spots on fins. Length 4 inches. Atlisco, Mexico. (*niger*, black; *tæniatus*, striped.)

*Graodus** *nigrotæniatus*, Günther, Cat., VII, 485, 1868, Atlisco, Mexico. (Coll. Boucard.)

Cliola nigrotæniata, Jordan, Proc. U. S. Nat. Mus., 1879, 226; Jordan & Gilbert, Synopsis, 164, 1883.

414. NOTROPIS KANAWHA, Jordan & Jenkins.

Head 4⅖; depth 4⅗; eye 3½; snout 3½. D. 8; A. 9; scales 4–37–2, 16 before dorsal; teeth 4–4, hooked, with grinding surface. Body rather elongate, moderately compressed, the back a little elevated. Snout bluntish, gently decurved; jaws equal; mouth rather oblique, the maxillary 3 in head, reaching front of eye; interorbital space flattish, slightly broader than eye which is large, preorbital broad; suborbitals narrow; fins all rather high; dorsal inserted distinctly behind ventrals. Translucent green, sides silvery, with few dark dots; no spot on fins or at base of caudal. Length 3½ inches. Tributaries of Kanawha River, southwestern Virginia.

Notropis kanawha, Jordan & Jenkins, Proc. U. S. Nat. Mus., 1888, 354, pl. XLIV, fig. 5, Reed Creek, Wytheville, Virginia. (Type, No. 39928. Coll. Jordan, Evermann, & Jenkins.)

415. NOTROPIS BRAYTONI, Jordan & Evermann, new specific name.

Head 3⅔; depth 3¾. D. 8; A. 7; scales 5-32–4. Body stout, rather deep; eye smallish, 3⅓ in head; about equal to snout and about ⅕ less than interorbital area, which is quite flat; margin of upper lip on level of pupil;

---

*The accidental loss of the teeth in two of the three typical examples was the occasion of the establishment of the nominal genus, *Graodus*.

mouth rather large, oblique; snout little pointed; maxillary reaching slightly past front of orbit, its length about 3⅙ in head; lower jaw shorter than upper, included; origin of dorsal slightly nearer tip of snout than base of caudal; about 12 scales in front of dorsal; tips of dorsal rays all coterminous when the fin is deflexed; length of longest ray 1½ in head; base of fin scarcely 2 in head; anal similar to dorsal, its longest ray 2 in head; base 3; pectorals reaching ¾ distance to ventrals, 1⅔ in head; ventrals reaching ⅔ distance to anal, 1⅔ in head; teeth 4–4, little hooked. Color brownish, a faint silvery band along sides, little wider than eye, a very small faint dark spot at base of caudal; fins all plain. Tributaries of Rio San Juan, at Cadereita, and Nuevo Leon. Allied to *N. blennius*, but differing in the larger, more oblique mouth. (Named for Dr. Alembert Winthrop Brayton, of Indianapolis, with pleasant memories of our explorations in Georgia and the Carolinas in 1877 and 1878.)

Moniana nitida, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 21, Cadereita, Mexico. (Type, No. 39657. Coll. Couch.) (Not *Alburnus nitidus*, KIRTLAND, also a *Notropis*.)

416. NOTROPIS SPECTRUNCULUS (Cope).

Head 4; depth 5½; eye 3. D. 8; A. 9; lateral line 37; teeth 4–4. Body elongate. Head large, rather flat, nearly as broad as deep. Muzzle thick. Mouth slightly oblique, maxillary reaching eye; 15 rows of scales in front of dorsal. Pale olive, silvery white below; a leaden band along the sides and a conspicuous black spot at base of caudal; head dusky; margins of scales above lateral line, as well as bases of dorsal and anal fins, blackish; pectorals, ventrals, dorsal, and anal more or less orange in life; no red on snout. Length 3 inches. Head waters of Tennessee River, in Tennessee, Virginia, and North Carolina; abundant in cold mountain streams and springs. A well-marked species. (Diminutive of *spectrum*, an image.)

Hybopsis spectrunculus, COPE, Journ. Ac. Nat. Sci. Phila., 1868, 231, Bear Creek, tributary of Middle Fork of Holston River. (Coll. Cope.)
Cliola spectruncula, JORDAN & GILBERT, Synopsis, 166, 1883.

417. NOTROPIS OZARCANUS, Meek.

Head 4½; depth 6½; eye 3. D. 7; A. 8; scales 36; teeth 4–4, hooked, with narrow grinding surface, their edges crenate. Allied to *N. spectrunculus*, but with slenderer body and head. Body little compressed. Mouth small, little oblique, maxillary not quite to eye; lips very thin; preorbital large; pectoral short. Olivaceous, sides with dark dots forming a faint lateral band. White River, Arkansas, in the Ozark Mountains.

Notropis ozarcanus, MEEK, Bull. U. S. Fish Comm., IX, 1889 (1891), 129, North Fork of White River, Arkansas. (Coll. Meek & Drew.)

418. NOTROPIS CHIHUAHUA, Woolman.

Head 4; depth 4; eye large, 3¾ in head, slightly longer than snout. D. 8; A. 7; scales 33 to 37; teeth 4–4, hooked, with very narrow grinding surface. Body rather plump, little compressed, the back little elevated; head large; snout blunt; mouth slightly oblique, the maxillary scarcely reaching eye; front of dorsal midway between snout and caudal; scales deeper than long; lateral line straight, complete. Light brown, scales above dark-edged; numerous round dark dots above, the largest sometimes nearly size of pupil, the spots unequal and irregularly placed, much as in *Hybopsis æstivalis*, or *H. hyostomus*; a plumbeous lateral stripe from eye through snout, ending in a black spot at base of caudal; fins plain. Rio de los Conchos, Chihuahua; locally abundant.

Notropis chihuahua, WOOLMAN, Amer. Nat., March, 1892, 260, Rio de los Conchos, Chihuahua, Mexico. (Type, No. 44151. Coll. Woolman & Cox.)

419. NOTROPIS TOPEKA, Gilbert.

Head 4; depth 3⅗; eye 4⅕. D. 8; A. 7; scales 5–35–4. Body compressed, stout and chubby; snout blunt; mouth small, terminal, oblique; 14 scales before dorsal; lateral line anteriorly decurved. Olivaceous, a dusky lateral streak ending in a small caudal spot; males in spring and summer with sides and lower fins bright red or orange. Length 2¾ inches. Western Iowa and eastern South Dakota, (Evermann), to Kansas; locally abundant in the prairie streams. A well-marked species, apparently allied to the group called *Codoma*.

Notropis topeka, GILBERT, Bull. Washburn Lab. Nat. Hist., Topeka, 1884, I, 13, tributary of Kansas River, Topeka, Kansas. (Type, No. 36609. Coll. Cragin.)

Notropis æneolus, HAY, Proc. U. S. Nat. Mus., 1887, 245, Solomon River, Wa Keeney, Kansas. (Type, No. 37945. Coll. Hay.)

Subgenus HUDSONIUS, Girard.

420. NOTROPIS GILBERTI, Jordan & Meek.

Head 4; depth 5; eye moderate, about 3½. D. 8; A. 9; scales 5–35–4. Slender, with long tail; head long, flattish above; snout moderate; mouth rather large, little oblique, the lower jaw included. Lips a little thickened, especially near angle of mouth. 17 scales before dorsal, which is inserted slightly behind ventrals. Light olive; sides with dusky streaks and dark specks. Length 2½ inches. Eastern Iowa to eastern Colorado, abundant in muddy streams of the plains, from the Des Moines River to the Platte. (Named for Dr. Charles Henry Gilbert, joint author of the "Synopsis of the Fishes of North America.")

Notropis gilberti, JORDAN & MEEK, Proc. U. S. Nat. Mus., 1885, 4, Des Moines River and Village Creek, Ottumwa, Iowa. (Type, No. 35840?. Coll. Jordan & Meek.)

421. NOTROPIS PIPTOLEPIS (Cope).

Head 4; depth 4⅓; eye 3½. D. 7; A. 8; scales 6–36–4; teeth 1, 4–4, 1. Physiognomy of *Hybŏpsis dissimilis*. Body elongate, not elevated. Head elongate. Mouth small, nearly horizontal, the maxillary reaching beyond line of orbit, the mandible somewhat projecting. Region in front of dorsal fin more or less bare of scales. Dorsal beginning opposite ventrals, nearer snout than base of caudal. Olivaceous; silvery below; a broad, silvery lateral band, with dark specks; sides of head with black specks; a dark vertebral band. Length 3 inches. North Platte River. (Cope.) A doubtful species, perhaps the same as *N. gilberti*. (πίπτω, to fall; λεπίς, scale.)

Photogenis piptolepis, Cope, Hayden's Geol. Surv. Terr. Wyom. for 1870, (1871), 438, Red Cloud Creek, a tributary of North Platte River.
Cliola zonata, Jordan & Gilbert, Synopsis, 183, 1883, (not *Notropis zonatus*).

422. NOTROPIS SIMUS (Cope).

Head 4⅕; depth 4⅕; eye 4⅕. D. 8; A. 9; scales 8–35–4, 22 series in front of dorsal fin; teeth 1, 4-4, 1; said to be without grinding surface. Body robust. Head short and broad, with short, decurved muzzle. Mouth large, oblique, upper lip below level of pupil, maxillary extending past front of orbit. Fins large, the dorsal well behind ventrals. Coloration entirely silvery, brightest on sides. Length 3½ inches. Rio Grande at at San Ildefonso, New Mexico. (Cope.) (*simus*, *σιμός*, snubnosed.)

Alburnellus simus, Cope, Zoöl. Wheeler Surv., v, 649, 1875, (1876), San Ildefonso, New Mexico. (Type, No. 16982. Coll. Yarrow.)
Cliola sima, Jordan & Gilbert, Synopsis, 170, 1883.

423. NOTROPIS LONGIROSTRIS (Hay).

Head 4¼; eye 4. D. 8; A. 7; scales 4–36–3; teeth 1, 4–4, 0 or 1,* with grinding surface. Form of *Ericymba buccata*. Head rather small; eye shorter than the blunt snout. Upper jaw rounded, considerably projecting beyond lower. Mouth rather large, horizontal; maxillary extending to front of eye. Scales large; about 12 large scales in front of dorsal. Origin of dorsal midway between tip of snout and base of caudal, directly over ventrals. Pectorals not reaching ventrals; the latter to vent. Straw color, with an obsolete lateral band and a narrow dorsal streak; fins dusky. Chickasawha River, Mississippi, to Escambia River, Florida. (*longus*, long; *rostrum*, snout.)

Alburnops longirostris, Hay, Proc. U. S. Nat. Mus., 1880, 504, Chickasawha River at Enterprise, Mississippi. (Type, Nos. 27440 and 32267. Coll. Hay.)
Cliola longirostris, Jordan & Gilbert, Synopsis, 167, 1883.
Notropis longirostris, Gilbert, Bull. U. S. Fish Comm., ix, 1889, 158.

424. NOTROPIS NUX, Evermann.

Head 4; depth 4½; eye large, 3 in head, equal to snout, and to interorbital width. D. 8; A. 7; scales 6–37–3, 13 before dorsal; teeth 1, 4–4, 1 or 0, rarely 1, 4–4, 2, the grinding surface developed and a little crenate. Body slender, the back somewhat elevated; head subconic, the snout rather blunt; mouth moderate, oblique; maxillary not reaching orbit; lower jaw slightly included; caudal peduncle long and slender. Dorsal inserted over ventrals, the longest rays as long as head; anal small; pectorals short, not to ventrals; caudal long; lateral line straight, complete. Greenish, the back with crosshatching of dark specks; a dark vertebral streak; a plumbeous lateral band, ending in a small, but distinct, caudal blotch, this band extending across opercles, eye, and snout; fins plain. Known only from Neches and Trinity rivers, near Palestine, Texas. (*nux*, nut; in Spanish, *neche*.)

Notropis nux, Evermann, Bull. U. S. Fish Comm., xi, 1891, (May 25, 1892), 77, Neches and Trinity rivers, Palestine, Texas. (Type, No. 45555. Coll. Evermann, Scovell, & Gurley.)

---

*According to Dr. Gilbert; Dr. Hay found the teeth 4-4.

425. NOTROPIS NOCOMIS, Evermann.

Head 4⅓; depth 4¾ to 5; eye large, 3 to 3¼ in head, equal to interorbital width. D. 8; A. 8; scales 6–36–3; teeth 1, 4–4, 1, small, hooked, the grinding surface narrow, slightly crenate. Body slender, little elevated; head heavy, formed as in *Cliola vigilax*; snout blunt and rounded, equal to eye; mouth small, inferior, horizontal; lower jaw included; maxillary short, not nearly reaching orbit; preorbital broad; caudal peduncle long and slender. Dorsal high, inserted over ventrals; pectorals short, not to ventrals; lateral line complete. Yellowish, with crosshatching of dark specks above; a dark lateral band, faint anteriorly; no caudal spot; fins plain. Length 2½ inches. Trinity, San Marcos, and Comal rivers, Texas; locally abundant. (*Nocomis*, an Indian name, applied by Girard to a group of fishes here regarded as a subgenus under *Hybopsis*.)

Notropis nocomis, EVERMANN, Bull. U. S. Fish Comm., XI, 1891, (May 25, 1892), 78, Trinity River, Palestine, Texas, and San Marcos River, San Marcos, Texas. (Type, No. 45556. Coll. Evermann, Scovell, & Gurley.)

426. NOTROPIS SHUMARDI (Girard.)

Head 3¾; depth 4⅕; eye very large, 2⅓ to 3 in head. A. 7; scales 5-36-2; teeth 1, 4–4, 1, (2, 4–4, 2, according to Girard), with deep grinding surface, and the edge strongly crenate. Body compressed, the back elevated; tail slender; snout short, not blunt; mouth terminal, very oblique; lower jaw included; maxillary reaching front of eye; dorsal inserted over ventrals; 12 scales before dorsal. Olivaceous, sides with dusky streaks and dark specks. Length 3 inches. Ohio and Tennessee basins to Iowa and the Ozark region, in cold streams and springs; abundant in Arkansas, and in northern Alabama. (Named for Dr. George C. Shumard, naturalist on the Mexican Boundary Survey.)

Alburnops shumardi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 194, Arkansas River, Fort Smith, Arkansas. (Coll. Shumard.)

Notropis boops, GILBERT, Proc. U. S. Nat. Mus., 1884, 201, Salt Creek, Brown County, Indiana, and Flat Rock Creek, Decatur County, Indiana. (Type, No. 34982. Coll. Gilbert.)

Minnilus shumardi, JORDAN & GILBERT, Synopsis, 194, 1883.

Minnilus scabriceps, JORDAN & GILBERT, Synopsis, 194, 1883, not of Cope.

427. NOTROPIS ILLECEBROSUS (Girard).

Head 4⅓; depth 4⅓; eye 3⅙; snout 3⅔. D. 8; A. 8; scales 7–35–3, 11 before the dorsal; teeth 1, 4–4, 1, slightly hooked, with slight grinding surface. Body rather deep, compressed, caudal peduncle deep, its least depth 2⅕ in head. Mouth large, oblique, maxillary reaching eye; lower jaw included; eye large, greater than snout; interorbital width equal to snout; width of lower jaw at base 1½ in eye. Origin of dorsal very little behind insertion of ventral fins, a little nearer snout than base of caudal. First rays of dorsal somewhat produced, their length greater than that of head; free margin of dorsal very slightly concave in the expanded fin; base of fin 1⅗ in longest ray. Longest anal ray 1⅓ in head. Pectorals equal longest dorsal ray. Pale straw color, side with a broad silvery band following course of lateral line; sides of head silvery. Length 3 inches. Description here drawn up from the types. Lower Arkansas River basin, probably not distinct from *Notropis shumardi.* (*illecebrosus*, enticing.)

Alburnops illecebrosus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 194, Arkansas River, Fort Smith, Arkansas. (Type No. 66. Coll. Dr. Shumard); GIRARD, Pac. R. R. Surv. x, 262, pl. 57, figs. 5–8, 1858.

Minnilus shumardi, JORDAN & GILBERT, Synopsis, 192, 1883 (in part).

428. NOTROPIS HUDSONIUS (DeWitt Clinton).

(SPAWN-EATER; SPOT-TAILED MINNOW; SHINER.)

Head 4¾; depth 4; eye 3. D. 8; A. 8; scales 5–39–4; teeth 1, 4–4, 0 or 1, or 2. Body elongate, considerably compressed in the adult. Head quite short. Muzzle blunt, decurved, shorter than the very large eye. Mouth moderate, nearly horizontal, the jaws nearly equal, the maxillary nearly reaching to the eye. Lateral line nearly straight, slightly decurved anteriorly. 18 scales before dorsal. Pectorals not reaching ventrals, the latter not to vent. Coloration very pale, with usually a dusky or black spot at base of caudal, especially in the young; sides with a broad, silvery band, which is sometimes dusky. Length 4 to 6 inches. The Dakotas and Lake Superior to New York, and southward to South Carolina; abundant in the Great Lakes, and not rare east of the Alleghany Mountains; a large and handsome minnow, the choice "live bait" of the St. Lawrence River angler. The typical form, *hudsonius*, in the Lower Great Lakes and the Hudson, Susquehanna, and other northeastern rivers, has the head short, 4⅔ in length; eye 3⅖ in head, as long as the blunt snout; mouth less oblique than in *selene*, more so than in *amarus*; maxillary not reaching front of eye; caudal spot jet-black. Teeth 2, 4–4, 1. Specimens apparently referable to *hudsonius* rather than to *amarus* occur in the Potomac, and in streams even so far south as South Carolina, but the boundaries of *hudsonius*, *amarus*, and *saludanus* are hard to fix.

Clupea hudsonia, DEWITT CLINTON, Ann. Lyc. Nat. Hist. N. Y., 1, 49, 1824, Hudson River.

Hudsonius fluviatilis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 210, Hudson River. (Type, No. 14. Coll. Baird.)

Hybopsis hudsonius, COPE, Cypr. Penn., 386, 1866.

Leuciscus hudsonius, GÜNTHER, Cat., VII, 250, 1868.

Cliola hudsonia, JORDAN & GILBERT, Synopsis, 171, 1883.

Represented in Lake Superior by

428a. NOTROPIS HUDSONIUS SELENE (Jordan).

With the head very short, 4⅘ in body, the mouth quite oblique, the premaxillary on level of lower part of pupil; snout ⅗ eye; maxillary reaching front of eye. Caudal spot jet-black. Teeth 2, 4–4, 2 or 1. (σηληνη, the moon.)

Luxilus selene, JORDAN, Bull. U. S. Nat. Mus., x, 60, 1877, Lake Superior, Bayfield, Wisconsin. (Coll. Milner.)

Minnilus selene, JORDAN & GILBERT, Synopsis, 188, 1883.

Southward it gives place to

428b. NOTROPIS HUDSONIUS AMARUS (Girard).

Very close to var. *hudsonius*, characterized by the longer and less obtuse head, 4½ to 4⅗ in length, the eye 3½ in head, longer than snout; the caudal spot faint or wanting, and the teeth 1, 4–4, 0. Delaware and Potomac rivers. This is not unlikely a distinct species, as Abbott has contended, but there is some evidence of its intergradation with *hudsonius*. *(amarus*, bitter, the type from brackish water.)

Hudsonius amarus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 210, Chesapeake Bay; Potomac River at Washington. (Coll. Girard.)
Hybopsis phaënna, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 279, Delaware River, Trenton, New Jersey. (Coll. Cope.)
Hybopsis storerianus, COPE, Cypr. Penn., 386, 1866.
Leuciscus storerianus, GÜNTHER, Cat., VII, 250, 1868, not *Rutilus storerianus*, KIRTLAND.
Hybopsis phaënna, ABBOTT, Amer. Nat., 1874, 333.
Cliola storeriana, JORDAN & GILBERT, Synopsis, 170, 1883.

This form gives place still further southward to

428c. NOTROPIS HUDSONIUS SALUDANUS (Jordan & Brayton).

Head 4¼; depth 4½; eye large, 3½, (3 to 4). D. 8; A. 8; scales 5–39–3; teeth 1, 4–4, 0, two or three of the teeth obtuse, not hooked, only one or two of them showing a grinding surface. Body elongate, but less so than in var. *hudsonius*; moderately compressed. Caudal peduncle long. Head large, rather heavy and gibbous forward, the muzzle rounded in profile. Mouth moderate, subinferior, the maxillary not reaching eye. Scales large, thin and loose, about 12 in front of dorsal. Lateral line somewhat decurved in front. Fins rather small; pectorals not reaching ventrals, the latter not to vent. Coloration pale olivaceous, nearly white, with traces of a plumbeous lateral streak, this sometimes appearing as a black lateral band, (var. *euryopa*), and sometimes leading to a black caudal spot as in *hudsonius*. Length 4 inches. Coastwise streams from the James to the Ocmulgee. Close to subspecies *amarus* with which it may intergrade. Head notably longer, 4⅙ to 4½, the snout especially longer, as long as eye, projecting beyond the inferior mouth.

Alburnops saludanus, JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 16, 1878; tributary of Saluda River, Greenville, South Carolina. (Type, No. 31128. Coll. Jordan & Brayton.)
Hudsonius euryopa, BEAN, Proc. U.S. Nat. Mus., 1879, 285, McBean Creek, tributary of Savannah River, Georgia. (Type, No. 23513. Coll. A. Graves.)
Cliola saludana and *euryopa*, JORDAN & GILBERT, Synopsis, 170, 171, 1883.

Subgenus CODOMA, Girard.

429. NOTROPIS ORNATUS (Girard).

Head 3¾ to 4; depth 3; eye 3¾ to 4. D. 8; A. 7; scales 7–40–4, those before dorsal large, 17; teeth 4–4. Body stout and compressed, the back arched, the head very blunt, thick and rounded, almost spherical in the male. Mouth small, somewhat oblique, the cleft mostly anterior; the jaws equal. Eye smallish. Scales deep, very closely imbricated, those on sides much higher than long; lateral line decurved. Dorsal a little behind ventrals. Fins all rather small. Snout highly prickly in spring males. Color dark; sides with about 8 to 10 more or less conspicuous crossbars; head mostly black in males; fins all with the middle part dusky or black, the tips milk-white, the ventrals and the anal notably so; females paler, the lateral bars narrower and shorter, the fins with less black. Length 2½ inches. Chihuahua River, our specimens taken in the original locality by A. J. Woolman. (*ornatus*, adorned.)

Codoma ornata, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 195, Chihuahua River; and U.S. Mex. Bound. Surv., Ichth., 53, pl. 29, figs. 22–25, 1859; this species and *Notropis aztecus* both well figured by Girard. (Type, No. 91. Coll. J. Potts.)
Cliola ornata, JORDAN & GILBERT, Synopsis, 173, 1883.

Subgenus MONIANA, Girard.

430. NOTROPIS FORMOSUS (Girard).

Head 3¾; depth 3½; eye 3½. D. 8; A. 8; scales 7–43–4, 23 before dorsal; teeth 4–4. Body elliptic, compressed, the form about as in *N. lutrensis*. Mouth moderate, oblique, the maxillary 3½ in head. Dorsal fin rather high. Sides with a dusky streak, a brown spot at base of caudal. Length 2¼ inches. Rio Mimbres, Chihuahua. Well distinguished from *N. lutrensis* and related forms by the small size of the scales. (*formosus*, comely.)

Moniana formosa, GIRARD, Proc. Ac. Nat.. Sci. Phila., 1856, 201, Rio Mimbres, Chihuahua.
Cliola formosa, JORDAN & GILBERT, Synopsis, 174, 1883.
Notropis formosus, JORDAN, Proc. U. S. Nat. Mus., 1885, 125.

431. NOTROPIS FRIGIDUS (Girard).

Head 4⅓; depth 3½ to 4; eye moderate, 4 in head. D. 9; A. 9.; lateral line 37. Body moderately elongate, compressed, with long caudal peduncle. Head moderate, the snout subconical, somewhat pointed. Mouth rather large, oblique, the maxillary scarcely extending to orbit. Lateral line decurved. Length 3¼ inches. Rio Frio, Texas; differing from *N. lutrensis* in the smaller scales. (*frigidus*, cold; in Spanish, frio.)

Moniana frigida, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 200, Rio Frio, Texas. (Type, No. 124. Coll. Clark.)
Cliola leonina, JORDAN & GILBERT, Synopsis, 174, 1883, not of Girard.

432. NOTROPIS LUTRENSIS (Baird & Girard).

Head 3⅔; depth 3 (adult) to 4; eye small, 4. D. 7 or 8; A. 8; scales 6–35–2; teeth 4–4. Body oblong, elevated, strongly compressed, the back arched; caudal peduncle rather slender. Head stout and deep, its upper outline depressed, the nape elevated, forming an angle, so that the profile is somewhat concave. Young more slender, the form variously elongate or elliptical. Mouth rather large, quite oblique, the lower jaw included. Lateral line strongly decurved. Thirteen scales in front of dorsal. Males profusely tuberculate in spring. Colors in life brilliant, steel-blue; the lower parts silvery; the belly orange-red in the males; a conspicuous violet-colored crescent behind the shoulders, followed by a crimson crescent; fins reddish, the anal and caudal blood-red. Female plain greenish, the fins unspotted. Length 2¾ inches. Southern Illinois to South Dakota, Kansas, and the Rio Grande; very abundant in clear brooks southwestward; a very brilliant and very variable little fish. (*lutra*, the otter; the species was first known from Otter Creek, Arkansas.)

Leuciscus lutrensis, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 391, Otter Creek, tributary of North Fork Red River, Arkansas. (Type, No. 104. Coll. Capt. Geo. B. McClellan.)
Cyprinella suavis, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 197, San Antonio, Texas.
Moniana lætabilis, Hurrah Creek, tributary of Rio Pecos; *couchi*, China, New Leon; *rutila*, Cadareita, New Leon; and *gracilis*, Monterey, New Leon, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 199–201. (Type, No. 116. Coll. Couch.)
Moniana leonina, Leon River near San Antonio; and *complanata*, Brownsville, Texas, Girard: *l. c.*, 199, are probably the same, though figured with smaller scales.
Moniana pulchella, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 200, Sugar Loaf Creek, tributary of Poteau River. (Coll. Möllhausen.)
Moniana gibbosa, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 201, Brownsville, Texas. (Type, No. 31159. Coll. Van. Vliet.)
Cyprinella billingsiana, Cope, Hayden's Geol. Surv. Terr. Wyom. for 1870, (1871), 439, St. Joseph, Missouri. (Coll. Dr. Wm. Stimpson.)
Moniana jugalis, Cope, Hayden's Geol. Surv. Wyom. for 1870, (1871), 439, St. Joseph, Missouri.
Hysilepis iris, Cope, Zoöl. Wheeler Surv., v, 653, 1875, (1876), Rio Grande, San Ildefonso, New Mexico. (Type, No. 16976. Coll. Yarrow.)
Cyprinella forbesi, Jordan, Bull. Ill. State Lab. Nat. Hist., ii, 57, 1878, clear streams of southern Illinois. (Type, No. 29867. Coll. Forbes.)
Cliola montiregis, Cope, Proc. Amer. Philos. Soc., 1884, 168, Monterey, New Leon.
Leuciscus lutrensis, Günther, Cat., vii, 258, 1868.
Cyprinella complanata, Jordan, Bull. Hayden's Geol. Surv. Terr., iv, 3, 665, 1878.
Cliola iris, Jordan & Gilbert, Synopsis, 172, 1883.
Cliola jugalis, Jordan & Gilbert, Synopsis, 172, 1883.
Cliola gibbosa, Jordan & Gilbert, Synopsis, 174, 1883.
Cliola lutrensis, Jordan & Gilbert, Synopsis, 175, 1883.
Cliola suavis, Jordan & Gilbert, Synopsis, 176, 1883.
Cliola billingsiana, Jordan & Gilbert, Synopsis, 177, 1883.
Cliola forbesi, Jordan & Gilbert, Synopsis, 174, 1883.

433. NOTROPIS PROSERPINA (Girard).

Head 3¾; depth 4; eye 4; snout 3½. D. 7; A. 7; scales 6–35–3, 14 before dorsal. Body rather robust; mouth subinferior, nearly horizontal. Brownish above, paler below, but no silvery lateral band; a metallic band of dark points from upper edge of preopercle to upper edge of caudal. Length 2 inches. Rio Grande region. (*Proserpina*, Proserpine, the allusion not evident.)

Moniana proserpina, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 200, Devil River, Texas. (Type, No. 117. Coll. Clark.)
Moniana aurata, Girard, *l. c.*, 200, Piedrapainte, New Mexico. (Type, No. 118. Coll. Clark).
? *Moniana tristis*, Girard, *l. c.*, 1856, 201, locality unknown. (Coll. Beckwith.)
Cliola deliciosa, Jordan & Gilbert, Synopsis, 175, 1883.
Cliola aurata, Jordan & Gilbert, Synopsis, 175, 1883.
Notropis proserpina, Jordan, Proc. U. S. Nat. Mus., 1885, 125.

434. NOTROPIS CALLISEMA (Jordan).

Head 4; depth 4⅗; eye 4¼. D. 8; A. 8; scales 6–39–3; teeth 4–4. Body rather elongate, fusiform, compressed. Head elongate, the muzzle rather blunt, projecting over the moderate, oblique mouth; maxillary not reaching to opposite eye. Eye moderate. Scales firm, closely imbricated, 15 in front of dorsal. Dorsal fin extremely high; its height in the males one-fourth length of body, in females somewhat lower; its insertion almost directly over first ray of ventrals. In the other similarly colored species of *Notropis* the dorsal is evidently behind the ventrals. Coloration brilliant, clear dark blue above, sides and below abruptly silvery; a blue lateral streak, much as in *N. cæruleus*, bounding the blue of the upper parts, the white pigment of the lower parts looking as if painted over the blue. Dorsal with a large black spot on its last rays above. Dorsal, anal, and caudal with the usual satin-white pigment at their tips: these fins otherwise of a clear, ferruginous orange. Females slender and dull-colored. Length 2¾ inches. Ocmulgee River, Georgia. An elegant fish. (*καλός*, beautiful; *σῆμα*, sail, from the dorsal fin.)

Episema callisema, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1876, 363, South Fork of Ocmulgee River, Flat Shoals, Georgia. (Type, No. 17864. Coll. Jordan & Gilbert.)
Codoma callisema, Jordan, Bull. U. S. Nat. Mus., xii, 52, 1878.
Cliola callisema, Jordan & Gilbert, Synopsis, 173, 1883.

Subgenus CYPRINELLA, Girard.

435. NOTROPIS BUBALINUS (Baird & Girard).

Head 4⅛; depth 3; eye 4 in head. D. 8; A. 9; scales 32 to 35. Body short, the back arched; head short and deep, blunt in profile; mouth moderate, oblique, the jaws subequal; lateral line decurved. Coloration plain in spirits, the males probably with bright pigment. Length 3½ inches. Streams of Arkansas and westward; not common. (Diminutive of *bubalus*, buffalo.)

Leuciscus bubalinus, Baird & Girard, Proc. Ac. Nat. Sci. Phila., 1853, 391, Otter Creek, Arkansas. (Coll. Capt. Geo. B. McClellan.)
Cyprinella beckwithi, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 197, Arkansas River, near Fort Makee. (Coll. Beckwith.)
Cyprinella gunnisoni, Girard, *l. c.*, 197; said to be from Cottonwood Creek, Utah, which must be an error, as no *Notropis* is found in Utah. (Type, No. 139. Coll. Kreuzfeld.)
Cyprinella umbrosa, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 197, and Pac. R. R. Surv., x, 266, 1858, Coal Creek, tributary of South Fork Canadian River. (Type, No. 133. Coll. Möllhausen.
Cyprinella lepida, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 197, Rio Frio, Texas; may be *lutrensis*; and Pac. R. R. Surv., x, 268, 1858. (Coll. Kennerly.)
Cyprinella bubalina, Girard, Pac. R. R. Surv., x, 265, 1858.
Cliola lepida, Jordan & Gilbert, Synopsis, 176, 1883.
Cliola umbrosa, *bubalina*, and *gunnisoni*, Jordan & Gilbert, Synopsis, 176, 1883.

436. NOTROPIS LUDIBUNDUS (Girard).

Head 4; depth 4¾; eye large, 3 in head; snout 4. D. 8; A. 7; scales 4–31–3, 13 before dorsal. Body elongate, subfusiform. Mouth oblique, small, the maxillary extending to eye. Dorsal fin high. Silvery; lateral line with black dots. Length 2 inches; locality unknown, probably Indian Territory. (*ludibundus*, playful.)

Cyprinella ludibunda, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 199, locality unknown. (Coll. Beckwith.)
Cliola ludibunda, Jordan & Gilbert, Synopsis, 177, 1883.

437. NOTROPIS MACROSTOMUS (Girard).

Head 4; depth 4⅓. D. 8; A. 9; lateral line 36; teeth 1, 4–4, 1. Body slender, the form approaching that of *N. atherinoides*. Head moderate. Mouth rather larger than in related species, oblique, the maxillary reaching front of eye. Eye large. Lateral line somewhat decurved. Dorsal behind ventrals. Brownish above; cheeks and sides bright silvery. Rio Grande region, northward to Kansas, if *umbrifer* is the same species. (*μακρός*, wide; *στόμα*, mouth.)

Cyprinella macrostoma, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 198, Devil River, Texas. (Type, No. 129. Coll. Clark.)

?*Cyprinella luxoides*, GIRARD, *l. c.*, 198, San Pedro Creek, Texas. (Coll. Kennerly.)

?*Cyprinella lugubris*, GIRARD, *l. c.*, 199, locality unknown. (Coll. Beckwith.)

?*Notropis umbrifer*, HAY, Proc. U. S. Nat. Mus., 1887, 245, Solomon River at Beloit, and Saline River near Wa Keeney, Kansas. (Coll. Hay.)

438. NOTROPIS TEXANUS (Girard).

Head 4; depth 4½; eye 3 in head. D. 8; A. 8; scales 5–35–4, 15 before dorsal. Body rather slender; snout bluntish; mouth nearly horizontal, the lower jaw slightly projecting. Lateral line nearly straight. Fins moderate. Eye slightly longer than snout, equal to maxillary. Silvery, dark points along lateral line; a small jet-black caudal spot slightly larger than pupil; a row of dark points along base of anal. Length 2 inches. Rivers of Texas from the Trinity to the Salado.

Cyprinella texana, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 198, Rio Salado and Turkey Creek, Texas. (Type, No. 182 (2710). Coll. Clark); MEEK, Proc. U. S. Nat. Mus., 1885, 124.

Notropis texanus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1886, 17.

439. NOTROPIS NOTATUS (Girard).

Head 4; depth 3⅘; eye 3½. D. 8; A. 7; scales 5–35–3. Body stoutish; the caudal peduncle slender. Eye moderate; snout bluntish. Mouth small, oblique, the maxillary not reaching to the eye. Ventrals in advance of dorsal. Fins moderate. Coloration plain in spirits, except the black caudal spot; sides silvery. Streams of Texas, from Austin westward. Allied to *N. venustus*, but the scales larger, and the caudal spot faint and veiled by the scales. (*notatus*, spotted.)

Cyprinella notata, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 198, Rio Seco, Texas; and Pac. R. R. Surv., x, 269, 1858. (Type, No. 136. Coll. Kennerly.)

Cliola notata, JORDAN & GILBERT, Synopsis, 177, 1883.

440. NOTROPIS VENUSTUS (Girard).

Head 4; depth 3⅘; eye large, 3⅗; snout 4. D. 7; A. 8; scales 5–31–3, 15 before dorsal; teeth 4–4. Body rather slender. Head long and rather pointed. Mouth oblique, the maxillary reaching front of eye; jaws subequal. Fins moderate; the dorsal behind ventrals. Coloration brownish above; sides silvery; a round black spot as large as eye at base of caudal. Rio Sabinal, Texas. Allied to *N. cercostigma*, but with larger scales; compared with *N. notatus*, the eye is smaller, the mouth more oblique, the snout more pointed and the caudal spot more distinct in *N. venustus*. (*venustus*, beautiful, like Venus.)

Cyprinella venusta, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 198, Rio Sabinal, Texas, (Coll. Kennerly); and Mex. Bound. Surv., Ichth., 54, 1859.
Cliola venusta, Jordan & Gilbert, Synopsis, 178, 1883.

441. NOTROPIS CERCOSTIGMA (Cope).

Precisely like *Notropis stigmaturus* except that the scales are larger, 37 to 39 in the lateral line, and the fins in adult males more deeply colored, orange yellow, with milky tips in life. Teeth 1, 4–4, 1. Caudal spot nearly circular. Sandy streams tributary to the Gulf of Mexico, from Pearl River and Red River to Rio Nueces; abundant, especially so in Rio Colorado of Texas. (*κέρκος*, tail; *στίγμα*, spot.)

Cyprinella cercostigma, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 157, Pearl River, Monticello, Mississippi.
Luxilus chickasavensis, Hay, Proc. U. S. Nat. Mus., 1880, 506, Chickasawha River, Mississippi. (Type, No. 27419. Coll. Hay.)
Cliola urostigma, Jordan & Meek, Proc. U. S. Nat. Mus., 1884, 475, San Saba River, Fort McKavit, a tributary of Rio Colorado; Clear Creek, Texas. (Type, Nos. 20446 and 17812. Coll. Anderson, Kumlein, & Earll.)
Minnilus cercostigma, Jordan & Gilbert, Synopsis, 173, 1883.
Notropis venustus, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1886, 19; but the true *venustus* seems to have still larger scales.

442. NOTROPIS STIGMATURUS (Jordan).

(Spotted-tail Minnow.)

Head 4½; depth 4¾; eye small, 4¼ in head. D. 8; A. 8; scales 7–42 to 44–3; teeth 1, 4–4, 1. Body elongate, fusiform, compressed. Head quite long, rounded above, the snout pointed. Mouth rather large, somewhat oblique, overlapped by the narrow upper jaw. Iris white. Maxillary reaching beyond nostrils; premaxillary on level of lower edge of pupil. Scales closely imbricated, 20 in front of dorsal. Fins low, the dorsal rather behind ventrals, its height less than one-fifth body. Color pale, clear olive; black dorsal spot not very distinct; fins with their tips charged with satin-white pigment, otherwise plain; a very distinct, large, oblong jet-black spot at base of caudal, the color extending up on the rays; this spot is visible on all specimens, and is larger than in any other of our *Cyprinidæ*; its length about one-third that of the head. First ray of dorsal dark in front; males with an obsolete black spot on the middle of the sides in front of the dorsal; the head, etc., tuberculate in spring. Length 4½ inches. Alabama Basin; very abundant. Very close to *N. cercostigma*, from which it differs chiefly in the smaller scales, and of which it may be an eastern variety. (*στίγμα*, spot; *οὐρά*, tail.)

Photogenis stigmaturus, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1876, 337, Etowah River, etc., Rome, Georgia. (Type, No. 17891. Coll. Jordan & Gilbert.)
Codoma stigmatura, Jordan, Bull. U. S. Nat. Mus., xii, 52, 1878.
Cyprinella calliura, Jordan, Bull. U. S. Nat. Mus., x, 61, 1877, Black Warrior River, Alabama. (Type, No. 6865. Coll. Prof. Alex. Winchell.)
Cliola calliura and *stigmatura*, Jordan & Gilbert, Synopsis, 178 and 182, 1883.

443. NOTROPIS TRICHROISTIUS (Jordan & Gilbert).

Head 4⅕; depth 4¼; eye moderate, 3⅔ in head; scales 6–42–3; teeth 1, 4–4, 1. Body rather slender, compressed. Head slender and pointed.

Mouth quite large, very oblique, the maxillary reaching anterior margin of eye, the premaxillaries on level of middle of pupil. Lateral line considerably decurved, usually with an abrupt angulation between pectorals and ventrals; 19 scales before dorsal. Fins moderate; dorsal well behind ventrals. Nuptial tubercles sparse on the head; caudal peduncle and sides, as far forward as the ventrals, tuberculate in spring males. Males bright steel-blue above; sides bright white; a large black spot at base of caudal, precisely as in *N. callistius*; dorsal fin with a broad, dusky, horizontal band at base, the membrane of the last rays jet-black, the tip milk-white, the rest of the fin of a bright, pale vermilion-red; caudal rosy, its tips white; anal and ventrals milky. Females duller, but the black markings distinct. Length 3½ inches. Alabama Basin; abundant in clear streams, with the preceding and the next. (*τρεῖς*, three; *χρῶς*, color; *ἱστίον*, sail.)

Codoma trichroistia, JORDAN & GILBERT, Bull. U. S. Nat. Mus., XII, 1878, 50, Etowah River, etc., Rome, Georgia. (Type, No. 31131. Coll. Jordan & Gilbert.)
Cliola trichroistia, JORDAN & GILBERT, Synopsis, 181, 1883.

444. NOTROPIS CALLISTIUS (Jordan).

Head 4⅕; depth 4⅗; eye large, 3⅗. D. 8; A. 8; scales 5-40-3; teeth 1, 4-4, 1. Body rather stout and compressed, rather heavy forward, the dorsal outline considerably elevated. Head stout and rather blunt, its upper part flattish; the nuptial tubercles not numerous, arranged in a few distinct, longitudinal rows, not scattered without order, as in related species. Mouth large, nearly horizontal, slightly overlapped by the heavy snout, the maxillary reaching nearly to eye, the premaxillaries anteriorly entirely below level of orbit. Scales large, not very closely imbricated, 16 in front of dorsal. Fins rather large, the height of the dorsal in males nearly one-fifth length of body. Coloration dark and brilliant; males with the back very dark steel-blue; sides a clear silvery violet; belly and lower fins satin-white; a heavy black blotch on posterior part of dorsal, extending downward and forming a horizontal bar at base of fin; rest of the fin vermilion, except the milk-white tip; caudal fin bright red, yellowish at base, milky at tip; a broad, golden vertebral band and a reddish lateral streak; a large, distinct, round black spot at base of caudal. Females olivaceous, with less black; the fins dull reddish. Length 4 inches. Alabama Basin. (*κάλλος*, beauty; *ἱστίον*, sail, i. e. dorsal fin.)

Photogenis callistius, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 337, Etowah River, etc., Rome, Georgia. (Type, No. 17882. Coll. Jordan & Gilbert.)
Codoma callistia, JORDAN, Bull. U. S. Nat. Mus., XII, 52, 1878.
Cliola callistia, JORDAN & GILBERT, Synopsis, 181, 1883.

445. NOTROPIS EURYSTOMUS (Jordan).

Head 4¼; depth 4⅓; eye moderate, 3½ in head. D. 8; A. 8; scales 6-39-3; teeth 1, 4-4, 1, with narrow grinding surfaces, the edges of which are usually crenate. Body elongate, compressed, tapering toward the snout and the long caudal peduncle. Head moderate, larger than in *N. niveus*, rather pointed, wide on top; snout rather long. Muzzle large, quite oblique, the premaxillaries on the level of the pupil; upper jaw slightly the longer. Scales moderate, rather closely imbricated, but less so than in *N. whipplii*. Pectorals not reaching ventrals, the latter about to vent; vertical fins not especially elevated. Color olivaceous, the sides bright silvery, a round black spot, nearly as large as eye, at base of caudal; dorsal blotch rather faint; dorsal fin chiefly yellowish green, ferruginous above, the extreme tip milky white; caudal fin rusty, with milk-white tips; lower fins milk-white. Snout and front in males tuberculate; minute tubercles on sides of tail. Length 4 inches. Chattahoochee River. (*εὐρύς*, wide; *στόμα*, mouth.)

Photogenis eurystomus, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1876, 356, Nancy's Creek, tributary of Chattahoochee River, near Atlanta; exclusive of the smaller specimens mentioned, which are *Notropis zonistius*; (not *Codoma eurystoma*, Jordan, Bull. U. S. Nat. Mus. XII, 42 = *Notropis zonistius*).

Photogenis leucopus, Jordan & Brayton, Bull. U. S. Nat. Mus., XII, 41, 1878, Chattahoochee River, Gainesville, Georgia. (Type, No. 31124. Coll. Jordan & Brayton.)

Cliola eurystoma, Jordan & Gilbert, Synopsis, 180, 1883.

446. NOTROPIS CÆRULEUS (Jordan).

Head 4⅓; depth 4⅗; eye moderate, 3½ in head. D. 8; A. 8; scales 6–38–3; teeth 1, 4–4, 1. Body fusiform, somewhat elongate, moderately compressed. Head moderate. Snout rather pointed, overlapping the small, oblique mouth, maxillaries reaching nostrils, premaxillaries below level of pupil. Scales firm, 15 in front of dorsal. Lateral line decurved. Fins all high, the height of dorsal nearly one-fifth length of fish; dorsal behind ventrals. Males with the snout thickly tuberculate. Color bright steel-blue; sides and belly silvery white; a very distinct lateral band of a bright blue-green color, most distinct posteriorly, and forming a spot at the base of caudal; black dorsal blotch rather faint and diffuse; tips of dorsal, anal, and caudal charged with satin-white pigment; the fins otherwise all of a clear, bright yellow. Females and young with the markings obscure, the blue lateral band usually evident. Length 3 inches. Alabama Basin; common; a very elegant little fish. (*cœruleus*, blue.)

Photogenis cæruleus, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1876, 338, Etowah River, Rome, Georgia. (Type, No. 17883. Coll. Jordan & Gilbert.)

Codoma cærulea, Jordan, Bull. U. S. Nat. Mus., XII, 52, 1878.

Cliola cærulea, Jordan & Gilbert, Synopsis, 182, 1883.

447. NOTROPIS NIVEUS (Cope).

Head 4½; depth 5½; eye 3⅓ in head. D. 8; A. 8; scales 6–39–3; teeth 1, 4–4, 1, with narrow grinding surface. Body regularly fusiform, the dorsal outline more arched than the ventral. Head conic. Muzzle obtuse, not projecting. Mouth nearly terminal, slightly oblique, maxillary reaching front of eye. Coloration very pale, a narrow bluish band along caudal peduncle, forming a faint spot at root of caudal. Dorsal fin in males considerably elevated, largely dusky on its last rays, the rest of the fin creamy; tip of dorsal, tips of caudal, and whole of anal with milk-white pigment. Males with the snout and antedorsal region covered with small tubercles. Length 2½ inches. Southern Virginia to South Carolina; common; an extremely variable species, which may prove to be inseparable as a species from *N. whipplii*, from which it differs in the slenderer head and in the blue caudal streak. (*niveus*, snowy.)

Hybopsis niveus, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 460, Catawba River, North Carolina.
Photogenis niveus, JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 20, 1878.
Cliola nivea, JORDAN & GILBERT, Synopsis, 180, 1883.

Represented in the Santee Basin by

447a. NOTROPIS NIVEUS CHLORISTIUS (Jordan & Brayton).

Head 4; depth 4; eye small, less than snout, 4 in head. D. 7; A. 8; scales 5–36–3; teeth 1, 4–4, 1. Body short and deep, strongly compressed, the form elliptical, as in *N. pyrrhomelas*, but rather deeper. Head rather small and pointed. Mouth quite oblique, the maxillary not reaching line of orbit, the upper jaw projecting beyond lower; premaxillary on level of pupil. Lateral line decurved. Fins moderate. Nuptial tubercles covering the whole body, except space anterior to ventrals and below lateral line; those on the body much smaller than those on the head. Coloration dark steel-blue; a very distinct blue stripe along each side of caudal peduncle; back clear green; lower part of sides abruptly milk-white; black dorsal blotch large, the lower part of the fin with bright pale-green pigment, the tip milky; caudal dusky, its tips milky, its base pale; anal and ventrals milky, a faint dusky spot on last rays of anal; iris white. Females slenderer and less brightly colored; no caudal spot. Length 3 inches. Santee River and tributaries; common. This form occurs in the Catawba with the typical *niveus*, into which it seems to intergrade; both forms are very close to *N. whipplii*, but should probably be considered distinct species. (*χλωρός*, green; *ἱστίον*, sail.)

Codoma chloristia, JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 21, 1878, tributary of Saluda River, Greenville, South Carolina. (Type, No. not given. Coll. Jordan & Brayton.)
Cliola chloristia, JORDAN & GILBERT, Synopsis, 183, 1883.

448. NOTROPIS WHIPPLII (Girard).

(SILVER-FIN.)

Head 4¼; depth 4 in adult males; females and young more slender, 4¼ to 5; eye small, 4½ in head. D. 8; A. 8; scales 5–38 to 40–3; teeth 1, 4–4, 1, the edges more or less distinctly serrate. Body moderately elongate, somewhat compressed, the dorsal and ventral outlines regularly and gently arched. Head rather short and deep. Mouth rather small, quite oblique, the lower jaw received within the upper when the mouth is closed. Leaden silvery, bluish in the males; edges of scales dusky; a dark vertebral line; a large black spot on the upper posterior part of the dorsal. Paired fins and lower part of belly, as well as the tips of the anal and caudal, and the front and upper parts of dorsal, charged with clear, satin-white pigment in males in spring; in full breeding dress the dorsal pigment with a greenish luster; no creamy band at base of caudal; males with the head and front covered with small tubercles. Length 4 inches. Central New York, Cayuga Lake, to Minnesota, northern Alabama and Arkansas, in clear streams; very abundant in the Ohio Valley. (Named for Captain A. W. Whipple, who collected the types.)

Cyprinella whipplii, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 198, Sugar Loaf Creek, tributary Poteau River, Arkansas. (Type, No. 137. Coll. Möllhausen.)

Photogenis spilopterus, COPE, Cypr. Penn., 378, 1866, St. Joseph River, Southwestern Michigan.

Luxilus kentuckiensis, KIRTLAND, Bost. Journ. Nat. Hist., v, 27, pl. VIII, fig. 3, 1847, (not of Rafinesque).

Hypsilepis kentuckiensis, COPE, Cypr. Penn., 371, 1866.

Leuciscus spilopterus, GÜNTHER, Cat., VII, 254, 1868.

Cliola whipplei and *analostana*, JORDAN & GILBERT, Synopsis, 178 and 179, 1883.

449. NOTROPIS ANALOSTANUS (Girard).

The eastern representative of *N. whipplii.* Entirely similar to *whipplii* except that the body is less elongate, the adult male 3½ in length instead of 4, and the scales larger, 34 or 35 in the lateral line instead of 38 to 40. Probably to be regarded as a different species, but possibly intergrading with *whipplii* on the westward and perhaps with *niveus* southward. Streams about Delaware and Chesapeake bays; abundant in the Potomac and James; recorded from the Susquehanna and Delaware. (From Analostan Island, in the Potomac.)

Cyprinella analostana, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 59, Rock Creek, Analostan Island, Potomac River; JORDAN & GILBERT, Synopsis, 179, 1883, (in part).

Leuciscus analostanus, GÜNTHER, Cat., VII, 256, 1868.

450. NOTROPIS GALACTURUS (Cope).

Head 4⅓; depth 4⅓. D. 8; A. 8; scales 6–41–3; teeth 1, 4–4, 1, usually with entire edges. Body fusiform, moderately elongate, not greatly compressed. Mouth rather large, jaws nearly horizontal, the upper projecting. Larger than *N. whipplii*, more elongate and less compressed, the scales less closely imbricated, the lateral line less decurved. Eye small. Steel-blue above, silvery below; dorsal with a black blotch on its posterior rays; caudal fin conspicuously creamy yellow at base, then dusky; males with the belly, paired fins, and especially tips of vertical fins charged with milk-white pigment in spring, the head and front then covered with small tubercles; in high coloration the anal and caudal are sometimes pale reddish; females olivaceous, obscurely marked. Length 5 to 6 inches. Ozark region to Cumberland, Tennessee, and Savannah rivers; abundant in the mountain streams. Known by its large size and the peculiar yellowish band across the caudal. (*γάλα*, milk; *οὐρά*, tail.)

Hypsilepis galacturus, COPE, Proc. Ac. Nat. Sci. Phila., 1867, 160, Holston River, Virginia. (Type, No. 14981. Coll. Cope.)

Leuciscus kentuckiensis, GÜNTHER, Cat., VII, 251, 1868, not of Rafinesque.

Cliola galactura, JORDAN & GILBERT, Synopsis, 179, 1883.

451. NOTROPIS CAMURUS (Jordan & Meek).

Head 4⅓; depth 3½. D. 8; A. 9; scales 6–38–4. More robust than *N. galacturus*, the back elevated; anterior profile steep, the snout bluntly decurved; mouth small, oblique; teeth crenate. Bluish silvery; dorsal fin in adult with a large dark blotch as in *N. whipplii*; males with silvery pigment. Length 4 inches. Arkansas River and tributaries, not rare in Kansas and southwestern Missouri. (*camurus*, blunt-faced.)

Cliola camura, Jordan & Meek, Proc. U. S. Nat. Mus., 1884, 474, Arkansas River, Fort Lyon, Colorado. (Type, No. 12256. Coll. Dr. E. Palmer.)

452. NOTROPIS XÆNURUS (Jordan.)

Head 4; depth 3¾; eye large, 3¾ in head. D. 8; A. 10; scales 6–39–3; teeth 1, 4–4, 1. Body moderately elongate, subfusiform, heavy forward. Head heavy, somewhat elongate, rounded above. Mouth large, oblique, the lower jaw included; maxillary reaching almost to orbit; premaxillary on level of upper part of pupil. Fins all rather low, the height of the dorsal fin, even in males, only two-thirds length of head; caudal fin large. Color dark steel-blue; silvery below; a faint black spot at base of caudal; scales above dark-edged; males with the fins mostly bright crimson; the dorsal largely black at its upper posterior part; dorsal, anal, and caudal fins with white pigment; belly and bases of lower fins likewise pigmented; head and caudal peduncle tuberculate in spring. Length 3 inches. Altamaha Basin, Georgia; locally abundant. (*ξαίνω*, to scratch; *οὐρά*, tail.)

Minnilus xænurus, Jordan, Proc. Ac. Nat. Sci. Phila., 1877, 79, Ocmulgee River, Flat Shoals, Georgia. (Type, No. 17862. Coll. Jordan & Gilbert.)
Codoma xænura, Jordan, Bull. U. S. Nat. Mus., xii, 52, 1878.
Cliola xænura, Jordan & Gilbert, Synopsis, 184, 1883.

453. NOTROPIS HYPSELOPTERUS (Günther).

Head 4¼; depth 4; eye 3. D. 8; A. 11; scales 6–35–3; teeth 1, 4–4, 1. Body short, much compressed, the back elevated. Head short, flattened above, the muzzle pointed. Mouth large, very oblique, the jaws just equal. Eye large, about equal to snout and to interorbital space. Scales with the exposed surfaces very narrow. Lateral line much decurved; 16 large scales before dorsal. Dorsal fin inserted entirely behind ventrals, greatly elevated, its longest ray a little longer than head; anal fin also very high and very long, extending almost to base of caudal; these fins somewhat lower in females. Color silvery; the dorsal blotch conspicuous; a distinct black caudal spot, smaller than eye and deeper than long; sides with a silvery band which passes around the nose, below this a dusky band. Breeding colors unknown. Length 2½ inches. Southern Georgia and Alabama. (*ὑψηλός*, high; *πτέρον*, fin.)

Alburnus formosus, Putnam, Bull. Mus. Comp. Zoöl., i, 9, 1863, Mobile, (not *Moniana formosa*, Girard).
Leuciscus hypselopterus, Günther, Cat., vii, 255, 1868, Mobile; substitute for *formosus*, preocupied. (Coll. Thos. Moore.)
Photogenis grandipinnis, Jordan, Bull. U. S. Nat. Mus., x, 62, 1877, Flint River, Georgia. (Type, No. 9296. Coll. Hugh M. Neisler.)
Cliola hypseloptera, Jordan & Gilbert, Synopsis, 184, 1883.

454. NOTROPIS PYRRHOMELAS (Cope).

Head 4; depth 3¾; eye large, 3. D. 8; A. 10; scales 6–35–3; teeth 1, 4–4, 1. Body deep and compressed. Head stout, rather blunt. Mouth oblique, the jaws about equal; maxillary reaching front of orbit. Pectorals barely reaching ventrals, the latter to anal; dorsal fin greatly elevated, its height in male as great as length of head; caudal very broad and long, its peduncle stout and compressed; anal fin large and long. Coloration of males dark steel-blue above; the scales darker-edged; belly abruptly milky white; head pale reddish; snout, tip of lower jaw, and iris scarlet; dorsal dusky at base, the usual large black blotch above, red in front, and broadly milk-white at tip; tips of caudal milk-white, next to this a dusky crescent, a wide crescent of bright scarlet inside of the black, extending into the two lobes of the fin; base of caudal pale; anterior region and sides of caudal peduncle with rather large tubercles. Females duller. Length 3¼ inches. Santee Basin; very abundant, the most ornate of our *Cyprinidæ*. (πῦρ, fire; μέλας, black.)

Phologenis pyrrhomelas, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 463, Catawba River, North Carolina. (Coll. Cope.)

Codoma pyrrhomelas, JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 22, 1878.

Cliola pyrrhomelas, JORDAN & GILBERT, Synopsis, 184, 1883.

455. NOTROPIS GARMANI, Jordan.

Head 4½; depth 2⅔. D. 8; A. 11; scales 7–38–3; teeth 1, 4–4, 1. Body deep, much compressed, the back arched. Head small; snout shorter than eye; maxillary not reaching eye; pectorals not reaching ventrals, the latter to anal; caudal deeply forked; scales much deeper than long. Brownish above, sides rosy or silvery; cheeks silvery, a brownish band from nape to pectorals; lower fins salmon color; caudal reddish. Length 3 inches. Tributaries of Lago del Muerte, Coahuila. (Garman.) (Named for Samuel Garman, the accomplished ichthyologist of the Museum of Comparative Zoölogy.)

Cyprinella rubripinna, GARMAN, Bull. Mus. Comp. Zoöl., VIII, 91, 1881, Lago del Muerte.

Notropis garmani, JORDAN, Cat. Fish. N. Am., 813, 1885, (substitute for *rubripinna*).

Cliola rubripinna, JORDAN & GILBERT, Synopsis, 884, 1883. The name *rubripinnis* has been twice earlier used in *Notropis*.

Subgenus LUXILUS, Rafinesque.

456. NOTROPIS CORNUTUS* (Mitchill).

(SHINER; RED-FIN; DACE.)

Head 4¼; depth 3¼, varying much with age; eye 4 to 5. D. 8; A. 9; scales 6–41–3; teeth 2, 4–4, 2, with rather narrow grinding surface. Body

---

*We adopt the specific name *cornutus* for this species, as the first preliminary notice by Dr. Mitchill, in which the species is named *Cyprinus cornutus*, is sufficient for its identification. This was published in July or August, 1817. In December, 1817, the same species was described by Rafinesque as *Cyprinus megalops*, and in February, 1818, Dr. Mitchill gives a detailed account calling it *Cyprinus cornutus*. The following is the preliminary notice of the Fishes of the Wallkill River, Amer. Monthly Mag., I, 1817, 289, July:

TRANSACTIONS OF LEARNED SOCIETIES.—LYCEUM OF NATURAL HISTORY.

Sitting of July 7, 1817.—Dr. Benjamin Akerly presented several specimens of fish, which he had obtained in Wallkill Creek, and which appeared to be undescribed species.

Sitting of July 14, 1817.—Dr. Mitchill made a detailed report on the ichthyology of the Wallkill, from the specimens of fishes presented to the Society at the last meeting by Dr. B. Akerly in behalf of the committee of exploration. They consisted of several sorts of

CYPRINUS, OR CARP.

1. The Corporal, or *C. corporalis*, a splendid silvery fish inhabiting that stream, the sturgeon [?] of Albany and the western waters. (New.)
2. The Mudfish, or *C. atronasus*, so called from his having a black stripe from tail to head, and encompassing the nose. (New.)
3. The Red-fin, or *C. cornutus*, having elegant scarlet fins and knobs, or long protuberances over the head. (New.)

SILURUS, OR CATFISH.

1. The common Silure, or American *S. catus*; a steady inhabitant of our fresh rivers and ponds.
2. The frog Silure, or *S. gyrinus*; having but a single dorsal fin, and a lanceolate tail resembling that of a tadpole when full grown. (New.)

LABRUS.

1. The Sunfish, or *L. auritus*, with the scarlet fins to the gill covers.
2. The Brown Labre, or *Labrus appendix*; so called from the black appendages to the gill covers, broader and longer than the preceding species, and with various other marks of difference. (New.)

ESOX OR PIKE.

1. The white-bellied Shilli-fish [Killi-fish], or *Esox pisciculus*, of his memoir on the fishes of New York. The description by himself and the drawings by Dr. B. Akerly, are all completed.

elongate in the young, in the adult short, compressed, with the anterior dorsal region much swollen and gibbous. Head rather heavy, compressed, rounded between the eyes, the snout bluntish. Mouth moderate, nearly horizontal, the jaws nearly equal, the lower somewhat included. Eye moderate; maxillary scarcely reaching front of eye, the premaxillaries below the level of eye. Scales always deeper than long on the sides, becoming extremely deep in the adult. Lateral line decurved. Dorsal moderate, inserted directly over ventrals in young, thrown somewhat backward in adult by the growth of the nuchal region. Pectorals barely or not reaching ventrals, the latter about to vent. Region in front of dorsal typically with about 23 scales, the number ranging from 15 to 40. Coloration dark steel-blue above; the scales with dusky edges, the bases also dusky; a gilt line along the back and one along each side, these distinct only when the fish is in the water; belly and lower part of the sides silvery, bright rosy in spring males; dorsal fin somewhat dusky; other fins plain; the lower fins all rosy in spring males; head dark above; a dark shade behind scapula; lower jaw and region in front of dorsal to tip of snout covered with small tubercles in spring males; female and young fishes are plain olivaceous above and silvery below. Length 5 to 8 inches. Entire region east of the Rocky Mountains excepting the South Atlantic States and Texas; almost everywhere the most abundant fish in small streams. Its variations are great, some of them appearing like distinct species. (*cornutus*, horned.)

Cyprinus cornutus, MITCHILL, Amer. Monthly Mag. Crit. Review, I, July, 1817, 289, Wallkill River, New York; preliminary notice; MITCHILL, *l. c.*, II, February, 1818, 324, detailed description.

Cyprinus megalops, RAFINESQUE, Amer. Monthly Mag. and Crit. Review, I, December, 1817, 121, Hudson River, above the Falls.

Cyprinus melanurus, RAFINESQUE, *l. c.*, 121, Hudson River, above the Falls.

Luxilus chrysocephalus, RAFINESQUE, *l. c.*, 47, 1820, Ohio River.

?*Luxilus interruptus*,* RAFINESQUE, *l. c.*, 49, Ohio River; may be *N. rubrifrons.*

Rutilus plargyrus, RAFINESQUE, Ichth. Oh., 50, 1820, Ohio River.

? *Rutilus compressus*,† RAFINESQUE, *l. c.*, 51, Monongahela River, etc.; may be *N. photogenis.*

Leuciscus vittatus, DE KAY, N. Y. Fauna: Fishes, 212, 1842, Chittenonda Creek, tributary of Mohawk River.

Argyreus rubripinnis, HECKEL, Russeggers Reisen, 1843, 1040.

Leuciscus spirlingulus, CUVIER & VALENCIENNES, XVII, 321, 1844, New Jersey; New Harmony, Indiana. (Coll. Le Sueur.)

Leuciscus obesus, STORER, Proc. Bost. Soc. Nat. Hist., July, 1845, 48, Florence, Alabama. (Coll. C. A. Hentz.)

---

[*] "42nd species, Yellow Shiner, *Luxilus interruptus*, Luxile jaunâtre: Diameter one-sixth of total length; yellowish olivaceous above, silvery beneath, rufous brown above the head, a rufous line from the dorsal to the tail, 2 straight and separated half lateral lines, the anterior one above the posterior; pectoral fins reaching the abdominal. Dorsal with 10 and anal with 9 rays. A small species, only 3 inches long, called Yellow Chub or Shiner. Seen in the Ohio. Sides opaque, with violet shades. Iris silvery, mouth large, lips very apparent. Fins yellowish, pectorals with 16 rays, caudals with 24."—*Rafinesque.*

[†] "47th species, Baiting Fallfish, *Rutilus compressus*, Rutile appat: Diameter one-seventh of total length; silvery, back fulvous, sides compressed, lateral line straight, raised upwards at the base, snout rounded, mouth hardly diagonal, nearly horizontal. Dorsal and anal fins with 9 rays. A small fish from 2 to 4 inches long, called Fallfish, Bait fish, Minny, etc. It is found in the Allegheny Mountains, in the waters of the Monongahela, Kanawha, and even in the Potomac. The name of Fallfish arises from its being often found near falls and ripples. Body more compressed than in the other species; as much so as in the genus *Minnilus.* Scales large; lips a little fleshy; iris silvery gilt; fins transparent; the pectoral with 14 rays, and not reaching the abdominal; tail with 32 rays."—*Rafinesque.*

Plargyrus typicus, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 196, after Rafinesque.

Plargyrus bowmani, Girard, *l. c.*, 196, Sweetwater River, Nebraska. (Coll. Bowman.)

Plargyrus argentatus, Girard, *l. c.*, 212, James River, Virginia. (Coll. Baird.)

Alburnops plumbeolus, Cope, Proc. Ac. Nat. Sci. Phila., 1864, 282, Saginaw River, Flint, Michigan.

Hypsilepis cornutus, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 158.

Leuciscus cornutus, Günther, Cat., vii, 249, 1868.

Minnilus cornutus, Jordan & Gilbert, Synopsis, 186, 1883.

Minnilus plumbeolus, Jordan & Gilbert, Synopsis, 192, 1883.

Represented northwards by the scarcely tangible

456a. NOTROPIS CORNUTUS FRONTALIS (Agassiz).

Thirteen to 18 scales before dorsal; head very heavy. Great Lakes; everywhere common in mouths of brooks. (*frontalis*, pertaining to the forehead.)

Leuciscus frontalis and *gracilis*, Agassiz, Lake Superior, 368, 370, 1850, Lake Superior.

Hypsilepis cornutus gibbus, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 158, Monroe County, Michigan.

In Northern Michigan occurs

456b. NOTROPIS CORNUTUS CYANEUS (Cope).

Scales of the dorsal and ventral regions very small, 31 to 40 in front of dorsal fin. Scales 10–40–4. Coloration extremely dark; blue-black above; fins chiefly black. Northern Peninsula of Michigan; not known to us. (κυανέος, blue.)

Hypsilepis cornutus cyaneus, Cope, Proc. Ac. Nat. Sci. Phila., 1867. 160, Montreal River. Keweenaw, Michigan. (Coll. Dr. John H. Slack.)

In the Roanoke River are two strikingly different forms which should perhaps rank as distinct species.

457. NOTROPIS CERASINUS (Cope).

Fifteen scales before dorsal; scales 6–37–3. Eye 3½ in head; snout short and blunt; dorsal and anal high, their edges concave. Head 4 in length; depth 3⅗. Colors very brilliant. Steel-blue, the sides always marked with irregular blackish cross blotches and bars formed by a broad dark edging on some scales. Males flushed with pink, the fins all deep red. Length never more than 4 inches. Roanoke River, in mountain brooks. (*cerasinus*, cherry-red.)

Hypsilepis cornutus cerasinus, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 159, Head waters of Roanoke River, Virginia. (Coll. Cope.)

458. NOTROPIS ALBEOLUS (Jordan).

Snout sharper than in the ordinary *cornutus*, the caudal peduncle and fin especially longer. Dorsal and anal high, their free edges concave. Eye 3½ in head; depth 4. Lateral line 38, 14 scales before dorsal. Pale, olivaceous above, sides and fins silvery white, the tip of the snout silvery in the male. Length 5 to 7 inches. Roanoke, Tar, and Neuse rivers, in the lower stretches and in the river channels, never in the mountain springs with *N. cerasinus.* Probably the representative form in the streams of the pine woods. The typical *cornutus* is not found coastwise south of the James. (*albeolus*, whitish.)

Notropis megalops albeolus, JORDAN, Bull. U. S. Fish Comm., VIII, 1888, (1891), 123, Roanoke River, near Roanoke, Virginia. (Coll. Jordan, Evermann, & Jenkins.)

459. NOTROPIS LACERTOSUS (Cope).

Head 4⅕; depth 4⅓; eye 3½. D. 8; A. 8; scales 5–38–3, 17 before dorsal. Teeth 2, 4–4, 2. Very close to *N. cornutus*, and resembling the young of the latter, but the mouth larger and the lower jaw projecting; maxillary 3 in head, reaching just past front of eye. Body stout, head broad and deep. Eye large, equal to muzzle and to width of interorbital space. Fins all low, dorsal inserted slightly behind ventrals. Green above, sides silvery; a dark speck on front of opercle; no red. Length 4 inches. Head waters of Tennessee River; rare. (*lacertosus*, lizard-like.)

Hybopsis lacertosus, COPE, Journ. Ac. Nat. Sci. Phila., 1868, 232, Bear Creek, tributary Middle Fork Holston River. (Coll. Cope.)

Minnilus lacertosus, JORDAN & GILBERT, Synopsis, 192, 1883.

Notropis lacertosus, JORDAN, Bull. U. S. Fish Comm., VIII, 1888, (1891), 144.

Subgenus HYDROPHLOX, Jordan.

460. NOTROPIS MACDONALDI, Jordan & Jenkins.

Head 3¾; depth 4¾; eye 4⅛. D. 8; A. 9 or 10; scales 7-39-2; teeth 2, 4–4, 2, with narrow grinding surface. Allied to *Notropis zonatus.* Body elongate, compressed, the snout little convex; eye moderate, a little shorter than snout; mouth large, terminal, oblique, the lower jaw projecting, the maxillary to opposite front of eye, 2⅞ in head. Scales less crowded than in *N. cornutus*, 17 to 20 before dorsal; dorsal inserted behind ventrals; fins moderate. Greenish, with a diffuse band of plumbeous silvery; a dark streak along back; no caudal spot; fins plain; males with the snout, chin, and axils red. Length 5 inches. Mountain streams of Virginia, tributary to the James and Shenandoah; common. (Named for Marshall McDonald, U. S. Commissioner of Fish and Fisheries.)

Notropis macdonaldi, JORDAN & JENKINS, Proc. U. S. Nat. Mus., 1888, 354, pl. 44, fig. 4, Shenandoah River, Luray, Virginia. (Type, No. 39859. Coll. Jordan & Jenkins.)

461. NOTROPIS COCCOGENIS (Cope).

Head 4; depth 4¼; eye large, 3½. Scales 7–42–3; teeth 2, 4–4, 2. Body elongate, compressed, not at all elevated. Head rather pointed. Mouth large, very oblique, the premaxillary nearly on a level with pupil; lower jaw projecting beyond upper; maxillary reaching past front of eye. About 20 scales in front of dorsal. Back olivaceous; the scales dark-edged; belly and sides silvery, rosy in spring males; a dusky scapular band; a scarlet bar down the line of the preopercle; muzzle and upper lip red; a red axillary spot; outer half of dorsal black, lower half yellowish; outer part of caudal dusky, base paler; a faint lateral streak and a dark vertebral line; lower fins white; snout swollen and tuberculate in spring males; females silvery, with only traces of red markings. Length 5 inches. Cumberland, Tennessee, and Savannah rivers; abundant in the mountain streams, especially in the head waters of the Tennessee; a showy little fish. (*κόκκος*, berry red; *γένειον*, cheek.)

Hypsilepis coccogenis, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 160, pl. 27, fig. 5, Holston River. (Type, No. 36849. Coll. Cope.)
Leuciscus coccogenis, Günther, Cat., VII, 253, 1868.
Minnilus coccogenis, Jordan & Gilbert, Synopsis, 188, 1883.

462. NOTROPIS ZONATUS (Agassiz).

Head $4\frac{1}{4}$; depth $4\frac{2}{3}$; eye very large, 3. D. 8; A. 9; scales 6–42–4; teeth 2, 4–4, 2, with narrow grinding surface. Body rather elongate, less slender than in *N. coccogenis*, the head long, not acute. Jaws equal; maxillary 3 in head, not reaching eye; snout shortish; lateral line decurved. Olivaceous, with a black lateral band, (plumbeous in female); no caudal spot and no spots on fins. Male in spring with the sides and lower parts flame-red. Length 5 inches. Mountain streams in the Ozark region of Missouri and Arkansas; abundant. A brilliant fish, representing *N. coccogenis* west of the Mississippi. (*zonatus*, banded.)

Alburnus zonatus (Agassiz) Putnam, Bull. Mus. Comp. Zoöl., 1, 9, 1863, Osage River, Mo.
Notropis zonatus, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1886, 2.

463. NOTROPIS ZONISTIUS (Jordan).

Head $3\frac{4}{5}$; depth $3\frac{2}{3}$; eye $3\frac{1}{2}$. D. 8; A. 10; scales 7–40–3; teeth 2, 4–4, 2, with very narrow grinding surface on 1 or 2 of them. Body rather stout, compressed, the back somewhat elevated, the form that of a young *Notropis cornutus*. Head heavy, broad and flattish above, the profile evenly descending. Mouth large, smaller than in *N. coccogenis*, oblique, the jaws about equal, the upper lip opposite middle of eye, the maxillary reaching front of orbit. Eye very large, longer than snout. Scales not very closely imbricated, 17 scales in front of dorsal. Lateral line strongly decurved. Fins moderate, pectorals scarcely reaching ventrals. Steel blue above; sides with considerable coppery luster; dorsal fin with a sharp jet black horizontal bar about half way up, reddish in young fishes, the tip of the fin somewhat milky, the base pale; a round black spot nearly as large as eye at base of caudal; anal fin plain; caudal dull ferrugineous red, pale at base as in *N. coccogenis*, milky at tip; back and sides with gilt lines; a faint red bar down the cheeks as in *N. coccogenis*; a dark humeral bar; males with the snout tuberculate; females plain, so much resembling *Notropis curystomus*, from the same waters, that the two species were at first confounded. Length 4 inches. Chattahoochee River; the typical examples from Suwannee Creek. (*ζώνη*, zone; *ιστίον*, sail.)

Codoma curystoma, Jordan & Brayton, Bull. U. S. Nat. Mus., XII, 42, 1878, (excl. syn., not *Photogenis curystomus*, Jordan).
Luxilus zonistius, Jordan, Proc. U. S. Nat. Mus., 1879, 239, Suwannee Creek, tributary of Chattahoochee River, in Northern Georgia. (Type, No. 23452. Coll. Jordan & Brayton.)
Minnilus zonistius, Jordan & Gilbert, Synopsis, 188, 1883.

464. NOTROPIS RUBRICROCEUS (Cope).

(RED FALLFISH.)

Head 4; depth 4½; eye 3½. D. 8; A. 9; scales 7–38–3; teeth 2, 4–4, 2, the edges of the grinding surface often serrate. Body moderately elongate, somewhat compressed. Head comparatively long and rather pointed. Mouth rather large, oblique, the jaws about equal. Eye large, as long as snout, premaxillary rather below pupil; maxillary reaching beyond front of orbit. Lateral line somewhat decurved; 19 scales in front of dorsal. Dorsal inserted somewhat behind ventrals. Females olivaceous, sometimes flushed with red. Males dark steel blue, a dark lateral band of coaly punctulations, which is usually distinct on the anterior part of the body, and passes through the eye around the snout; fins all rich, clear red, the dorsal crimson, the caudal pink, the lower fins scarlet; head pale red, the lower jaw flushed as if bloody; eyes bluish or flushed with red; a lustrous streak along sides; silvery below. In high coloration the whole body is more or less red. Males with the head and antedorsal region dusted with fine white tubercles. Length 4 inches. Head waters of the Tennessee and Savannah rivers; a surpassingly beautiful little fish, abounding in rock pools at the foot of the cascades. (*ruber*, red; *croceus*, saffron color.)

Hybopsis rubricroceus, COPE, Journ. Ac. Nat. Sci. Phila., 1868, 231, pl. 28, fig. 4, Tumbling Creek, tributary North Fork Holston River. (Coll. Cope.)
Hydrophlox rubricroceus, JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 32, 1878.
Minnilus rubricroceus, JORDAN & GILBERT, Synopsis, 189, 1883.

465. NOTROPIS CHLOROCEPHALUS (Cope).

Head 4; depth 5; D. 8; A. 8; eye large, 3 in head; scales 6–39–3; teeth 2, 4–4, 2. Body stout, with deep caudal peduncle. Head broad, with descending muzzle; mouth oblique, the maxillary reaching beyond line of orbit; premaxillary opposite lower margin of pupil; interorbital space greater than muzzle. Lateral line moderately decurved; 16 scales in front of dorsal. Color olivaceous, everywhere dusted with blackish specks, forming a lateral band which terminates in a dusky spot at base of caudal; green vertebral and lateral lines; top of head and upper portion of cheeks metallic green; males with the belly dark crimson, the whole body more or less flushed; lower jaw not black; dorsal and caudal red at base; sides of head and lateral band red; snout and antedorsal region tuberculate; fins plain. Length 2½ inches. Santee Basin, in North and South Carolina; abundant in clear mountain streams. (χλωρός, green; κεφαλή, head.)

Hybopsis chlorocephalus, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 461, Catawba River, North Carolina. (Coll. Cope.)
Minnilus chlorocephalus, JORDAN & GILBERT, Synopsis, 190, 1883.

466. NOTROPIS LUTIPINNIS (Jordan & Brayton).

Head 4⅓; depth 4¼; eye 3⅗. D. 8; A. 8; scales 7–40–3; teeth 2, 4–4, 2. Body stout and rather strongly compressed, the dorsal region somewhat elevated, the outline of the back sloping each way from the dorsal fin.

Head short and rather deep, broad and flattish above, the muzzle moderately rounded. Eye rather large. Mouth rather large, but smaller than in the preceding, quite oblique, the maxillary reaching orbit; mandible included; 18 scales in front of dorsal. In life clear olive, with very intense green dorsal and vertebral lines; an intense metallic blackish band along sides; below this the sides are bright silvery; the whole body in the males bright, clear red; head and fins all bright golden yellow, with no red; tip of lower jaw black. Length 3 inches. Small clear streams of the pine woods, tributary to the Santee and Oconee rivers; rare. (*luteus*, yellow; *pinna*, fin.)

Hydrophlox lutipinnis, JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 36, 1878, Oconee River, Hall's Springs, Georgia. (Type, No. 31090. Coll. Jordan & Brayton.)
Minnilus lutipinnis, JORDAN & GILBERT, Synopsis, 190, 1883.
Notropis lutipinnis, JORDAN, Bull. U. S. Fish Comm., VIII, 1888, (1891), 157.

467. NOTROPIS CHILITICUS (Cope).

Head 4; depth 5½; eye large, 3 in head, longer than muzzle. D. 8; A. 8; scales 7–36–2; teeth 2, 4–4, 2. Body elliptical. Head broad behind; occiput convex. Muzzle acuminate, greater than interorbital width. Maxillary extending beyond anterior rim of orbit; premaxillaries opposite middle of pupil; lateral line strongly decurved. Dorsal fin small. Olivaceous, a distinct silvery lateral band; usually a dark caudal spot; dorsal scales brown-edged; males with the lips and snout vermilion; a vermilion band through dorsal and one through anal fin. Length 2 inches. Allied to *N. altipinnis*, but more slender, with larger mouth. Basin of the Great Pedee River, North Carolina, common in upland streams. (χεῖλος, lip.)

Hybopsis chiliticus, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 462, Yadkin River, Roane County, North Carolina. (Coll. Cope.)

468. NOTROPIS ALTIPINNIS (Cope).

Head 4⅓; depth 3½; eye very large, longer than snout, 2¾ in head. D. 8; A. 9; scales 5–36–2. Allied to *N. chalybœus*, but more robust in form. Body rather short and deep; head short, compressed. Ventrals extending to beyond last rays of dorsal, reaching anal. Dorsal elevated, its height equal to half its distance from the snout. Scales before dorsal small. Greenish; a lateral silvery band, strongly punctate with black; a black band across eye and snout; lower jaw always blackish; young with a black caudal spot; no black at base of anal; snout yellowish; vertical fins light reddish in life. Length 2¼ inches. Clear streams of the pine woods, tributary to the Great Pedee and Cape Fear rivers; abundant. (*altus*, high; *pinna*, fin.)

Alburnellus altipinnis, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 464, Yadkin River, Roane County, North Carolina. (Coll. Cope.)
Minnilus altipinnis, JORDAN & GILBERT, Synopsis, 195, 1883.

469. NOTROPIS ROSEUS (Jordan).

Head 4⅓; depth 4½; eye nearly 3. A. 7, never 8, as in the related *N. chalybœus*. Scales 5–38–5; teeth 2, 4–4, 2. Body short and stout, little compressed. Head rather short, thick, bluntly rounded. Mouth moderate, slightly oblique, the jaws about equal. Eye large, about equal to muzzle, a little less than the broad interorbital space. 15 scales before dorsal; dorsal fin high, directly over ventrals. Olivaceous; scales dark-edged; a broad plumbeous lateral band; lips black; a dark caudal spot; a dark vertebral line; anal region dusted with dark points; cheeks and belly silvery; males with the dorsal, anal, caudal, and pectorals mostly rosy red; iris, top of head, and tip of snout red. Length 2½ inches. Lowland streams of the Gulf States from the Ogeechee to the Mississippi; the commonest species in the Okeefinokee swamps. (*roseus*, rosy.)

Luxilus roseus, Jordan, Bull. U. S. Nat. Mus., x, 61, 1877, Notalbany River, near Tickfaw, Louisiana. (Type No. 17831. Coll. Bean.)
Minnilus roseus, Jordan & Gilbert, Synopsis, 189, 1883.

470. NOTROPIS CHALYBÆUS (Cope).

Head 3⅘; depth 5; eye large, 3 in head. D. 8; A. 8; scales 6–33–3; teeth 2, 4–4, 2. Body moderately elongate, the back a little elevated, with slender caudal peduncle. Head flat above, rather narrow; muzzle rather pointed. Mouth very oblique, the lower jaw the longer. Lateral line decurved. Dorsal inserted behind ventrals; dorsal and anal very short and high; pectorals and ventrals short; 16 to 18 scales in front of dorsal. Color dark; a broad, black, shining lateral band from muzzle to base of caudal; a light band above it on the muzzle; belly straw-colored, bright orange in spring males; fins plain; a small dark spot at base of caudal; a dark streak along base of anal. Length 2 inches. Delaware River to the Ogeechee River; in coastwise streams and swamps, rather scarce. Strongly resembles *N. anogenus*, the teeth, and scales of back different. (*χαλυβαῖος*, iron-colored.)

Hybopsis chalybæus, Cope, Cypr. Penn., 383, 1866, Schuylkill River, Pennsylvania.
Minnilus chalybæus, Jordan & Gilbert, Synopsis, 191, 1883.

471. NOTROPIS CHROSOMUS (Jordan).

Head 4⅓; depth 5; eye 3¼, as long as muzzle. D. 8; A. 8; scales 5–37–3; teeth 2, 4–4, 2. Form chubby, little compressed, the back somewhat elevated; caudal peduncle not much contracted. Head rather large, rounded above, the snout somewhat pointed. Mouth moderate, oblique, the upper jaw the longer. Scales everywhere large, 16 before dorsal. Lateral line little decurved. Scales hyaline green in life, with blue reflections; belly clear silvery; a scarlet bar across dorsal, anal, and base of caudal; a narrow scarlet band from upper edge of opercles straight to caudal; below this a silvery band; a row of black dots along lateral line, forming a small, distinct spot at base of caudal; top of head and vertebral line golden. Snout tuberculate in males. Length 2½ inches. Alabama Basin; very abundant in clear streams and outlets of springs. A graceful little fish. (*chrosomus*, colored body, name of a related genus.)

Hybopsis chrosomus, Jordan, Ann. Lyc. Nat. Hist. N. Y., 1876, 333, Etowah River, etc., Rome, Georgia. (Type, No. 17881. Coll. Jordan & Gilbert.)
Hydrophlox chrosomus, Jordan & Brayton, *l. c.*, 49, 1878.
Minnilus chrosomus, Jordan & Gilbert, Synopsis, 191, 1883.

472. NOTROPIS XÆNOCEPHALUS (Jordan).

Head 4⅕; depth 5; eye very large, 2¾ in head. D. 8; A. 7; scales 5–38–3; teeth 2, 4–4, 2. Body rather short and deep, with thick caudal peduncle; back wide, not elevated. Head large, flattish and broad above, the snout rounded; mouth large, oblique, the jaws nearly equal. Lateral line somewhat decurved; 13 scales in front of dorsal; dorsal slightly behind ventrals. Dark olivaceous above, the scales being extensively dark-edged, so as to give a checkered appearance; a dark band along sides of caudal peduncle, which vanishes in black points along sides of body, reappearing on the head and passing around the snout; a dusky blotch at base of caudal; males without red markings, the snout swollen and tuberculate in the spring. Length 2¾ inches. Georgia to Mississippi; common in streams of the pine woods, descending to brackish water; abundant in Perdido Bay. (*ξαίνω*, to scratch; *κεφαλή*, head, from the tuberculate male.)

Hybopsis xænocephalus, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 334, Etowah River, etc., Rome, Georgia. (Type, No. 20116. Coll. Jordan & Gilbert.)
Minnilus xænocephalus, JORDAN & GILBERT, Synopsis, 192, 1883.

Subgenus ORCELLA, Jordan & Evermann.

473. NOTROPIS ORCA, Woolman.

Head 4½; depth 5; eye 4, small, slightly shorter than snout. D. 7; A. 8; scales 8–42–4. Teeth, 2, 4–4, 2, strongly hooked, with little or no grinding surface. Body plump, little compressed, with broad back and belly; dorsal outline somewhat elevated; head heavy, snout blunt, decurved; mouth subinferior, little oblique, lower jaw slightly included; maxillary scarcely reaching vertical of pupil. No barbel. Top of head unusually high and transversely rounded so that the eye is as near the lower as to the upper profile of head; interorbital space very wide and very convex, equal to distance from tip of snout to pupil. Fins moderate, origin of dorsal a little nearer snout than base of caudal, slightly behind insertion of ventrals; dorsal falcate, its first rays longest, 1⅓ in length of head; its last rays less than half length of first; anal not so high, its longest rays 1½ in head, and about twice as long as its last ray; margin concave; pectorals slightly falcate, about reaching ventrals, 1½ in head; ventrals short, 2 in head, not reaching vent; caudal very deeply forked, the middle rays 2½ in longest lateral ones, which are as long as head. Scales rather large, thin, lateral line somewhat decurved. Color in spirits pale; side with a broad, distinct silvery band, as broad as length of snout, bordered above by a narrow plumbeous line; back sparsely covered with fine dark punctulations, median line of back with a faint plumbeous band; top of head darkish, rest of head silvery; under part pale; fins pale. Length 3½ inches. Rio Grande at El Paso, Texas; several specimens. A curious species, little related to any other. (*orca*, the great killer, from a slight resemblance in form of head to that of a dolphin.)

Notropis orca, WOOLMAN, Bull. U. S. Fish Comm., XIV, 1894, (May 3, 1894), 56, Rio Grande, El Paso, Texas. (Coll. Woolman & Cox.)

Subgenus NOTROPIS.

474. NOTROPIS ARIOMMUS (Cope).

Head 3¾ to 4¼; depth 4¼ to 5. D. 8; A. 9; scales 6–39–2; teeth 2, 4–4, 2. Body stout, moderately elevated, somewhat compressed. Head heavy, broad above, the snout moderate, somewhat decurved. Mouth moderate, oblique, the jaws equal, the upper lip on level of pupil, the maxillary reaching the front of eye. Eye very large, 2⅗ in head, much longer than snout, larger than in any other of the American Cyprinidæ, except *N. swaini.* Fins moderate, the dorsal almost directly opposite ventrals. Scales large, 15 in front of dorsal. Lateral line much decurved. Olivaceous; scales above dark-edged; sides and below bright silvery; no red. Length 5 inches. Ohio and Tennessee valleys, generally rare, but abundant about Indianapolis; Greensburg, Kentucky; and Florence, Alabama. A handsome species. (*ἀρι-*, an intensive particle; *ὄμμα*, eye.)

Photogenis ariommus, Cope, Cypr. Penn., 378, 1866, White River, near Indianapolis.
Minnilus ariommus, Jordan & Gilbert, Synopsis, 194, 1883.

475. NOTROPIS SCABRICEPS (Cope).

Head 4; depth 4¼; eye very large, 3 in head, longer than snout. D. 8; A. 8; scales 6–38–3; teeth 2, 4–4, 2. Body rather stout, little compressed, the back slightly elevated, the form as in *Hybopsis amblops.* Head rather short and broad, the muzzle bluntish, somewhat decurved. Mouth moderate, terminal, little oblique, the jaws subequal, the maxillary reaching front of orbit. Lateral line not much decurved. Fins rather small; dorsal inserted over ventrals. Color plain olivaceous; scales dark-edged above; sides white, with a lateral band formed of dusky specks, this band running through the eye around the snout. Males tuberculate in spring. Smaller than *N. ariommus* and less silvery. Kanawha River, scarce; not yet recognized elsewhere. (*scaber*, rough; *–ceps*, head.)

Photogenis scabriceps, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 166, Sinking Creek, Walker's Creek, tributaries of Kanawha River. (Coll. Cope.)
Minnilue scabriceps, part, Jordan & Gilbert, Synopsis, 194, 1883; confused with *N. shumardi.*

476. NOTROPIS JEJUNUS (Forbes).

Head 4; depth 4⅔; eye rather large, 3⅔ in head, equal to snout, less than interorbital space. D. 8; A. 7; scales 5–37–3; teeth 2, 4–4, 1. Body rather slender; head flattish above, the snout blunt and rounded; mouth rather large, oblique. Dorsal over ventrals; 16 scales before dorsal. Color pale, with a broad silvery lateral band overlying a plumbeous shade; dorsal sometimes punctulate. Length 3 inches. Western Pennsylvania to Kansas, and north to Winnipeg; not rare. (*jejunus*, hungry.)

Episema jejuna, Forbes, Bull. Ills. Lab. Nat. Hist., II, 60, 1878, Illinois River. (Coll. Forbes.)
Minnilus jejunus, Jordan & Gilbert, Synopsis, 194, 1883.

477. NOTROPIS SWAINI, Jordan.

Head 4⅙; depth 4½; eye very large, 2⅔ in head, half longer than the bluntish snout. D. 9; A. 8 or 9; scales 6–35 to 38–3, 14 before dorsal; teeth 1, 4–4, 2, or 1, with very narrow grinding surface or none. Body moderately elongate, compressed, rather stouter than in *N. rubrifrons.* Head short and broad, the interorbital space ⅔ eye. Mouth large, oblique, the lower jaw projecting; maxillary to near front of pupil, 2⅘ in head; dorsal inserted behind ventrals; fins small. Color greenish, with a plumbeous lateral shade and dark dots; no spot at base of caudal; fins pale. Length 2½ inches. Rivers of Texas from the Colorado westward, the type from Rio Comal. (Named for Dr. Joseph Swain, President of the University of Indiana.)

Alburnus megalops, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 193, San Felipe Creek, Texas.
Notropis swaini, Jordan, Proc. U. S. Nat. Mus. 1885, 123, Rio Comal; Evermann and Kendall, Bull. U. S. Fish Comm., xii, 1892, (1894), 103, plate xvii, fig. 3.
Alburnellus megalops, Girard, U. S. Mex. Bound. Surv., Ichth., 52, 1859. (Coll. Clark.)
Minnilus megalops, Jordan & Gilbert, Synopsis, 195, 1883, not *Cyprinus megalops*, Rafinesque.

478. NOTROPIS AMABILIS (Girard).

Head 3⅘; depth 4⅛; eye large, considerably longer than snout, 3 in head. D. 8; A. 8; scales 5–34–3. Body elliptical, rather deep, head short and rather deep, less acute than in *N. dilectus.* Mouth terminal, oblique, the maxillary reaching front of eye. Jaws equal, snout moderately pointed. Lateral line decurved. Fins moderate. Dorsal somewhat behind ventrals. Color olivaceous; sides silvery; a faint dusky blotch at base of caudal. Length 2½ inches. Rio Leona, a tributary of Rio Nueces, Texas. (*amabilis*, amiable.)

Alburnus amabilis, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 193, Rio Leona, Texas.
Notropis amabilis, Jordan, Proc. U. S. Nat. Mus. 1885, 122.
Alburnellus amabilis, Girard, U. S. Mex. Bound. Surv., Ichth., 51, 1859. (Coll. Clark.)
Minnilus amabilis, Jordan & Gilbert, Synopsis, 195, 1883.

479. NOTROPIS LEUCIODUS (Cope).

Head 4½; depth 5. D. 8; A. 8; scales 5–39–3. Body rather slender; muzzle rounded in profile. Mouth oblique, the mandible not projecting. Lateral line nearly straight; 13 scales in front of dorsal; dorsal a little behind ventrals; anal short and high. Olivaceous; scales above dark-edged; sides silvery, with a purplish band; a black spot at base of caudal, always very distinct; muzzle and base of dorsal red in males. Length 3 inches. Tennessee Basin, in mountain streams very abundant, but not ascending cold brooks as far as *N. telescopus*, *spectrunculus*, and *rubricroceus.* It is close to *N. telescopus*, but has the anal shorter, the eye smaller, paler colors, and always a distinct caudal spot. (*λευκός*, white; *εἶδος*, appearance.)

Photogenis leuciodus, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 165, Holston River, Virginia.
Minnilus leuciodus, Jordan & Gilbert, Synopsis, 194, 1883. (Coll. Cope.)

480. NOTROPIS SCOPIFER, Eigenmann & Eigenmann.

Head 4 to 4⅓; depth 4½; eye 3 in head, little less than interorbital. D. 9; A. 8 or 9; scales 6–36 to 42–4; 14 to 18 scales in front of dorsal; teeth 2, 4–4, 2, grinding surface very narrow, on two teeth only. Allied to *Notropis leuciodus.* Head heavy, compressed, flat above; snout blunt, much decurved; mouth small, little oblique; maxillary extending to eye; lateral line complete, evenly and gently decurved to above origin of anal; a conspicuous black spot at base of middle caudal rays; a silvery lateral band, its dorsal margin distinct. Manitoba; common; obtained at Winnipeg, Brandon, Fort Qu 'Appelle and Medicine Hat. (Eigenmann & Eigenmann.) (*scopa*, broom; *fero*, I bear.)

Notropis scopiferus, EIGENMANN & EIGENMANN, Amer. Nat., February, 1893, 153, Winnipeg.

481. NOTROPIS TELESCOPUS (Cope).

Head 4¼; depth 4¾ to 5½; eye very large, longer than muzzle, 2¾ in head. D. 8; A. 10; scales 5–38–3. Body elongate, not much compressed; snout short, sharp; 13 scales before dorsal; dorsal fin inserted about midway between snout and base of caudal, a little behind ventrals. Mouth very oblique; mandible not projecting. Color pale greenish; the dorsal scales extensively dark-edged, the two uppermost rows of scales running into outline of back. Length 4 inches. Tennessee River; in cold mountain streams, very abundant; with *N. leuciodus*, making the bulk of the small minnows in the Holston River. (*τηλέσκοπος*, far-seeing.)

Photogenis telescopus, COPE, Proc. Ac. Nat. Sci. Phila., 1867, 165, Holston River, Virginia. (Coll. Cope.)
Leuciscus telescopus, GÜNTHER, Cat., VII, 252, 1868.
Minnilus telescopus, JORDAN & GILBERT, Synopsis, 201, 1883.

Represented in the Ozark region by

481a. NOTROPIS TELESCOPUS ARCANSANUS, Meek.

Head 4⅖; depth 5 to 5⅓; scales 5–35 to 38–3, 15 before dorsal. A. 10 or 11. Eye 2¾ in head, the pointed snout 3⅔. Smaller than the eastern form and darker, the dorsal farther back, midway between nostril and base of caudal; slightly behind ventrals. White River and Little Red River, Arkansas.

Notropis telescopus arcansanus, MEEK, Bull. U. S. Fish Comm., IX, 1889, (1891), 133, White River, Eureka Springs, Arkansas; Mammoth Springs, Arkansas. (Coll. Meek & Drew.)

482. NOTROPIS SOCIUS (Girard).

Head 4; depth 4⅓; eye 3. D. 8; A. 10. Lateral line 33. Allied to *Notropis swaini*, but deeper; the eye smaller, maxillary past front of eye; lower jaw longest. Silvery, the sides without dark dots; fins plain. Live Oak Creek, southwestern Texas. (*socius*, social.)

Alburnus socius, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 193, Live Oak Creek, Texas. (Type, No. 70. Coll. Pope.)

483. NOTROPIS NOTEMIGONOIDES, Evermann.

Head 4 to 4¼; depth 4 to 4¼. D. 8; A. 10 or 11; scales 10–41–3, 29 before dorsal; teeth 2, 4–4, 2, hooked, crenate, with moderate grinding surface. Body slender, greatly compressed, the back somewhat elevated, the form much as in *Abramis* (*Notemigonus*) *crysoleucas*; snout pointed, equal to eye, which is 3¼ to 3½ in head; caudal peduncle long. Fins moderate; dorsal well behind ventrals; anal long; pectorals falcate, not reaching ventrals. Yellowish, silvery below; upper parts dusted with black; spots on anterior part of sides so arranged as to form about 16 obtuse angles fitting into each other, the angles opening forward, thus, ≫, these markings on alternate scales; tip of lower jaw with dark specks; fins pale, dusted with dark specks. Rio Neches, near Palestine, Texas, and streams about Houston. (*Notemigonus;* είδος, likeness.)

Notropis notemigonoides, EVERMANN, Bull. U. S. Fish Comm., XI, 1891, (May 25, 1892), 81, Neches River, Palestine, Texas, and Sims Bayou, Houston, Texas. (Type, No. 45559. Coll. Evermann, Scovell, & Gurley); Evermann & Kendall, Bull. U. S. Fish Comm., XII, 1892 (1894), 103, pl. XVIII, fig. 2.

484. NOTROPIS STILBIUS, Jordan.

Head $4\frac{1}{5}$; depth 5; eye 3. D. 8; A. 10; scales 5–37–2; teeth 2, 4–4, 1. Body rather slender. Head rather long, somewhat pointed. Mouth large, oblique, the maxillary reaching eye. Eye very large, greater than snout and interorbital width. Fins rather high; the ventrals reaching to opposite last rays of dorsal. Color pale green; side with a broad silvery band, on which are many dark punctulations; these are numerous just behind shoulder girdle and at base of caudal, where they form an evident spot, a mark which will usually distinguish this species from the related ones; cheeks pure silvery; lips dusky. Length 3 inches. Alabama River and tributaries; common. (στίλβη, shining.)

Notropis stilbius, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 343, Etowah and Oostanaula rivers, Rome, Georgia. (Type, No. 31132. Coll. Jordan & Gilbert.)
Minnilus stilbius, JORDAN & GILBERT, Synopsis, 201, 1883.

485. NOTRÓPIS ATHERINOIDES, Rafinesque.

Head $4\frac{2}{3}$; depth $5\frac{1}{2}$; eye $3\frac{1}{4}$. D. 8; A. 11; scales 5–38–3, 15 before dorsal; teeth 2, 4–4, 2. Body long and slender, compressed, the back not elevated, Head blunt, conic, proportionately shorter than in related species. Mouth moderate, very oblique, upper lip on level of upper part of pupil; maxillary about reaching front of eye. Eye large, rather longer than snout. Fins low; dorsal well behind ventrals; tips of ventrals extending to beyond middle of dorsal. Lateral line decurved. Color translucent green above; sides bright silvery; scales above faintly punctate, but not enough so to render them dark-edged, nor to form blotches along sides; a faint dark vertebral line; males in spring with the snout rosy. Length 4 to 6 inches. Great Lake region and Ohio and Mississippi valleys, and north to Winnipeg. Abundant in lakes, quiet places, and river channels; very variable. Next to *N. arge*, the largest and handsomest species of this type. (*atherina*, the silverside; εἶδος, resemblance.)

Notropis atherinoides, RAFINESQUE, Amer. Month. Mag. & Crit. Rev., 1818, 204, Lake Erie.
Minnilus dinemus, RAFINESQUE, Ichth. Oh., 45, 1820, Ohio River.
Alburnus rubellus, AGASSIZ, Lake Superior, 364, 1850, Lake Superior.
Alburnus nitidus, KIRTLAND, Cleveland Ann. Sci., 1854, 44, tributaries of Lake Erie.
Alburnellus jaculus, COPE, Cypr. Penn., 387, 1866, St. Joseph River and Dowagiac River, Michigan.
Leuciscus rubellus, GÜNTHER, Cat., VII. 254, 1868.
Leuciscus copii, GÜNTHER, *l. c.*, 255, substitute for *jaculus*, preoccupied in *Leuciscus*.
Minnilus rubellus and *dinemus*, JORDAN & GILBERT, Synopsis, 202, 1883.

486. NOTROPIS ARGE (Cope).

Head 4¼; depth 6; eye 2¾ to 3. D. 8; A. 11; scales 5–39–3. Close to *N. atherinoides* but the eye very large, longer than snout; lateral line nearly straight, head large, the snout not very blunt; mouth large, the chin projecting. Pale greenish, the silvery band on sides bounded by a blackish line; a dark vertebral streak. Length 3½ inches. Upper Wabash Valley, southern Michigan, Green River, Kentucky, etc.; slenderer than the usual *atherinoides*, the eye much larger, but apparently varying into the latter, hence of doubtful validity. (*ἀργή*, shining white.)

Alburnellus arge, Cope, Cypr. Penn., 388, 1866, Detroit River or St. Joseph River; locality confused.

Notropis arge, Evermann & Jenkins, Proc. U.S. Nat. Mus., 1888, 47; Jordan, Man. Vert., ed. v, 62, 1890.

487. NOTROPIS DILECTUS (Girard).

Head 4⅔; depth 4¾; eye 3. D. 8; A. 11; scales 7–38–3; teeth 2, 4–4, 2. Body elongate, compressed, but a little deeper and more compressed, with blunter snout; eye large, larger than snout; mouth oblique, smaller than in related species, the jaws subequal, the maxillary 3⅓ in head, reaching eye. Colors very pale; silvery, snout and bases of fins rosy; a row of black dots above base of anal; young often finely speckled. Length 3½ inches. Lower Ohio to the Rio Grande, abundant in Arkansas and eastern Texas, in sandy streams; representing *rubrifrons* southwestward, and perhaps varying into it. (*dilectus*, delightful.)

Alburnus dilectus, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 193, Arkansas River, Fort Smith. (Type, No. 71 (36927). Coll. Shumard.)

Alburnus lepidulus,* Girard, Proc. Ac. Nat. Sci. Phila., 1856, 212, Black Warrior River, Alabama. (Coll. Winchell.)

Alburnus oligaspis, Cope, Proc. Ac. Nat. Sci. Phila., 1864, 282, Kansas; anal rays given by error as I, 14. (Coll. Dr. W. A. Hammond.)

Alburnellus jemezanus, Cope, Zoöl. Wheeler Survey, v, 650, 1875, Rio Grande, San Ildefonso, New Mexico. (Type, No. 15981. Coll. Cope & Yarrow.)

Alburnellus dilectus, Girard, Pac. R. R. Surv., x, 259, 1858.

Albramis ? oligaspis, Günther, Cat., vii, 309, 1868.

Minnilus oligaspis, Jordan & Gilbert, Synopsis, 200, 1883.

Minnilus jemezanus, Jordan & Gilbert, Synopsis, 203, 1883.

488. NOTROPIS FUMEUS, Evermann.

Head 4⅔; depth 4⅘ to 5; eye large, 3⅓. D. 8; A. 11; scales 7–40–3; teeth 2, 4–4, 2. Close to *Notropis dilectus*, but the lateral line more decurved, the scales a little smaller, and the sides with a dark band. Body slender, greatly compressed, the outlines gently arched; snout pointed, shorter than eye; lower jaw somewhat projecting; maxillary scarcely reaching orbit. Yellowish above, much speckled, sides with a broad dark plumbeous band, overlaid with rather large brown spots, most numerous and distinct posteriorly; base of anal with row of specks; fins plain, with dusky specks. Length 2 inches. Hunter Creek, Houston, Texas. Perhaps a variety of *N. dilectus*. (*fumeus*, smoky.)

---

* This nominal species is probably identical with *N. dilectus*. The following description is taken from 3 specimens 2¾ inches long, collected in Pearl River, Jackson, Miss., by Dr. O. P. Hay:

Body long and slender. Maxillary scarcely reaching front of orbit. Front of dorsal equidistant between snout and concavity of caudal. Eye 3 in head, equal to interorbital space. Mandible projecting slightly, its tip, when closed, opposite middle of pupil. Lateral line decurved; 17 scales in front of dorsal. Dorsal fin high, its highest rays equal to head. Color pale, the sides bright silvery; a row of dots along base of anal. Head 4½; depth 5 or 6. D. 11; A. 12. Scales 7–35–3. Sandy streams of Alabama and Mississippi.

Notropis fumeus, Evermann, Bull. U. S. Fish Comm., xi, 1891, (May 25, 1892), 81, Hunter Creek, Houston, Texas. (Type, No. 45558. Coll. Evermann, Scovell, & Gurley); Evermann & & Kendall, Bull. U. S. Fish Comm., xii, 1892 (1894), 103, pl. xviii, fig. 1.

489, NOTROPIS RUBRIFRONS (Cope).

Head 4; depth 4¾; eye 4. D. 8; A. 10; scales 5–39–3, those before dorsal large, 15 to 17 in number. Teeth 2, 4–4, 2, little hooked, one of them sometimes showing a slight grinding surface. Body moderately elongate, the back scarcely elevated, the caudal peduncle somewhat contracted. Head longer than in most related species, conic and rather pointed. Mouth rather large, very oblique, upper lip above line of middle of pupil, maxillary reaching to opposite eye. Eye moderate, anterior, usually shorter than the sharp snout. Olivaceous above; scales with darker edges; sides silvery; a dark vertebral line; a row of dark dots along base of anal; males with the snout tuberculate in spring, the forehead, opercular region, and base of dorsal being then flushed with red. Length 2¾ inches. New York and western Pennsylvania to southern Michigan, Kansas, and Kentucky; very abundant in clear streams, especially in the Ohio Valley. An elegant species, smaller than *atherinoides*, with larger head and deeper body. It will probably be found to grade into *N. dilectus*, but in all specimens examined the eye is larger in *dilectus*, the snout shorter and more blunt. (*ruber*, red; *frons*, forehead.)

Alburnus rubrifrons, Cope, Proc. Ac. Nat. Sci. Phila., 1865, 85, Kiskiminitas River, a tributary of Alleghany River. (Coll. Cope.)

Alburnellus percobromus, Cope, Hayden's Geol. Surv. Wyom. for 1870, 440, 1871, Missouri River at St. Joseph, Missouri.

Alburnellus rubrifrons, Cope, Cypr. Penn., 388, 1866.

Minnilus rubrifrons, Jordan & Gilbert, Synopsis, 202, 1883.

Minnilus percobromus, Jordan & Gilbert, Synopsis, 202, 1883.

490. NOTROPIS PHOTOGENIS (Cope).

Head 4¼; depth 5½; eye 3. D. 8; A. 10; scales 6–40–3. Body slender, compressed, the form similar to that of *N. rubrifrons*. Head moderate. Mouth quite oblique, lower jaw scarcely projecting; maxillary about reaching orbit. Back broad. Dorsal fin inserted behind middle of body, a little behind ventrals. Scales before dorsal 25. Lateral line decurved. Eye larger than in N. *rubrifrons*. Color olivaceous, with brown vertebral and dorsal lines; sides and below, bright silvery, with dark specks along the lateral line; none along base of anal. Length 3 inches. Alleghany region, thus far recorded only from the Youghiogheny and Kanawha, unless *N. amœnus* should prove to be a variety of it. The latter is stouter, with larger eye, and has dark dots along base of anal. Var. *engraulinus*, Cope, from the Kanawha is slenderer, the depth 6 in length, the head 3⅔. (*φῶς*, light; *γένειον*, cheek.)

?*Rutilus compressus*, Rafinesque, Ich. Oh., 51, 1820, Monongahela River, etc.; not identifiable; may be *N. cornutus.*

Squalius photogenis, Cope, Proc, Ac. Nat. Sci. Phila., 1864, 280, Youghiogheny River, Penn.

Photogenis leucops, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 164., Sinking Creek, and near Austinville, Va. (Coll. Cope.)

Photogenis leucops engraulinus, Cope, *l. c.*, 1867, 164, tributaries of Kanawha River, Austinville, Va. (Coll. Cope.)

Leuciscus photogenis, Günther, Cat., vii, 252, 1868.

491. NOTROPIS AMŒNUS (Abbott).

Head 4; depth 5⅓, (4¾ to 5½); eye 3⅓. D. 8; A. 10; scales 6–39–3. Close to *Notropis rubrifrons*, but the scales before dorsal smaller, as in *N. photogenis.* Body elongate, compressed; eye large, longer than snout. Mouth large, oblique, the jaws subequal, the maxillary to front of eye; 22 to 25, (rarely 18 to 20) scales before dorsal; lateral line much decurved. Dorsal high, behind ventrals; pectorals moderate. Translucent green, sides silvery, with sometimes a faint plumbeous band ending in an obscure plumbeous spot. Length 3¾ inches. Clear streams east of the Alleghanies from the Raritan to the Neuse; abundant; formerly confounded with *N. photogenis*, of which it may be a variety. (*amœnus*, attractive.)

Alburnellus amœnus, Abbott, Amer. Nat., viii, 1874, 334, Raritan River, New Jersey.

Notropis amœnus, Jordan, Bull. U. S. Fish Comm., xiii, 1888, (1891), 102.

492. NOTROPIS SCEPTICUS (Jordan & Gilbert).

Head 3¾; depth 4½; eye 3. D. 8; A. 10; scales 6–38–3; teeth 2, 4–4, 1. Body short and deep, compressed and somewhat elevated. Head rather large, deep, bluntish. Mouth moderate, terminal, oblique, lower jaw slightly included; upper lip opposite middle of eye; maxillary extending to front of orbit. Eye very large, longer than snout; interorbital space broad, flattish. Lateral line much decurved. Scales before dorsal large, in 13 to 15 rows. Fins moderate; dorsal well behind ventrals; tips of ventrals extending to last dorsal ray; caudal peduncle moderate. Coloration very pale green; sides with a bright silvery band; scales with very little dark edging; a dark line at base of dorsal; males in spring with the snout profusely tuberculate. Length 3 inches. Rivers of Carolina from the Cape Fear to the Santee; abundant, replacing the allied *amœnus*, from which it differs in the deeper body and larger nuchal scales. (*σκεπτικός*, observant, from the large eye.)

Notropis photogenis, ("pale variety"), Jordan & Brayton, Bull. U. S. Nat. Mus., xii, 23, 1878.

Minnilus scepticus, Jordan & Gilbert, Synopsis, 200, 1883, Saluda River, Greenville, South Carolina. (Type, No. 31081. Coll. Jordan & Brayton.)

493. NOTROPIS MICROPTERYX (Cope).

Head 4½; depth 5½; eye 3½. D. 8; A. 10; scales 5–38–2. Body very slender, compressed; head moderate, rather pointed. Mouth large, oblique; upper lip on level of pupil; maxillary reaching to opposite front of orbit. Eye moderate, about as long as muzzle. Scales large. Lateral line decurved. Fins all quite small, the dorsal farther back than in related species, so that the short ventrals do not reach much beyond its anterior rays, their length 2 in head. Color olivaceous; sides bright silvery; dorsal scales conspicuously dark-edged; a dusky blotch at base of caudal, underlying the silvery luster. Length 2¾ inches. Head waters of Cumberland and Tennessee rivers and also in the Ozark region; abundant in clear streams in northern Arkansas. (μικρός, small; πτέρυξ, fin.)

Alburnellus micropteryx, COPE, Journ. Ac. Nat. Sci. Phila., 1868, 233, **Holston River.**
Minnilus micropteryx, JORDAN & GILBERT, Synopsis, 203, 1883.

494. NOTROPIS METALLICUS, Jordan & Meek.

Head 4; depth 5; eye 3. D. 8; A. 11. scales 5–35–3, 16 before dorsal; teeth 2, 4–4, 2, the grinding surface obsolete. Body elongate, compressed, the back a little elevated. Head small, the snout little acute, shorter than eye, which is large. Mouth large, oblique, the cleft reaching front of eye, 3⅓ in head; chin projecting. Lateral line decurved. Dorsal inserted well behind ventrals; dorsal and anal high, the anal very long. Dark brown, a rosy band from eye to upper lobe of caudal; below this a metallic dusky band broader than eye, ending in a black spot at base of caudal; dorsal with a black band obliquely across it; no spot at its base; other fins nearly plain. Length 1¾ inches. Swamp streams in Georgia and Florida, from the Suwannee Basin to the Escambia. (*metallicus*, metallic.)

Notropis metallicus, JORDAN & MEEK, Proc. U. S. Nat. Mus., 1884, 475, **Allapaha* River, Nashville, Georgia.** (Type, No. 28511. Coll. W. J. Taylor.)

Subgenus LYTHRURUS, Jordan.

495. NOTROPIS BELLUS (Hay).

Head 4¼; depth 3¾. D. 8; A. 10 or 11; scales 7–41–3; teeth 2, 4–4, 2, "sharp-edged, but with a masticatory surface." Body short, deep, considerably compressed; the back elevated. Head short; muzzle short, rather pointed, the profile somewhat concave; mouth large, oblique, the maxillary extending to opposite front of orbit; lower jaw projecting. Lateral line much decurved. Scales crowded forward, 25 in front of dorsal. Dorsal midway between snout and caudal, behind ventrals; pectorals not reaching ventrals; the latter to vent. Dusky above, with a narrow, dark dorsal line; sides silvery, with plumbeous streak; no spot at base of dorsal; fins mostly black-tipped; belly flame color in life; fins orange at base. Length 2½ inches. Tombigbee River, Mississippi. (Hay.) (*bellus*, beautiful.)

Minnilus bellus, HAY, Proc. U. S. Nat. Mus., 1880, 510, **Tombigbee River, Artesia and Macon, Mississippi.** (Type, No. 27426. Coll. Hay.) JORDAN & GILBERT, Synopsis, 199, 1883.

496. NOTROPIS LIRUS (Jordan).

Head 4⅓; depth 5¼; eye 3. D. 8; A. 10; scales 8–45–4; teeth 2, 4–4, 2, with very narrow or obsolete grinding surface. Body slim, compressed. Head small, short, moderately deep, flattish above. Mouth rather large, very oblique, the lower jaw slightly projecting. Eye very large, longer than snout; the maxillary about reaching its front. Scales small, loosely imbricated, their outlines extremely distinct. Fins moderate. Coloration very pale translucent green; scales of back finely punctate; sides with a very distinct metallic blue band formed of dark punctulations, this band passing through the eye and snout, forming a most characteristic color marking; a streak of black dots along the bases of dorsal and anal, that on the dorsal suggesting the peculiar spot of *N. umbratilis*; tip of snout black; fins pale olivaceous, red in the males. Males in the spring with the head and antedorsal region profusely tuberculated. Length 2½ inches. Alabama River; abundant in sandy streams. (λειρός, lily-white.)

---

* Not "*Altamaha* River," as misprinted. The Allapaha is a tributary of the Suwannee River.

Notropis lirus, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 342, Etowah River, etc., Rome, Georgia.

Notropis alabamæ, JORDAN & MEEK, Proc. U. S. Nat. Mus., 1884, 476, Alabama River, Montgomery, Alabama. (Type, Nos. 35295 and 35297. Coll. McDonald.)

Minnilus lirus, JORDAN & GILBERT, Synopsis, 199, 1883.

497. NOTROPIS ROSEIPINNIS, Hay.

Head 4½; depth 4; eye 3½. D. 8; A. 11; scales 8–45–3. Body long and slender, much compressed. Mouth large, oblique, the lower jaw somewhat projecting, the maxillary reaching vertical from front of eye. Eye large, slightly longer than snout. Scales small, especially along the back, somewhat higher than long, but not so closely imbricated as in *N. bellus*. Lateral line much decurved. Dorsal far back, midway between pupil and base of caudal, considerably posterior to ventrals; pectorals not reaching ventrals, the latter to vent. Dark; scales above all with black points; a plumbeous lateral band, ending in a vague caudal spot; a narrow dorsal band; a black spot on the upper anterior portion of dorsal and also on anal, each surrounded by a diffuse blotch; tip of ventrals and edge of pectorals dark; vertical fins red. Length 2¼ inches. Sandy streams of the Gulf States, from the Escambia to the Chickasawha. (*roseus*, rosy; *pinna*, fin.)

Minnilus rubripinnis, HAY, Proc. U. S. Nat. Mus., 1880, 509, (not *Argyreus rubripinnis*, Heckel = *N. cornutus*), Chickasawha River, Enterprise, Mississippi. (Type, Nos. 27420 and 32302. Coll. Hay.) JORDAN & GILBERT, Synopsis, 198, 1883.

Notropis roseipinnis, HAY, in Jordan, Cat. Fish. N. A., 1885, 27, substitute for *rubripinnis*, preoccupied in *Notropis*.

498. NOTROPIS UMBRATILIS* (Girard).

(RED-FIN.)

Head 4¼; depth 4 to 4½; eye 3 to 4. D. 7; A. 11; scales 9–40 to 52–3; teeth 2, 4–4, 2. Body compressed, the caudal peduncle long. Head long, conic, rather pointed. Mouth large, moderately oblique, the premaxillary on level of pupil, the maxillary extending to opposite eye; lower jaw somewhat projecting. Eye moderate, about equal to muzzle. Scales closely imbricated, crowded anteriorly, about 30 before dorsal. Dorsal fin high, inserted about midway between ventrals and anal; pectorals not reaching ventrals, the latter to vent; caudal fin long. Coloration dark steel blue above; pale or silvery below; a more or less evident black spot at base of dorsal in front; the fins otherwise all plain. Males with the anterior dorsal region and the head profusely covered with small whitish tubercles, the belly and lower fins being of a bright brick red in the spring. Females very pale olive, sometimes almost colorless. Length 3½ inches. Minnesota to Western New York, (Cayuga Lake), North Carolina, Alabama, and Kansas; generally abundant in small, clear streams. An ornate and excessively variable little fish, of which the following are recognizable varieties.

---

* "A comparison of these specimens from the Tennessee River with others from the Roanoke River (*ardens*), the Pamlico and Neuse (*matutinus*), the Wabash in Indiana, (*cyanocephalus*) [rather *lythrurus*; *cyanocephalus* came from Racine, Wisconsin], various streams in Illinois (*atripes*), and the Arkansas River (*umbratilis*) [= *nigripinnis*], has shown the impossibility of recognizing any of these forms as distinct species. *Matutinus* is smaller and paler than *ardens* and shows less brilliant coloration, these differences being apparently dependent on the sluggish character of the streams it frequents, with their frequent sandy stretches. The resemblance between specimens from the Roanoke and the Tennessee is very close. Both have larger mouth and eye, more brilliant coloration, and more elongate form than in specimens from the north and west. Our specimens from the Tennessee, however, average distinctly deeper than typical *ardens*, and are further characterized by the presence, in males, of several (5 to 8) dark steel blue, vertical bars, irregular in position and shape. This form I here distinguish provisionally as subspecies *fasciolaris*. In Tennessee and Kentucky it undoubtedly passes insensibly into the form common in tributaries of the Ohio and Mississippi (*cyanocephalus*, *atripes*), which shows usually an evidently deeper body, a smaller eye, and a tendency to the accumulation of black pigment in the tips of the ventrals and the anterior rays of the dorsal and anal. Typical *umbratilis* from Kansas and Arkansas appears very distinct from the more easterly form. It has the larger eye of *fasciolaris*, a very deep body, and adult males have all the fins largely black and the sides uniform dusky. Furthermore, the black spot at the base of the anterior dorsal rays, so characteristic of related forms, is here indistinct or wanting. In Iowa and Missouri, however, *umbratilis* appears to pass imperceptibly into *cyanocephalus*, some specimens lacking the dorsal spot, while others from the same locality, and not otherwise differing, have it well developed.

"I have thought it best, therefore, to consider all these forms as poorly defined varieties of a single widespread species, which may stand provisionally as *N. umbratilis umbratilis*, *N. umbratilis cyanocephalus*, *N. umbratilis fasciolaris*, *N. umbratilis ardens*, and *N. umbratilis matutinus*. East of the Alleghanies the species has not been recorded north of the Roanoke nor south of the Neuse, and is not known from the Gulf States south of the Tennessee and Arkansas Basins. Rafinesque's *Semotilus diplæmius*, so long identified with this species, is evidently *Semotilus atromaculatus*, as a synonym of which it must appear." (Gilbert, Bull. U. S. Fish Comm., IX, 1889, 148.)

The typical, that is, earliest known form, but the most aberrant of the series, occurs in Iowa and southwestward to the Arkansas Basin.

498a. NOTROPIS UMBRATILIS UMBRATILIS (Girard).

Head 4; depth 3⅓ to 3⅗; eye about 4. D. 8; A. 11; scales 40 to 44. Body short, deep and compressed. Eye smaller than in other forms. Lateral line deflexed. Male steel blue, smutty above, a dark curved bar on scapular region; dorsal black except at base mesially, the dark spot in front obscure; lower fins all dusky, flushed with red; females very pale olivaceous, the black scapular bar usually plain, the dark spot represented by dark punctulations. Length 3 inches. Arkansas River and streams of Kansas and southwestern Iowa. (*umbra*, shade.)

Alburnus umbratilis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 193, Sugar Loaf Creek, tributary Poteau River, Arkansas. (Type, No. 73. Coll. Möllhausen.)

Luxilus lucidus, GIRARD, Proc. Ac. Nat. Sci. 1856, 203, Coal Creek, tributary South Fork Canadian River. (Coll. Möllhausen.)

Minnilus nigripinnis, GILBERT, Bull. Washb. Lab. Nat. Hist., 1, 1884, 14, Shunganunga Creek, near Topeka, Kansas. (Type, No. 36613. Coll. Cragin.)

Minnilus umbratilis, JORDAN & GILBERT, Synopsis, 200, 1883.

Notemigonus lucidus, JORDAN & GILBERT, Synopsis, 249, 1883.

---

* The following is Prof. Forbes' account of *Notropis macrolepidotus*: This fish, represented by a single specimen in our collections from Illinois, closely resembles *Notropis atripes*, from which it differs especially in the larger scales, and in the entire absence of any blotch at the front of the base of the dorsal fin. It is elliptical in outline, strongly compressed, its greatest thickness being less than half its depth, the back making a uniform curve from the front of the dorsal to the nostrils. Length 2.1 inches, depth 4.2 in length, caudal peduncle 4.6. Color in alcohol plain, the sides somewhat silvery, the opercles brightly so; no dark vertebral line, but the scales upon the back and upon the upper part of the sides thickly sprinkled with rather large circular black specks; fins all plain; upper surface of the head a little dusky, and thickly sprinkled with black. The head is a compressed cone, 4.5 in length, upper surface convex; snout regularly decurved, 3.5 in head; mouth rather large, terminal, oblique; upper lip opposite the middle of the pupil; maxillary to posterior margin of nostril; upper jaw 3.15 in head, lower not projecting, 2.6 in head; teeth 4, 2–2, 4; eye large, circular, 3.75 in head; dorsal fin I–8, about 4 scales behind the ventrals; anal 11; scale formula 6–40–3, 19 before dorsal.

Further eastward in Illinois and Iowa in prairie brooks occurs

498b. NOTROPIS UMBRATILIS ATRIPES (Jordan).

Head 4⅓; depth 4; eye 4. D. 7; A. 11; scales 9–52–5. Body very strongly compressed. Head comparatively pointed; eye small, shorter than muzzle. Coloration of body dark bluish, without traces of vertical bars; sides not silvery, the scales dusted with dark punctulations; dorsal with the usual black spot at base in front, smaller than in *lythrurus* or *ardens*; a black bar crosses its upper part; anal colored like the dorsal, with a black spot at base in front, the markings paler; ventral fins dusky; males profusely tuberculate, and doubtless red in spring. Length 3 inches. Southern Illinois and Iowa. (*ater*, black; *pes*, foot.)

Lythrurus atripes, JORDAN, Bull. Ill. Lab. Nat. Hist., II, 59, 1878, streams of Union and Johnson counties, Illinois. (Type, No. 26295. Coll. Forbes.)
Minnilus atripes, JORDAN & GILBERT, Synopsis, 197, 1883.

Represented throughout the Ohio Valley and neighboring regions by

498c. NOTROPIS UMBRATILIS LYTHRURUS (Jordan).

The central type from which the others seem to have diverged. Body moderately elongate, the depth 4¼ in length, the females nearly 5; eye large, about 3½ in head. Scales 9–47–3. Dorsal with a conspicuous black spot in front, the rest of the fin mostly pale; no anal spot. Length 3½ inches. Ohio Valley and rivers of neighboring states. (*λύθρον*, blood; *οὐρά*, tail.)

*Rutilus ruber**, RAFINESQUE, Ich. Oh., 52, 1820, Elkhorn and Kentucky rivers; named but not described.
Notropis lythrurus, JORDAN, Proc. U. S. Nat. Mus., 1884, 476, White River, Indianapolis, Indiana. (Type, No. 20115. Coll. Jordan & Copeland.)
Hypsilepis diplæmia, COPE, Proc. Ac. Nat. Sci. Phila., 1867, 162.
Minnilus diplæmius, JORDAN & GILBERT, Synopsis, 197, 1883; not *Semotilus diplæmius*, Rafinesque.

Represented northward by the deep-bodied

498d. NOTROPIS UMBRATILIS CYANOCEPHALUS (Copeland).

Head 4⅓; depth 4; eye 3⅓. D. 8; A. 12; scales 9–46–4; teeth 2, 4–4, 2. Body short, stout, chubby, moderately compressed, the form resembling that of *Pimephales*. Head very short, deep, its greatest depth three-fourths its length. Snout blunt, shorter than eye. Eye large, not so wide as the interorbital space. Coloration dark bluish above; sides not silvery; males in spring profusely covered with small tubercles; the sides and fins clear, bright red; the back, and especially the top of the head, of a clear glaucous blue; dorsal in both sexes with a large black spot at the base of its anterior rays, this spot about as large as eye; dorsal, anal, and ventrals blackish at tip. Length 2⅓ inches. Rivers of southern Wisconsin, etc. (*κνάγεος*, blue; *κεοαλή*, head.)

Lythrurus cyanocephalus, COPELAND, Proc. Ac. Nat. Sci. Phila., 1877, 70, Racine River, Wisconsin. (Type, No. 17857. Coll. Hoy & Copeland.)
Minnilus cyanocephalus, JORDAN & GILBERT, Synopsis, 196, 1883.

---

* "51st species, Red Minny, *Rutilus? ruber*, Rutile rouge. Entirely red; tail forked. I add here a fine small fish, which I have never seen as yet, but it is said to live in the small streams which fall into the Elkhorn and Kentucky. It is a slender fish, only 2 inches long, compressed, and of a fine purple red. It may belong to this genus, or to any other of this tribe. It is commonly called Red Minny."—*Rafinesque.*

Represented east of the Alleghanies by the slim-bodied

498e. NOTROPIS UMBRATILIS ARDENS (Cope).

Slender and brilliantly colored, the depth 4⅔ in males; eye 3½ in head. Steel blue, the fins bright red, base of dorsal largely black. Roanoke River, Virginia. A beautiful inhabitant, with *Notropis cerasinus*, of the clear mountain streams. (*ardens*, burning.)

Hypsilepis ardens, COPE, Proc. Ac. Nat. Sci. Phila., 1867, 163, headwaters of Roanoke River, Montgomery County, Virginia. (Coll. Cope.)
Leuciscus ardens, GÜNTHER, Cat., VII, 257, 1868.
Minnilus ardens, JORDAN & GILBERT, Synopsis, 198, 1883.

Represented in Tennessee and northern Alabama by

498f. NOTROPIS UMBRATILIS FASCIOLARIS, Gilbert.

Body usually deep, the males with 5 to 8 dark blue vertical crossbars as in *Notropis cerasinus*. Colors brilliant. Southern bend of Tennessee River, in limestone streams; abundant. (*fasciolaris*, with small cross bands.)

Notropis umbratilis fasciolaris, GILBERT, Bull. U. S. Fish Comm., IX, 1889, (1891), 148, streams about Florence, Alabama. (Type, No. 42504. Coll. Gilbert & Swain.)

Represented in the Carolina pine woods by the slender and pale

498g. NOTROPIS UMBRATILIS MATUTINUS (Cope).

Head 4¼; depth 5½; eye 3½. D. 8; A. 11; scales 7–44–3. Body slender; eye large, scarcely longer than muzzle, equal to interorbital width. Olivaceous above; the scales brown-shaded; a plumbeous lateral band with dark points; a small black spot at base of dorsal in front, preceded by a dark streak along middle of back; a dark spot at base of caudal. Males with the snout, chin, and upper half of dorsal red. Length 2½ inches. Neuse and Pamlico rivers; common in sandy brooks, with *Notropis albeolus*. (*matutinus*, of the morning, rosy.)

Alburnellus matutinus, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 465, Neuse River, Wake County, North Carolina. (Coll. Cope.)
Minnilus matutinus, JORDAN & GILBERT, Synopsis, 199, 1883.
Notropis matutinus, JORDAN, Bull. U. S. Fish Comm., VIII, 1888, 125.

Represented in tributaries of the lower Mississippi by the deep-bodied

498h. NOTROPIS UMBRATILIS PUNCTULATUS (Hay).

Head 4⅔; depth 4⅓; eye moderate, 3. D. 8; A. 10 or 11; scales 11–49–3; teeth 2, 4–4, 2, with grinding surface. Body short, deep, compressed; back elevated in front of dorsal. Head short and deep; the profile nearly straight; mouth large, quite oblique, maxillary reaching front of orbit. Scales small, 25 in front of dorsal. Lateral line much decurved. Dorsal beginning midway between muzzle and base of caudal. Straw color; silvery on sides and below; scales above dark-edged; a dark dorsal line; a dark band on caudal peduncle; a small black spot at base of dorsal. Length 2 inches. Tributaries of Big Hatchee River, northern Mississippi. (Hay.) (*punctulatus*, speckled.)

Minnilus punctulatus, Hay, Proc. U. S. Nat. Mus., 1880, 508, Tuscumbia River, a tributary of the Big Hatchee, near Corinth, Mississippi. (Type, No. 27430. Coll. Hay.)
Minnilus punctulatus, Jordan & Gilbert, Synopsis, 198, 1883.

124. ERICYMBA, Cope.

Ericymba, Cope, Proc. Ac. Nat. Sci. Phila., 1865, 88, (*buccata*).

Body rather elongate, little compressed; muzzle broad. Premaxillary protractile. Interopercle, suborbital, and dentary bones containing conspicuous, externally visible, mucous channels; lips thin; no barbel. Teeth 1, 4–4, 0, without grinding surface, hooked, the edges entire. Scales rather large; the lateral line continuous. Dorsal fin above ventrals. Anal basis short. Silvery fishes of small size, known at once from all other minnows by the cavernous bones of the lower part of the head. One species known; a curious and interesting little fish of the larger creeks. (*ἐρι-*, an intensive particle; *κύμβη*, a cavity; in allusion to the development of the mucous channels.)

499. ERICYMBA BUCCATA, Cope.

Head 4; depth 5; eye large, 4 in head. D. 8; A. 8; scales 5-33-3; teeth 1, 4–4, 0. Body fusiform, rather elongate, little compressed, the back not elevated. Head rather long, somewhat depressed above, with broad and prominent muzzle. Mouth rather small, horizontal, subinferior, the lower jaw considerably shorter than upper; upper lip below level of pupil; maxillary not reaching to eye; dentary bones dilated, the mucous channels conspicuous. Suborbital very broad, silvery, with an elevated longitudinal ridge and conspicuous cross lines; opercle small. Fins small, dorsal over ventrals. Scales moderate; lateral line nearly straight; breast scaleless; 15 large scales before dorsal. Color olivaceous, rather pale; sides bright silvery with bluish reflections; a dark dorsal streak, conspicuous posteriorly; fins plain; males without tubercles or bright colors. Length 3 to 5 inches. Michigan and western Pennsylvania to Kansas and southward to West Florida; locally very abundant. One of the most remarkable of our little minnows. (*bucca*, cheek.)

Ericymba buccata, Cope, Proc. Ac. Nat. Sci. Phila., 1865, 88, Kiskiminitas River, western Pennsylvania, a tributary of the Monongahela. (Coll. Cope); Cope, Cypr. Penn., 361, 1866; Günther, Cat., VII, 185, 1868; Jordan & Gilbert, Synopsis, 204, 1883.

125. PHENACOBIUS, Cope.

Phenacobius, Cope, Proc. Ac. Nat. Sci. Phila., 1867, 96, (*teretulus*).
Sarcidium, Cope, Hayden's Geol. Surv. Wyom. for 1870, (1871), 440, (*scopiferum*).

Body elongate, little compressed. Head moderate, subterete; mouth inferior, the lower lip thin mesially, but enlarged into a fleshy lobe on each side toward the angle of the mouth, thus presenting a superficial resemblance to that of *Exoglossum*, with which the genus has probably real affinities; upper lip with a callous covering within; dentary bones distinct, except at symphysis. No barbel. Upper jaw protractile. Teeth 4–4, hooked, without grinding surface. Scales rather small; lateral line complete. Dorsal fin in front of ventrals; anal basis short. Isthmus extremely wide. Intestines short; peritoneum white. Small species, with the aspect of young suckers. (*φέναξ*, deceptive; *βίος*, life; the appearance of the fish suggesting an herbivorous species with long intestines, which it really is not.)

- *a.* Scales moderate, 42 to 53 in the lateral line.
  - *b.* Breast scaly; no distinct spot at base of caudal. TERETULUS, 500.
  - *bb.* Breast naked; caudal spot very distinct.
    - *c.* Scales in lateral line 49 to 53, their outlines blended. MIRABILIS, 501.
    - *cc.* Scales in lateral line 43 to 45, their outlines emphasized by dark edgings. SCOPIFER, 502.
- *aa.* Scales small, about 60 in the course of the lateral line; breast naked.
  - *d.* Body very slender; base of caudal with a distinct black spot. URANOPS, 503.
  - *dd.* Body moderately slender; base of caudal with a vague dusky blotch. CATOSTOMUS, 504.

500. PHENACOBIUS TERETULUS, Cope.

Head 4⅔; depth 4⅔; eye large, high up, 3½ in head. D. 8; A. 7; scales 6–43–5; teeth 4–4. Body slender, little compressed, the back not elevated, the caudal peduncle stout. Head stout, the muzzle elongate, obtusely decurved, heavy. Mouth small, inferior, horizontal, the maxillary not reaching to eye. Isthmus wide. Breast scaly. Lateral line nearly straight. Pale yellowish; the scales above dark-edged; snout blackish; a plumbeous lateral band; fins plain. Length 3½ inches. Kanawha River; not common. (*Teretulus*, an old name of the Red Horse, *Moxostoma*.)

Phenacobius teretulus, COPE, Proc. Ac. Nat. Sci. Phila., 1867, 96, Kanawha River, Eggleston Springs, West Virginia. (Coll. Cope.) JORDAN & GILBERT, Synopsis, 204, 1883.

501. PHENACOBIUS MIRABILIS (Girard).

Head 4⅓; depth 4½; eye large, 4 in head. D. 8; A. 7; scales 7–48 to 52–5. Body moderately slender. Head short, rather blunt anteriorly. Mouth small, the maxillary not reaching to eye. Pale olivaceous; a silvery lateral band and a conspicuous black spot at base of caudal, smaller than eye; outlines of scales blended, not emphasized by dark edgings. Fins pale. Length 3½ inches. Illinois River to Arkansas, rather common in sandy streams; specimens examined from the Illinois, Des Moines, Osage, Missouri, Arkansas, and Sabine rivers. (*mirabilis*, wonderful.)

Exoglossum mirabile, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 191, and Pac. R. R. Surv., x, 256, 1858, Arkansas River, Fort Smith. (Coll. Shumard.)

Phenacobius mirabilis, JORDAN & GILBERT, Synopsis, 205, 1883; JORDAN & MEEK, Proc. U. S. Nat. Mus., 1885, 6.

502. PHENACOBIUS SCOPIFER (Cope).

Head 4 to 4¼; depth 4¼; scales 6–43 to 45–5. Very close to the preceding, differing so far as known only in the larger scales, the outlines of which are sharply defined on account of dark edgings. Caudal spot distinct. Illinois to the Rio Grande, about as abundant as the preceding, perhaps more widely distributed. It is possible that this form represents simply the extreme of variation of *P. mirabilis*. (*scopifer*, bearing a stem.)

Sarcidium scopiferum, COPE, Hayden's Geol. Surv. Wyom. for 1870, (1871), 440, Missouri River, near St. Joseph, Missouri.

Phenacobius teretulus liosternus, NELSON, Bull. Ill. Lab. Nat. Hist. I, 1876, 46, brooks of McLean County, Illinois.

Phenacobius scopiferus, JORDAN, Bull. Hayden's Geol. Surv., IV, 666, 1878.

Phenacobius mirabilis, in part, JORDAN & GILBERT, Synopsis, 205, 1883.

503. PHENACOBIUS URANOPS, Cope.

Head 4¾; depth 6; eye 3½. D. 8; A. 7; scales 7–60–6; teeth 4–4. Body very slender, little compressed; back not elevated, caudal peduncle long and slender. Head long and rather slender, flat above, the muzzle broad, blunt, and projecting. Mouth entirely inferior, larger than in the other species, with conspicuous lips. Eye large, placed high, behind middle of head. Scales small, 24 in front of dorsal. Lateral line straight. Breast and middle line of belly naked; width of isthmus half length of head. Fins small. Color pale olivaceous, with a distinct dark spot at base of caudal. Upper Tennessee Basin, rather common in river channels, not ascending brooks. (*οὐρανός*, sky; *ὤψ*, eye; = stargazer.)

Phenacobius uranops, COPE, Proc. Ac. Nat. Sci. Phila., 1867, 96, Holston River, Saltville, Virginia; (Coll. Cope); JORDAN & GILBERT, Synopsis 206, 1883; JORDAN, Bull. U. S. Fish Comm., VIII, 1888, 146.

504. PHENACOBIUS CATOSTOMUS, Jordan.

Head 4½ to 5; depth 5⅔; eye 3½. D. 8; A. 7; scales 7–60–5; teeth 4–4. Body rather slender, nearly terete, scarcely compressed; back not elevated; caudal peduncle stout. Head deep, the muzzle blunt and heavy, the cheeks tumid. Mouth small, inferior, altogether below level of eye, the maxillary barely reaching nostrils; lips much thinner than in *P. uranops*. Eyes large, high up, behind middle of head. Scales small, thin, loosely imbricated; back and belly scaled; breast naked. Lateral line nearly straight; 22 scales in front of dorsal. Fins all small. Width of isthmus 2½ to 3 in head. Pale olivaceous; white below; a silvery lateral band, underlaid by dusky, which forms vague blotch at base of caudal; back dusted with dark specks; top of head black; a yellowish vertebral line. Length 4 inches. Alabama Basin, rather common. (*Catostomus*, a sucker, which it much resembles.)

Phenacobius catostomus, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 332, Etowah and Oostanaula rivers, Rome, Georgia. (Type, No. 17889. Coll. Jordan & Gilbert.) JORDAN & GILBERT, Synopsis, 206, 1883.

126. EVARRA, Woolman.

Evarra, WOOLMAN, Bull. U. S. Fish Comm., XIV, 1894, May 3, 1894, 64, (*eigenmanni*).

Body long and low, formed as in *Tiaroga*, subterete and covered with very small scales. Head small, bluntish and thick at tip; mouth very small, terminal, oblique, without barbels, the lips thickish; the upper jaw protractile, but not much movable. Eye moderate; isthmus moderate; lateral line complete. Dorsal low, inserted rather posteriorly; anal small and short. Teeth small, 4–4. Intestine about as long as body. One species known, from Mexico. (*Evarra*, an Indian name, "maker of gods in lands beyond the sea.")

505. EVARRA EIGENMANNI, Woolman.

Head 4¼; depth 5⅓; snout 3¼ in head; eye small, 4. D. 8; A. 7; scales about 17–88–10; teeth 4–4; intestine as long as body. Body long and low, subterete, looking like a small sucker; head small, the snout anteriorly truncate, the interorbital space broad and flattish; mouth short, mostly anterior, the maxillary not reaching to eye; premaxillary protractile, but not much movable; lips somewhat thickened; scales very small, those on belly and before dorsal minute; lateral line complete, decurved anteriorly; fins all very small, the dorsal slightly behind ventrals, its tip not pointed; pectorals short, reaching about half way to anal. Olivaceous, belly silvery, sides with a rather faint plumbeous lateral band ending in a small black caudal spot; a darker dorsal stripe; fins all pale. Length 3 inches. City of Mexico; here described from one of Mr. Woolman's types. (Named for Dr. Carl H. Eigenmann.)

Evarra eigenmanni, WOOLMAN, Bull. U. S. Fish Comm., XIV, 1894, May 3, 1894, 64, City of Mexico. (Type, No. 45571. Coll. Woolman & Cox.)

127. TIAROGA, Girard.

Tiaroga, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 204, (*cobitis*).

Body decidedly elongate, having the form of a loach (*Cobitis*), subfusiform, little compressed and covered with minute scales. Lateral line complete. Head small, subconical, depressed, the mouth very small, terminal, oblique, without barbels, the lips fleshy and the premaxillary not protractile. Eye moderate. Isthmus very wide. Dorsal inserted slightly behind ventrals, the fin high, its first rudimentary ray somewhat enlarged; anal with short base. Teeth very small, apparently 1, 4–4, 1, and without grinding surface. One species known, a very singular little fish from the Gila region. (A coined name.)

506. TIAROGA COBITIS, Girard.

Head $4\frac{3}{4}$; depth 6; eye $3\frac{3}{4}$. D. 8; A. 7; lateral line 65. Teeth without grinding surface, 1, 4–4, 1.* Maxillary falling far short of eye, 4 in head; lower jaw included. Eye moderate, high up, midway in head; isthmus very wide. Lateral line nearly straight. Body olivaceous, with dusky specks above; a black spot at base of caudal. Length $2\frac{1}{2}$ inches. Rio San Pedro, a tributary of Rio Gila; only the types yet known. (*cobitis*, the loach, a European fish of similar form.)

Tiaroga cobitis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 204, Rio San Pedro, Arizona. (Coll. Clark.) GIRARD, U. S. Mex. Bound. Surv., Ichth., 60, 1859.
Leuciscus cobitis, GÜNTHER, Cat., VII, 247, 1868.
Cliola cobitis, JORDAN & GILBERT, Synopsis, 170, 1883.
Tiaroga cobitis, JORDAN, Proc. U. S. Nat. Mus., 1885, 126.

128. RHINICHTHYS, Agassiz.

(BLACK-NOSED DACE.)

Argyreus, HECKEL, Russeggers Reisen, I, 1040, 1843, (*atronasus*), name preoccupied in Entomology.
Rhinichthys, AGASSIZ, Lake Superior, 353, 1850,. (*atronasus*).

Body rather elongate, not much compressed. Mouth small, subinferior, the upper jaw not protractile, the upper lip continuous with the skin of the forehead, forming a very broad frenum; a small or minute barbel terminal on the maxillary. Teeth mostly 2, 4–4, 2 or 1, hooked, without grinding surface. Intestinal canal short. Scales very small; lateral line continuous. Dorsal fin inserted behind the ventrals. Anal basis short.

---

* Not 1, 3–3, 1, as stated by Girard.

Coloration dark, the males rosy in spring. Active little fishes inhabiting mountain springs, the species very difficult to distinguish. (*ῥίγ*, snout; *ἰχθύς*, fish; the snout being prominent.)

a. Snout long and prominent, projecting notably beyond the mouth, about twice length of eye in adult; barbel evident.
  b. Scales 14–65–8 to 14. CATARACTÆ, 507.
  bb. Scales 9–60–7. SIMUS, 508.
aa. Snout moderate, projecting little beyond the small mouth, its length 1½ times eye in adult; barbel minute or obsolete. ATRONASUS, 509.

507. RHINICHTHYS CATARACTÆ (Cuvier & Valenciennes).

(LONG-NOSED DACE.)

Head 4; depth 5; eye 2 in snout, 5 in head. D. 8; A. 7; scales 14–65–8, (62 to 68); teeth 2, 4–4, 2. Body elongate, little compressed, not elevated. Head long, the muzzle flattened, narrowed, and extremely prominent, the mouth being entirely inferior and horizontal. Eye nearly median. Isthmus wide. Barbel evident. Pectoral fins enlarged in males. Insertion of dorsal nearly median. Color olivaceous, paler below, with numerous dusky punctulations; the back often almost black; some of the scales usually irregularly darker, producing a mottled appearance; no distinct black lateral band; young specimens with a dusky lateral shade; a blackish spot on the opercle; males in spring with the lips, cheeks, and lower fins crimson. Length 5 inches. New England to Virginia and Wisconsin; its varieties ranging to Utah and the Columbia Basin, frequenting clear and boisterous streams and rock pools. (*cataractæ*, of the Cataract, the original type being from Niagara Falls.)

Gobio cataractæ, CUVIER & VALENCIENNES, XVI, 315, 1842, Niagara Falls. (Coll. M. Milbert.)
Leuciscus nasutus, AYRES, Journ. Bost. Soc. Nat. Hist., IV, 1843, 299, West Hartford, Conn.
Rhinichthys marmoratus, AGASSIZ, Lake Superior, 354, 1850, Lake Superior. (Type, No. 9053.)
  Scales smaller, 10–70–10; otherwise similar. GÜNTHER, Cat., VII, 189, 1868.
Argyreus nasutus, COPE, Cypr. Penn. 369, 1866.
Rhinichthys nasutus, GÜNTHER, Cat., VII, 189, 1868.
Ceratichthys cataractæ, GÜNTHER, Cat., VII, 176, 1868.
Rhinichthys cataractæ, JORDAN & GILBERT, Synopsis, 207, 1883.

Represented in the Rocky Mountain region on both sides of the divide by

507a. RHINICHTHYS CATARACTÆ DULCIS (Girard).

Head 4; depth 5 to 5½. D. 8; A. 7; scales 11 or 12–63 to 70–9 to 12. Body elongate, not elevated. Head long, the muzzle long and projecting, as in *R. cataractæ*, but rather sharper. Barbel evident, but smaller than in *R. cataractæ*. Insertion of dorsal a little farther back than in *cataractæ*, being usually midway between nostril and base of caudal. Silvery; darker above; a dusky lateral shade, at least in the young; males largely rosy. Length 5 inches. Headwaters of the Missouri, Platte, Arkansas, and Rio Grande; also throughout the Columbia basin, and in tributaries of Great Salt Lake, the Jordan, Provo, and Bear rivers, with the species of *Apocope*, which it closely resembles; abundant in swift brooks. (*dulcis*, sweet, first taken in Sweetwater River.)

Argyreus dulcis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 185, Sweetwater River, Nebraska. (Type, No. 210 (20225). Coll. Bowman.) JORDAN, Bull. U. S. Fish Comm., IX, 1889, 8.

Rhinichthys maxillosus, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 278, Kansas. (Coll. Hammond.) COPE & YARROW, Zoöl. Wheeler Survey, V, 644, 1875.

Rhinichthys transmontanus, COPE, Amer. Nat., July, 1879, 441, tributaries of Rio Grande in Colorado and New Mexico. (Type, No. 17084. Coll. Yarrow.)

Rhinichthys ocella, GARMAN, Science Observer, 1881, 58, Northeastern Wyoming and Montana.

Rhinichthys luteus, GARMAN, Science Observer, 1881, 59, Bear River, Ogden, Utah; scales below lateral line about 14.

Rhinichthys dulcis, JORDAN & GILBERT, Synopsis, 885, 1883; EVERMANN, Bull. U. S. Fish Comm., XI, 1891, (1892), 42.

Rhinichthys maxillosus and *transmontanus*, JORDAN & GILBERT, Synopsis, 207, 1883.

508. RHINICHTHYS SIMUS, Garman.

Head 4¼. D. 9; A. 8; scales 9–60–7. Head depressed above and in front of eyes; snout rather broad, thin, little projecting. First ray of dorsal midway between eye and base of caudal. Clouded brown, a dark lateral stripe, bordered above by a silver one. Coahuila, Mexico. (Garman); not seen by us. (*simus*, *σίμος*, blunt-nosed, an epithet early applied to Socrates.)

Rhinichthys simus, GARMAN, Science Observer, 1881, 61, Coahuila; JORDAN & GILBERT, Synopsis, 886, 1883.

509. RHINICHTHYS ATRONASUS (Mitchill).

(BLACK-NOSED DACE.)

Head 4; depth 4½; eye 1½ in snout, 4½ in head. D. 7; A. 7; lateral line 64; teeth 2, 4–4, 2. Body moderately elongate, little compressed. Head moderate, rather broad and flattish above. Snout moderate. Mouth small, horizontal, subterminal, the lower jaw included; barbel minute but probably always present; upper lip on level of the lower part of pupil; maxillary not reaching nearly to eye. Eye small, nearly median. Fins rather small; dorsal fin well back, its insertion about midway between nostril and base of caudal. Scales quite small, somewhat embedded. Color blackish above; some of the scales irregularly darker; a black band passing from snout through eye and along sides of body; a paler streak below this; belly silvery; males in spring with the lateral band and the lower fins, and sometimes the whole body, bright crimson; males in late summer with the lateral band scarlet or orange, the red color growing fainter later in the season. Length 3 inches. New England to Minnesota, Northern Alabama, and Virginia; very abundant in clear brooks and mountain streams. Excessively variable, running into several varieties, the extremes of which seem like distinct species. (*ater*, black; *nasus*, nose.)

Cyprinus atronasus, MITCHILL, Trans. Lit. and Phil. Soc. N. Y., I, 1815, 460, Wallkill River; brooks of New York; MITCHILL, Amer. Monthly Mag., I, 1817, December, 289.

Cyprinus vittatus, RAFINESQUE, Amer. Monthly Mag. I, 1817, 121, December, Hudson River above the Falls.

Rhinichthys atronasus, GÜNTHER, Cat., VII, 191, 1868; JORDAN & GILBERT, Synopsis, 208, 1883.

Represented in the Tennessee Basin by

509a. RHINICHTHYS ATRONASUS CROCEUS (Storer).

Head 4; depth 4½; eye 5. D. 7; A. 6; scales 70; teeth 2, 4-4, 2. Very similar to *R. atronasus*, but usually rather stouter, the scales smaller, the barbel more distinct, the head a little shorter, the upper jaw more projecting, and the coloration somewhat different. Back olivaceous, much mottled with darker; sides with a rather faint brownish band, margined above and below with creamy yellowish; a dusky blotch in the middle of the base of the dorsal fin; males with the pectoral fins enlarged, and with the lateral band rosy. Length 3 inches. Tennessee Basin; abundant in clear brooks. (*croceus*, saffron color.)

Leuciscus croceus, STORER, Proc. Bost. Soc. Nat. Hist., July, 1845, 48, Florence, Alabama. (Coll. Chas. A. Hentz.)

Rhinichthys obtusus, AGASSIZ, Amer. Journ. Sci. Arts, 1854, 357, Huntsville, Alabama; GÜNTHER, Cat., VII, 190, 1868; JORDAN & GILBERT, Synopsis, 208, 1883.

Rhinichthys badius, GARMAN, Science Observer, 1881, 60; "Scales 14-80-10," Clinch River.

Replaced northwestward by

509b. RHINICHTHYS ATRONASUS LUNATUS (Cope).

Much like var. *croceus*, the coloration mottled, the lateral band obsolete, the mouth more inferior, with shorter and wider cleft. Eye 5 in head; depth 5 in length. Insertion of dorsal midway between nostril and base of caudal. Scales 62. The common form in the lakes and brooks of Michigan and Indiana, and probably of Wisconsin and Minnesota, also.

Rhinichthys lunatus, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 278, Grosse Isle, Michigan. (Coll. Prof. Fox.)

Rhinichthys arenatus, GARMAN, Science Observer, 1881, 62, Sand Hill River, Minnesota.

Represented in the prairie streams by

509c. RHINICHTHYS ATRONASUS MELEAGRIS (Agassiz.)

Similar to subspecies *croceus*, but the jaws nearly equal. Head broad, narrowed anteriorly. Scales 11-70-8. Illinois and Iowa, perhaps indistinguishable from *lunatus*. (*meleagris*, generic name of the turkey, from its color?)

Rhinichthys meleagris, AGASSIZ, Amer. Journ. Sci. Arts, 1854, 357, Burlington, Iowa. (Coll. Dr. Rausch.) JORDAN & GILBERT, Synopsis, 886, 1883.

129. AGOSIA, Girard.

Agosia, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 186, (*chrysogaster*).

Apocope, COPE, Hayden's Geol. Surv. Mont. for 1871, 472, 1872, (*carringtoni*).

Eritrema, COPE, Zoöl. Wheeler's, Geol. Surv. W. 100th Mer., V, 648, 1876, (*henshavii*).

Zophendum, JORDAN, Bull. Hayden's Geol. Surv. Terr., IV, 1878, 786, (*siderium*).

This genus differs from *Rhinichthys* only in having the premaxillaries protractile. Even this character shows a disposition to disappear by degrees, as many specimens of *Agosia yarrowi* possess a narrow frenum, which, however, is distinct from the very broad frenum of *Rhinichthys*. In form, appearance, and habits the two groups agree perfectly, all the species inhabiting mountain streams and springs. Rocky Mountain region. (A coined name without meaning.)

APOCOPE, (ἀποκοπη, a cutting away, from the imperfect lateral line):

- *a.* Teeth two-rowed, usually without grinding surface.
  - *b.* Dorsal fin rather low, and not strongly falcate; caudal lobes obtuse.
    - *c.* Snout rather long, less than 4 in head, resembling that of *Rhinichthys.*
      - *d.* Scales small, usually more than 70 in lateral line.
        - *e.* Head 4; snout 4; scales very small, about 89 in lateral line. OSCULA, 510.
        - *ee.* Head rather long, about 4⅛; scales larger, about 78 in lateral line. YARROWI, 511.
        - *eee.* Head shorter, 4½ to 5; scales about 74. COUESII, 512.
      - *dd.* Scales larger, fewer than 70 in lateral line.
        - *f.* Scales about 65; snout 2⅔; eye 5 to 5½. ADOBE, 513.
        - *ff.* Scales large, usually 52 to 65.
          - *g.* Body quite deep, depth 3½ to 4 in length; fins low. NEVADENSIS, 514.
          - *gg.* Body more slender, depth 3¾ to 5 in length.
            - *h.* Scales moderate, usually fewer than 70. NUBILA, 515.
  - *bb.* Dorsal fin high and strongly falcate.
    - *i.* Inner rays of ventral fins without membranous stays joining them to the body.
      - *j.* Eye large, 3 in head; scales large, about 56 in lateral line. VELIFERA, 516.
      - *jj.* Eye smaller, 3½ to 4 in head; scales smaller, 63 to 70 in lateral line. UMATILLA, 517.
    - *ii.* Inner rays of ventral fins united to body by 2 or 3 membranous stays. FALCATA, 518.

AGOSIA:

- *aa.* Teeth one-rowed, 4–4, with grinding surface; scales very small; intestinal canal somewhat elongate. CHRYSOGASTER, 519.

Subgenus APOCOPE, Cope.

510. AGOSIA OSCULA (Girard).

Head 4; depth 4¾; eye 4, shorter than snout. D. 8; A. 7; scales 18–89–15; teeth 1, 4–4, 1. Body rather elongate, the tail stout; muzzle obtuse, but narrowed anteriorly, not overhanging the mouth; barbel small, sometimes obsolete. Scales very small. Dusky olive above, a blackish lateral band; males with axils of pectorals and ventrals scarlet; a scarlet patch above gill opening and one on side of muzzle. Length 2 to 3 inches. Lower Colorado and Gila rivers; not rare. (*osculus*, small mouthed.)

Argyreus osculus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 186, Babocomori Creek, a tributary of the Rio San Pedro, Arizona. (Type, No. 50. Coll. Clark.) GIRARD, U. S. & Mex. Bound. Surv. Zoöl., 47, plate XXVII, figs. 9 to 12, 1859.

Argyreus notabilis, GIRARD, *l. c.*, 1856, 186, Rio Santa Cruz, Sonora, a tributary of the Rio San Pedro, which is a tributary of the Rio Gila. (Coll. Clark.) GIRARD, Mex. Bound. Surv. Zoöl., 47, plate XXVII, figs. 5 to 8, 1859.

Ceratichthys ventricosus, COPE, Proc. Amer. Philos. Soc. Phila., 1874, 136, Arizona; Plagop. Ichth. Utah, 10, 1874. (Type, No. 15784. Coll. Newberry.)

Apocope ventricosa, COPE & YARROW, Zoöl. Wheeler Surv., 648, plate XXVIII, figs. 1 and 1a, 1875, (1876).

Apocope oscula (in part) and *ventricosa*, JORDAN & GILBERT, Synopsis, 211, 1883.

511. AGOSIA YARROWI, Jordan & Evermann.

Head 4⅛; depth 5 to 5½; eye 5½ to 6; snout short, obtuse, 2⅔ to 2¾. D. 7; A. 7; scales small, averaging about 16–78–13. Barbel small but distinct. Body elongate, little compressed; head long and rather heavy, bluntish, upper lip with or without narrow frenum joining it mesially to snout; the frenum present in about half of our many specimens; lips full, maxillary about 3½ in head. Lateral line complete. Dorsal fin well backward, its origin about midway between base of caudal and eye;

pectoral $1\frac{1}{3}$ in head, usually not quite reaching ventrals, the latter reaching past vent; caudal large. Color dark olive, more or less mottled above with black; sides with two ill-defined dark lateral bands, the interspaces paler; axils of the fins mostly crimson in life, as in related species. Length 2 to 5 inches. Streams of Colorado in the Colorado River Basin, very abundant in small streams in the mountain meadows, less common in the larger streams. (Named for Dr. Henry C. Yarrow, naturalist of the Survey West of the Hundredth Meridian.)

Agosia yarrowi, JORDAN & EVERMANN, Bull. U. S. Fish Comm., IX, 1889, (1891), 28, Tomichi Creek and Gunnison River, Gunnison, Colorado. (Coll. Jordan, Evermann, Fesler, & Davis.)

Apocope oscula, COPE & YARROW, Zoöl. Wheeler Survey, 647, 1875, (1876), not of GIRARD; JORDAN & GILBERT, Synopsis, 211, 1883, in part.

512. AGOSIA COUESII (Yarrow).

Head 4 to $4\frac{1}{4}$; depth $4\frac{1}{5}$ to $4\frac{1}{2}$; eye $4\frac{1}{2}$ to 5; snout $2\frac{4}{5}$. D. I, 8, (sometimes 7); A. I, 7; scales 12–74–11, (range from 70 to 76); teeth 1 or 2, 4–4, 2 or 1. Barbel present. Body moderately stout, ventral and dorsal outlines gently arched; head long and pointed; snout pointed, mouth broad, inferior; eye small, high up; interorbital width equal to snout; caudal peduncle long, slender, and compressed. Origin of dorsal behind insertion of ventrals, about midway between base of middle caudal rays and nostril. Scales small, firm and close-set; lateral line complete. Color dark gray above and on sides to lateral line; below pale; no lateral band; fins all plain. Length $4\frac{1}{2}$ inches. Colorado River Basin. (Named for Dr. Elliott Coues, the well-known ornithologist.)

Apocope couesii, YARROW, Field and Forest, 1876, and Zoöl. Wheeler Surv., 648, 1875, (1876), Camp Apache, Arizona.

513. AGOSIA ADOBE, Jordan & Evermann.

Head $3\frac{2}{3}$ to $3\frac{5}{6}$; depth $4\frac{1}{2}$ to 5; eye 2 in snout, 5 to $5\frac{1}{2}$ in head. D. 8; A. 7; scales 12–63 to 70–10. Body slender and elongate, the head long and low, sharp in profile. Snout long, about $2\frac{2}{3}$ in head, its tip projecting considerably beyond the thick upper lip; mouth larger than in *A. nubila*, the maxillary extending beyond nostril; barbel well developed. Lateral line complete. Insertion of dorsal midway between front of eye and base of caudal; pectorals shortish; caudal large. Length 2 to 4 inches. Clay-colored, with a dark lateral band; back with some dark dots. Sevier River, Utah, locally abundant. (*adobe*, clay, in Spanish.)

Agosia adobe, JORDAN & EVERMANN, Bull. U. S. Fish Comm., IX, 1889, (1891), 36, Sevier River, Juab, Utah. (Type, No. 41674. Coll. Jordan, Evermann, Fesler, & Davis.)

514. AGOSIA NEVADENSIS (Gilbert).

Head $3\frac{1}{2}$ to 4; depth $3\frac{1}{2}$ to 4; eye very small, $5\frac{1}{3}$ in head, half interorbital width, which equals distance from tip of snout to middle of eye. D. 8; A. 7; scales 65; pores about 58. Body robust, with broad, heavy head, its greatest depth at occiput, 5 in body, ($6\frac{1}{4}$ in *A. nubila*, of same size). Mouth terminal, very oblique, the lower jaw included, the premaxillaries not overlapped by snout. Maxillary 3 in head, reaching front of eye; barbels well developed; scales small, very irregularly placed, the lateral line incomplete in adult. Fins all small; front of dorsal midway between base of caudal and middle of occiput, behind base of ventrals. Ventral rays apparently seven, the outer rudimentary. Brown, much speckled above, white below, a dark lateral stripe ending in an obscure caudal spot. Warm springs in the deserts of southwestern Nevada; Ash Meadows, Indian Creek, and Vegas Creek, Nevada.

Rhinichthys (Apocope) nevadensis, GILBERT, Death Valley Expedition, 230, pl. VI, fig. 1, 1893, Ash Meadows, Amargosa Desert. (Coll. Merriam & Bailey.)

515. AGOSIA NUBILA (Girard).

Head 3¾ to 4⅗; depth 3¾ to 5; eye 3½ to 5; snout 2¾ to 3⅓. Dorsal usually 8, sometimes 9, one or two rudimentary anterior rays; anal 7; scales variable, ranging from 47 to 70, usually between 52 and 65. Teeth 1, 4–4, 1; 1, 4–4, 0; 1, 4–4, 2; or 2, 4-4, 2. Barbel usually present, especially in coastwise specimens. Body not compressed, head rather short, snout moderate, mouth inferior, horizontal or oblique. Fins not falcate; origin of dorsal usually somewhat behind insertion of ventrals and usually midway between base of middle caudal rays and posterior edge of preopercle, but varying either way as much as diameter of eye. Color usually dark grayish above, becoming paler below, a faint lateral band of dark, extending through eye and around snout, especially plain in specimens from the heavily wooded region of western Washington. An extremely abundant and variable species, and a study of a large amount of material from many different localities in the Columbia River basin has not enabled us to recognize any differences of value for purposes of specific separation. Length 3½ inches. Basin of the Columbia River from western Idaho, below the Shoshone Falls of Snake River to the coast, and in coastwise streams from Washington southward into Oregon. Specimens from the following localities are included under this species in the above description: Clearwater River, Potlatch Creek, near Lewiston, Idaho; Boise River, Caldwell, Idaho; Pataha River, Starbuck, Washington; Umatilla River, Pendleton, Oregon; Mill Creek, Walla Walla; Walla Walla River, Wallula, Washington; Cœur d'Alene Lake, Idaho; Little Spokane River, Spokane, Washington; Hangman Creek, Tekoa, Washington; Columbia River Umatilla, Washington; Colville River, Colville, Washington; Natchess River, North Yakima, Washington; Newaukum River and Skookumchuck River, Chehalis, Washington. (*nubilus*, dusky.)

Argyreus nubilus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 180, and Pac. R. R. Surv., 244, 1858, Fort Steilacoom, Puget Sound. (Type, No. 51. Coll. Suckley.)

Apocope nubila, JORDAN & GILBERT, Synopsis, 210, 1883.

Agosia nubila, GILBERT & EVERMANN, Investigations in Columbia River Basin, 41, 1894.

Represented eastward by

515a. AGOSIA NUBILA CARRINGTONII (Cope).

Head 3⅕ to 4⅗; depth 4⅖ to 5; eye 4 to 4⅗; snout 3 to 3⅓. D. I, 9, rarely I, 8; A. I, 7; scales 64, (53 to 72). Barbel usually present. Teeth variable, but usually 1, 4–4, 2, hooked. Body rather stout, back little elevated, caudal peduncle compressed; head moderate, snout broad, gently decurved; mouth broad, inferior, oblique; interorbital width equals length of snout. Fins not falcate; insertion of dorsal slightly behind ventrals, about midway between base of middle caudal rays and pupil; height of dorsal and anal about equal, $1\frac{1}{6}$ in head; caudal not deeply forked. Lateral line often, but not always, incomplete. Color grayish, with scattered dark spots or blotches; faint dark lateral band extending forward through eye and around snout; dorsal and anal fins with some dark markings; other fins plain. Length 4 inches. Upper Snake River Basin to Heart Lake in Yellowstone Park, thence extending southward in the Great Basin to Utah Lake; very abundant and extremely variable. To this form we also refer provisionally specimens from Lake Tahoe and elsewhere in the Lahontan basin, and also those from various coastwise localities in central and southern California, where it is abundant in clear streams and springs as far south as San Luis Obispo. These California and Nevada forms may be distinct species, but if so, we are unable to define them. (Named for Campbell Carrington, naturalist of the Hayden Survey in Utah and Idaho.)

Apocope carringtonii, Cope, Hayden's Fifth Annual Report U. S. Geological Survey, 1871, (1872), 472, **Warm Springs, [Box Elder County], Utah.** (Coll. Campbell Carrington.) Cope & Yarrow, Zoöl. Wheeler Survey, 645, 1875, (1876).

Apocope vulnerata, Cope, *l. c.*, 473, **Logan, Utah.** (Type, No. 15768. Coll. Henshaw.) Cope & Yarrow, Zoöl. Wheeler Surv., 646, 1875, (1876).

Tigoma rhinichthyoides, Cope, *l. c.*, 473, **Logan, Utah.** (Coll. Carrington.)

Rhinichthys henshavii, Cope, Proc. Amer. Philos. Soc. Phila., 1874, 133, **Provo, Utah**; Plagop. Ichth. Utah, 7, 1874.

Agosia novemradiata, Cope, Proc. Ac. Nat. Sci. Phila., 1883, 141, **Weber River at Echo, Utah.**

Ceratichthys nubilus, Cope, Hayden's Fifth Annual Report U. S. Geol. Surv. 1871, (1872), 472.

Apocope carringtoni, vulnerata, and *henshavii*, Jordan & Gilbert, Synopsis, 210, 1883.

Agosia nubila, Jordan, Bull. U. S. Fish Comm., IX, 1889, (1891), 32 and 48.

Agosia nubila carringtonii, Gilbert & Evermann, Investigations in Columbia River Basin, 41, 1894.

516. AGOSIA VELIFERA (Gilbert).

Head 4; depth $4\frac{3}{4}$; eye 3. D. 8; A. 7; lateral line with 56 pores; 10 scales between lateral line and dorsal; teeth 2, 4–4, 2, hooked. Upper lip as in *A. yarrowi* with a narrow frenum, thus indicating a transition toward *Rhinichthys*. Snout narrow, bluntly rounded, not projecting beyond premaxillaries. Mouth small, horizontal, the maxillary equal to eye, reaching front of eye, $3\frac{1}{2}$ in head. Pectorals nearly reaching base of ventrals, the latter beyond front of anal; origin of dorsal behind ventrals, midway between base of caudal and middle of eye, the fin unusually high; caudal lobes more pointed than usual. Brown; a black lateral band and a small black caudal spot. Three specimens from a hot spring in Pahranagat Valley, southwestern Nevada. (*velum*, sail; *fero*, I bear.)

Rhinichthys (*Apocope*) *velifer*, Gilbert, Death Valley Expedition, 229, pl. VI, fig. 2, 1893, **Pahranagat Valley, Nevada.** (Coll. Merriam & Bailey.)

517. AGOSIA UMATILLA, Gilbert & Evermann.

Head 4; depth 4¾ to 5; eye 3½ to 4; snout 3. D. I, 9; A. I, 7; scales 13 or 14–63 to 70–7 or 8; teeth 1, 4–4, 1, hooked. Body rather slender, back somewhat elevated; head pointed, narrow; caudal peduncle compressed, its least depth 2 in head. Origin of dorsal fin slightly behind insertion of ventrals, midway between nostril and base of middle caudal rays; dorsal falcate, its anterior rays nearly as long as head; rudimentary rays not much enlarged nor spine-like; anal strongly falcate, the anterior rays much produced, about as long as head; pectorals not quite reaching ventrals, 1¼ in head; ventrals reaching front of anal, 1½ in head; caudal deeply forked. Color as in *A. falcata*, which it resembles, but from which it differs in the absence or very weak development of ventral stays, and in the notably smaller scales. Known from the Columbia River at Umatilla and Payette River at Payette, Idaho. (*Umatilla*, type locality.)

Agosia umatilla, GILBERT & EVERMANN, Investigations in Columbia River Basin, 42, pl. IX, fig. 2, 1894, Columbia River, Umatilla, Oregon. (Type, No. 45390. Coll. Gilbert & Rutter.)

518. AGOSIA FALCATA, Eigenmann & Eigenmann.

Head 3¾ to 4⅕; depth 4⅓ to 5¼; eye 3½ to 4⅕; snout 2¾ to 3. D. II, 9; A. I, 7; scales 52 to 57. Body slender, caudal peduncle and head very slender; mouth inferior, nearly horizontal, overhung by the rather long snout; eye large, interorbital space wide. Fins falcate; dorsal about over insertion of ventrals, about midway between base of middle caudal rays and pupil, its longest rays nearly as long as head; the two anterior rays strong and spine-like; anal rays about as long as those of dorsal; pectorals variable, usually nearly as long as head; ventrals provided with 2 or 3 membranous stays uniting the inner rays with the body. Dark, mottled above, blotched with dark on sides and at base of caudal fin; head dark above and down to lower level of eye; under parts pale. Fins with some dark markings, especially the caudal; pectorals and ventrals palest. Body and inner sides of pectoral fins often profusely covered with minute tubercles. Columbia River basin; locally abundant; Boise River at Caldwell, Idaho; Payette River at Payette, Idaho; Columbia River at Pasco and Umatilla; and Mill Creek at Walla Walla. (*falcatus*, falcate.)

Agosia falcata, EIGENMANN & EIGENMANN, American Naturalist, XXVII, February 4, 1893, 153, Boise River, Caldwell, Idaho. (Coll. Eigenmann.) GILBERT & EVERMANN, Investigations in Columbia River Basin, 42, 1894.

Agosia shuswap,[*] EIGENMANN & EIGENMANN, American Naturailst, XXVII, February 4, 1893, 154, Shushwap Lake, near mouth of Eagle River, British Columbia. (Coll. Eigenmann.)

Agosia falcata shuswap, EIGENMANN, Bull. U. S. Fish Comm., XIV, 1894, (July 7, 1894), 111.

Subgenus AGOSIA.

519. AGOSIA CHRYSOGASTER, Girard.

Head 4; depth 4; eye 4. D. 8; A. 7; scales 88; teeth 4–4, without grinding surface. Barbel small, but evident. Body fusiform; head rather heavy, conical; snout tuberculate in males in spring. Mouth terminal, the upper jaw the longer; maxillary reaching about line of orbit; mouth forming more than a semicircle. Fins long, the ventrals reaching anal. Color, dark iron gray above, sometimes spotted; a darker band of same along sides above lateral line, extending from end of snout to middle of caudal where it is most conspicuous; males with the belly yellow or orange. Tributaries of the Gila River, not rare in mountain brooks. (*χρυσός*, gold; *γαστήρ*, belly.)

---

[*] Dorsal equidistant from base of middle caudal rays and posterior half of eye, inserted directly over origin of ventrals; lateral band well marked, otherwise as in *A. falcata*. (Eigenmann.) Apparently not differing from *A. falcata*.

Agosia chrysogaster, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 187, and U. S. & Mex. Bound. Surv., Zoöl., 49, plate XXVIII, figs. 5 to 8, 1859, Rio Santa Cruz, Sonora. (Coll. Clark.) JORDAN & GILBERT, Synopsis, 209, 1883.

Agosia metallica, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 187, and U. S. & Mex. Bound. Surv., Zoöl., 49, plate XXVIII, figs. 1 to 4, 1859, Rio San Pedro, Arizona. (Coll. Clark.) JORDAN & GILBERT, Synopsis, 209, 1885.

Hyborhynchus siderius,* (lapsus for *Hybognathus*), COPE, Zoöl. Wheeler Surv., V, 670, plate XXXI, figs. 6, 6a, 1875, (1876), Camp Lowell, Arizona. (Type, No. 16984. Coll. Rutter.)

Zophendum siderium, JORDAN & GILBERT, Synopsis, 155, 1883.

130. HYBOPSIS, Agassiz.

(HORNY-HEADS.)

Hybopsis, AGASSIZ, Amer. Journ. Sci. Arts, 1854, 358, (*gracilis* = *amblops*).

Nocomis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 190, (*nebrascensis* = *kentuckiensis*).

Ceratichthys, Baird MS., GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 212, (*biguttatus* = *kentuckiensis*).

Erinemus, JORDAN, Man. Vert., Ed. I, 279, 1876, (*hyalinus* = *amblops*).

Erimystax, JORDAN, Geol. Surv. Ohio, IV, Zoöl., 858, 1882, (*dissimilis*).

Yuriria, JORDAN & EVERMANN, new subgenus, (*altus*).

Body robust, or variously elongate. Mouth terminal or inferior, with lips thin or somewhat fleshy, a conspicuous barbel always present and terminal on the maxillary; a second barbel sometimes present on each side; premaxillaries protractile. Teeth 4–4, or 1, 4–4, 1, or 0; hooked, the grinding surface narrow or obsolete. Scales usually rather large, 35 to 58 in lateral line; lateral line continuous. Dorsal fin inserted over, in front of, or slightly behind ventrals; anal basis short. Males usually with nuptial tubercles, and sometimes flushed with red. A large and varied group, closely allied to *Notropis*, from which it differs chiefly in the presence of the small maxillary barbel. We here divide it into 4 subgenera, but a greater number of subordinate groups could be recognized. The group shows a range of variation as wide as that in *Notropis*, though with a smaller number of species. (*ὑβός*, gibbous; *ὄψις*, face.)

a. Species of moderate or small size, the mouth inferior, horizontal; preorbital broad, silvery; sexes similar, the male sometimes tuberculate or with the fins rosy.
  ERIMYSTAX, (*ἐρι*, an intensive particle; *μύςταξ*, barbel or moustache):
    b. Teeth one-rowed, 4–4; lips thickish; body long and low, with the aspect of *Gobio* or *Phenacobius*.
      c. Teeth without grinding surface; sides not marked by a series of dark blotches connected by a lateral band; eye moderate, 3½ to 5½ in head.
        d. Scales rather large, 35 to 44 in the lateral line; barbel very long, sometimes duplicated; dorsal fin without black blotch on its upper posterior portion; snout projecting; body slender; fins high.

---

* In the type of *H. siderius* the barbel is plainly evident, a fact which Mr. Barton A. Bean has recently kindly verified for us.

e. Barbels four; body sprinkled with black dots. TETRANEMUS, 520.

ee. Barbels two.

f. Back and sides sprinkled with dark dots.

g. Lower lobe of caudal pale; snout moderate.

h. Eye small, 3½ to 4 in head. ÆSTIVALIS, 521.

hh. Eye rather large, 3¼ in head. HYOSTOMUS, 522.

gg. Lower lobe of caudal black in life; color of back darker; snout very long. GELIDUS, 523.

ff. Back and sides pale, not dusted with dark dots.

i. Lower lobe of caudal black in life; eye small, 4½ in head. MEEKI, 524.

ii. Caudal fin with both lobes pale; eye larger, 3¾ in head.

j. Scales 37. MONTANUS, 525.

jj. Scales 45. CUMINGI, 526.

dd. Scales small, about 56 in lateral line; dorsal fin with a large black blotch on its posterior rays; a dark spot at base of caudal. MONACUS, 527.

cc. Teeth with a slight grinding surface; eye very large, about 2¾ in head; sides with a dark lateral band, expanded at intervals into round dark blotches.

k. Scales in lateral line about 44; 17 before dorsal. DISSIMILIS, 528.

kk. Scales in lateral line about 50; 20 before dorsal. WATAUGA, 529.

HYBOPSIS:

bb. Teeth two-rowed, 1, 4–4, 1 or 0, without grinding surface; mouth small, below the blunt snout; scales large, 34 to 42 in lateral line. Silvery species, with conspicuous preorbital. Aspect of *Notropis.*

l. Dorsal fin in adult with a large dark blotch on its last rays above; lips thick, the barbel very long; eye 3⅓ in head. LABROSUS, 530.

ll. Dorsal fin plain, without distinct markings.

m. Eye moderate, 3¼ to 3½ in head; fins with red in spring males; sides with a dark band ending in a caudal spot.

n. Head small, conical; depth 4; scales 5–40–3. HYPSINOTUS, 531.

nn. Head larger and less conical; depth 5; scales 5–36–3. RUBRIFRONS, 532.

mm. Eye large, 2¾ to 3 in head.

o. Sides with a dusky shade; size small, length 2 to 3 inches. AMBLOPS, 533.

oo. Sides bright silvery; silvery preorbital broad and conspicuous; size large, 4 to 10 inches or more in adult. STORERIANUS, 534.

YURIRIA, (from Lake Yuriria, Guanajuato, where the typical species abounds):

bbb. Teeth one-rowed, 4–4, with broad grinding surface and slight hook; mouth rather large, terminal; scales moderate, about 45; 18 before dorsal. Silvery species, with conspicuous preorbital and very small barbel; size very large. ALTUS, 535.

NOCOMIS:

aa. Species of large size, not silvery, with the mouth large, nearly terminal, the dorsal inserted slightly behind ventrals; the teeth 4–4, or 1, 4–4, 1. Eye small; scales in lateral line about 41. Aspect of *Semotilus.* KENTUCKIENSIS, 536.

Subgenus ERIMYSTAX, Jordan.

520. HYBOPSIS TETRANEMUS, Gilbert.

Head 4; depth 5⅓; snout 2½ in head, ⅓ of it projecting beyond mouth; eye small, 5 in head. D. 8; A. 8; lateral line 36 to 38; teeth 4–4. Closely resembling *H. æstivalis* but with two long barbels at each angle of the mouth, the one pair taking the place of the fleshy prominence seen in *gelidus* and *æstivalis*; longest barbel as long as eye. Head very slender, slenderer than in *æstivalis.* Dorsal over ventrals, a little nearer tip of snout than caudal. Fins large. Color as in *æstivalis*, translucent silvery, with irregular, scattered black dots above; median rays of each caudal lobe dusky at base. Length 2 inches. Tributaries of Arkansas River in Kansas and Arkansas; not rare; a most remarkable little fish, the only American minnow with more than two barbels. (*τετρα-*, four; *νῆμα*, barbel.)

Hybopsis tetranemus, GILBERT, Bull. Washburn College Lab., 1886, 208, Elm and Spring creeks, Medicine Lodge, Kansas. (Coll. Cragin.)

521. HYBOPSIS ÆSTIVALIS (Girard).

Head 3¾; depth 5⅓. D. 8; A. 8; scales 6–36–4; teeth 4-4. Body slender, with long caudal peduncle, the back scarcely elevated. Head long and slender, the snout much projecting and rather pointed. Mouth moderate, inferior, the maxillary reaching posterior nostril. Barbels conspicuous, nearly as long as snout, about 3 in head; each maxillary with but a single one. Eye small, 4 to 4½ in head. Fins rather long, the caudal deeply forked, its lobes subequal; dorsal over ventrals, nearer snout than base of caudal. Color silvery; everywhere sprinkled with small black dots; fins plain. Length 2½ inches. Arkansas River to the Rio Grande, abundant in sandy river channels, not in small brooks. (*æstivalis*, pertaining to summer.)

Gobio æstivalis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 189, Rio San Juan, near Cadereita, New Leon. (Coll. Couch.)

Ceratichythys sterletus, COPE, Zoöl. Wheeler Survey, v, 652, 1875, (1876), Rio Grande, at San Ildefonso, New Mexico. (Type, No. 16973. Coll. Cope & Shedd.)

Ceratichthys sterletus and *æstivalis*, JORDAN & GILBERT, Synopsis, 216, 1883.

Hybopsis æstivalis, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1886, 8.

Represented in Central Texas by

521a. HYBOPSIS ÆSTIVALIS MARCONIS, Jordan & Gilbert.

Eye larger than in *æstivalis*, 3½ in head; caudal peduncle stouter than usual, its least depth half greatest depth of body. Length 3 inches. Abundant in Rio San Marcos, a clear stream issuing from an immense spring at San Marcos, Texas; also known from the Guadalupe River, near San Marcos, and the Rio Comal at New Braunfels.

Hybopsis æstivalis marconis, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1886, 22, Rio San Marcos, San Marcos, Texas. (Type, No. 36524. Coll. Jordan & Gilbert.) EVERMANN & KENDALL, Bull. U. S. Fish Comm., XII, 1892, (1894), 104, plate 19, fig. 1.

522. HYBOPSIS HYOSTOMUS (Gilbert).

Head 4; depth 5½; eye 3¼. D. 8; A. 8; lateral line 37. Body and head very slender; snout long, acute, projecting beyond mouth for half its length; mouth short, wide, inferior; barbel long; pectoral large; other fins small; 13 scales before dorsal. Silvery, everywhere dusted with dark specks; fins pale, the lower lobe of caudal like the other. Length 2½ inches. Indiana to Iowa, and south to the Alabama River; rather common in sandy river channels. (*ὗς*, hog; *στόμα*, mouth.)

Nocomis hyostomus, GILBERT, Proc. U. S. Nat. Mus., 1884, 203, White River, Bedford, Indiana. (Type, No. 34980. Coll. Gilbert.)

523. HYBOPSIS GELIDUS (Girard).

Head 4; depth 5; eye 6¼; snout 2⅖. D. 8; A. 9; scales 6–44–4. Body slender, not much compressed, back little arched; head long and slender; mouth inferior, horizontal, broad, overhung by the very long, pointed snout, which is considerably decurved; barbel short, $1\frac{2}{3}$ in eye; eyes very small, high up, midway of head; interorbital width equal to width of mouth, about 3 in head. Caudal peduncle very long and slender. Fins moderate; origin of dorsal a little nearer snout than base of caudal, directly over base of ventrals; free edge of dorsal fin slightly concave, the anterior ray but little produced, its length $1\frac{2}{5}$ in head; free edge of anal little concave, length of first rays $1\frac{3}{5}$ in head; pectorals much shorter than in *H. meeki*, $1\frac{1}{2}$ in head, the first rays not produced nor filamentous, and not reaching ventrals; ventrals barely reaching vent, $1\frac{2}{3}$ in head; caudal very long and deeply forked, the lobes as long as head, the lower slightly the longer. Lateral line complete, straight; teeth 4–4, strongly hooked. Color, sides silvery, pale below, scales of back each with a group of fine dark specks on posterior border, these extending almost to lateral line; rest of back and upper part of sides sparsely dusted over with minute brownish specks; fins all pale except the caudal, the lower lobe of which is dark, with a narrow white border below; upper lobe slightly dark at base. From *Hybopsis meeki*, which it most closely resembles, this species may be distinguished by the much longer and more pointed snout, the smaller eye, the much shorter pectoral fins, and the darker coloration of the back. Middle Missouri River basin from Wyoming to eastern Nebraska, locally common, but hitherto overlooked; our specimens from Powder River at Arvada, Wyoming, collected by Cox and Gillum. (*gelidus*, frozen.)

Gobio gelidus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 188, Milk River, Montana. (Coll. Suckley.) GIRARD, Pac. R. R. Surv., 248, 1858.
Ceratichthys gelidus, JORDAN & GILBERT, Synopsis, 216, 1883, (in part).

524. HYBOPSIS MEEKI, Jordan & Evermann, new species.

Head 4; depth $5\frac{1}{2}$. D. 8; A. 8; lateral line 44. Body very slender, not elevated. Snout long, thick, blunt, overhanging the rather large mouth. Barbel as long as eye. Head slender and elongate. Eye small, rather high, $4\frac{1}{2}$ in head. Mouth small, subterminal, the maxillary not extending to eye. Fins all large; pectoral as long as head; caudal deeply forked. Lateral line decurved; scales rather large. Coloration silvery, unspotted; a dusky lateral streak ending in a blackish spot at base of caudal; lower lobe of caudal abruptly black, edged below with white. Male with the nuptial tubercles excessively developed, covering most of the body. Length 2 inches. Missouri River at St. Joseph and elsewhere, in the river channel; the types (No. 35889) collected by Jordan and Meek. A curious little fish, heretofore confounded with *H. gelidus*. (Named for Dr. Seth Eugene Meek, of the University of Arkansas.)

Ceratichthys gelidus, JORDAN & GILBERT, Synopsis, 216, 1883, (in part).
Hybopsis geludus, JORDAN & MEEK, Proc. U. S. Nat. Mus., 1885, 10.

525. HYBOPSIS MONTANUS, Meek.

Head $3\frac{5}{8}$; depth 5. D. 8; A. 6; scales 4–37–4, 14 before dorsal; teeth 4–4. Body slender, little elongate, the eye high up, $3\frac{3}{4}$ in head; snout blunt, rather long, $3\frac{1}{6}$ in head; mouth rather large, inferior, the lower jaw included; the maxillary past front of eye; barbel long. Dorsal above ventrals; fins moderate. Color plain brownish, without black dots, sides and below silvery; fins plain. Length 2½ inches. Types supposed to be from the upper Missouri.

Hybopsis montanus, MEEK, Proc. U. S. Nat. Mus., 1884, 526, locality unknown, but collected by Dr. F. V. Hayden. (Type, No. 36882.)

526. HYBOPSIS CUMINGII (Günther.)

Head 4⅓; body 5. D. 8; A. 8; scales 6–45–6; teeth one-rowed? Barbels minute. Eye entirely in the anterior half of the length of the head, and nearly as long as the snout, which is obtuse, rounded, convex, the mouth being subinferior. Interobital space convex, as wide as the orbit. Suborbital ring extremely narrow. Origin of dorsal fin a little behind ventrals, somewhat nearer root of caudal than end of snout. Pectorals not reaching ventrals. Olivaceous, a grayish silvery band from gill opening to the root of caudal, where it terminates in a black spot. Length 3½ inches. California, (Günther.) Not seen by us. (Named for H. Cuming.)

Ceratichthys cumingii, GÜNTHER, Cat., VII, 177, 1868, California, (Coll. H. Cuming); copied in JORDAN & GILBERT, Synopsis, 213, 1883.

527. HYBOPSIS MONACUS (Cope).

Head 4; depth 5¼. D. 8; A. 8; scales 8–56–4; teeth 4–4. Body slender, somewhat compressed, not much elevated. Head long and rather slender, flattish above, with projecting muzzle; mouth inferior, horizontal, small, the maxillary not reaching the eye, which is quite small, 4⅕ in head. Scales rather small; 24 scales in front of dorsal. Fins moderate. Color light olive; a metallic vertebral band; sides and belly silvery; no lateral band; a conspicuous black spot at base of caudal; muzzle dusky; membrane of upper posterior part of dorsal fin black as in *Notropis whipplii* and related species. Length 4 inches. Tennessee Basin, in the river channels; rather scarce. (*monachus*, *μόναχος*, solitary.)

Ceratichthys monacus, COPE, Journ. Ac. Nat. Sci. Phila., 1867, 227, Holston River, Washington County, Virginia. (Coll. Cope.)
Ceratichthys monachus, JORDAN & GILBERT, Synopsis, 217, 1883.

528. HYBOPSIS DISSIMILIS (Kirtland).

(SPOTTED SHINER.)

Head 4½; depth 5. D. 8; A. 7; scales 6–40 to 47–5; teeth 4–4, often with slight grinding surface. Body long and slender, little compressed, with long caudal peduncle. Head long, rather flat above, the snout somewhat bluntly decurved, projecting a little beyond the rather small, horizontal mouth; lower jaw included; both jaws with the skin hard in front, forming a sort of lip laterally. Barbel considerably shorter than pupil; maxillary not reaching nearly to orbit. Eye very large, high up, somewhat directed upward, rather behind middle of head, forming more than one-third length of head. Opercle small. Dorsal rather large, its posterior border oblique; anal small; caudal well forked; pectoral rather long. Scales rather large, 16 to 18 in front of dorsal. Lateral line nearly straight. Olivaceous; back irregularly mottled; sides silvery, with a bluish lateral band, which is widened into several dusky spots, formed by dark punctulations, and most distinct posteriorly; a dusky band on head, through eyes and snout; fins plain. Length 3 to 4 inches. Lake Erie to the headwaters of the Tennessee, west to Arkansas and Iowa; rather common in the river channels. (*dissimilis*, not similar, to other shiners.)

Luxilus dissimilis, Kirtland, Bost. Journ. Nat. Hist., III, 1840, 341, pl. IV, fig. 2, Mahoning River, Ohio, and Lake Erie, near Cleveland.

Ceratichthys dissimilis, Cope, Cypr. Penn., 367, 1866; Günther, Cat., VII, 177, 1868; Jordan & Gilbert, Synopsis, 215, 1883.

529. HYBOPSIS WATAUGA, Jordan & Evermann.

Head 4⅓; depth 5½ to 6. D. 7; A. 7; scales 5-48 to 52-4, 20 to 24 before dorsal; teeth 4-4, small, hooked, with slight grinding surface. Body more elongate than in *H. dissimilis*, the scales smaller and the coloration less variegated. Olivaceous, with a bluish lateral stripe not so wide as eye passing around snout; on this stripe 8 to 12 blackish spots, diffuse and smaller than eye, one of these at base of caudal; a dark speck on front of opercle; fins plain. Length 4 inches. Known from Holston River, Virginia; Watauga River, Tennessee; White River, Arkansas; Big Barren River, Kentucky; and Tippecanoe River, Indiana; probably abundant and apparently replacing *H. dissimilis* in mountain streams; size usually larger than in *H. dissimilis*.

Hybopsis watauga, Jordan & Evermann, Proc. U. S. Nat. Mus., 1888, 355, Watauga River, Elizabethtown, Tennessee; North Fork Holston River, Saltville, Virginia. (Type, No. 39929. Coll. Jordan, Jenkins, & Evermann.) Woolman, Bull. U. S. Fish Comm., XII, 1892, 258.

Subgenus HYBOPSIS.

530. HYBOPSIS LABROSUS (Cope).

Head 4¼; depth 4¼. D. 8; A. 7; scales 5-34 to 40-3; teeth 1, 4-4, 1. Body long and slender, little compressed. Head rather long, narrow, and pointed, very slender in young specimens, stouter in adults. Snout decurved in profile, long, overhanging the large mouth; lips much thickened, the lower with an internal fringe of papillæ; barbels extremely long, more than half diameter of eye. Eye moderate, nearly median, 3⅓ in head. Scales moderate, closely imbricated, 16 in front of dorsal. Fins rather small; caudal deeply forked, its peduncle long and slender. Males dark steel blue, with black markings on back and especially at base of dorsal; females very pale silvery, with a blue streak along sides of tail. A small round black spot at base of caudal; a dark lateral streak, obsolete anteriorly; large specimens with a large dark patch on the last rays of the dorsal, as in *Notropis whipplii*; base of the caudal with dark points; males in spring with the head and neck profusely tuberculate and the fins flushed with crimson. Length 3 inches. Basin of the Santee, in North and South Carolina; common. (*labrosus*, thick-lipped.)

Ceratichthys labrosus, Cope, Proc. Amer. Phil. Soc., 1870, 458, tributaries of Catawba River, McDowell and Burke counties, North Carolina. (Coll. Cope.)

Ceratichthys zanemus, Jordan & Brayton, Bull. U. S. Nat. Mus., XII, 1878, 24, Saluda River, Greenville, North Carolina. (Type, No. 31126. Coll. Jordan & Brayton.)

Ceratichthys labrosus and *zanemus*, Jordan & Gilbert, Synopsis, 217, 1883.

531. HYBOPSIS HYPSINOTUS (Cope).

Head 3¾; depth 4. D. 8; A. 8; scales 5–40–3; teeth 1, 4–4, 1. Body stouter, more elevated, and more compressed than in *H. rubrifrons*. Head short, broad above, much smaller and more conical than in *H. rubrifrons*; outline of back rather abruptly declining behind front of dorsal fin, so that the base of the fin is oblique. Mouth inferior, horizontal, small, the maxillary reaching line of orbit. Barbels small. Eye small, 3½ in head. Color silvery, with a double series of black specks along lateral line, and a lateral band of dusted blackish, which passes through eye and snout and ends in a faint caudal spot; males with the fins bright red, and the body with a deep violet luster, as in *Notropis rubricroceus*. Length 3 inches. Santee Basin, in North Carolina and South Carolina; rather rare. Resembles *Notropis procne*, but has an evident barbel. (*ὑψι-*, high; *νῶτος*, back.)

Ceratichthys hypsinotus, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 458, tributaries of Catawba River, McDowell County, North Carolina. (Coll. Cope.) JORDAN & BRAYTON, Bull. U. S. Nat. Mus., XII, 1878, 25, and JORDAN & GILBERT, Synopsis, 215, 1883.

532. HYBOPSIS RUBRIFRONS (Jordan).

Head 4; depth 5. D. 8; A. 7; scales 5–36–3; teeth 1, 4–4, 0. Form of *Hybopsis amblops*. Head long, narrower than in *H. amblops*. Eye moderate, 3⅓ to 3½ in head, wider than the interorbital space. Mouth small, inferior, overhung by the bluntly decurved but not very broad muzzle; barbels quite long and distinct, 13 scales in front of the dorsal. Fins well developed; the first rays of the dorsal about twice height of last. Pale olivaceous; sides with a plumbeous silvery band, in some specimens forming a stripe through eye and snout, and a dark spot at base of caudal; cheeks silvery; snout in males red, with numerous dust-like tubercles; specimens in high spring coloration have the fins largely red. Length 3 inches. Basin of the Altamaha, Georgia; common. (*ruber*, red; *frons*, forehead.)

Nocomis rubrifrons, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 330, Ocmulgee River, Flat Shoals, Georgia. (Type, Nos. 17863 & 20146. Coll. Jordan.)
Ceratichthys rubrifrons, JORDAN & GILBERT, Synopsis, 214, 1883.

533. HYBOPSIS AMBLOPS (Rafinesque).

(SILVER CHUB.)

Head 4; depth 5. D. 8; A. 7; scales 5–38–4; teeth 1, 4–4, 1. Body rather slender, somewhat heavy anteriorly, not much compressed. Head large, flattened and broad above; eye very large, longer than snout and longer than interorbital space, 3 in head. Mouth horizontal, subinferior, and rather small; muzzle bluntly decurved; upper lip below level of orbit; maxillary not reaching line of front of orbit; barbel evident. Fins moderate. Lateral line somewhat decurved; sixteen scales before dorsal. Color translucent greenish; scales somewhat dark-edged; sides with a bright silvery band which overlies dark pigment, so that sometimes a plumbeous or even blackish band appears; a dark band through eye around snout; males without tubercles or red coloration. Length 2 to 3 inches. New York to Iowa, and southward to Alabama. Very common in the Ohio Valley and the Tennessee Valley. Southern specimens, (var. *winchelli*), have the head narrower and the barbel rather shorter. (ἀμβλύς, blunt; ὤψ, face.)

Rutilus amblops, RAFINESQUE, Ichth. Oh., 51, 1820, Ohio River, at the Falls.
Hybopsis gracilis, AGASSIZ, Amer. Journ. Sci. Arts, 1854, 358, Huntsville, Alabama.
Hybopsis winchelli, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 211, Black Warrior River, Alabama. (Coll. Winchell.)
Ceratichthys hyalinus, COPE, Journ. Ac. Nat. Sci. Phila., 1868, 226, tributary Holston River. (Type, No. 14995. Coll. Cope.) GÜNTHER, Cat., VII, 179, 1868.
Nocomis amblops, JORDAN, Ann. Lyc. Nat. Hist. N. Y., 1876, 328.
Ceratichthys amblops, JORDAN & GILBERT, Synopsis, 214, 1883.

534. HYBOPSIS STORERIANUS (Kirtland).

Head 4⅓; depth 4; eye 3; snout 3. D. 8; A. 8; scales 5–42–4. Body elongate, compressed, the back somewhat elevated from the occiput to base of dorsal, thence rapidly declined to the long and slender caudal peduncle. Head short, compressed, the cheeks nearly vertical. Interorbital space rather broad and flat, somewhat grooved. Eye very large, circular, high up, about 3 in head, nearly midway of length of head, its diameter about equal to length of snout, scarcely greater than width of interorbital space. Preorbital bone large, oblong, conspicuous, and silvery. Mouth rather small, horizontal, the lower jaw included; edge of premaxillary below level of eye; maxillary not reaching to front of orbit. Barbel conspicuous. Snout boldly and abruptly decurved, much as in *H. amblops*, the tip of the snout thickened, forming a sort of pad. Lateral line somewhat decurved. Rows of scales along back converging behind dorsal, where the upper series run out, as in *Notropis cornutus*. Fins rather higher and more falcate than in *H. kentuckiensis*; dorsal fin inserted well forward, over ventrals; pectoral fins pointed, not reaching ventrals; ventrals not reaching vent; caudal long, deeply forked. Teeth usually 1, 4–4, 0, hooked, without grinding surface. Translucent greenish above; sides and below brilliantly silvery; cheeks and opercles with a bright silvery luster; fins plain; a slight plumbeous lateral shade; no caudal spot; no red. Length 5 to 10 inches. Lake Erie to Nebraska and eastern Wyoming, Tennessee, and Arkansas; abundant in the larger streams, especially in Iowa. (Named for David Humphreys Storer, author of the excellent History of the Fishes of Massachusetts, and of the first "Synopsis of the Fishes of North America," (1846).

Rutilus storerianus, KIRTLAND, Proc. Bost. Soc. Nat. Hist., I, 1842, 71, Lake Erie.
Gobio vernalis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 189, Arkansas River, Fort Smith. (Coll. Shumard.)
Ceratichthys lucens, JORDAN, Proc. U. S. Nat. Mus., 1879, 238, Falls of Ohio River, New Albany, Indiana; (Type, No. 23462. Coll. Jordan.), and JORDAN & GILBERT, Synopsis, 213, 1883.
Hybopsis storerianus, JORDAN & MEEK, Proc. U. S. Nat. Mus., 1885, 6.

Subgenus YURIRIA, Jordan & Evermann.

535. HYBOPSIS ALTUS (Jordan).

(PESCA BLANCA.)

Head 3⅔ to 4¼; depth 3¾ to 4⅓. D. 8; A. 8; scales 9–45–3, 16 to 19 before dorsal; teeth 4–4, with broad grinding surface and slight hook. Body rather elongate, compressed, the back elevated; head rather long and low, the anterior profile gently curved, a little depressed over the eye; snout long, rather blunt at tip, 3½ in head; eye rather small, 5½ in head; mouth rather large, oblique, the lower jaw slightly included, the premaxillary on level of pupil; maxillary reaching about to eye, 3⅖ in head; a very small, but evident barbel at tip, (overlooked in the original description); preorbital broad; suborbital narrow; opercle broad, silvery. Lateral line complete, decurved anteriorly. Scales large, not closely imbricated, those on breast and back little reduced. Dorsal high, pointed, the anterior rays much longer than posterior, the first over ventrals and over 17th scale of lateral line, 1⅓ in head; caudal well forked; anal short, pointed; pectorals pointed, reaching ventrals. Color pale olivaceous above; sides silvery; fins plain; sexes alike. Length 15 inches. Lakes and streams of Guanajuato, tributary to Rio Lerma, Pacific drainage. One of the largest minnows; a food-fish of some local importance; here described from specimens obtained by Mr. Woolman in Rio de Lerma, at Salamanca, in Guanajuato. (*altus*, high, from the form of the body.)

Hudsonius altus, JORDAN, Proc. U. S. Nat. Mus., 1879, 301, Lake Tupataro, Guanajuato. (Type, No. 23125–9. Coll. Dugès.)
Cliola alta, JORDAN & GILBERT, Synopsis, 163, 1883.
Hybopsis altus, WOOLMAN, Bull. U. S. Fish Comm., XIV, 1894, 61.

Subgenus NOCOMIS, Girard.

536. HYBOPSIS KENTUCKIENSIS (Rafinesque).

(HORNY HEAD; RIVER CHUB; JERKER; INDIAN CHUB.)

Head 4; depth 4¼. D. 8; A. 7; scales 6–41–4; teeth 1, 4–4, 1, or 1, 4–4, 0, sometimes 4–4. Body rather robust, little elevated, not much compressed. Head large, rather broadly rounded above; the snout conical, bluntish. Mouth rather large, subterminal, little oblique, the lower jaw somewhat the shorter; upper lip rather below level of eye; maxillary not reaching to front of eye. Eye small, median, high up. Barbel well developed. Suborbitals very narrow; preorbital large. Fins moderate; the dorsal rather posterior, slightly behind insertion of ventrals; caudal broad, little forked. Scales large, not crowded anteriorly, 18 rows in front of dorsal. Lateral line somewhat decurved. Color bluish olive; sides with bright green and coppery reflections; a curved dusky bar behind opercle; scales above with dark borders; belly pale, but not silvery, rosy in spring males; fins all pale orange, without black spot; males in spring with a crimson spot on each side of head; adults with the top of the head swollen, forming a sort of crest, which is sometimes a third of an inch higher than level of the neck and is covered with large tubercles; young with a dark caudal spot. Length 6 to 9 inches. Pennsylvania to Wyoming and Alabama, on both sides of the Alleghanies; everywhere abundant in the larger streams, seldom ascending small brooks; one of the most widely diffused of our *Cyprinidæ*; western specimens usually have the teeth in two rows. Variable.

Luxilus kentuckiensis, RAFINESQUE, Ichth. Oh., 48, 1820, Ohio River.
Catostomus melanotus, RAFINESQUE, *l. c.*, 58, 1820, Ohio River, at the Falls.
Semotilus biguttatus, KIRTLAND, Bost. Journ. Nat. Hist., 1840, III, 344, pl. V, fig. 1, Yellow Creek, a tributary of Mahoning River, Ohio.

Ceratichthys biguttatus, COPE, Cypr. Penn., 366, 1866; GÜNTHER, Cat., VII, 178, 1868.
Ceratichthys biguttatus and *C. micropogon*, JORDAN & GILBERT, Synopsis, 212, 1883.

131. COUESIUS, Jordan.

Couesius, JORDAN, Bull. Hayden's Geol. Surv. Terr., IV, 785, 1878, (*milneri*).

Body elongate. Head normal, not depressed, the profile convex. Mouth terminal, normal, a well-developed barbel on the anterior side of maxillary, just above its tip. Teeth 2, 4–4, 2, hooked, without grinding surface. Scales rather small; lateral line continuous. Dorsal fin over or slightly behind ventrals; anal basis short. Size rather large. This genus is closely related to the section *Nocomis* under *Hybopsis*, from which it may be separated by the presence of 2 teeth in the lesser row, by the position of the barbel, and by the smaller scales. Its relations with *Semotilus* are equally close. The species are not well known. (Named for Dr. Elliott Coues, the most versatile and most inspiring writer on American ornithology, (1842——) who collected the type species in large numbers.)

a. Scales in a cross series from dorsal to lateral line about 17; 66 in the lateral line. SQUAMILENTUS, 537.
aa. Scales in a cross series from dorsal to lateral line 10 to 13.
  b. Scales in the lateral line 63 to 72.
    c. Free margin of dorsal fin concave, the anterior rays extending beyond the last rays when the fin is depressed. PLUMBEUS, 538.
    cc. Free margin of dorsal not concave, the tips of the anterior rays not reaching tips of last rays when the fin is depressed. DISSIMILIS, 539.
  bb. Scales in the lateral line 55 to 58.
    d. Scales before dorsal about 36. GREENI, 540.
    dd. Scales before dorsal about 27. ADUSTUS, 541.

537. COUESIUS SQUAMILENTUS (Cope).

Head $3\frac{4}{5}$; depth 5; eye $4\frac{2}{3}$. D. 8; A. 7; scales 17–66–14; teeth 2, 4–4, 1. Form stout, the profile nearly plane; muzzle not prominent. Mouth horizontal, the maxillary not reaching orbit; eye rather small, shorter than snout. Isthmus wide. Barbel quite small. Dorsal fin slightly in advance of ventrals, behind middle of body. Scales quite small. Olivaceous above; sides silvery; a lateral band of dark punctulations; fins plain. Henry's Fork of Green River in southwestern Wyoming. (Cope.) Perhaps not distinct from *C. dissimilis*, but the scales in transverse series said to be much more numerous. (*squamilentus*, small-scaled.)

Ceratichthys squamilentus, COPE, Hayden's Geol. Surv. Wyom., 1870, (1871), 442, Henry Fork of Green River, Wyoming, Colorado basin.
Couesius squamilentus, JORDAN & GILBERT, Synopsis, 218, 1883.

538. COUESIUS PLUMBEUS (Agassiz).

Head $4\frac{1}{2}$; depth $4\frac{1}{2}$; eye 4. D. 8; A. 8; scales 11–60 to 70–7; teeth 2, 4–4, 2. Form of *Semotilus atromaculatus*, but more elongate and less compressed.

Head flattish above, the snout broad, somewhat projecting over the large, oblique mouth; maxillary reaching front of eye. Barbel evident. Eye large, as long as snout, $1\frac{1}{2}$ in interorbital space. Scales small, crowded forwards, those on the back smaller. Dorsal beginning over last ray of ventrals. Height of dorsal fin 1 to $1\frac{1}{3}$ in head; free margin of the fin concave, the anterior rays produced and extending beyond the others when the fin is depressed; longest anal ray $1\frac{1}{5}$ to $1\frac{2}{5}$ in head, its form similar to that of dorsal. Dusky above; sides somewhat silvery; an obscure dusky band through eye around snout; fins plain. Length 6 inches. Streams and lakes, from Lake Superior east to the Adirondack region and New Brunswick; not very common, except northward. (*plumbeus*, lead-colored.)

Gobio plumbeus, Agassiz, Lake Superior, 366, 1856, Lake Superior. (Coll. Agassiz.)

Ceratichthys prosthemius, Cope, Cypr. Penn., 365, 1866, Montreal River, Keweenaw Point, Lake Superior. (Coll. Dr. J. H. Slack.)

Nocomis milneri, Jordan, Bull. U. S. Nat. Mus., x, 64, 1877, Lake Superior. (Type, No. 20332. Coll. Milner.)

Ceratichthys plumbeus, Günther, Cat., vii, 176, 1868.

Couesius dissimilis, Jordan & Gilbert, Synopsis, 218, 1883, in part.

Couesius prosthemius, Jordan & Gilbert, Synopsis, 219, 1883.

539. COUESIUS DISSIMILIS (Girard).

Head $4\frac{1}{3}$ to $4\frac{1}{2}$; depth 4 to 5; eye 4 to 5 in head; snout 3 to 4. D. 8; A. 8; scales 12–68–8, varying from 64 to 72. Very close to *C. plumbeus*, the only important difference being in the form of the dorsal fin. Height of dorsal fin $1\frac{1}{3}$ to $1\frac{1}{2}$ in head; free margin of fin nearly straight, the anterior rays little if at all produced; when depressed barely reaching end of other rays; longest anal ray $1\frac{2}{3}$ in head, the free margin of fin straight, the first rays where depressed not reaching beyond others. Upper Missouri and Black Hills region; generally common; probably a variety of *C. plumbeus*. (*dissimilis*, dissimilar, to *Semotilus atromaculatus*.)

Leucosomus dissimilis, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 189, Milk River and Little Muddy River, Montana. (Type, No. 158. Coll. Suckley.)

540. COUESIUS GREENI, Jordan.

Head $4\frac{1}{10}$; depth $4\frac{1}{10}$; snout $3\frac{3}{4}$. D. 8; A. 8; scales 10–57–7; teeth 2, 4–4, 2. Body robust, the back convex before the dorsal, profile of head straight and rather steep, space between eyes broad and flattish, $3\frac{1}{4}$ in head. Snout bluntish, but rather long; premaxillary just above level of lower part of pupil; maxillary reaching almost to orbit, $3\frac{3}{4}$ in head; barbel well developed, not quite at end of maxillary; its length considerably less than that of pupil. Mouth moderately oblique, the lower jaw slightly included. Dorsal fin inserted behind base of ventrals and behind middle of body, at a point midway between preopercle and base of caudal, the fin of moderate height. Pectoral shortish, $1\frac{1}{2}$ in head, ventrals nearly 2. Caudal well forked, the lobes equal; scales larger than in most related species, scarcely reduced forward and but little smaller on the back than on the sides; 36 scales in front of the dorsal. Color dark olive above, the sides reddish silvery; slight traces of a lateral band, a dark streak below the eye, undulating and extending from side of upper jaw to opercle. Lining of shoulder girdle dusky; fins without definite marking, the upper somewhat dusky. Length 6 inches. Stuart Lake, headwaters of Fraser River, British Columbia, and Lake Pend d'Oreille, Idaho. (Named for its discoverer, Ashdown H. Green, of Victoria.)

Couesius greeni, JORDAN, Proc. U. S. Nat. Mus., 1893, 313, Stuart's Lake, British Columbia. (Type, No. 44454.) GILBERT & EVERMANN, Investigations in Columbia River Basin, 44, 1894.

541. COUESIUS ADUSTUS, Woolman.

Head $4\frac{1}{4}$; depth $4\frac{2}{3}$; eye moderate, $3\frac{2}{3}$ to 4; snout $3\frac{1}{3}$ to $3\frac{1}{2}$. D. 8; A. 7; scales 13–58–8, 27 before dorsal; teeth 2, 4–4, 2. Body moderately elongate, compressed, the back a little elevated, the anterior profile rather convex. Snout rather long, slightly pointed; mouth low, terminal, oblique, the jaws subequal, the maxillary opposite posterior nostril; barbel evident in young, inconspicuous in adult, its position not quite terminal. Interorbital space broad, flattish; eye moderate; preorbital broad. Scales small, those before dorsal and on belly smallest; lateral line decurved. Dorsal inserted over or a little behind ventrals, the latter reaching the vent. Olivaceous, dusky above; sides silvery, a narrow plumbeous lateral band from snout to caudal, ending in a small black caudal spot which is obsolete in adult; fins all plain. Length 4 inches. Rio de los Conchos, Chihuahua; three specimens known. The smallest of these is deeper in body, more silvery, and with the barbel more conspicuous. (*adustus*, scorched.)

Couesius adustus, WOOLMAN, Bull. U. S. Fish Comm., XIV, 1894, 57, May 3, 1894, Rio de los Conchos, Chihuahua. (Coll. Woolman & Cox.)

132. PLATYGOBIO, Gill.

Platygobio, GILL, Trans. Amer. Phil. Soc. Phila., V, 12, 178, 1863, (*communis*).

Body rather elongate, somewhat compressed. Head rather short, more or less broad or depressed above; mouth normal, rather large, subterminal, with a well-developed barbel at its angle, at the extremity of the maxillary. Scales large. Lateral line continuous. Dorsal inserted anteriorly, rather in front of ventrals. Teeth 2, 4–4, 2, with rather narrow grinding surface. Size large; males without nuptial pigments or bright colors. (πλατύς, broad; *Gobio*, a gudgeon.)

a. Anterior profile nowhere concave, the head not specially depressed above; eye moderate, $4\frac{2}{3}$ in head. PHYSIGNATHUS, 542.

aa. Anterior profile more or less concave above the depressed and flattened head.

  b. Eye small, 4 to 6 in head in adult; snout not tuberculate in males, so far as known; size large. GRACILIS, 543.

  bb. Eye large, $3\frac{3}{4}$ in head; males with the snout tuberculate; size small. PALLIDUS, 544.

542. PLATYGOBIO PHYSIGNATHUS (Cope).

Head $4\frac{2}{3}$; depth $4\frac{2}{3}$; eye $4\frac{2}{3}$ in head, $1\frac{1}{2}$ in snout, which is 3 in head. D. 8; A. 8, scales 6–48–5, 20 before dorsal; teeth 2, 4–4, 2, with distinct grinding surface. Body slender, the caudal peduncle stout. Head shorter, narrower, blunter, and less depressed than in *P. gracilis*. Dorsal outline little arched, the profile descending steeply to the lip, nearly even and nowhere concave. Lower jaw included, maxillary reaching anterior border of orbit. Barbels well developed. Dorsal fin inserted in front of ventrals. Olivaceous above, white below; a plumbeous lateral band; fins plain. Length 6 inches. Upper waters of Arkansas River; very abundant in the channels, the most common fish at Pueblo, Colorado. (*φυσάω*, to thicken; *γνάθος*, jaw.)

Ceratichthys physignathus, COPE, Wheeler Surv., Zoöl., v, 651, 1875, (1876), Arkansas River, Pueblo, Colorado. (Coll. Aiken.)

Couesius physignathus, JORDAN & GILBERT, Synopsis, 219, 1883; JORDAN, Bull. U. S. Fish Comm., IX, 1889, 17.

543. PLATYGOBIO GRACILIS (Richardson).

(FLAT-HEADED CHUB.)

Head 4¼; depth 4¾; eye 6 in adult. D. 8; A. 8; scales 6–50–5; teeth 2, 4–4, 2. Body rather elongate, somewhat compressed, little elevated. Head small and short, its upper surface very broad and depressed, the interorbital width being nearly half length of head; region behind nape gibbous, so that the anterior profile is more or less concave. Mouth rather large, slightly oblique, the upper lip on level of lower part of eye; maxillary reaching front of eye; upper jaw very protractile, lower jaw included. Eye small, rather high up and anterior. Fins rather large; dorsal in advance of middle of body; pectoral falcate, its upper rays elongate; caudal peduncle rather stout. Scales large and silvery; lateral line decurved; 23 scales in front of dorsal. Snout not tuberculate in males, so far as known. Coloration pale; back olive, sides and below silvery; head mostly white; fins pale; no dark lateral band or caudal spot. Length 12 inches. East slope of the Rocky Mountains, from the Missouri and Yellowstone rivers to the Saskatchewan; abundant in river channels as far south as Kansas City, not ascending to springs. (*gracilis*, slender.)

Cyprinus (Leuciscus) gracilis, RICHARDSON, Fauna Bor.-Amer., Fishes, 120, 1836, Saskatchewan River, at Carleton House.

Pogonichthys communis, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 188, and Pac. R. R. Surv., x, 247, 1858, Fort Pierre, Fort Union, Milk River, Yellowstone River, Sweetwater River. (Type, No. 189, etc. Coll. Suckley.)

Pogonichthys (Platygobio) gulonellus, COPE, Proc. Ac. Nat. Sci. Phila., 1864, 277, near Bridger's Pass; "anal rays 9; scales 48." (Coll. Hammond.)

Leuciscus gracilis, GÜNTHER, Cat., VII, 240, 1868.

Leucosomus communis and *gulonellus*, GÜNTHER, Cat., VII, 267, 268, 1868.

Platygobio communis, GILL, Captain Simpson's Expl. Utah, 408, 1876.

Platygobio gracilis, JORDAN & GILBERT, Synopsis, 220, 1883.

544. PLATYGOBIO PALLIDUS, Forbes.

Head 4; depth 4⅔; eye 3¾, 2 in interorbital width; snout 3¾. D. 8; A. 8; scales 6–55–5; teeth 2, 4–4, 2, hooked and with masticatory surface. Head flat above, the snout overhanging the mouth, which is large and wide, with a maxillary barbel about one-third as long as eye. Mandible reaching vertical through middle of iris. Scales with 22 rows before dorsal, where they are much smaller than elsewhere. Lateral line straight, except for a few scales in front. Pectoral fins large and pointed, reaching ventrals, the latter to vent; front of dorsal a trifle before ventrals and a little nearer snout than caudal. Color plain, with a plumbeous luster along sides, and traces of a dusky lateral stripe behind dorsal. Length 2½ inches. (Forbes.) One specimen from the Ohio River at Cairo, probably adult, as the snout is tuberculate. A doubtful species, perhaps the young of *P. gracilis*. (*pallidus*, pale.)

Platygobio pallidus, FORBES, MS., JORDAN & GILBERT, Synopsis, 220, 1883, Ohio River, at Cairo, Illinois. (Coll. Forbes.)

133. EXOGLOSSUM (Rafinesque).

Exoglossum, RAFINESQUE, Journ. Ac. Nat. Sci. Phila., I, 1818, 420, (*lesueurianum*).
Maxillingua, RAFINESQUE, *l. c.*, 1818, 421, (*maxillingua*).

Body moderately elongate, little compressed. Mouth peculiar, the mandible being contracted and incurved, its outline strongly 3-lobed; this appearance is due to the fact that the dentary bones lie close together, parallel, and are united throughout their length, instead of forming a broad arch, as in all other Cyprinoid fishes; lower lip represented by a broad, fleshy lobe on each side of the mandible. Upper jaw not protractile; upper lip thick, somewhat plicate. Pharyngeal bones small, the tooth hooked, without grinding surface, 1, 4–4, 1. Scales moderate. Lateral line complete. Fins without spines. Dorsal slightly behind ventrals. Anal basis short. Isthmus broad. Gill rakers weak. Pseudobranchiæ present. Air bladder normal. Alimentary canal short; peritoneum white. Size rather large. Sexual changes not marked, the males with some black pigment. One of the most strongly marked genera of *Cyprinidæ*, with a single species. (ἔξω, outside; γλῶσσα, tongue.)

545. EXOGLOSSUM MAXILLINGUA (Le Sueur).

(CUT-LIPS; NIGGER CHUB; NIGGER DICK.)

Head 4; depth 4½. D. 8; A. 7; scales 8–53–5; teeth 1, 4–4, 1. Body rather stout, little compressed. Head large, broad and flattish above, with tumid cheeks. Mouth moderate, slightly oblique, the end of maxillary not reaching line of orbit. Upper jaw longer than lower. Scales rather crowded anteriorly, those in front of dorsal small. Color olivaceous, smoky or dark above; a blackish bar behind opercle, and a dusky shade at root of caudal in young; fins unmarked. Length 6 inches. Lake Ontario, St. Lawrence River, Lake Champlain, Hudson River, and Cayuga Lake, and southward to Virginia; abundant in the basins of the Susquehanna, Hudson, Potomac, James, Roanoke, and Kanawha, but not widely distributed. One of the most singular of the *Cyprinidæ*, distinguished at sight by its 3-lobed lower jaw. (*maxilla*, jaw; *lingua*, tongue.)

Cyprinus maxillingua, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1817, 85, Pipe Creek, Maryland.

Exoglossum annulatum, RAFINESQUE, Journ. Ac. Nat. Sci. Phila., I, 1818, 421, Hudson River.

Exoglossum nigrescens, RAFINESQUE, *l. c.*, 1818, 421, Lake Champlain.

Exoglossum vittatum, RAFINESQUE, *l. c.*, 1818, 421, Hudson River.

Exoglossum lesueurianum, RAFINESQUE, *l. c.*, 1818, 421, (after Le Sueur).

Exoglossom maxillingua, GÜNTHER, Cat., VII, 188, 1868; COPE, Cypr. Penn., 360, 1866; JORDAN & GILBERT, Synopsis, 160, 1883.

134. LEPIDOMEDA, Cope.

Lepidomeda, COPE, Proc. Amer. Phil. Soc. Phila., 1874, 131, (*vittata*).

Body elongate. Mouth terminal, without barbels. Teeth 2, 4–4, 2, hooked, without grinding surface. Scales small; lateral line complete. Dorsal fin with a strong spine, composed of two, the posterior received into a longitudinal groove of the anterior. Inner border of the ventral fins adherent to the body. Dorsal fin inserted behind the ventrals. Anal basis short. Size small. Extraordinary little fishes of the desert region of Arizona. (*λεπίς*, scale; *Meda.*)

a. Eye 3¾ in head; depth 4¼ in length. VITTATA, 546.
aa. Eye large, 3¼ in head; depth 5 in length. JARROVII, 547.

546. LEPIDOMEDA VITTATA, Cope.

Head 3¾; depth 4¼; eye 3¾. D. II, 7; A. 9; teeth 2, 4–4, 2. Body rather stout. Head wide and flat above, slightly depressed behind the eyes. Muzzle obtuse, not prominent. Mouth terminal, oblique. Scales small, covering the whole body except space behind pectorals; 26 series above lateral line and 56 in front of dorsal. Preorbital bone trapezoidal. Second dorsal spine as long as the first and wider. Dorsal rays somewhat enlarged and ossified. Pectorals scarcely enlarged. Color silvery; a lead-colored lateral band and a black dorsal band. Length 3½ inches. Known only from the Colorado Chiquito River, Arizona, and from Pahranagat Valley, Nevada. (*vittatus*, striped.)

Lepidomeda vittata, COPE, Proc. Amer. Phil. Soc. Phila., 1874, 131, Rio Colorado Chiquito, Arizona; (Type, No. 15785. Coll. Henshaw;) and Zoöl. Wheeler Surv., v, 642, pl. XXVI, figs. 2, 2a, 1875, (1876); JORDAN & GILBERT, Synopsis, 251, 1883, (1876); GILBERT, Fishes of Death Valley Expedition, 231, 1893.

547. LEPIDOMEDA JARROVII, Cope.

Head 4; depth 5; eye 3¼. D. II, 7; A. 9; teeth 2, 4–4, 2. Body more elongate. Mouth nearly horizontal, lower jaw somewhat projecting. Eye larger than in *L. vittata*, maxillary reaching its anterior border. Spines slender. Scales very small and difficult to detect, 51 series before dorsal fin. Olivaceous; a median black vertebral band; sides silvery; bases of ventral fins red. Length 3 inches. Colorado Chiquito River, Arizona, (Cope), also in southern Nevada, in springs in the desert, (Gilbert). (Named for Dr. Henry C. Yarrow.)

Lepidomeda jarrovii, COPE, Proc. Am. Philos. Soc. Phila., 1874, 133, Rio Colorado Chiquito, Arizona; (Type, No. 15786. Coll. Henshaw;) and Zoöl. Wheeler Surv., v, 643, pl. XXVI, figs. 1, 1a, 1875, (1876); JORDAN & GILBERT, Synopsis, 251, 1883.

135. MEDA, Girard.

Meda, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 191, (*fulgida*).

Body elongate. Mouth terminal, normal; no barbels. Teeth 2, 5–5, 2, hooked, without grinding surface. Body entirely scaleless. Fins as in *Lepidomeda*. Size small. Gila region. (*Meda*, a classical feminine name, of no evident application to these singular fishes.)

548. MEDA FULGIDA, Girard.

D. II, 7; A. 8; teeth 2, 5–5, 2. Body slender, elongate, compressed. Head elongate, subconical, the snout rounded. Mouth large, subterminal, slightly oblique, the lower jaw included; maxillary extending to below orbit. Second dorsal spine highest; dorsal behind ventrals. Coloration silvery. Closely allied to *Plagopterus argentissimus*, but with the eye a little larger, the snout shorter, the lower jaw more prominent. Rio Gila. (*fulgidus*, shining.)

Meda fulgida, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 191, Rio San Pedro, Arizona. (Type, No. 154. Coll. Clark.) GÜNTHER, Cat., VII, 263, 1868. JORDAN & GILBERT, Synopsis, 251, 1883.

136. PLAGOPTERUS, Cope.

Plagopterus, COPE, Proc. Amer. Phil. Soc. Phila., 1874, 301, (*argentissimus*).

Body slender. Mouth terminal; a barbel at the extremity of the maxillary. Teeth 2, 5–4, 2, hooked, without grinding surface. Body entirely scaleless. Fins as in *Meda* and *Lepidomeda*. Size small. (*πλαγή*, wound; *πτερόν*, fin; in allusion to the armature of the dorsal fin.)

549. PLAGOPTERUS ARGENTISSIMUS, Cope.

Head 4; depth 6; eye $4\frac{1}{5}$. D. II, 7; A. 10; teeth 2, 5–4, 2. Body slender. Head rather broad, the muzzle slightly depressed, overhanging the rather small, horizontal mouth. Lips thin, the maxilliary reaching front of eye. Eye moderate. Dorsal fin entirely behind ventrals, the first spine curved, longer than the second; soft rays of dorsal thickened and ossified at base; fifth ray of ventral bound to the abdomen by a membrane for nearly its whole length; pectoral rays osseous at base. Lateral line complete, slightly deflexed. Color clear silvery; back dusky, with minute black dots. Length $2\frac{1}{2}$ inches. Colorado Basin in western Colorado, (Cope;) Fort Yuma, (Gilbert.) (*argentissimus*, most silvery.)

Plagopterus argentissimus, COPE, Proc. Amer. Phil. Soc. Phila., 1874, 130, San Luis Valley, Colorado; (Type, No. 15776. Coll. G. C. Newberry;) and Zoöl. Wheeler Surv., V, 640, pl. XXVI, figs. 3, 3a, 1875, (1876); JORDAN & GILBERT, Synopsis, 252, 1883.

Suborder HETEROGNATHI.

Brain case not produced between the orbits. Lower pharyngeals rarely modified into falciform structures bearing differentiated teeth. Jaws with or without teeth; no pseudobranchiæ. Adipose fin present or absent. Fins with soft rays only. Fresh water fishes of the tropics, constituting two families. They are really allied to the *Cyprinidæ* and to the other groups with modified anterior vertebræ, but in appearance they have many analogies with the *Salmonidæ*. (*ἕτερος*, different; *γνάθος*, jaw.)

ANALYSIS OF FAMILIES OF HETEROGNATHI.

a. Supra-occipital confined to back of skull and with a very slight vertical crest. Adipose fin wanting. ERYTHRINIDÆ, XXXVIII.

aa. Supra-occipital partly superior and carinated by a procurrent crest. Adipose fin well developed. CHARACINIDÆ, XXXIX.

Family XXXVIII. ERYTHRINIDÆ.

Heterognaths with the skull above truncated behind, and the supraoccipital confined to back of skull and carinated by a very slight vertical crest. (Gill.) Adipose fin none; gill openings wide, the membranes slightly united, free from the isthmus; nostrils close together; teeth in jaws well developed; pharyngeal teeth villiform; cheeks covered by the suborbitals; brain case inclosed above. Body elongate, belly rounded. Dorsal fin short, of 8 to 15 rays. Carnivorous species, with short intestines. Otherwise as in the *Characinidæ*. Fresh waters of South America. Genera 4. Species about 20, one of them reaching our limits.

a. Dorsal fin inserted in advance of anal, over ventrals; gape very wide, little oblique; both jaws with strong canines; maxillary with fine pectinate teeth; teeth on palatines; caudal rounded; lateral line developed.

b. Walls of air bladder normal; teeth all pointed; maxillary with a canine; palatine teeth with an outer series of enlarged teeth separated from the villiform teeth.

MACRODON, 137.

137. MACRODON, Müller.

(TRAHIRAS OR AIMARAS.)

Macrodon, MÜLLER, Archiv., 308, 1842, (*trahira* = *malabaricus*).

Adipose fin none. Body elongate, the belly rounded; gill openings wide, the membranes slightly united, free from the isthmus; nostrils close together. Mouth very large; snout pointed. Teeth well developed; an outer series of palatine teeth enlarged and separated from the villiform teeth; a detached patch of teeth in front of palatines; lower jaw with canines anteriorly and laterally; all the teeth pointed; maxillary with a canine anteriorly; dentary process joined to the dentary at the symphysis within the lateral canines and merging into the dentiferous ridge midway between symphysis and posterior angle of dentary; the pit formed behind the larger canine and the one behind the lateral canine filled with numerous short conical teeth which lie concealed in the muscles; a deep pit in the premaxillary for the reception of the larger dentary canine; supratemporal plate single. Two species; large, voracious fishes, especially abundant in the Amazon region. (*μακρός*, long; *ὀδούς*, tooth.)

a. Scales across back of tail from lateral line to lateral line eleven in number.

MICROLEPIS, 550.

550. MACRODON MICROLEPIS, Günther.

D. 14; A. 11; lateral line 43 or 44; scales a little smaller than in *M. malabaricus*,* there being 11 in a row across the tail above, from the lateral

---

*This species, *Macrodon malabricus*, is universally common throughout eastern South America, from Trinidad and Rio Magdalena to Rio de la Plata. Its scales are nine from lateral line to lateral line as above indicated. Its occurence north of the isthmus is not improbable.

Concerning the name of this species Professor Cope remarks: "Authors who think, with the American Ornithologists' Union, that scientific nomenclature may record error instead of truth, call this well-known South American species *Macrodon malabaricus*, because Bloch described it first under that name, under the mistaken idea that it was a native of India." In the judgment of the present writers, the law of priority by which the first unpreoccupied name is right, and all others wrong, a rule which tends to secure fixity of nomenclature, is more important than any rule leading toward truthfulness or purism in the name itself. On this ground, *Macrodon malabaricus* does not mean a *Macrodon* from Malabar. It simply designates that *Macrodon* of which the earliest unpreoccupied binominal specific name is *malabaricus*. The errors in meaning in specific names deceive nobody and rarely cause inconvenience.

line on one side to that on the other; sides mottled with light or dark brown. Panama to Ecuador, chiefly west of the Andes. Known from Rio Chagres and from Ecuador. (Eigenmann). (*μικρός*, small; *λεπίς*, scale.)

Macrodon microlepis, GÜNTHER, Cat., v, 282, 1864, Western Ecuador; Chagres River, Guatemala; (Coll. Fraser.) EIGENMANN, Ann. N. Y. Ac. Sci , 1889, 102.

Family XXXIX. CHARACINIDÆ.

(THE CHARACINS.)

Heterognaths with the skull above more or less invaded by reentering valleys from behind, and the supra-occipital partly superior and carinated by a procurrent crest. (Gill). Body variously formed, covered with cycloid scales. Head naked. Margin of upper jaw formed mesially by the premaxillaries and laterally by the maxillaries; no barbels; premaxillaries not protractile. Teeth various, often incisor-like, often wanting. Branchiostegals usually 3. Gill membranes united to the isthmus or not; no pseudobranchiæ; gills 4, a slit behind the fourth; lower pharyngeals not truly falciform, but more or less curved, armed with small, sometimes villiform teeth. Adipose fin present or absent.* Pyloric cœca usually numerous. Air bladder transversely divided into two portions, and communicating with the organ of hearing by means of auditory ossicles, as in *Cyprinidæ*; anterior vertebræ coalesced and modified. A very large family of some 55 genera and 300 species, inhabiting the fresh waters of South America and Africa, where they take the place of the *Salmonidæ* and *Cyprinidæ* of the Northern Hemisphere. A single species reaches the United States. The few species enumerated below are but the overflow of the vast South American river fauna.

(*Characinidæ*, GÜNTHER, Cat., v, 278–380, 1864).

CURIMATINÆ:
- *a.* Dentition imperfect.
  - *b.* Teeth none; no gill rakers; belly trenchant or not, with a median series of scales not ending in spiniform processes; lateral line complete; mouth nearly horizontal; tongue adnate, short and thick. CURIMATA, 138.
- *aa.* Teeth well developed in both jaws; dorsal fins short; gill openings wide, the membranes not attached to the isthmus; nostrils close together.

  TETRAGONOPTERINÆ:
  - *c.* Teeth compressed, notched or denticulated.
    - *d.* Anal fin short, (10 to 12 rays); no lateral line; premaxillary teeth in one series. PIABUCINA, 139.
    - *dd.* Anal fin more or less elongate; lateral line more or less developed.
      - *e.* Belly in front of ventrals rounded; gill rakers slender.
        - *f.* Premaxillary teeth in a double series; no conical teeth behind front teeth of lower jaw. TETRAGONOPTERUS, 140.
        - *ff.* Premaxillary teeth in three or four series; a pair of conical teeth behind middle of the front series of teeth in lower jaw. BRYCON, 141.
      - *ce.* Belly in front of ventrals compressed; no canines; ventral fins very small. GASTEROPELECUS, 142.

---

*The adipose fin in *Characinidæ* is probably a survival from a remote ancestry which they share with Siluroid forms. In the *Salmonidæ*, it is doubtless also a survival, but notwithstanding the superficial resemblances in certain genera, (as *Curimatinæ* and *Coregoninæ*,) there is no evidence of any special relationship between the *Salmonidæ* and *Characinidæ*. They should not be placed in the same order; scarcely even in related orders. The adipose fin in *Percopsidæ* is probaby also an independent survival.

Characininæ:

cc. Teeth in premaxillary and mandible all conical; dorsal short; gill membranes free from isthmus.
  g. Teeth on the palate none; anal fin long; body oblong or elevated.
    h. Scales very small; jaws with external tooth-like processes; teeth in lower jaw uni-serial; in upper uniserial or irregularly biserial. Rœboides, 143.
    hh. Scales of moderate size; jaws without tooth-like processes; teeth in jaws uniserial. Bramocharax, 144.
  gg. Teeth on the palate numerous, very small; head and body elongate; jaws very long; scales moderate, (43). Luciocharax, 145.

138. CURIMATA (Cuvier) Cloquet.

Les Curimates, Cuvier, Règne Animal, Ed. 1, II, 165, 1817, (*edentulus*).
Curimata, Cloquet, Dict. Sci. Nat., XII, 240, 1818, (*edentulus*).
Curimatus, Cuvier & Valenciennes, XXII, 5, 1849, (*edentulus*).
Curimatella, Eigenmann & Eigenmann, Ann. N. Y. Ac. Sci., 1889, 7, (*lepidurus*).
Semitapicis, Eigenmann & Eigenmann, *l. c.*, 9, (*planirostris*).

No teeth anywhere; no gill-rakers. Body oblong or elevated, the outline of belly behind ventrals trenchant or not, always with a median series of scales which do not end in spinous processes. Lateral line complete. Tongue short and thick, adnate; no lips; margins of jaws trenchant. Dorsal fin nearly median; adipose fin present; anal moderate; ventrals below the dorsal. Amazon region; one species north to Panama. (*Curimata*, a Portuguese name used by Marcgrave, analogous to *Queriman* and *Curema*.)

551. CURIMATA MAGDALENÆ, Steindachner.

(Sardina Blanca.)

Head 3½; depth 4⅔; eye 3⅔ to 4⅙ in head. D. III, 9; A. III, 7; scales 6–37–6. Body not greatly compressed; caudal short, its lobes equal. A silvery lateral streak; no caudal spot and no spot on dorsal. Rio Magdalena; and Rio Mamoni, Panama. (Steindachner.)

Curimatus magdalenæ, Steindachner, Fisch-fauna des Magdalenen-stromes, 34, 1878, Rio Magdalena; Steindachner, Flussfische Südamerikas, I, 167, 1879.

139. PIABUCINA, Cuvier & Valenciennes.

Piabucina, Cuvier & Valenciennes, XXII, 161, 1849, (*erythrinoides*).

Body oblong, covered with moderate scales; belly rounded. No lateral line. Mouth moderate, the teeth rather small, tricuspid, those of the premaxillary in one series, those of the mandible in two; a few small teeth on the maxillary; palate toothless. Nostrils close together. Gill openings wide, the membranes free from the isthmus. Anal fin short; dorsal fin inserted just behind the ventrals. Adipose fin present. Species few. (Diminutive of *Piabuca*, a related genus, *Piabuca* being a Brazilian name.)

552. PIABUCINA PANAMENSIS, Gill.

Head 3½; depth 4. D. 10; A. 12; scales 30–8. Lower jaw slightly projecting; maxillary reaching middle of eye; eye 4 in head, longer than snout. Caudal emarginate; pectoral 4 in head, longer than ventrals.

Yellowish, with a dark lateral band extending from humeral spot to dark area at base of caudal; dorsal with a dark spot at base. Length 3½ inches. Rio Frijoli, Atlantic slope of Isthmus of Panama. (Gill.)

Piabucina panamensis, GILL, Proc. Ac. Nat. Sci. Phila., 1876, 336, Rio Frijoli, Isthmus of Panama.

140. TETRAGONOPTERUS, Cuvier

(SARDINAS BLANCAS.)

Tetragonopterus, CUVIER, Règne Animal, Ed. I, Vol. II, 166, 1817, (*argenteus*).
Astyanax, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 26, (*argentatus*).
Pœcilurichthys, GILL, Ann. Lyc. Nat. Hist. N. Y., 1858, 417, (*brevoorti*).
Hemigrammus, GILL, *l. c.*, 420, (*unilineatus*).
Hemibrycon, GÜNTHER, Cat., V, 330, 1864, (*polyodon*).

Body oblong or elevated, compressed, covered with moderate scales. Lateral line complete, (*Tetragonopterus*), or interrupted, (*Hemigrammus*). Belly rounded. Cleft of mouth medium. Anterior teeth strong, incisor-like; lateral teeth small; premaxillary and mandibular teeth equal in size, with a compressed, notched crown, the former in a double, the latter in a single series; maxillary with few or many teeth, not produced at tip. Nostrils of each side close together, separated by a valve only. Lower pharyngeals very slender, curved, approaching the form in *Cyprinidæ*, armed with a single series of slender, hooked teeth. Gill openings wide, the membranes free from the isthmus and from each other. Gill-rakers setiform. Dorsal fin midway of body, just behind ventrals; anal fin long. Fin rays in males in some species rough with small prickles. Species about 40, in all the warmer parts of America, one of them entering the United States. (τετράγωνος, four-angled; πτερόν, fin or wing; of no special application to this group, the original word used by Klein for his genus including *Chætodontids*, being *Tetragonoptrus* = "Τετραγωνοπτρός, *i. e.*, *quadratus aspectu.*"

- *a.* Lateral line complete; caudal fin with an oblong spot or band at base.
  - *b.* Maxillary with few teeth or none along its edge.
    - ASTYANAX:* (Astyanax, Αστυάναξ, a son of Hector.)
      - *c.* Body ovate, the depth less than half the length; anal rays less than 40.
        - *d.* Anal fin long, its rays 25 to 35.
          - *e.* Depth 2¾ to 2⅔ in length. ÆNEUS; RUTILUS; PANAMENSIS; MICROPHTHALMUS, 553 to 556.
          - *ee.* Depth 3 to 3¼ in length. ŒRSTEDII; PETENENSIS; SCABRIPINNIS; HUMILIS, 557 to 560.
        - *dd.* Anal fin moderate, its rays 20 to 23; humeral spot obsolete.
          - *f.* Pectoral not reaching ventrals. BREVIMANUS, 561.
          - *ff.* Pectoral reaching ventrals. MEXICANUS; ARGENTATUS, 562; 563.

Subgenus ASTYANAX, Baird & Girard.

553. TETRAGONOPTERUS ÆNEUS, Günther.

Head 4; depth 2¾; eye 3⅓ in head. D. 11; A. 26; V. 8; scales 7–35–6. Snout rather compressed; upper profile slightly concave; maxillary to front of eye; pectoral extending about to ventrals. Deep bronze color; a blackish caudal spot. (Günther.) Oaxaca, Mexico, and Rio Chagres, south to Brazil. (*æneus*, brassy.)

---

* The species of this group needs a critical revision; some of them are of doubtful validity.

Tetragonopterus æneus, GÜNTHER, Proc. Zoöl. Soc. Lond., 1860, 319, Oaxaca, Mexico. (Coll. Sallé.) GÜNTHER, Cat., v, 326, 1864.

554. TETRAGONOPTERUS RUTILUS, Jenyns.

Head 4¼; depth 2⅔; eye 3½ in head. D. 11; A. 25 to 29; scales 6–37–6; upper profile little concave; maxillary reaching beyond front of ventrals; dorsal inserted just behind root of ventrals; pectorals reaching ventrals. Silvery, with an indistinct round dark spot behind shoulder; generally a band-like blackish spot on root of caudal; sometimes extending as a dark band to humeral spot; this band sometimes silvery; sometimes both band and spots absent. Mexico to Ecuador and Rio de la Plata, recorded as common in Central America. (Rio Chisoy, Rio Guacalate, Huamuchal, Cordova, etc.) (*Rutilus*, the roach, from *rutilus*, ruddy.)

Tetragonopterus rutilus, JENYNS, Zoöl. Beagle, Fish., 125, 1842, Rio Paraná. (Coll. Darwin). EIGENMANN, Proc. U. S. Nat. Mus., 1891, 52.

Tetragonopterus tæniatus, JENYNS, *l. c.*, 126, 1842, Rio Janeiro. (Coll. Darwin.)

Tetragonopterus fuscoauratus, CASTELNAU, Anim. Amér. Sud; Poiss., 66, pl. 33, fig. 2, 1855, Bahia.

Tetragonopterus microstoma, GÜNTHER, Cat., v, 323, 1864, Bahia. (Coll. Dr. Wucherer.)

Tetragonopterus fasciatus, GÜNTHER, Cat., v, 322, 1864, (not of CUVIER & VALENCIENNES).

555. TETRAGONOPTERUS PANAMENSIS, Günther.

Head 3⅘; depth 2¾; eye 3½ in head. D. 11; A. 28; scales 8–36–7. Similar to *T. rutilus*, but with more scales in a transverse series. Maxillary to front of eye; pectorals reaching a little beyond ventral base. Humeral and caudal spots present, united by a silvery band. (Günther.) Streams about Panama and Lake Yzabal; locally abundant.

Tetragonopterus panamensis, GÜNTHER, Cat., v, 324, 1864, Panama; Yzabal. (Coll. Godman & Salvin.)

Tetragonopterus fischeri, STEINDACHNER, Flussfische Südamerikas, I, 167, 1879, Mamoni River at Chepo, Colombia.

556. TETRAGONOPTERUS MICROPHTHALMUS, Günther.

Head 4¼; depth 2¾; eye about 4 in head. D. 11; A. 26 to 29; scales 7–36–8. Similar to *T. rutilus*, but the pectoral fin shorter, not reaching base of ventral. Maxillary reaching front of eye. Silvery, with a band-like spot at root of caudal; usually a silvery lateral band. Guatemala, (Lake Amatitlan), to Peru. (Günther.) (*μικρός*, small; *ὀφθαλμός*, eye.)

Tetragonopterus microphthalmus, GÜNTHER, Cat., v, 324, 1864, Lake Amatitlan; Rio Rimac, Peru. (Coll. Salvin.)

557. TETRAGONOPTERUS ŒRSTEDII, Kröyer.

Head 4; depth 3; eye 3 in head. D. 11; A. 29 to 31; scales 7–37–8. Mouth moderate, the maxillary about to front of eye; pectorals about to ventrals. Humeral and caudal spots present, connected by a faint silvery band. Rio San Juan, Nicaragua. (Lütken.) (Named for Professor A. S. Örsted of Copenhagen.)

Tetragonopterus œrstedii, KRÖYER, MS., LÜTKEN, Ict. Bidrag, III, 229, 1874, Rio San Juan, Nicaragua.

558. TETRAGONOPTERUS PETENENSIS, Günther.

Head 4; depth 3; eye 3½ in head. D. 11; A. 27; scales 7–37–7. Snout rather compressed; upper profile of head scarcely concave; maxillary to front of eye; dorsal inserted very slightly behind ventrals; pectorals not reaching ventrals. A silvery lateral band ending in an oblong black caudal spot. Lake Peten to western Ecuador, southeast to Argentine Republic. (Günther.)

Tetragonopterus petenensis, GÜNTHER, Cat., v, 326, 1864, Lake Peten. (Coll. Salvin.)

559. TETRAGONOPTERUS SCABRIPINNIS, Jenyns.

Head 3½; depth 3. D. 10; A. 25 to 28; scales 6–37–5. Upper profile scarcely concave; maxillary to beyond front of eye; pectoral extending beyond base of ventrals; humeral and caudal spots present, united by a silvery band. (Günther.) Jamapa, Mexico to Rio Janeiro. (*scaber*, rough; *pinna*, fin, the males having, as in *humilis, brevoortii*, etc., some of the fin rays roughened.)

Tetragonopterus scabripinnis, JENYNS, Zoöl. Beagle, Fishes, 125, 1842, Rio Janeiro. (Coll. Darwin.) GÜNTHER, Cat., v, 325, 1864.

560. TETRAGONOPTERUS HUMILIS, Günther.

Head 4⅛; depth 3¼; eye 3¾. D. 11; A. 27 to 31; V. 8; scales 7–36–7. Upper profile of head straight; maxillary to front of orbit; dorsal inserted behind ventrals; pectoral about to ventrals. Humeral and caudal spots more or less distinct; sides silvery; anal and ventrals with broad, red margins. Lake Amatitlan, Guatemala. (Günther.) (*humilis*, humble.)

Tetragonopterus humilis, GÜNTHER, Cat., v, 327, 1864, Lake Amatitlan, Guatemala. (Coll. Salvin.)

561. TETRAGONOPTERUS BREVIMANUS, Günther.

Head 3½; depth 3. D. 11; A. 22; scales 6–38–5. Snout short and thick; eye about 4 in head; upper profile of head not concave; maxillary extending to beyond front of eye. Dorsal inserted just behind ventrals; pectorals not reaching ventrals; caudal spot usual. Guatemala. (Günther.) (*brevis*, short; *manus*, hand.)

Tetragonopterus brevimanus, GÜNTHER, Cat., v, 325, 1864, Yzabal; Rio San Geronimo, Guatemala. (Coll. Godman & Salvin.)

562. TETRAGONOPTERUS MEXICANUS, Filippi.

Head 4; depth 2¾; eye 3½. D. 10 or 11; A. 21 to 23; scales 7–39–5. Snout bluntly rounded, projecting beyond the mouth; forehead transversely convex; maxillary to beyond front of eye; pectoral about to ventrals, as usual a little longest in males. Sides with the usual silvery band, ending in an oblong black caudal spot. Lakes about the City of Mexico. (Steindachner.)

Tetragonopterus mexicanus, FILIPPI, in Guérin's Rev. Mag. Zoöl., 1853, 166, City of Mexico; STEINDACHNER, Ichthyol. Notizen, VII, 11, 1868.

563. TETRAGONOPTERUS ARGENTATUS (Baird & Girard).

Head 4; depth 3. D. 10; A. 21; scales 6–38–6. Body oblong, compressed. Snout blunt, lower jaw scarcely included. Pectorals reaching ventrals, the latter to vent. Olivaceous; a broad silvery band along sides; an oblong black spot at base of caudal, running up on the fin. Southern Texas and Mexico, (Rio Nueces, Rio Leona, and Rio Grande); also recorded, probably by error, from Arkansas by Le Sueur. Locally abundant; the northernmost representative of the family, perhaps identical with *T. mexicanus*, but apparently a little more slender, the lower jaw less included. Our specimens collected by Woolman and Cox in Chihuahua River. (*argentatus*, silvered.)

Astyanax argentatus, BAIRD & GIRARD, Proc. Ac. Nat. Sci. Phila., VII, 1854, 27, Rio Nueces; Rio Leona; Zoquito, Texas; Comanche Spring; Elm Creek; Turkey Creek; San Felipe; Devil River; Brownsville; Rio Sabinal. (Coll. Clark.) GIRARD, U. S. & Mex. Bound. Surv., Ichth., 74, 1859.

Tetragonopterus argentatus, GÜNTHER, Cat., V, 380, 1864; JORDAN & GILBERT, Synopsis, 255, 1883.

NOTE.—In addition to these species more or less well defined, we add the following, too scantily characterized to receive a definite place in the system. They are noted by M. F. Bocourt, in Annales des Sciences Naturelles, 5ème Série, Zoölogie, T. IX, p. 62, 1868.

NOTE SUR LES POISSONS DU GENRE TÉTRAGONOPTÈRE PROVENANT DU MEXIQUE ET DE GUATEMALA, PAR M. BOCOURT.

La division générique des Poissons de la famille des Salmonides à laquelle Cuvier a réservé le nom de Tétragonoptère, employé précédemment par Artédi dans une acception plus large, compte de nombreux représentants dans les eaux douces de la région mexicaine et parmi les espèces que j'ai rencontrées pendant mon voyage dans cette partie de l'Amérique, il en est plusieurs qui me paraissent nouvelles. Je me propose d'en publier prochainement une description détaillée, accompagnée de figures, et en attendant, pour prendre date, j'en donnerai ici la liste.

*1. Espèces chez lesquelles la longueur de l'espace interorbitaire est égale au diamètre longitudinal de l'œil:

1. *Tetragonopterus cobanensis.*

Cette espèce est bien caractérisée: 1° par la longueur et l'épaisseur de la tête; 2° par la direction rectiligne du profil sucéphalique; 3° par les dimensions de la base de l'anale qui sont moindres que l'espace comprise entre les deux dorsales. Rivière de Coban.

2. *Tetragonopterus oaxacanensis.*

Cette espèce diffère de la précédente par la forme de la tête qui est plus courte et plus épaisse. Oaxaca.

3. *Tetragonopterus nitidus.*

Cette espèce ressemble au *T. argentatus* par le peu de longueur de la base de ses anales, mais elle s'en distingue nettement: 1° par la largeur de son interorbitaire; 2° par la forme et la structure de ses écailles, dont les stries radiées sont nombreuses, bien dessinées et traversées par des lignes concentriques non diagonales, comme dans l'espèce précédente. De Tasco.

*2. Espèces chez lesquelles la largeur de l'espace interorbitaire est plus grande que le diamètre de l'œil:

4. *Tetragonopterus fulgens.*

Cette espèce se distingue aussi du *T. nitidus* par les dimensions moindres de ses yeux et par la situation de la dorsale placée un peu plus en avant. Province de Cuernavaca.

5. *Tetragonopterus finitimus.*

Cette espèce, très-voisine du *T. macrophthalmus*, mais qui s'en distingue: 1° par la position plus reculée de la dorsale dont le premier rayon est environ au milieu du corps; 2° par les écailles plus fortement striées; 3° par la grandeur de ses yeux. Environs de Orizaba.

6. *Tetragonopterus belizianus.*

Espèce voisine du *T. panamensis*: elle se distingue par une plus grande élévation du corps; par la disposition et le nombre des stries des écailles (12 à 13) et par le système de coloration. Environs de Belize.

141. BRYCON, Müller & Troschel.

Brycon, MÜLLER & TROSCHEL, Horæ Ichthyologiæ, I, 15, 1845, (*falcatus*).
Chalcinopsis, KNER, Sitzungsber. Akad. Wiss. München, 1863, 226, (*striatulus*).
Megalobrycon, GÜNTHER, Proc. Zoöl. Soc. Lond., 1869, 423, (*cephalus*).

Dorsal inserted behind ventrals, in middle of length of body; anal fin long. Body oblong, covered with scales of uniform size; belly rounded before ventrals, compressed behind them. Mouth wide, the premaxillary with 3 or 4 series of tricuspid teeth; maxillary with small teeth; mandible with a series of strong tricuspid teeth and a pair of conical teeth in the middle, behind them. Nostrils close together, separated by a valve. Gill openings wide, the membranes slightly united, free from isthmus. Gill-rakers lanceolate. Species numerous, chiefly Brazilian. (βρύκω, to bite.)

CHALCINOPSIS, (*Chalcinus*, a related genus; ὄψις, appearance):
- *a.* Premaxillary teeth in four series.
  - *b.* Scales moderate, 48 to 55 in lateral line. DENTEX, 564.
  - *bb.* Scales small, 73 to 80 in lateral line. STRIATULUS, 565.

Subgenus CHALCINOPSIS, Kner.

564. **BRYCON DENTEX**, Günther.

Head 4½; depth 3¼. D. 11; A. 35; scales 9–48 to 55–7. Snout longer than eye in adult; maxillary not reaching to center of eye; caudal deeply forked; pectoral reaching about to ventrals. Silvery, some scales spotted or margined with black; humeral part of gill opening black; usually a black spot at base of caudal; anal usually black-edged. Yucatan to Ecuador. (Günther.) (*dentex*, large-toothed.)

Brycon dentex, GÜNTHER, Proc. Zoöl. Soc. London, 1860, 240, Esmeraldas, Ecuador. (Coll. Fraser.)
Chalcinopsis dentex, GÜNTHER, Cat., v, 337, 1864.

565. **BRYCON STRIATULUS** (Kner).

D. 11; A. 36 or 37; scales 13–73 to 80–9. Scales much smaller than in *B. dentex*; sides of body immaculate, or with rows of oblique brownish spots; caudal spot sometimes present. Rio Chagres and streams about Panama. (Kner.) (*striatulus*, narrowly streaked.)

Chalcinopsis striatulus, KNER, Sitzungsber. Akad. Wiss. München, 1863, 223, Panama; GÜNTHER, Cat., v, 337, 1864.
Chalcinopsis chagresensis, KNER, *l. c.*, 223, Rio Chagres; GÜNTHER, *l. c.*, 338, 1864.

142. GASTEROPELECUS (Gronow) Pallas.

Gasteropelecus, GRONOW, Mus. Ichthyol., II, 7, 1763, (nonbinomial).
Gasteropelecus, PALLAS, Spicilegia, 1769, VIII, 50, (*sternicla*).

Body strongly compressed, the thoracic region dilated into a semicircular disk; the belly compressed to a sharp edge; scales moderate; lateral line incomplete, descending backwards towards anal fin. Mouth moderate, with compressed tricuspid teeth in 1 or 2 series in premaxillary, in 1 series in lower jaw; maxillary with a few minute conical teeth; palate toothless; nostrils close together. Gill openings wide, the membranes free from isthmus; gill-rakers slender, lanceolate. Dorsal fin inserted behind middle of body, above anal; anal long; pectorals long; ventrals small or rudimentary. Species few, chiefly Brazilian. (*γαστήρ*, belly; *πελέκυς*, axe.)

566. GASTEROPELECUS MACULATUS, Steindachner.

(PÈCHE-PÈCHE.)

Head 3⅔; depth 1⅔. D. 11; A. III, 33; P. 10; scales 31 or 32. Premaxillary teeth in two rows; upper jaw with three simple canines on each side; pectoral falcate, nearly half length of body; ventrals minute; dorsal small; caudal moderate; anal very long; lateral line not reaching anal. Length 3 inches. Silvery, many of the scales above with dark spots; a silver gray stripe from shoulder to caudal. Rio Mamoni, near Panama. (Steindachner.) (*maculatus*, spotted.)

Gasteropelecus maculatus, STEINDACHNER, Fluss-fische Südamerikas, 168, 1879, Rio Mamoni, at Chepo, Panama.

143. RŒBOIDES, Günther.

Rœboides, GÜNTHER, Cat., v, 347, 1864, (*microlepis*).

Body oblong or rather elevated, covered with very small scales; lateral line complete. Belly rounded in front of ventrals, which are close to pectorals; humerus dilated or produced in a process before pectorals. Mouth wide, with conical teeth in premaxillary, maxillary and mandible; those on mandible uniserial; those in upper jaw uniserial or irregularly biserial; front of jaws with short, conical, tooth-like processes directed forwards; palate toothless. Nostrils close together, separated by membrane only. Gill-openings wide, the membranes separate, not attached to the isthmus; gill-rakers slender, lanceolate. Dorsal fin short, nearly median, behind ventrals; anal long, beginning below or before dorsal. Adipose fin present. Species few. (*ῥαβοιδής*, crooked-looking.)

567. RŒBOIDES GUATEMALENSIS (Günther).

Head 4; depth 2¾; eye 3½ in head. D. 11; A. 51; scales 19–80–22. Vertebræ 12 + 22. Each jaw anteriorly with a short, conical, tooth-like process directed forward on each side; no canine teeth above, those below small and short; lower jaw shortest; maxillary reaching nearly to middle of eye. Back elevated, the upper profile forming an S-shaped curve. Humeral process ending in a point. Dorsal inserted above fifth or sixth anal ray; caudal deeply forked; ventral below middle of pectoral, which nearly reaches anal. Olivaceous, with a silvery lateral band. Rio Chagres, and streams of Guatemala. (Günther.)

Anacyrtus guatemalensis, GÜNTHER, Cat., v, 347, 1864, Rio Chagres; Huamuchal. (Coll. Salvin & Dow.)

144. BRAMOCHARAX, Gill.

Bramocharax, GILL, Proc. Ac. Nat. Sci. Phila., 1877, 189, (*bransfordi*).

Body elongate, fusiform, compressed, covered with moderate-sized scales; belly before ventrals rounded; lateral line decurved, complete.

Head moderate, with slender and pointed snout; suborbital bones well developed; nostrils separated by a membranous partition; mouth rather large, oblique, reaching to beyond front of eye; teeth in each jaw in 1 series, compressed and conical, some of the lower teeth enlarged near symphysis; teeth of maxillary extending along nearly its entire edge, small, compressed, and multicuspid; teeth on palate undescribed, probably wanting; gill openings broad, the membranes separate and free. Dorsal fin short, behind ventrals; anal moderate; pectorals moderate. One species, apparently allied to the South American genus, *Salminus*, but the teeth uniserial, not biserial. (*Brama*, bream; *Charax*, for Characin.)

568. BRAMOCHARAX BRANSFORDI, Gill.

Head $3\frac{2}{3}$; depth $2\frac{3}{4}$; eye large, 4 in head. D. 11; A. II, 26; V. I, 8. Snout somewhat longer than eye, attenuated and projecting slightly beyond chin; maxillaries much decurved, reaching beyond middle of eye; Physiognomy of subgenus *Astyanax*, (*Tetragonopterus*). Scales and color undescribed. Lake Nicaragua. (Gill.) (Named for Dr. J. F. Bransford.)

Bramocharax bransfordi, GILL, Proc. Ac. Nat. Sci. Phila., 1877, 190, Lake Nicaragua.

145. LUCIOCHARAX, Steindachner.

Luciocharax, STEINDACHNER, Fisch-fauna des Magdalenen-stromes, 67, 1878, (*insculptus*).

Head and body elongate, the belly rounded; surface of head bony; snout produced, conical; jaws very long, each armed with 1 series of very small teeth with the points directed backward; maxillary short, with teeth; many small teeth on the palate. Gill membranes free and separate. Scales not very small; lateral line incomplete. Dorsal behind ventrals and behind middle of body; dorsal and anal extended backward. Intestinal canal short. One species. (*Lucius*, pike; *Charax*, used for Characin.)

569. LUCIOCHARAX INSCULPTUS, Steindachner.

Head 3; depth 6; eye 9 in head. D. II, 8; A. III, 9; P. 20; scales 44, 10 in transverse series, the lateral line on 20 to 24. Body elongate; all the bones of the head sculptured; snout long and narrow. Grayish, sides silvery, a black spot edged with pale at base of caudal. Length a foot. Rio Magdalena and Rio Mamoni, (near Panama). (Steindachner.) (*insculptus*, chiseled.)

Luciocharax insculptus, STEINDACHNER, Fisch-fauna des Magdalenen-stromes, 67, 1878, Rio Magdalena and Rio Mamoni.

Suborder GYMNONOTI.

Body more or less elongate and eel-like, with many vertebræ. Shoulder girdle suspended from the skull; parietal bones distinct, largely in contact; pterotic normal; symplectic bone present; opercular bones complete; mouth with its upper edge formed chiefly by the premaxillaries; no præcoracoid or interclavicles; anterior vertebræ united, modified, and with the ossicula auditus, as in the *Nematognathi* and the other *Plectospondyli*. Superior pharyngeal bones simple. Dorsal fin wanting or reduced to an adipose strip. Vent near the head, the anal fin being exceedingly long. Scales small or wanting. Ribs well developed. Air bladder present, double. Stomach with a blind sac and pyloric cœca. Ovaries with oviducts. Fresh-water fishes from South America, about thirty species being known. The group is divisible into two families quite diverse from each other, the one containing the singular Electric Eel, (*Electrophorus electricus*), which Cope regards as intermediate between the eel-like Siluroids, (*Clariidæ*), and the Eels. In this group the maxillaries are rudimental and the form decidedly eel-like. The remaining species, constituting the suborder *Gymnonoti*, resemble the Characins rather than the Eels, and have no appreciable relationships to the latter. It seems to us unlikely that any of the Eels are descended from fishes like the *Gymnonoti*, with the anterior vertebræ modified. The eel-like form of *Electrophorus* is probably the result of independent skeletal degradation. (*Gymnotidæ*, Günther, Cat., VIII, 1–11, 1870.) (*γυμνός*, naked; *νῶτος*, back.)

Family XL. GYMNOTIDÆ.

Body elongate, compressed, covered with rather small scales, the tail much produced and usually ending in a point. Mouth small, the teeth moderate, sometimes wanting, the margin of the upper jaw formed partly by the maxillaries. Dorsal fin absent or reduced to an adipose strip; caudal fin rudimentary or wanting; no ventrals. Vent close behind the head, the anal fin very long. Genera 6; species 30; abounding in the rivers of South America, with the *Characinidæ*, to which group they are probably most closely related. (Günther, Cat., VIII, 1–9, 1870.)

a. Tail ending in a point without fins; no trace of dorsal fin.
  b. Each jaw with a series of conical teeth. GITON, 146.
  bb. Each jaw with a patch or band of very small teeth; eyelid covering the eye, without free rim. EIGENMANNIA, 147.

146. GITON, Kaup.

Carapus, CUVIER, Règne Animal, Ed. I, 237, 1817, (in part; *macrourus*, *fasciatus*, etc.).

Carapus, MÜLLER & TROSCHEL, Horæ Ichthyol., III, 13, 1845, (restricted to *fasciatus*; not *Carapus*, Rafinesque).

Giton, KAUP in DUMÉRIL, Analyt. Ichth., 201, 1856, (*fasciatus*; no description.)

Snout of moderate length, depressed. A series of conical teeth in each jaw. Lower jaw projecting. Anterior nostrils wide, in the upper lip. No trace of caudal or dorsal fin. Vent below the gill opening. (*γείτων*, neighbor.)

570. GITON FASCIATUS (Pallas).

(CARAPO.)

Eye very small; scales moderate. Anal beginning below point of pectoral; teeth $\frac{26 \text{ to } 40}{38 \text{ to } 56}$. Color dusky, the young with irregular dark crossbars, which break up into spots with age. Guatemala to Rio de la Plata; generally abundant, especially in South America; recorded from Rio Matagua and Grenada. (*fasciatus*, banded.)

Carapo, MARCGRAVE, Hist. Pisc. Bras., 170, 1648, Brazil.

Gymnotus fasciatus, PALLAS, Spicilegia Zoöl., VII, 35, 1769, anal rays about 180, fresh waters of America.

Gymnotus albus, PALLAS, *l. c.*, 36, 1769, Surinam.

Gymnotus brachiurus, BLOCH, pl. 157, fig. 1, 1787.

Gymnonotus carapo, BLOCH, Naturg., pl. 157, fig. 2, 1787; BLOCH & SCHNEIDER, Ichth., 521, 1801, anal rays 193, fresh waters of America, (after *fasciatus*, Pallas).
Gymnotus putaol, LACÉPÈDE, Hist. Nat. Poiss., II, 176, 1801, Brazil.
Carapus inæquilabiatus, VALENCIENNES, in d'Orb. Voy. Amer. Merid. Poiss., pl. 14, 1839.
Carapus fasciatus, GÜNTHER, Cat., VIII, 9, 1870.

147. EIGENMANNIA, Jordan & Evermann, new generic name.

Cryptops, EIGENMANN, Ann. N. Y. Ac. Sci., VII, February, 1894, 625, (*humboldti*); preoccupied in WORMS.

This genus differs from *Gymnotus* or *Sternopygus*, only in not having the orbital rim free. No trace of dorsal or caudal. Mouth moderate, the jaws subequal, both with a patch or band of small villiform teeth; a patch of minute teeth on each side of palate; snout moderate; anterior nostrils on upper side of head; vent behind the orbit. Only one species in our waters. (Named for Dr. Carl H. Eigenmann, in recognition of his excellent work on the fresh-water fishes of South America.)

571. EIGENMANNIA HUMBOLDTI (Steindachner).

(MACANA.)

Head $1\frac{2}{5}$ in greatest depth; P. 18, its length $1\frac{2}{3}$ in head. A. 24. Body strongly compressed, the snout pointed. Eye without free margin, its diameter 2 in snout, which is 3 in head. Mouth small, the jaws equal, the upper as long as eye. Anal beginning below upper ray of pectoral; vent under posterior edge of interopercle; scales largest near front of second half of body, along lateral line; scales on nape very small. Length $1\frac{1}{2}$ feet. Rio Magdalena and Rio Mamoni, (near Panama). (Steindachner.) (Named for Alexander von Humboldt.)

Sternopygus humboldti, STEINDACHNER, Fisch-fauna des Magdalenen-Stromes, 55, 1878, Rio Magdalena.

We next append four orders of fishes which agree in the degradation of the skeleton and in the eel-like form of the body, this form being produced by the development of a great number of vertebræ, and the corresponding deterioration of the fins and their basal segments. These fishes are all probably descended from extinct soft-rayed fishes, but the line of descent is not yet traced. We put them in this place in the series because less interruption seems to be caused by doing so than would result from interpolating them elsewhere.

Order O. SYMBRANCHIA.

Body eel-shaped; premaxillary, maxillary, and palatine bones well developed and distinct from each other, as in ordinary fishes. Shoulder girdle joined to the skull in typical species, (in one family, *Amphipnoidæ*, distinct from the skull as in the eels). No mesocoracoid; symplectic present or absent; scales minute or wanting; no paired fins; vertical fins rudimentary, reduced to folds of the skin; vent at a great distance from the head; gill openings confluent in a single slit; no air bladder; stomach without blind sac or pyloric cœca; ovaries with oviducts; skull solid, the bones firmly united; vertebræ numerous, the anterior unmodified. Eel-like fishes, widely distributed in warm seas and in fresh waters.

The species are few, but highly diversified in structure, constituting two suborders and four families. They are probably related to the *Apodes*, but this is not certain, and in the structure of the head they approach more nearly to the true fishes. They represent degraded rather than primitive types, and the line of their descent is as yet unknown. It is not even certain that the forms grouped in this order are closely related. Cope makes two orders of them, *Ichthyocephali*, (*Monopteridæ*), and *Holostomi*, (*Amphipnoidæ* of Gill, and *Symbranchidæ*). But Dr. Gill has shown that the *Symbranchidæ* belong rather with the *Monopteridæ*. (*Symbranchidæ*, Günther, Cat., VIII, 12–18, 1870.) (*ςύν*, together; *βράγχια*, gills.)

ANALYSIS OF FAMILIES OF SYMBRANCHIA.

a. Symplectic present.
  b. Shoulder girdle connected to the skull by a bony post-temporal; vent behind the middle of the body; vertebræ about 80 + 55; gills well developed; palatine teeth in a band; gills without peculiar modification. SYMBRANCHIDÆ, XLI.

Family XLI. SYMBRANCHIDÆ.

(THE SYMBRANCHOID EELS.)

Body eel-shaped, naked, the abdomen very long, longer than the tail; shoulder girdle attached to the skull by a well-developed, bifurcate post-temporal; snout short; eyes small, anterior; teeth small; palatine teeth in a band; gills well developed; gill openings confluent in a narrow slit; 4 gill arches; no accessory breathing sac; gill membranes free from the isthmus. Fresh water fishes, 1 genus and 3 species known. (*Symbranchidæ*, genus. *Symbranchus*, Günther, Cat., VIII, 15–17, 1870.)

148 SYMBRANCHUS, Bloch.

Symbranchus, BLOCH, Ichthyologia, IX, 87, 1795, (*marmoratus*).
Unibranchapertura, LACÉPÈDE, Hist. Nat. Poiss., V, 658, 1803, (*marmoratus*).
Ophisternon, MCCLELLAND, Calcutta Journ. Nat. Hist., V, 197, 1845, (*bengalensis*).
Tetrabranchus, BLEEKER, Nat. Tyds. Ned. Ind., II, 69, 1862, (*microphthalmus*).

Characters of the genus included above. Three species known, two from India, and the following. (*ςύν*, together; *βράγχος*, gill.)

572. SYMBRANCHUS MARMORATUS, Bloch.

Snout short, rounded or pointed; eyes small, rather close to the end of the snout. Gill opening narrow, not extending to the edge of the ventral surface, generally transverse, arched, frequently appearing as a longitudinal slit unless drawn out. Vertebræ 79 + 57. Color brownish, variously marbled, sometimes immaculate. Tropical America, in streams from the Amazon northward to southern Mexico and St. Lucia; generally abundant. Recorded northward from Vera Cruz, Trinidad, St. Lucia, Lake Peten, Huamuchal, Rio Chisoy, etc.

Symbranchus marmoratus, BLOCH, Ichthyologia, IX, 87, pl. 418, 1795; GÜNTHER, Cat., VIII, 15, 1870.
Symbranchus immaculatus, BLOCH, *l. c.*, pl. 419, fig. 1.
Synbranchus transversalis, BLOCH & SCHNEIDER, 524, 1801, Guinea, after Gronow.
Unibranchapertura grisea, *marmorata*, *immaculata*, and *lineata*, LACÉPÈDE, Hist. Nat. Pass., V, 658, 1803, Surinam.
Synbranchus fuliginosus, RANZANI, Nov. Comm. Ac. Sci. Inst. Bonon., IV, 75, plate 11, fig. 1, 1840, Brazil.
Muræna lumbricus, GRONOW, Catalogue Fishes, 18, 1854, Sea of Guinea.
Symbranchus vittatus, CASTELNAU. An. Amer. Sud., 84, pl. 44, fig. 3, 1855, Rio de Janeiro.

Order P. CARENCHELYI.

(The Long-necked Eels.)

Teleost fishes with the intermaxillaries (premaxillaries), and supramaxillaries (maxillaries), developed and united by suture, and immovably connected with the cranium; branchial apparatus as in Apodes; scapular arch remote from the skull, and the body anguilliform. This order includes a single family, *Derichthyidæ*, lately discovered in the deep seas. (Gill.) (*κάρα*, head; *ἔγχελυς*, eel.)

Family XLII. DERICHTHYIDÆ.

Body anguilliform, slender, with a neck-like contraction between the head and pectoral fins, and submedian anus. Scales absent, the skin being perfectly smooth. Lateral line commencing on the side, behind the head, near the back, but submedian behind. Head oblong, oval. Eyes in the anterior half of the head. Nostrils lateral, in front of the eyes, neither tubular. Mouth with the cleft little oblique, extending behind the eyes. Jaws well developed, maxillaries approximated to the front of the vomer and attenuated backwards. Mandible moderately stout; the dentary with the coronoid process moderate and not far from posterior end. Teeth conic, in cardiform bands on the jaws and vomer. Lips moderate. Tongue moderate. Preorbital bones and opercular apparatus moderately developed; operculum inserted rather low on the hyomandibular by a peduncle, horizontally oblong, with emarginate upper edge and convex lower one; suboperculum curved and applied below operculum; interoperculum long, connected in front with angle of jaw and behind with front of suboperculum; preoperculum moderate. Branchial apertures lateral; vertical slits in front of pectorals. Branchiostegal rays in small number, (about 6), rather slender and curved upwards behind the opercula. Dorsal, anal, and caudal confluent in an uninterrupted fin; dorsal commencing far behind the head; anal commencing about midway between snout and end of tail or middle of body; caudal pointed and reduced. Pectorals inserted nearer the breast than back, narrow and rather long, with about 10 or 11 fine rays, and bent forward. Branchial arches slender; glossohyal moderately long; urohyal very slender and pointed; first basibranchial very long; second and third basibranchials moderate; epipharyngeals reduced to a pair (?); hypopharyngeals long and closely appressed and superincumbent on the rudimentary fifth arch. One species known, an eel like fish, from the abysses of the Atlantic. (Gill.)

(*Derichthyidæ*, Gill, Amer. Nat., xviii, 1884, 433.)

149. DERICHTHYS, Gill.

Derichthys, Gill, American Naturalist, xviii, 1884, 433, (*serpentinus*).

The generic characters are included in the family diagnosis above. (*δέρη*, neck; *ἰχθύς*, fish.)

573. DERICHTHYS SERPENTINUS, Gill.

Body stout, somewhat compressed, especially behind vent; greatest height in region of vent, nearly equal to head; its postanal portion equal to distance from vent to posterior margin of orbit. Head small, snake-like, its resemblance to that of a serpent being enhanced by the contracted neck-like appearance of the anterior portion of the body; its anterior portion depressed, the outline from above abruptly truncate; width of tip of snout considerably greater than interorbital space. Lower jaw narrower and included; upper jaw projecting beyond its tip a distance nearly equal to diameter of eye. Length of snout one-third that of head. Cleft of mouth extends behind eye a distance equal to or slightly greater than diameter of orbit. Nostrils elongate, the exterior slit occupying the middle third of the space between anterior margin of orbit and tip of snout. Length of neck four-fifths that of head, equal to distance from posterior limit of nostril to posterior portion of head. Pectorals inserted high up, almost in median line, and composed of 2 or 3 flexible, filiform rays. Origin of dorsal about midway between vent and tip of snout, the fin composed of flexible, delicate rays, not sufficiently differentiated from the thin membrane to be easily counted, those rays being longest in region above vent. Vent nearly median; anal fin beginning immediately behind vent, similar in height and appearance to dorsal fin, which it apparently joins at tip of tail. No ventrals. Lateral line inconspicuous, with minute pores, though its location is emphasized by the lancelet-like arrangement of the muscular fibers. Length of type 8 inches; of head, ½ inch; of region in advance of pectorals, 1 inch; greatest height, seven-sixteenths of an inch. Color, in life, ruddy brown; in alcohol, light yellow. (Goode & Bean.) A single specimen known. (*serpentinus*, like a snake.)

Derichthys serpentinus, Gill, Amer. Nat., XVIII, 1884, 433, Gulf Stream, Albatross Station 2094, in 1022 fathoms. (Coll. Albatross.) Goode & Bean, Oceanic Ichthyology, 161, fig. 169, 1895.

Order Q. APODES.

(The Eels.)

Teleost fishes with the premaxillaries atrophied or lost, the maxillaries lateral, and the body anguilliform and destitute of ventral fins. The most striking feature is the absence of the premaxillaries, taken in connection with the elongate form and the little development of the scapular arch, which is not attached to the cranium. Other characters not confined to the Apodes are the following: The absence of the symplectic bone, the reduction of the opercular apparatus and of the palatopterygoid arch, the absence of ventral fins, the absence of the mesocoracoid or præcoracoid arch, and the reduction or total absence of the scales. There are no spines in the fins, the gill openings are comparatively small, and there are no pseudobranchiæ. The vertebræ are in large number[*] and none

---

[*] *Numbers of vertebræ in Apodes.*

Murænesox coniceps	40 + 71 = 111.	*Lycodontis unicolor*	65 + 71 = 136.
Anguilla anguilla	46 + 70 = 116.	*Muræna helena*	70 + 71 = 141.
Echidna catenata	65 + 51 = 116.	*Ophichthus gomesi*	45 + 96 = 141.
Lycodontis meleagris	60 + 60 = 120.	*Lycodontis ocellatus*	48 + 94 = 142.
Lycodontis nebulosus	65 + 57 = 122.	*Lycodontis moringa*	65 + 79 = 144.
Lycodontis undulatus	64 + 68 = 132.	*Synaphobranchus pinnatus*	31 + 115 = 146.
Ophichthus ocellatus	52 + 82 = 134.	*Leptocephalus conger*	55 + 99 = 154.
Echidna zebra	97 + 38 = 135.	*Gordiichthys irretitus*	125 + 100 = 225.

of them are specially modified. The tail is isocercal; that is, with the caudal vertebræ remaining in a straight line to its extremity, as in the embryos of most fish, and in the *Anacanthini.*

We begin our discussion of the eels with the forms which seem nearest to the primitive stock from which the members of the group have descended. It is evident that among the eels, the forms of simplest structure, as *Uropterygius*, *Channomurœna*, and *Sphagebranchus* are not in any sense primitive forms, but the results of a long continued and progressive degeneration, so far as the fins and mouth parts are concerned. The *Apodes* are probably descended from *Isospondylous* or *Iniomous* types, possibly from ancestors of the *Anacanthini*, and their divergence from typical forms is, in most respects, a retrogression.* (*a*, without; πούς, foot, from the absence of ventral fins.)

(*Murænidæ*, GÜNTHER, Cat., VIII, 19–145, 1870.)

FAMILIES OF APODES.

ENCHELYCEPHALI:

- *a.* Gill openings well developed, leading to large interbranchial slits; tongue present; opercles and branchial bones well developed; scapular arch present.
  - *b.* Skin covered with rudimentary embedded scales, usually linear in form, arranged in small groups, and placed obliquely at right angles to those of neighboring groups; pectorals and vertical fins well developed, the latter confluent about the tail; lateral line present; posterior nostril in front of eyes; tongue with its margins free.
    - *c.* Gill openings well separated; branchiostegals long, bent upwards behind.
      - *d.* Gill openings lateral and vertical; snout conic, the jaws not very heavy; gape longitudinal; lips thick; lower jaw projecting; teeth in cardiform bands on jaws and vomer; eggs minute. ANGUILLIDÆ, XLIII.
      - *dd.* Gill openings horizontal, inferior.
        - *e.* Snout very blunt, with very strong jaws; gape transverse; lips obsolete; teeth blunt, in one series, on jaws only. SIMENCHELYIDÆ, XLIV.
        - *ee.* Snout conical and slender, the jaws of moderate strength; gape lateral; lips obsolete; tongue but little developed; teeth acute, in bands on jaws and vomer. ILYOPHIDÆ, XLV.
    - *cc.* Gill openings inferior, very close together, apparently confluent; branchiostegal rays abbreviated behind; head conical; tongue small; posterior nostrils in front of eye. SYNAPHOBRANCHIDÆ, XLVI.
  - *bb.* Scales wholly wanting; eggs (so far as known) of moderate size, much as in ordinary fishes.
    - *f.* Tip of tail with a more or less distinct fin, the dorsal and anal fins confluent around it; the tail sometimes ending in a long filament. Coloration almost always plain, brownish, blackish, or silvery, the fins often black-margined.
      - *g.* Posterior nostril without tube, situated entirely above the upper lip.
        - *h.* Tongue broad, largely free anteriorly and on sides; vomerine teeth moderate.
          - *i.* Pectoral fins well developed; body not excessively elongate; lower jaw not projecting; anterior nostril remote from eye. LEPTOCEPHALIDÆ, XLVII.
        - *hh.* Tongue narrow, adnate to the floor of the mouth or only the tip slightly free; vomerine teeth well developed, sometimes enlarged.
          - *j.* Jaws not attenuate and recurved at tip; gill openings well separated; anterior nostrils remote from eye.

---

* For a detailed account of the species of Apodes, see "A Preliminary Review of the Apodal Fishes or Eels," Rept. U. S. Fish Comm., 1888, (first published June 14, 1892), pp. 581–677, by David Starr Jordan and Bradley Moore Davis.

k. Pectoral fins well developed; skin thick; skeleton firm; snout moderate; tail not ending in a filiform tip. MURÆNESOCIDÆ, XLVIII.

kk. Pectoral fins wholly wanting; snout and jaws much produced, the upper longer; jaws straight; skin thin, the skeleton weak; tail ending in a filiform tip; gill openings small, subinferior; teeth sharp, subequal, recurved; a long series on the vomer; deep-sea eels, soft in body, black in color. NETTASTOMIDÆ, XLIX.

jj. Jaws long and slender, tapering to a point, recurved at tip; nostrils large, both pairs close in front of eye; gill openings convergent forward, separate or confluent; pectorals and vertical fins well developed; membranes of fins thin, not enveloping the rays; skeleton well developed; deep-sea eels. NEMICHTHYIDÆ, L.

gg. Posterior nostril close to the edge of the upper lip; tongue more or less fully adnate to the floor of the mouth; teeth subequal. MYRIDÆ, LI.

ff. Tip of tail without rays, projecting beyond the dorsal and anal fins (not filiform); posterior nostril on the edge of the upper lip; anterior nostril near tip of snout, usually in a small tube; tongue usually adnate to the floor of the mouth. Coloration frequently variegated. OPHICHTHYIDÆ, LII.

COLOCEPHALI:

aa. Gill openings small, roundish, leading to restricted interbranchial slits; tongue wanting; pectoral fins (typically) wanting: opercles feebly developed; fourth gill arch modified, strengthened, and supporting pharyngeal jaws.

l. Scapular arch obsolete or represented by cartilage; heart not far back; pectorals wanting; skin thick; coloration often variegated. MURÆNIDÆ, LIII.

Suborder ENCHELYCEPALI.

(THE EELS.)

The characters of this group are given above. (*ἔγχελυς*, eel; *κεφαλή*, head.)

Family XLIII. ANGUILLIDÆ.

(THE TRUE EELS.)

The true eels or *Anguillidæ* are characterized by their scaly skin in association with a conical head and a general resemblance to the *Congers*. The group is thus diagnosed by Dr. Gill:

Enchelycephalous Apodals with conical head, well-developed opercular apparatus, lateral maxillines, cardiform teeth, distinct tongue, vertical lateral branchial apertures, continuous vertical fins, with the dorsal far from the head, pectorals well developed, scaly skin, and nearly perfect branchial skeleton.

The *Anguillidæ* approach more nearly than most of the other eels to the type of the true fishes. In one respect, that of the minute ova and concealed generation, however, they differ widely from these. The single genus of living *Anguillidæ* is widely diffused in temperate and tropical waters. Unlike the other eels the *Anguillidæ* freely ascend the rivers, descending to the sea for purposes of reproduction. One genus, with 5 or more valid species. (*Murænidæ*, genus *Anguilla*, GÜNTHER, Cat., VIII, 23 to 37, 1870.)

a. Dorsal fin inserted well behind base of pectorals, shoulder girdle well developed; lower jaw projecting. ANGUILLA, 150.

150. ANGUILLA, Shaw.

(EELS.)

Anguilla, SHAW, General Zoölogy, IV, 15, 1804, (*anguilla*).
Muræna, BLEEKER, POEY, etc., (taking as type *Muræna anguilla*, the first species mentioned by ARTEDI under *Muræna*).

Body elongate, compressed behind, covered with embedded scales which are linear in form and placed obliquely, some of them at right angles to others. Lateral line well developed. Head long, conical, moderately pointed, the rather small eye well forward and over the angle of the mouth. Teeth small, subequal, in bands on each jaw and a long patch on the vomer. Tongue free at tip. Lips rather full, with a free margin behind, attached by a frenum in front. Lower jaw projecting. Gill openings rather small, slit-like, about as wide as base of pectorals and partly below them. Nostrils superior, well separated, the anterior with a slight tube. Vent close in front of anal. Dorsal inserted at some distance from the head, confluent with the anal around the tail. Pectorals well developed. Species found in most warm seas, (the eastern Pacific excepted), ascending streams, but mostly spawning in the sea. The eels often move for a considerable distance on land, in damp grass. Waterfalls, dams, and other obstructions are often passed in this way. It is thought that the eel spawns only in the sea, the female dying after having once produced ova. The females are larger than the males, paler in color, with smaller eyes and higher fins. Eels are among the most voracious of fishes. "On their hunting excursions, they overturn alike huge and small stones, beneath which they find species of shrimp and crayfish, of which they are excessively fond. Their noses are poked into every imaginable hole in their search for food, to the terror of innumerable small fishes." (W. H. Ballou.) The single American species differs* slightly from the European *Anguilla anguilla* (Linnæus). (*anguilla*, the eel.)

---

*As is shown in the following analysis:

a. Distance between origin of dorsal and vent $\frac{5}{6}$ to $1\frac{1}{4}$ in head; pectoral 3 to $3\frac{2}{3}$ in head; head $2\frac{1}{2}$ to $2\frac{4}{5}$ in trunk; upper jaw $3\frac{3}{4}$ to $4\frac{1}{4}$ in head. Yellow, brown, or black, underparts paler. ANGUILLA.

aa. Distance between origin of dorsal and vent $1\frac{1}{6}$ to 2 in head; pectoral $2\frac{5}{6}$ to $3\frac{3}{8}$ in head; head 2 to $2\frac{1}{2}$ in trunk; body more robust and trunk slightly shorter than in *anguilla*, otherwise similar. CHRYSYPA, 568.

Dr. Günther states that a specimen of the European eel from New Jersey is in the Liverpool Museum. There is no other American record, and this must be regarded as very questionable.

Dr. Seth E. Meek, (Bull. U. S. Fish Comm., 1883, 430), after a careful comparison of American and European eels, concludes that "in American specimens the dorsal fin is proportionately farther from the end of snout, making the distance between front of dorsal and front of anal a little shorter than in European specimens. Otherwise no permanent difference seems to exist. We should not, therefore, in my opinion, consider the two as distinct species, but rather as geographical varieties of the same species."

In *A. chrysypa*, according to Dr. Meek, the distance from tip of snout to front of dorsal is, on an average, $.33\frac{1}{2}$ of the length; the distance from front of dorsal to front of anal, $.09\frac{3}{4}$, or less than length of head, $(.12\frac{1}{2})$.

In the European *Anguilla anguilla* the first distance is $.30\frac{1}{2}$, the second, $.13\frac{2}{3}$, or a little more than length of head $(.13\frac{1}{8})$. Cuban specimens, (*Anguilla cubana*, Kaup), agree fully with *A. chrysypa*, as also Texan ones (*Anguilla* "*tyrannus*" or "*texana*"). Probably our eel should be regarded as a subspecies, (*chrysypa*), of *A. anguilla*.

574. ANGUILLA CHRYSYPA,* Rafinesque.

(American Eel; Fresh Water Eel.)

Distance from front of dorsal to vent 1⅙ to 2 in head; pectoral 2⅚ to 3⅖ in head; head 2 to 2½ in trunk. Form rather robust. Brown, nearly plain, often tinged with yellowish; paler below, the color extremely variable. Length 4 or 5 feet. Atlantic coast of the United States; very abundant from Maine to Mexico; ascending all rivers south of Canada and east of the Rocky Mountains and resident throughout the Mississippi Valley. Common in the West Indies. Not found in the Pacific. A food-fish of importance. (χρυσός, gold; ὑπό, below.)

Anguilla chrysypa, Rafinesque, Amer. Month. Mag. & Crit. Rev., 1817, 120, Lake George; Hudson River; Lake Champlain.
Anguilla blephura, Rafinesque, Amer. Month. Mag. & Crit. Rev., 1817, 120, Long Island.

Anguilla chrysypa, Jordan & Davis, Review of Apodal Fishes, 668, 1892.

Family XLIV. SIMENCHELYIDÆ.

(The Snub-nosed Eels.)

This family contains a single species, a large deep-sea eel, parasitic in larger fishes, having the general characters of *Anguilla*, but with the form of the head strikingly different. The following diagnosis is given by Dr. Gill:

Apodal fishes with a blunt snout, transverse, anterior mouth, massive jaws with an acrodont dentition, and inferior longitudinal branchial slits moderately far apart from each other.

---

*Among the multitudes of American eels examined by us we have been unable to detect specific differences. As all these specimens differ in a slight degree from any we have seen from Europe, we may provisionally recognize the American form under its oldest name, *Anguilla chrysypa*, as a distinct species. As these differences are slight, it is not unlikely that intermediate forms may occur, in which case the American form may stand as var. *chrysypa*. Dr. Bean records in the "Nineteenth Report of the Commission of Fisheries of New York," page 280, five individuals from Great South Bay, Long Island, which he thinks may represent *Anguilla argentea* (Le Sueur). These specimens are described as having "large eyes, short snout, and long pectoral fins as compared with the common form, silvery gray above with a clear satiny white abdomen separated from the color above by the lateral line." These specimens are very interesting because they were found "to be males with the generative glands so well developed as to leave no doubt concerning the sex."

The skin has the peculiar rudimentary scales of *Anguilla*; the teeth are blunt, uniserial, on the edge of the jaws only, and there are no lips.

151. SIMENCHELYS, Gill.

Simenchelys, GILL, in GOODE & BEAN, Bull. Essex Inst., 27, 1879, (*parasiticus*).
Conchognathus, COLLETT, Bull. Soc. Zoöl. France, 122, 1889, (*grimaldii*).

Body eel-shaped, covered with linear embedded scales, disposed at right angles as in *Anguilla*. Lateral line present, faint. Head very short, rounded, very blunt anteriorly, slightly compressed. Mouth small, entirely anterior. Premaxillaries and maxillaries of each side coalesced and separated from those of the other side by the ethmoid. Jaws equal, their edges hard, provided with a single series of small, rounded, close-set, incisor-like teeth. No vomerine teeth. Tongue broad, somewhat free anteriorly. Mandible very deep and strong. Operculum saber-shaped. Gill openings very small, inferior, longitudinal, well separated, situated in front of the pectorals and below them. Both nostrils large, the anterior with a slight rim, but no tube. Lips full. Pectorals short; vertical fins confluent around the tail, the dorsal beginning not far behind pectorals; vent in front of anal, near middle of body. One species known. (*σιμός*, pug-nosed; ἔγχελυς, eel.)

575. SIMENCHELYS PARASITICUS, Gill.

Eye 1½ to 2 in snout; pectoral 2½ in head; head 4½ to 4⅗ in trunk; tail a head's length longer than head and trunk; anterior profile of head bluntly rounded; angle of mouth at a point half way between the tip of snout and anterior edge of eye; body stout, the depth at vent about equal to length of head; dorsal beginning about a head's length behind gill openings; color dark brown, nearly plain. Length about 2 feet. Offshore banks, in deep water, south of Newfoundland; also recorded from the Azores; abundant; often found burrowing in the flesh of the halibut, (whence the name *parasiticus*, parasitic.)

Simenchelys parasiticus, GILL MS., in GOODE & BEAN, Bull. Essex, Inst., 27, 1879, Newfoundland Banks; BEAN, Proc. U. S. Nat. Mus., 1880, 113; JORDAN & GILBERT, Synopsis, 363, 1883; GÜNTHER, Voy. Challenger, XXII, 252, 1887; JORDAN & DAVIS, *l. c.*, 670.
Conchognathus grimaldii, COLLETT, Bull. Soc. Zoöl. France, 122, 1889, Azores.

Family XLV. ILYOPHIDÆ.

(THE OOZE EELS.)

This family contains a single species with characters intermediate between the *Simenchelyidæ* and the *Synaphobranchidæ*, combining the general physiognomy of *Synaphobranchus* with the separate gill slits and long-bowed branchiostegal rays of *Simenchelyidæ*. Deep-sea eels from the eastern Pacific.

152. ILYOPHIS, Gilbert.

Ilyophis, GILBERT, Proc. U. S. Nat. Mus., 1891, 351, (*brunneus*).

Body scaly; pectorals well developed; lateral line prominent; gill slits horizontal, inferior, well separated; nostrils lateral, the posterior immediately in front of the eye, the anterior with a short tube, near tip of snout. Maxillaries as in *Synaphobranchus*; the clamping processes closely appressed to the side of the vomer behind its head; lower jaw strong, apparently with the coronoid process well developed; series of teeth on head and shaft of vomer continuous; no lips; tongue little developed, with narrow free margin; branchiostegal rays 15 in number, (as determined without dissection), not shortened, some of them curved around and above the opercle. Dorsal, anal, and caudal confluent, rather high, the rays clearly visible through the skin; dorsal beginning well forward, its origin immediately behind the base of pectorals; origin of anal near end of anterior third of body. (*ἰλύς*, ooze; *ὄφις*, snake.)

576. ILYOPHIS BRUNNEUS, Gilbert.

Body narrow, compressed throughout; snout and jaws slender; gape one-half length of head, extending beyond the eye for a distance less than the diameter of the latter; maxillary teeth small, bluntly conic, in narrow bands; teeth on vomer large, conic, those on shaft of vomer in a single row; teeth in mandible in narrow band, those on the inner series enlarged and retrorse though less than half the size of the vomerine teeth; front of pupil over end of second third of length of jaw; gill slits narrow, inferior, horizontal, crescent-shaped, about equaling horizontal diameter of eye, their lower (anterior) ends separated by a distance equal to their own length, their upper (posterior) ends by 1½ times that distance; head 2 in trunk; head and trunk 3¼ in total length; pectorals small, 6 in head, rays evident; scales very fine, arranged in groups at right angles to one another; lateral line running high anteriorly, its pores white and conspicuous. Color brown, the fins, lower side of head, and branchial regions darker. (Gilbert.) Length 15 inches. One specimen, from Chatham Island, Galapagos Archipelago, in 634 fathoms. (*brunneus*, brown.)

Ilyophis brunneus, GILBERT, Proc. U. S. Nat. Mus., 1891, 352, Chatham Island; JORDAN & DAVIS, *l. c.*, 670. (Coll. Albatross.)

Family XLVI. SYNAPHOBRANCHIDÆ.

This group consists of deep-sea eels, differing from the *Anguillidæ* in having the gill openings externally confluent into a single slit. The following diagnosis is given by Dr. Gill:

Enchelycephalous Apodals with conic, pointed head, moderate opercular apparatus, lateral maxillines, cardiform teeth, distinct tongue, inferior branchial apertures discharging by a common aperture, continuous vertical fins, pectorals well developed, scaly skin, and nearly perfect branchial skeleton.

Body eel-shaped, covered with linear, imbedded scales placed at right angles, as in *Anguilla*. Lateral line present. Head long and pointed, the snout produced. Mouth very long, the eye being over the middle of its cleft. Jaws about equal; teeth small, sharp, in a broad band in each jaw, becoming a single series anteriorly; those of inner series in upper jaw and of outer series in mandible somewhat enlarged; vomerine teeth in a narrow band anteriorly. Gill openings inferior, horizontal, close together, convergent forward, somewhat confluent at the surface, but separated by a considerable isthmus within. Branchiostegals peculiarly formed, in moderate number (about 15), attached to the sides of the compressed ceratohyal and ephiyal, slender, abbreviated, and moderately bowed, not being curved up above the operculum. Tongue long, free only at the sides. Nostrils large, the anterior with a short tube, the posterior before the lower part of the eye. Pectoral well developed; dorsal low, beginning behind vent; anal longer than dorsal, rather high, its rays slender, branched, not imbedded in the skin; vertical fins confluent around the tail. Vent near the anterior fourth of body. Muscular and osseous systems well developed. Stomach very distensible. Deep-sea fishes; two genera with 6 or 8 species known. (*Murænidæ*, group *Synaphobranchina*, Günther, Cat., VIII, 22–23.)

a. Dorsal fin low, beginning behind vent; vomerine teeth in a single patch; pectorals long, longer than the rather slender snout. SYNAPHOBRANCHUS, 153.

aa. Dorsal fin beginning close behind base of pectorals; vomerine teeth in two patches, one behind the other; pectorals short, not longer than the short snout. HISTIOBRANCHUS, 154.

153. SYNAPHOBRANCHUS, Johnson.

Synaphobranchus, JOHNSON, Proc. Zoöl. Soc. London, 1862, 169, (*kaupii*).

Dorsal beginning behind vent. This genus contains two or three species, deep-sea fishes from the Atlantic and Pacific. (*συνᾰφής*, united; *βράγχια*, gills.)

577. SYNAPHOBRANCHUS PINNATUS (Gronow).

Dorsal fin beginning ¼ to ½ head's length behind vent; maxillary reaching a point almost opposite gill opening; head 3 to 3½ in distance from tip of snout to dorsal, ¼ to ¾ in trunk; snout 3½ in head; eye 2 to 2¼ in snout; cleft of mouth 1½ to 1¾ in head; pectorals 3 in head, their insertion about equidistant from snout and anus. Uniform brown, vertical fins darker behind, light-edged anteriorly; inside of mouth blue-black; gill openings dark. North Atlantic and western Pacific, common about the Madeiras, Canaries, etc., and also about the banks of Newfoundland; "a common resident of the deep waters of the offshore banks in 200 to 300 fathoms, where individuals are often taken on the fisherman's trawl lines." The Japanese species, *S. affinis*, Günther, is probably the same. (*pinnatus*, feathered or finned.)

Muræna pinnata, GRONOW, Cat. Fish. Brit. Mus., 19, 1854, locality unknown.

Synaphobranchus kaupii, JOHNSON, Proc. Zoöl. Soc. Lond., 1862, 169, Madeira. (Coll. J. Y. Johnson.)

?*Synaphobranchus affinis*, GÜNTHER, Ann. and Mag. Nat. Hist., XX, 1877, 445, Inosima, Japan.

Synaphobranchus pinnatus, GÜNTHER, Cat., VIII, 23, 1870; GOODE & BEAN, Bull. Essex Inst., 26, 1879; BEAN, Proc. U. S. Nat. Mus., 1880, 113; GOODE & BEAN, Bull. Mus. Comp. Zoöl., 222, 1883; JORDAN & GILBERT, Synopsis, 364, 1883; GÜNTHER, Voy. Challenger, XXII, 253, 1887; VAILLANT, Voyage Travailleur et Talisman, 89, 1888; JORDAN & DAVIS, *l. c.*, 672.

154. HISTIOBRANCHUS, Gill.

Histiobranchus, GILL, Proc. U. S. Nat. Mus., 1883, 255, (*infernalis*).

This genus is close to the preceding, from which it is distinguished by the more anterior insertion of its dorsal. Two species have been described, perhaps identical with each other. (*ἱστίον*, sail, i. e. dorsal fin; *βράγχια*, gills; from the insertion of the dorsal.)

a. Pectoral fin longer than snout. BATHYBIUS, 578.
aa. Pectoral fin shorter than snout. INFERNALIS, 579.

578. HISTIOBRANCHUS BATHYBIUS, Günther.

Pectoral fin longer than snout; eye $\frac{1}{2}$ or $\frac{2}{3}$ of the length of snout; head and trunk $1\frac{1}{4}$ in tail; dorsal commencing above or immediately behind the pectoral, which is only $\frac{1}{3}$ length of head; scales quite rudimentary, lanceolate, imbedded in the skin; cheeks naked; dorsal and anal fins low, especially the former. Uniformly black. (Günther.) Northern and western Pacific in deep water, Bering Strait, off Japan, and off Cape of Good Hope. One specimen obtained by Dr. Gilbert in Bering Sea in 1890, (Albatross Explorations). (*βαθύς*, deep; *βίος*, life.)

Synaphobranchus bathybius, GÜNTHER, Ann. and Mag. Nat. Hist., XX, 1877, 445; and in Voy. Challenger, 254, pl. LXII, fig. b, 1887, off Yedo; North Pacific; Kerguelen Island.
Histiobranchus bathybius, JORDAN and DAVIS, *l. c.*, 673.

579. HISTIOBRANCHUS INFERNALIS, Gill.

Body moderately elongated and compressed; its height at the anus $\frac{56}{1000}$ of the length. Head 9 in total length, its width a little less than one-half its length; snout moderate, less than greatest width of head; eye moderate, much less than one-half the snout; upper jaw nearly one-tenth of total length; lower jaw a little more. Dorsal commencing not far behind vertical from the root of pectoral; anal inserted a little nearer tip of snout than end of tail; both are moderately developed. Pectorals considerably shorter than snout. Color in life almost uniform dark plumbeous; in alcohol the trunk is dark yellowish brown, becoming almost black on the abdominal region, as well as on the intermandibular integuments and around the pectorals, while the dorsal and anal are whitish except towards the posterior fourth of the length, where they are very dark or blackish. A specimen, No. 33279, was taken by the *Albatross* at station 2037, in 1,731 fathoms, 38° 30′ N. 69° 8′ W. (Goode & Bean.) (*infernalis*, infernal, from its black color.)

Histiobranchus infernalis, GILL, Proc. U. S. Nat. Mus., 1883, 255, Gulf Stream, Lat. 38° 30′ N., Long. 69° W., in 1,731 fathoms. (Type, No. 33279. Coll. Albatross.) GOODE & BEAN, Oceanic Ichthyology, 145, fig. 165, 1895.
Synaphobranchus infernalis, GÜNTHER, Challenger Report, XXII, 254, 1887.

Family XLVII. LEPTOCEPHALIDÆ.

(THE CONGER EELS.)

This family includes those eels which are scaleless, and have the tongue largely free in front, the body moderately elongate, the end of the tail surrounded by a fin, the posterior nostril remote from the upper lip and near front of eye, and the pectoral fins well developed. All the species are plainly colored, grayish or dusky above, silvery below, and the dorsal edged with black. Genera 3,* species about 15, found in most warm seas,

---

*As the osteology of most of the species is unknown, we can not say whether the *Murænesocidæ*, *Echelidæ*, and *Heterocongridæ* should really be separated from this group. Bleeker places all these genera with *Nettastoma* and *Nemichthys*, also in his family of *Congroidei*. Günther approximates *Conger* to *Anguilla*, while recognizing the allies of *Murænesox*, *Echelus*, *Heteroconger*, and *Nemichthys* as so many distinct subfamilies. *Nettastoma* he places with *Neoconger* and *Murænesox*.

usually at moderate depths. Most of the species undergo a metamorphosis, the young being loosely organized and transparent, band-shaped and with very small head. The body grows smaller with increased age, owing to the compacting of the tissues. (*Murænidæ*, part, Günther, Cat., VIII, 37–44.)

a. Vomerine teeth in bands, none of them canine-like; lips thick.

b. Dorsal fin inserted at a point behind base of pectoral, but nearer pectoral than vent; head with inconspicuous mucous cavities; jaws with an outer series of close-set teeth, forming a cutting edge; tail about half longer than rest of body. Leptocephalus, 155.

bb. Dorsal fin beginning over the gill opening; bones of front of head with large muciferous cavities; mouth rather small; jaws with bands of small teeth, the outer not forming a cutting edge; tail from half to two-thirds of total length. Congermuræna, 156.

aa. Vomerine teeth uniserial, some of them canine-like; maxillary teeth biserial; dorsal beginning above root of pectoral; cleft of mouth extending beyond middle of eye; tail very long and slender, about half longer than rest of body. Uroconger, 157.

155. LEPTOCEPHALUS (Gronow) Scopoli.

(Conger Eels.)

(*a*) Larval Forms.

Leptocephalus, Scopoli, Int. Hist. Nat., 453, 1777, (*morrissi*).
Oxyurus, Rafinesque, Caratteri, 19, 1810, (*vermiformis*).
Helmictis, Rafinesque, Indice d'Ittiologia Siciliana, 62, 1810, (*punctatus*).
Helmichthys, Costa, Fauna Napoli, Pesci, 1854, (*diaphanus*).
? *Leptocephalichthys*, Bleeker, Act. Soc. Sci. Ind. Neerl., 1, Manado, 69, (*hypselosoma*).
? *Diaphanichthys*, Peters, Monatsber. Ak. Wiss. Berl., 399, 1864, (*brevicaudus*).

(*b*) Adult Forms.

Echelus, Rafinesque, Caratteri, etc., 63, 1810, (in part; includes species of *Conger*, *Ophisoma* and *Myrus*; restricted by Bleeker to *Myrus*).
Conger, Cuvier, Règne Animal, Ed. II, II, 350, 1829, (*conger*).
Ariosoma, Swainson, Nat. Hist., Class'n Fishes, I, 220, 1838, (no type mentioned; diagnosis worthless).
Ophisoma, Swainson, Nat. Hist., Class'n Fishes, II, 334, 1839, (*acuta*, *obtusa*). Substitute for *Ariosoma*; not *Ophisomus*, Swainson, *l. c.*, 227 = *Murænoides*, Lacépède.
Congrus, Richardson, Voyage Erebus & Terror, 107, 1844, (*conger*).

Body formed as in *Anguilla*, the skin scaleless. Head depressed above, anteriorly pointed. Lateral line present. Mouth wide, its cleft extending at least to below middle of eye. Teeth in outer series in each jaw equal and close-set, forming a cutting edge; no canines; band of vomerine teeth short. Tongue anteriorly free. Vertical fins well developed, confluent around the tail; pectoral fins well developed; dorsal beginning close behind pectorals. Gill openings rather large, low. Eyes well developed. Posterior nostril near eye; anterior near tip of snout, with a short tube. Lower jaw not projecting. Skeleton differing in numerous respects from that of *Anguilla*. Vertebræ about 56 + 100. In most warm seas. This genus contains the well-known and widely distributed Conger eel and three or four closely related species. The earliest generic name used for members of the group is *Leptocephalus*, based on a curious, elongate, transparent, band-like creature with minute head and very small mouth, found in the waters of Europe, and known as *Leptocephalus morrissi.* This has been shown by Gill, Günther, and Facciolá to be the young and larval form of *Leptocephalus conger.* A number of the genera and species of the supposed family of Leptocephalidæ have been described, but there is no doubt that all of them are larvæ, some of eels, as *Conger*, *Congermurœna*, *Ophisurus*, and *Nettastoma*, others of Isospondylous fishes, as *Albula*, *Elops*, *Alepocephalus*, *Stomias*, etc. (See Günther, Cat., VIII, 136.) It is thought by Dr. Günther that the Leptocephalid forms are probably "individuals arrested in the development at a very early period of their life, yet continuing to grow to a certain size, without corresponding development of their internal organs, and perishing without having attained the characters of the perfect animal." The recent observations of Dr. Gilbert on the larvæ of *Albula*, *Elops*, and *Conger*, however, seem to point to the conclusion that these curious forms are normal young, and that the individuals grow smaller in size for a time with increased age, owing to the increasing compactness of the tissues.

Inasmuch as the name *Leptocephalus* has been associated for more than a century with larval forms it is a decided inconvenience to accord to it precedence as a generic name over *Conger*. The strict law of priority, however, demands its retention, and the tendency among systematic zoölogists is to recognize as few exceptions as may be to this rule. The unfamiliar names *Oxyurus* and *Helmictis* are both earlier than *Conger.* (*λεπτός*, slender; *κεφαλή*, head.)

a. Dorsal beginning nearly opposite tip of pectoral; head about 1⅘ in trunk. CONGER, 580.
aa. Dorsal fin beginning above middle of pectorals; head about 1⅗ in trunk. CAUDILIMBATUS, 581.

580. LEPTOCEPHALUS CONGER (Linnæus).

(CONGER EEL.)

Dorsal beginning opposite to or just behind tip of pectoral; eye 1½ in snout, 5 to 6 in head; snout 3¼ to 4¼ in head; gape extending nearly or quite to posterior margin of eye; head 1⅘ to 1$\frac{6}{7}$ in trunk; tail longer than rest of body; pectorals 3½ in head; upper lip full, with conspicuous pores. Ashy gray or blackish; vertical fins with a black margin; body sometimes (var. *niger*) entirely black. Atlantic Ocean, generally common on both coasts, from Cape Cod to Brazil; also on coasts of Asia and Africa; almost cosmopolitan, but not found in the eastern Pacific. It reaches a length of 8 feet, and is a food fish of importance, especially in Europe. (*Conger*, the ancient name of the eel.)

Conger niger, Jordan & Gilbert, Synopsis, 362, 1883.
Leptocephalus conger, Jordan & Davis, *l. c.*, 664.

581. LEPTOCEPHALUS CAUDILIMBATUS (Poey).

Dorsal fin beginning above the middle of pectorals; eye as long as snout, 4½ in head; gape extending to beyond the middle of the eye; head 1½ to 1¾ in trunk; tail longer than rest of body; pectorals 3 to 3¼ in head. Brown, vertical fins with a broad black margin, which is again edged with white; the dorsal black anteriorly for ⅔ its depth. Tropical parts of Atlantic; Pensacola to Cuba and Madeira; not rare. (*cauda*, tail; *limbatus*, margined.)

Echelus caudilimbatus, Poey, Repertorio, II, 249, 1867, Cuba.
Conger macrops, Günther, Cat., VIII, 40, 1870, Madeira; Bahamas. (Coll. Hasslar.)
Conger caudicula, Bean, Proc. U. S. Nat. Mus., 1882, 435, Pensacola. (Type, No. 30709. Coll. Silas Stearns.) Jordan & Gilbert, *l. c.*, 262.
Conger caudilimbatus, Poey, Enumeratio, 152, 1875.
Leptocephalus caudicula, Jordan & Gilbert, Synopsis, 900, 1883.
Leptocephalus caudilimbatus, Jordan & Davis, *l. c.*, 666

156. CONGERMURÆNA, Kaup.

Conger-Muræna,* Kaup, Apodes, 108, 1856, (*balearica*).
Gnathophis, Kaup, Aale Hamb. Mus., 1859, (*heterognathus*).
Congromuræna, Günther, Cat., VIII, 40, 1870, (amended spelling).
Ophisoma, Bleeker, Jordan & Davis, etc., (*acuta*).

This genus contains numerous species of small Congers, distinguished by the more anterior insertion of the dorsal and by the greater development of the muciferous cavities in the head. The species are very closely related and not well known. (*Conger*; *Muræna*; related genera.)

a. Snout more or less projecting beyond mandible.
  b. Vent submedian in position, the body and tail about equal in length; upper jaw little projecting. BALEARICA, 582.
  bb. Vent anterior in position, the tail much longer than rest of body.
    c. Snout short and heavy, blunt, projecting little beyond mandible. MACRURA, 583.
    cc. Snout long and acute, considerably projecting.

---

* By the rules of the American Ornithologists' Union, the generic name *Congermuræna* would be adopted. *Ariosoma* is ineligible because no type is expressed, and the diagnosis is valueless. *Ophisoma* would by some be set aside on account of the prior *Ophisomus*. *Ophisoma* was based on two species, *acuta* and *obtusa*, the latter the common Conger Eel, and this group is really synonymous with Conger.

d. Tail less than twice length of rest of body; eye small, 8⅓ in head; mandible strong. PRORIGERA, 584.

dd. Tail much more than twice length of rest of body; eye large, 7 in head. NITENS, 585.

aa. Snout long, but not projecting; the lower jaw much longer than upper; tail twice length of rest of body; eye 6 in head. FLAVA, 586.

582. CONGERMURÆNA BALEARICA (De la Roche).

Upper jaw but little projecting; lips thin; head about 6 in total length; the tail a little longer than the head and trunk; eye about equal to snout, 5 in head. Color brownish or yellowish; silvery on sides and below; vertical fins with a narrow black edge. Tropical parts of the Atlantic and eastern Pacific. Known from the Mediterranean, Cuba, Brazil, St. Helena, Cape San Lucas and the Galapagos. Possibly more than one species should be recognized, in which case the American form would stand as *C. opisthophthalmus.* (Eu.) (Name from the Balearic Islands, off the coast of Spain.)

Muræna balearica, DE LA ROCHE, Ann. Mus., XIII, 1809, 327, fig. 3, Balearic Islands.

Ophisoma balearicum, JORDAN & DAVIS, *l. c.*, 661.

583. CONGERMURÆNA MACRURA (Gilbert).

Vent anterior in position, the tail much longer than the body. Snout comparatively short and heavy, blunt, and broadly rounded, projecting but little beyond tip of mandible; tail twice length of body; lips full; teeth in mandible in a broad band, those of outer series the largest; maxillary and vomerine teeth also in broad bands; vomerine patch divided by a groove into which fits the tip of the mandible; no teeth on shaft of vomer; posterior nostril an elliptical slit, on level of upper margin of pupil; anterior nostril a round pore near tip of snout; five large mucous pores on each side of jaws; gape extending slightly beyond pupil, 2¾ in head; eye moderate, ¾ in snout, 6 in head; head 1⅕ in trunk, 4 in tail; pectorals ⅓ length of head; origin of dorsal slightly behind base of pectorals. Color dusky above; under side of head and abdomen light, the two areas separated by a well-defined line; fins dusky, becoming black towards tip of tail, with whitish border; inside of mouth, gill cavity, and peritoneum silvery. (Gilbert.) Gulf of California; one specimen known, 9½ inches long. (*μακρός*, long; *οὐρά*, tail.)

---

* According to Poey the vent is exactly in the middle of the body in *Congermuræna analis,* and an eye's diameter nearer the head in *Congermuræna impressa.*

Ophisoma macrurum, GILBERT, Proc. U. S. Nat. Mus., 1891, 351, Gulf of California. (Coll. Albatross.)

584. CONGERMURÆNA PRORIGERA (Gilbert).

Tail considerably longer than rest of body. Eye small, 2 in snout, 8⅓ in head, slightly less than length of gill slit; snout long and sharp, the acute tip projecting beyond mandible for ⅔ length of orbit; teeth villiform, in broad bands, none of them enlarged, a transverse groove behind head of vomer to receive tip of mandible; posterior nostril slit-like, the anterior with distinct membranous tube; mandibles very broad and strong; gape reaching to vertical from posterior margin of pupil, ⅓ of head; conspicuous pore just behind angle of mouth; head equal to trunk, 3 in tail without fin; depth 13 in total length; pectoral 3½ in head; dorsal beginning in advance of gill opening, its distance from tip of snout slightly less than half the distance from snout to anal. Uniform light brown; fins dusky, black near tip of tail, and there with narrow bright white margin; mouth, gill cavity, and peritoneum black. (Gilbert.) Length 1 foot. Panama to Ecuador. (*prora*, prow; *gero*, I bear.)

Ophisoma prorigerum, GILBERT, Proc. U. S. Nat. Mus. 1891, 350, Coast of Ecuador; Panama. (Coll. Albatross.)

585. CONGERMURÆNA NITENS (Jordan & Bollman).

Tail much more than twice length of body; body slender; tail compressed; lower jaw considerably shorter than the upper; dorsal beginning slightly in advance of the root of the pectoral. Head 1⅐ in trunk, 5⅓ in tail; tail 2⅔ times as long as head and trunk; snout 4¼ in head, very soft; eye very large, 7 in head, 1⅔ in snout; interorbital area 2 in eye; cleft of mouth 3⅕ in head, extending slightly behind middle of eye; pectoral long and narrow, 2⅘ in head, 1¾ times as long as gill slit. Color olivaceous, upper parts of head and body with numerous fine black dots; a silvery shade across opercles and below lateral line; peritoneum bright silvery, giving belly a pale color; dorsal and anal with a narrow black margin, below which are a few small spots: pectoral pale. One specimen dredged at *Albatross* station 2801 off Panama, 8° 47′ N., 79° 29′ 30″ W., in 14 fathoms. (*nitens*, shining.)

Ophisoma nitens, JORDAN & BOLLMAN, Proc. U. S. Nat. Mus., 1889, 153, Panama; JORDAN & DAVIS, *l. c.*, 662. (Coll. Albatross.)

586. CONGERMURÆNA FLAVA, Goode & Bean.

Lips somewhat thickened. Snout long, about twice diameter of eye, which is 6 in head. Lower jaw projecting far beyond the upper. Anterior nostril in short tube, posterior nostril pore-like, in advance of eye, and above the horizontal line of its diameter. Cleft of mouth extending very slightly behind middle of eye. Teeth in very narrow bands, villiform, a dense cluster on the vomer. Length of head equal to that of trunk. Tail about twice as long as body. Dorsal beginning far in advance of gill opening and pectoral. Color yellowish; blackish on termination of tail. Specimens obtained by the *Albatross* at stations 2121 and 2122, in 31 to 34 fathoms, and at station 2402, in 111 fathoms;

also by the *Blake* at station 264, in 84 fathoms. (Goode & Bean.) (*flavus*, yellow.)

Congermuræna flava, GOODE & BEAN, Oceanic Ichthyology, 138, fig. 159, 1895, Gulf Stream. (Type, No. 44612. Coll. Albatross.)

157. UROCONGER, Kaup.

Uroconger, KAUP, Apodes, 110, 1854, (*lepturus*).

Mouth very large, its cleft passing middle of eye; vomerine teeth uniserial, some of them canine-like; teeth in jaws in two series. Tail long, slender, whip-like. Dorsal inserted above pectoral. Species few. (*οὐρά*, tail; Conger.)

587. UROCONGER VICINUS, Vaillant.

Depth 20 in length. Vomer with two strong teeth anteriorly. Space separating gill openings considerably greater than their diameter. (Goode & Bean.) Deep waters off coast of northern Africa; a young individual taken by the *Albatross* at station 2161 in 146 fathoms. (*vicinus*, near, *i. e.* to *Uroconger lepturus*.)

Uroconger vicinus, VAILLANT, Exped. Travailleur et Talisman, 86, pl. VI., fig. 1, 1888, Banc d'Arguin, off Soudan, off Cape Verde Islands; GOODE & BEAN, Oceanic Ichthyology, 138, 1895.

Family XLVIII. MURÆNESOCIDÆ.

Scaleless anguilloid eels, with the posterior nostril not labial, the tongue largely adnate, the jaws not excessively elongate, the end of the tail surrounded by the caudal fin, and the pectoral fins well developed. None of these characters appear to have in themselves great importance, but according to Dr. Gill, in the genus *Murænesox*, the only genus in which the osteology is well known, the characters are such as fully to justify family distinction. Dr. Gill gives the following diagnosis of Murænesocidæ:

> "Enchelycephalous Apodals with the tongue not free, the branchiostegal membrane connecting the opposite sides below, the epipharyngeals reduced to one pair, and the hypopharyngeals linguiform and encroaching on the fourth branchial arch."

To this should be added: Gill openings rather wide; pectoral fins well developed; jaws of moderate length; vomer well armed.

Whether all these characters are found in the other genera commonly associated with *Murænesox* is not yet known. The family, as understood by us, seems divisible into two well-marked groups, which are, perhaps, as distinct from each other as from the *Echelidæ* or the *Congridæ*. The species of this family are not very numerous, and a large proportion are American. In general appearance and habits they approach the Congers. All are plainly colored and some descend to rather deep water. (*Murænidæ*, *Murænesocinæ*, Günther, Cat., VIII, 45–49.)

MURÆNESOCINÆ:

a. Dorsal and anal fins well developed throughout, the dorsal beginning nearly above gill opening; snout moderately produced; vomerine teeth very strong.

  b. Teeth in jaws in several series; gill openings wide.

c. Teeth in jaws in several series, those of one series enlarged and compressed, long canines in front; vomer with several long series of teeth, the middle one of conical canines. MURÆNESOX, 158.

cc. Teeth all conical, slender and sharp, those of jaws in wide bands; maxillary with a deep groove, running the entire length of the bone, dividing the band of teeth into two portions; shaft of vomer with a median series of conical teeth. XENOMYSTAX, 159.

bb. Teeth in jaws biserial, small; vomer with a series of long, pointed canines; tail about 4 times as long as rest of body; gill openings narrow. HOPLUNNIS, 160.

STILBISCINÆ:

aa. Dorsal and anal fins very low anteriorly, developed chiefly on the tail.

d. Tail about as long as rest of body; teeth moderate; dorsal beginning before the vent.

dd. Tail short, little more than half as long as rest of body; teeth all uniserial, unequal, some of them canine-like; body very slender, whip-shaped.

e. Body moderately elongate, the diameter more than one-thirtieth the length; dorsal beginning just before vent. NEOCONGER, 161.

ee. Body whip-shaped, the diameter less than one-fiftieth the length.

f. Dorsal fin beginning not far behind pectoral. LEPTOCONGER, 162.

ff. Dorsal fin beginning behind the vent. STILBISCUS, 163.

fff. Dorsal fin beginning close behind the nape. GORDIICHTHYS, 164.

158. MURÆNESOX, McClelland.

Muræenesox, MCCLELLAND, Calcutta Journ. Nat Hist., IV, 408, 1843, (*tricuspidata*).
Cynoponticus, COSTA, Fauna Napoli, Pesci., pl. 28, 1850, (*ferox* = *savanna*).
Brachyconger, BLEEKER, Nederl. Tidsskr., Dierkunde, II, 236, 1865, (*savanna*).
Congresox, GILL, Proc. U. S. Nat. Mus., 1890, 234, (*talabon*).

Body robust. Dorsal and anal fins well developed, the dorsal beginning nearly above gill opening. Mouth large; teeth in jaws in several series, those of one series enlarged and depressed, forming long canines in front; vomer with several long series of teeth, the middle one of strong canines. This genus contains numerous species, large, conger-like eels, some of which are found in all warm seas. They are remarkable for the strong armature of the vomer. (*Muræna*; *Esox*, pike.)

MURÆNESOX:

a. Median teeth on vomer enlarged, compressed, and cultrate; median teeth on side of lower jaw also enlarged and compressed or bluntish.

b. Middle series of teeth on vomer not distinctly tricuspidate; pectoral rather more than half head. CONICEPS, 588.

bb. Middle series of teeth on vomer distinctly tricuspidate in young, becoming entire with age; pectoral 2⅔ in head. SAVANNA, 589.

Subgenus MURÆNESOX.

588. MURÆNESOX CONICEPS, Jordan & Gilbert.

Vomer with a median row of about 15 very large, strong teeth, which are much compressed, the tip angular and directed backwards, and with a nick on the posterior edge, thus: ; one or two of the anterior teeth only slightly tricuspidate; on each side of the median row on vomer some very small, blunt teeth, disappearing anteriorly, arranged in one or two rows very close to the median row; jaws with one or two outer rows of small, blunt teeth, next a row of rather large, wedge-shaped teeth, and then an inner band of small, conical, blunt teeth in two, three, or four series; front of both jaws with groups of canines, which are shorter than the pupil; in old examples the teeth, especially those on the vomer, are often so worn that their original form is not at all evident; head 2 in trunk, 3¾ in tail; pectoral fin 2 in the distance between the tip of snout and the base of the fin or rather more than half length of head; eye 2⅓ in the snout, 1½ in interorbital width, 3½ in cleft of mouth, situated a little behind middle of gape; cleft of mouth 2½ in the head; gill openings large, containing the isthmus twice; dorsal beginning over the gill openings. Olive-brown above, dull-whitish below; dorsal and anal light brown with a dark margin; caudal and pectoral fins black. Length 2 or 3 feet. Cape San Lucas to the coast of Columbia, generally common. Very close to the next, the difference in dentition evident only in the young. (*conus*, cone; *-ceps*, head.)

Murænesox coniceps, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1881, 348, Mazatlan; Jordan & Davis, *l. c.*, 648. (Type, No. 28136. Coll. Gilbert.)

589. MURÆNESOX SAVANNA (Cuvier).

Median series of teeth on vomer distinctly tricuspidate in the young, becoming entire with age, with nearly even surface, thus: ; pectoral as long as maxillary, 2⅔ in head; eye 2 in snout, which is 4½ in head; dorsal inserted over the gill opening. Brown above, silvery below; dorsal and anal edged with black. Otherwise as in *M. coniceps*. Cuba to Rio Janeiro, not common, occasional in the Mediterranean Sea. (Eu.) (Called "Savanne" in Martinique.)

Muræna savanna, Cuvier, Règne Animal, Ed. 2, Vol. 2, 350, 1829, Martinique; Bennett, Proc. Comm. Zoöl. Soc., 135, 1831.

Conger brasiliensis, Ranzani, Nov. Spec. Pisc. Diss. Prima., IV, 17, pl. 13, fig. 1, 1838, Brazil.

Congrus curvidens, Richardson, Voy. Erebus & Terror, 111, 1844, no locality.

Cynoponticus ferox, Costa, Fauna Napoli, Pesc., pl. 28, 1854, Naples.

Conger limbatus, Castelnau, Anim. Am. Sud, 83, pl. 43, fig. 3, 1855, Rio Janeiro.

Brachyconger savanna, Bleeker, Atlas des Murènes Indes Orient, IV, 20, 1864.

Murænesox savanna, Günther, Cat., VIII, 47, 1870; Jordan & Davis, *l. c.*, 648.

159. XENOMYSTAX, Gilbert.

Xenomystax, Gilbert, Proc. U. S. Nat. Mus., 1891, 348, (*atrarius*).

Scaleless; pectorals well developed; vertical fins large, continuous around the tail, the rays evident; dorsal beginning before base of pectorals. Gill slits vertical and rather wide, the gill membrane continuous below the throat. Branchiostegals apparently 11 or 12 in number, long and much curved, continuing around the posterior and upper edges of the opercles; mouth with wide lateral cleft, not extending far beyond eye; maxillaries very wide, not extending far forwards, the clasping processes applied to shaft of vomer well behind its head. Teeth all conical, slender, and sharp, mostly depressible, those in jaws in wide bands; maxillary with a deep lengthwise groove running the entire length of the bone and dividing the band of teeth into two portions; lower jaw much shorter than upper. Posterior nostril a linear slit, midway between eye and tip of snout; the anterior in a short tube just behind the head of vomer; tongue small, with the tip free; lips undeveloped; the lateral line conspicuous. One species. (*ξένος*, strange; *μύσταξ*, maxilla.)

590. XENOMYSTAX ATRARIUS, Gilbert.

Snout very long and slender; end of maxillary equidistant from tip of mandible and gill opening; front of orbit over the beginning of last third of gape; long slit-like pores on margin of upper jaw, a conspicuous series on mandible and preopercle; teeth in jaws in wide bands, mostly depressible; maxillary teeth divided by a deep groove running entire length of jaw, those on inner side of groove long, close-set, rigid, in single series; mandible with much narrower and shallower groove, on the inner edge of which is a single series of very small conical teeth, directed inwards; tip of mandible enlarged to form a knob which fits into a toothless depression just behind head of vomer, the vomer extending well beyond the tip of lower jaw; teeth on head of vomer and knob of mandible similar, slightly larger than those of side of jaw; anterior part of shaft of vomer with median series of strong conical teeth, accompanied by smaller lateral series and followed by a narrower band of very small conical teeth. Head equal to trunk and $\frac{1}{3}$ of tail; gill openings broadly lunate, vertical length of slit $\frac{1}{3}$ of snout, interspace $\frac{2}{3}$ length of slit; pectorals narrow, $\frac{1}{2}$ snout. Color very dark brown; fins black; pores of lateral line white. (Gilbert.) Coast of Ecuador, at *Albatross* station 2792, in 401 fathoms. (*atrarius*, blackish.)

Xenomystax atrarius, GILBERT, Proc. U. S. Nat. Mus., 1891, 348, Lat. 1° S., Long. 81° W. (Coll. Gilbert.)

160. HOPLUNNIS, Kaup.

Hoplunnis, KAUP, Aale Hamburg Museum, 19, 1859, (*schmidtii*).

This genus differs from *Murænesox* chiefly in the dentition; the teeth in the jaws are small and biserial and the vomer has a series of long, pointed canines. The very long tail is four times length of rest of body. Gill openings wide. Two species, American. (*ὅπλον*, armature; *ὕννις*, vomer; correctly written *Hoplynnis*.)

a. Eye 3 in snout; tail four times rest of body. SCHMIDTII, 591.
aa′. Eye 3 to $3\frac{2}{3}$ in snout; cleft of mouth extending beyond eye. DIOMEDIANUS, 592.

591. HOPLUNNIS SCHMIDTII, Kaup.

Tail about four times as long as rest of body; eye 3 in snout; posterior portion of vertical fins black. (Kaup per Günther.) Caribbean Sea at Puerto Cabello; one specimen known and very imperfectly described. (A personal name.)

Hoplunnis schmidtii, KAUP, Aale Hamb. Mus., 19, pl. 2, fig. 4, 1859, Puerto Cabello; GÜNTHER, Cat., VIII, 49, 1870.

592. HOPLUNNIS DIOMEDIANUS, Goode & Bean.

Allied to *H. schmidtii*, with height of body 4 in head; its width $\frac{2}{3}$ its height. Snout 3 to $3\frac{2}{3}$ times eye. Cleft of mouth extends slightly beyond hind margin of eye. Teeth in jaws small, pointed, in narrow bands, the inner series of the lower jaw consisting of enlarged, widely separated canines a pair of larger canines near the end of the lower jaw in the example figured; a row of six to eight strong, large canines on the vomer. A single individual (No. 44240 U. S. Nat. Mus.) was obtained by the *Albatross* at station 2402, Gulf of Mexico, 111 fathoms, lat. 28° 36′, long. 86° 50′. (Goode and Bean.) (Named for the Albatross, *Diomedea*.)

Hoplunnis diomedianus, GOODE & BEAN, Oceanic Ichthyology, 146, 1895, Gulf of Mexico.

161. NEOCONGER, Girard.

Neoconger, GIRARD, U. S. Mex. Bound. Surv., Ichth., 77, 1859, (*mucronatus*).

Body moderately elongate, not whip-like. Pectoral fins present; vertical fins rudimentary, passing around the tail, towards the end of which they are more developed; dorsal beginning just before vent. Cleft of mouth extending beyond the small eye; maxillary teeth slender, in several series; vomerine teeth uniserial, forming a patch in front; tail not much longer than rest of body. Gill openings vertical, rather large. Two species. (*νέος*, new; Conger.)

a. Pectoral small; Gulf of Mexico.	MUCRONATUS, 593.
aa. Pectoral well developed, 3½ to 4 in head; Pacific Ocean.	VERMIFORMIS, 594.

593. NEOCONGER MUCRONATUS, Girard.

Head small, slender, pointed; upper jaw the longer; dorsal fin beginning just in front of the vent, forming a membranous ridge until near the tail, where it expands and becomes fin-like; pectorals small. Dark reddish brown above, paler below. Coast of Texas. (Girard.) One specimen known; the imperfect description not distinguishing it from *N. vermiformis*. (*mucronatus*, mucronate.)

Neoconger mucronatus, GIRARD, U. S. Mex. Bound. Surv., Ichth., 77, 1859, St. Joseph Island, Texas. (Coll. Würdemann.) GÜNTHER, Cat., VIII, 49, 1870; JORDAN & GILBERT, Synopsis, 360, 1883; JORDAN & DAVIS, *l. c.*, 646.

594. NEOCONGER VERMIFORMIS, Gilbert.

Pectoral well developed, 3½ to 4 in head. Snout anteriorly short, slightly projecting beyond mouth; mouth small, reaching slightly behind eye; teeth small, conical, uniserial in jaws, biserial anteriorly on the vomer, uniserial posteriorly; gill slits vertical, longer than eye, a little longer than isthmus; dorsal beginning half length of head in advance of vent; body not very slender, its depth 2½ in head; head 3⅕ in trunk; cleft of mouth 3½ in head; tail usually a little longer than rest of body; tip of tongue slightly free. Color uniform yellowish olive on body and fins, finely dotted with black. Lower California and Panama, in about 30 fathoms; several specimens known. Length 6 inches (*vermis*, worm; *forma*, shape.)

Neoconger vermiformis, GILBERT, Proc. U. S. Nat. Mus., 1890, 57, off Lower California, Albatross Station 3035; (Coll. Gilbert); JORDAN & DAVIS, *l. c.*, 646.

162. LEPTOCONGER, Poey.

Leptoconger, POEY, Anales Hist. Nat. Esp., 250, 1880, (*perlongus*).

This genus differs from *Neoconger* in the much slenderer form, the body being whip-shaped as in *Stilbiscus*. Dorsal beginning between gill opening and vent. (*λεπτός*, slender; *Conger*.)

595. LEPTOCONGER PERLONGUS (Poey).

Head 4 in trunk; tail about a third longer than rest of body; gape 4 in head; eye large, 1¾ in snout; snout pointed; teeth hooked, short and robust, subequal and uniserial, a few in front enlarged; lower jaw much shorter than upper; dorsal beginning just behind tip of pectoral. Violet brown, pale below; dark points over the entire surface. (Poey.) Matanzas, Cuba; one specimen known. (*perlongus*, very long.)

Neoconger perlongus, POEY, Ann. Lyc. Nat. Hist. N. Y., 67, pl. 9, fig. 3–4, 1874, Matanzas.
Leptoconger perlongus, POEY, Ann. Hist. Nat. Esp., 250, 1880; JORDAN & DAVIS, *l. c.*, 644.

163. STILBISCUS, Jordan & Bollman.

Stilbiscus, JORDAN & BOLLMAN, Proc. U. S. Nat. Mus., 1888, 549, (*edwardsi*).

Body whip-shaped, with the tail very short; teeth uniserial, some of the anterior canine. Fins low, the dorsal beginning behind vent. One species known. (*στίλβω*, to shine.)

596. STILBISCUS EDWARDSI, Jordan & Bollman.

Head 7½ in trunk, 4½ in tail; snout 7 in head, its length somewhat greater than distance between gill openings; eye 1⅘ in snout, 1½ in interorbital space; cleft of mouth reaching to posterior margin of eye; upper jaw 5 in head; height of gill opening 1½ in snout; teeth all uniserial, some of the anterior enlarged, canine-like; dorsal beginning $1\frac{2}{7}$ length of head behind vent; length of first part about equal to head and pectoral; developed part of dorsal at tail contained 1⅔ times in the head; pectoral 6 in head. Upper part of head and body above lateral line brown; lower parts bright metallic-bluish silvery; dorsal and anal pale, the latter with a dusky stripe on each side of its base; pectorals dusky; caudal black. Green Turtle Cay, one of the Bahamas. One specimen known. (Named for Dr. Charles Lincoln Edwards, of the University of Cincinnati.)

Stilbiscus edwardsi, JORDAN & BOLLMAN, Proc. U. S. Nat. Mus., 1888, 549, Green Turtle Cay, Bahamas. (Coll. Edwards.)

164. GORDIICHTHYS, Jordan & Davis.

Gordiichthys, JORDAN & DAVIS, Prelim. Review Apodal Fishes, 644, 1892, (*irretitus*).

Body whip-shaped, excessively long and slender; tail very short; vertical fins low, the dorsal beginning close behind the nape. Teeth uniserial, unequal, some of them canine-like. One species known. (Gordius, the horsehair worm, from *Γόρδιος*, the king whose complicated knot was cut by Alexander; *ἰχθύς*, fish.)

597. GORDIICHTHYS IRRETITUS, Jordan & Davis.

Dorsal fin beginning before the gill opening, not far behind the nape; trunk very long; tail 1⅕ in rest of body; head about 16 in trunk (15 to 18, the type being so injured that the gill openings can not be made out); greatest depth of body 40 to 50 times in length of body; upper jaw much the longer, arched, the eye behind its middle; eye moderate, 2½ in snout, 4½ in gape; lower jaw with one row of about 10 stoutish, recurved teeth on each side, those in front enlarged and canine-like; upper jaw with a series of similar teeth on each side and another down middle of vomer, these three series converging forward and meeting at a point opposite middle of lower jaw; in front of this on premaxillary and nasal bones about 4 large, stout, hooked canines, the largest teeth of all; 123 vertebræ in trunk (probably about 100 in tail); pectoral, gill opening, and skin wholly digested in the type; coloration probably similar to *Stilbiscus edwardsi.* Length 2½ feet. Snapper Banks of West Florida, in rather deep water, known from half digested specimens and fragments found in stomachs of other fishes. (*irretitus*, entangled.)

Gordiichthys irretitus, Jordan & Davis, Apodal Fishes, 644, 1892, off Pensacola, Florida. (Coll. Stearns.)

Family XLIX. NETTASTOMIDÆ.

(The Sorcerers.)

Eels without pectoral fins, with the tongue not free, the posterior nostrils remote from the lip, the gill openings small, separate, and subinferior, the vent remote from the head, the tail ending in a slender tip or filament, the dorsal and anal fins moderately developed, and the jaws produced, slender, and straight, the upper the longer, and both, as also the vomer, armed with bands of sharp, close-set, recurved, subequal teeth. This family contains a few species of deep-sea eels, closely allied to the *Murænesocidæ* in technical characters, but more resembling the *Nemichthyidæ* in appearance, form of the head, and in dentition. Three genera are known—deep-sea fishes, with fragile bodies and the thin skin charged with black pigment. (*Murænidæ*, part, Günther, Cat., VIII, 48, 1870.)

a. Dorsal fin low, beginning nearly above gill opening.
  b. Nostrils lateral, the posterior slit-like, placed just in front of eye; snout without fleshy tip. Chlopsis, 165.
  bb. Nostrils nearly superior, the posterior above and in front of eye, the anterior at tip of bony portion of snout; head with numerous mucous pores.
    c. Snout with a long, slender, fleshy tip or proboscis, at the base of which are the anterior nostrils. Venefica, 166.

165. CHLOPSIS, Rafinesque.

Chlopsis, Rafinesque, Indice Ittiol. Sicil, 58, 1810, (*bicolor*).
Saurenchelys, Peters, Berliner Monatsberichte, 1864, 397, (*cancrivora*).

This genus, sufficiently characterized above, is very close to *Nettastoma*, differing chiefly in the position of the nostrils. Two species known, in rather deep water. (χλόη, a twig; ὄψις, appearance.)

598. CHLOPSIS EQUATORIALIS, Gilbert.

Head, 2⅗ in head and trunk; eye 3½ in snout; body extremely slender, tapering posteriorly to a very narrow tail, which is, however, not filamentous; head long and slender, lower jaw shorter than the upper; eye nearly over angle of mouth; posterior nostril a long horizontal slit immediately in front of lower margin of eye; series of slit-like mucous pores along upper jaw; series of round pores along lower jaw; transverse series on occiput; both jaws and vomer with wide bands of short, sharp, conical teeth, inner series on jaws slightly longer than the other; bands on shaft of vomer reaching back to front of posterior nostril; gill openings with their margins much curved, forming $\frac{4}{5}$ of a circle, their vertical diameter nearly equal to that of eye, and more than twice the length of the interspace; gape $2\frac{3}{5}$ in head; body $3\frac{1}{4}$ in tail; dorsal beginning $1\frac{1}{2}$ length of head behind the same. Color dusky olive, dotted with coarse brown specks everywhere except on under side of head and fins; blackish streak on median line of belly; fins translucent. (Gilbert.) Coast of Ecuador, at *Albatross* station 2792, in 401 fathoms. (*Æquator*, *Ecuador*, *Equator*, the great circle of latitude of the earth.)

Chlopsis equatorialis, GILBERT, Proc. U. S. Nat. Mus., 1891, 347, off Coast of Ecuador, Lat. 1° S., Long. 81° W. (Coll. Albatross.)

166. VENEFICA, Jordan & Davis.

Venefica, JORDAN & DAVIS, Apodal Fishes, 651, 1892, (*procerum*).

This genus sufficiently described above, differs from the European genus *Nettastoma*, only in the presence of a fleshy proboscis on the tip of the snout. Two species known. (*Venefica*, sorceress, from the name Sorcière, used at Nice for *Nettastoma melanurum.*)

599. VENEFICA PROCERA, Goode & Bean.

Body very elongate, compressed, tapering to a very slender attenuate point; its greatest height contained nearly 4 times in distance from gill opening to tip of lower jaw, and equals half length of snout. Head slender, conical; jaws somewhat depressed; upper jaw heavier and thicker, and projecting beyond the lower a distance equal to eye. Length of snout equal to distance from posterior margin of orbit to gill opening; cleft of mouth extending behind eye a distance equal to orbit. On each side of upper jaw, and in advance of eye, are twelve pores; behind each eye are three pores, while on median line, on top of upper jaw, are several pores posteriorly arranged in pairs, of which there are four, the ultimate pair being between the posterior nostrils. A pair of pores upon nape, connecting postorbital rows, and seventeen on each side of mandible. Mandibular series continued by another series extending over cheeks and nape. Snout with a slender, filamentous tip, whose length is equal to twice eye. Tongue apparently absent. Teeth arranged as in *Nettastoma melanurum*, but exceedingly small. Dorsal fin commencing above gill opening. Anal inserted at a distance from snout equal to $3\frac{2}{3}$ times length of head. Tail twice as long as rest of body. Lateral line highly specialized, with numerous pores, corresponding in general character to those upon the head, and arranged in a deep furrow, their distances apart being about the same as in the case of those upon the head. Height of dorsal and anal fins about equal to half the height of body. Color, apparently, brownish; peritoneum black. Types, two fishes obtained at station 325, N. lat. 33° 35′ 20″, W. long. 76°, at a depth of 647 fathoms. Another mutilated specimen, about 190 millimeters long, taken at station 327. This species is in many respects closely allied to *Nettastoma melanurum* of the Mediterranean, but appears to differ from it in the greater length of the tail, the much smaller teeth, and in the presence of a filamentous nasal tip. Length 30 inches. (Goode & Bean.) Also taken off San Pedro, California. (Gilbert. Albatross Coll.) (*procerus*, tall or long.)

Nettastoma procerum, GOODE & BEAN, Bull. Mus. Comp. Zoöl., x, 1883, 224, Gulf Stream.
Venefica procera, JORDAN & DAVIS, Apodal Fishes, 652; GOODE & BEAN, Oceanic Ichth., 149, 1895.

Family L. NEMICHTHYIDÆ.

(THE SNIPE EELS.)

Body excessively slender, not strongly compressed, deepest near the middle, tapering backward to the tail, which usually ends in a long and slender filament, and forward to a very long and slender neck, which is abruptly enlarged at the occipital region. No scales. Lateral line represented by one or more rows of pores. Head resembling that of *Tylosurus*, the head proper small, short, and rather broad, with flat top and vertical sides. Nostrils large, close together in front of the eye, without tube or flap; jaws excessively prolonged, almost needle-like, the upper the longer and somewhat recurved. Teeth in both jaws small, very numerous, close-set, retrorse. Gill openings rather large, running downward and forward, separated by a narrow isthmus or partly confluent. Pectorals well developed. Anal fin beginning near the vent, higher than the dorsal, becoming obsolete on the caudal filament. Dorsal beginning close behind occiput, its anterior rays soft, succeeded by a long series of very low, simple, spine-like rays, which are slightly connected by membrane, their height rather less than the length of the interspaces; on the tail these spines again give place to soft rays. The soft rays of the fins are connected by thin membrane instead of being imbedded in thick skin, as in eels generally. Color translucent, the lower parts dark, the back pale. Stomach not distensible. Muscular and osseous systems well developed. Abdominal cavity extending far behind the vent. Genera 6, species about 10; singular inhabitants of the deep seas. The species are little known and their anatomy has not been studied. They are certainly eels, and their nearest relations seem to be with the *Nettastomidæ*. The truncate tail of some specimens is probably a result of mutilation. (*Murænidæ*, group, *Nemichthyina*, GÜNTHER, Cat., VIII, 21, 1870.)

- *a.* Gill openings partly confluent, rather large; vomerine teeth conspicuously enlarged.
  - *b.* Vomerine teeth lancet-shaped, very close set; jaws moderate, the snout not longer than rest of head; vent at a distance behind head about equal to postorbital part of head; eye above angle of mouth. SERRIVOMER, 167.
  - *bb.* Vomerine teeth conical; jaws very long, attenuate; color silvery. SPINIVOMER, 168.
- *aa.* Gill openings distinctly separate; vomerine teeth moderate; jaws excessively attenuate, the upper longer and recurved; tail probably always normally with a filiform tip; (truncate in injured specimens; short and band-like in translucent larvæ).
  - *c.* Vent remote from the head, at a distance behind pectoral more than 3 times length of that fin; color black.
    - *d.* Gill slits lateral, vertical, well separated; dorsal commencing above pectorals; tail filamentous; jaws long and slender; a single series of pores along lateral line. AVOCETTINA, 169.
  - *cc.* Vent at the throat, at a distance behind the head less than length of pectoral; anal fin beginning below middle of pectorals; body very long and slender, most of the dorsal rays very slender, nearly free, appearing like slender spines; jaws very slender, not expanded at tip.

e. One row of pores along lateral line; tail truncate, (doubtless mutilated); color black. LABICHTHYS, 170.

ee. Three rows of pores along lateral line; color dusky silvery, darker below; tail always ending in a long filament. NEMICHTHYS, 171.

167. SERRIVOMER, Gill & Ryder.

Serrivomer, GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 260, (*beanii*).

Nemichthyids with the head behind eyes of an elongated parallelogramic form, with moderately attenuated jaws; branchiostegal membrane confluent at posterior margin, but with the branchial aperture limited by an isthmus except at the margin, and with lancet-shaped vomerine teeth in a crowded (sometimes doubled) row. (*serra*, saw; *vomer*, vomer.)

600. SERRIVOMER BEANII, Gill & Ryder.

Stoutest of the family, with much shorter jaws than any other, and with a very formidable vomerine armature; depth of head at vertical from mandibular articulation contained 37 times in the total length; greatest height 29¾ in total length. (Gill & Ryder.) Gulf Stream. (Lat. 41° 40′ 30″, long. 65° 28′ 30″, at 855 fathoms.) Also taken by Dr. Gilbert in the Gulf of California. (Named for Tarleton Hoffman Bean.)

Serrivomer beanii, GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 261, Gulf Stream; JORDAN & DAVIS, *l. c.*, 653. (Type, No. 33383. Coll. Albatross.)

168. SPINIVOMER, Gill & Ryder.

Spinivomer, GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 261, (*goodei*).

Nemichthyids with a rectilinear occipitorostral outline, with very attenuated jaws, high mandibular rami, the branchial aperture nearly confluent; enlarged acute conic teeth in a median row on the vomer, and with a silvery epidermis and filiform tail. (*spina*, spine; *vomer*, vomer.)

601. SPINIVOMER GOODEI, Gill & Ryder.

Silvery; recognizable also from its smaller eye and deeper mandibles; greatest height of body at the branchial regions contained 52 times in total length; rays ensheathed in a tough membrane. (Gill & Ryder.) Gulf Stream. (Lat. 38° 19′ 26″, long. 68° 20′ 20″, at 2,361 fathoms.) (Named for George Brown Good.)

Spinivomer goodei, GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 261, Gulf Stream; JORDAN & DAVIS, *l. c.*, 654. (Type, No. 33293. Coll. Albatross.)

169. AVOCETTINA, Jordan & Davis.

Avocettina, JORDAN & DAVIS, Apodal Fishes, 655, 1892, (*infans*).

This genus is closely allied to *Nemichthys*, but differs notably in the position of the vent. Lateral line with one series of pores. (*Avocetta*, the avocet, *Recurvirostra*, from the form of the bill.)

602. AVOCETTINA INFANS (Günther).

Eye rather large, contained 2 to 3 times in the distance between eye and pectoral; jaws long and filamentous, upper jaw 4 times the length of postorbital part of head; both jaws covered with very fine recurved teeth; pectoral fin about as long as the head is high; gill openings a little less than eye; postorbital part of head contained about 4 times in trunk; dorsal beginning over pectorals, consisting of very delicate rays; trunk contained at least 12 times in tail; greatest depth of body about equal to head without snout. Lateral line with one series of conspicuous pores. Color uniform black, jaws lighter. Deep sea; known from West Indies, mid-Atlantic, off Pernambuco. Also from Alaska, the present description from a specimen taken by Dr. Gilbert off the coast of Alaska, apparently referable to *A. gilli*, but agreeing with Günther's figure of *A. infans*. (*infans*, immature.)

Nemichthys infans,* GÜNTHER, Ann. and Mag. Nat. Hist., 1878, 24, and in Voyage Challenger, XXII, 264, 1887, mid-Atlantic, 2,500 fathoms.

? *Labichthys*† *gilli*, BEAN, Proc. U. S. Nat. Mus., 1890, 45, east of Prince of Wales Island, Alaska. (Type, No. 44239. Coll. Albatross.)

Avocettina infans, JORDAN & DAVIS, *l. c.*, 655.

170. LABICHTHYS, Gill & Ryder.

Labichthys, GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 261, (*carinatus*).

According to Goode & Bean the scantily described genus *Labichthys* is identical with *Avocettina*.‡ The following is the original diagnosis:

Nemichthyids with the head behind the eyes, contracted, with very attenuated jaws, the branchiostegal membrane connected to the throat, and the branchial apertures limited to the sides; with small, conical teeth in a band along the vomer, and otherwise dentition of *Nemichthys*; a black epidermis, and the tail abruptly truncated. (Gill & Ryder.) (*λαβή*, grip or hold, correlated with *λαβίς*, forceps; *ἰχθύς*, fish.)

a. Ridges bounding the median rostral groove converging backward in a median keel.
CARINATUS, 603.

aa. Ridges bounding the median rostral groove not confluent backward in a keel.
ELONGATUS, 604.

603. LABICHTHYS CARINATUS, Gill & Ryder.

The ridges that bound the median rostral groove converging and forming a carina along the median line in vertical from the anterior border of the orbit; greatest height $34\frac{1}{3}$ in total length. Color black. (Gill & Ryder.) Dorsal beginning over base of pectoral; vent close behind the pectorals. (Bean.) Gulf Stream, 41° 13′ N., 65° 33′ W.; a scantily described species, not seen by us. (*carinatus*, keeled.)

Labichthys carinatus, GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 253, 255, 261, Gulf Stream; JORDAN & DAVIS, *l. c.*, 656. (Type, No. 33369. Coll. Albatross.)

---

* *Nemichthys infans*, GÜNTHER: Body much less elongate and eye much smaller than in *Nemichthys scalopacea*. Vent twice or thrice as distant from root of pectorals as is the latter from eye. Eye of moderate size, its diameter about $\frac{1}{3}$ its distance from pectoral fin, and about twice interorbital space. (Günther.)

† *Labichthys gilli*, BEAN: Eye half length of postorbital part of head and $\frac{2}{3}$ length of pectoral. Postorbital part of head is $\frac{1}{4}$ upper jaw and $\frac{3}{11}$ of lower from angle of mouth. Dorsal beginning nearly over end of pectoral. Vent distant from head a space equal to 4 times postorbital part of head. Depth of body equals length of head without snout, $\frac{1}{39}$ of total. Dorsal rays very short; longest anal rays $\frac{1}{5}$ length of head. Lateral line of one series of large pores. Color uniform black. Length $18\frac{1}{5}$ inches. Type from east of Prince of Wales Island, 55° 20′ N., 136° 20′ W., at 1,569 fathoms. (Bean.) Probably identical with *Avocettina infans*. (Named for Theodore Gill.)

‡ We should accept this view were it not that the type of *Labichthys* is said to have the vent at the throat as in *Nemichthys*. The posterior portion of the vent defines *Avocettina*.

604. LABICHTHYS ELONGATUS, Gill & Ryder.

The ridges that bound the rostral groove not confluent backwards in a carinaform extension, but ending in a vertical from the orbit; greatest height of body 36 in a total length. Color black. (Gill & Ryder.) Vent not described. Gulf Stream, Albatross Station 2100, 39° 22′ N., 68° 34′ W. (*elongatus*, elongate.)

Labichthys elongatus, GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 262, Gulf Stream; JORDAN & DAVIS, *l. c.*, 656. (Type, No. 33577. Coll. Albatross.)

171. NEMICHTHYS, Richardson.

Nemichthys, RICHARDSON, Voyage Samarang, 16, 1848, (*scolopaceus*).
Leptorhynchus, LOWE, Ann. Mag. Nat. Hist., x, 1852, 54, (*leuchtenbergii*), (preoccupied).
Belonopsis, BRANDT, Mém. Ac. St. Petersb., Savans Étrangères, 174, 1854, (*leuchtenbergii*).

Gill openings separate; vomerine teeth moderate; vent at the throat. Body very long and slender, ending in a filamentous tail. Jaws very slender, recurved, not expanded at tip. This genus contains one or two species of long and very slender eels, living in deep water, though perhaps nearer the surface than the members of related genera. (*νῆμα*, thread; *ἰχθύς*, fish.)

a. Eye moderate, less than half postorbital part of head; depth of head 7 in its greatest length. SCOLOPACEUS, 605.
aa. Eye larger, half length of postorbital part of head; depth of head 9 in its length. AVOCETTA, 606.

605. NEMICHTHYS SCOLOPACEUS, Richardson.

(SNIPE EEL.)

Head comparatively stout, its depth one-seventh its greatest length. Eye moderate, less than one-third the length of the head without snout. Length of pectoral fins slightly less than height of the anal, which is less than the height of the body and rather more than greatest depth of head. Pale above, belly and anal fin blackish, the color not abruptly changing, the back somewhat speckled. Length 36 inches. Atlantic Ocean, in deep water; very many specimens taken with the beam trawl off the New England coast and off the Grand Banks. Common about Madeira. (*scolopax*, snipe.)

Nemichthys scolopacea, RICHARDSON, Voy. Samarang, 25, 1848, South Atlantic; GÜNTHER, Cat., VIII, 21, 1870; GOODE & BEAN, Bull. Essex Inst., 26, 1879; GOODE, Proc. U. S. Nat. Mus., 1880, 485; GOODE & BEAN, Bull. Mus. Comp. Zoöl., 225, 1883; JORDAN & GILBERT, Synopsis, 366, 1883; GÜNTHER, Voy. Challenger, XXII, 263, 1887.
Leptorhynchus leuchtenbergii, LOWE, Mém. Soc. Savans Étrangères, Petersburg, 171, 1854, Madeira.
Belonopsis leuchtenbergii, BRANDT, Mém. Soc. Sav. Étr., Petersb., 174, 1854, (with good plate).
Nemichthys scolopaceus, JORDAN & DAVIS, *l. c.*, 657.

606. NEMICHTHYS AVOCETTA, Jordan & Gilbert.

Head 10; depth 58; depth of anal 64 in length of body. Head slenderer, its depth one-ninth its greatest length. Eye large, one-third the head, without snout. Length of pectoral scarcely greater than height of anal, which is scarcely less than greatest depth of body, and more than greatest depth of head. Translucent; belly with close-set dark spots, its lower edge and anal fin black, the back abruptly white and unspotted. Length 22 inches. Puget Sound, near Seattle. One example known, found swimming at the surface; differing in some slight respects from all Atlantic specimens examined, but very likely not a distinct species. (*avocetta*, the avocet.)

Nemichthys avocetta, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 409, Harbor of Port Gamble, Puget Sound, near Seattle. (Type, No. 27299. Coll. University of Washington.) JORDAN & GILBERT, Synopsis, 367, 1883; JORDAN & DAVIS, *l. c.*, 657.

Family LI. MYRIDÆ.

(THE WORM EELS.)

End of tail surrounded by the confluent vertical fins; the posterior nostril is in, or very near, the upper lip, and the tongue is more or less fully adnate to the floor of the mouth. The species are usually of small size and plain colors, more or less worm-like in form, and inhabit sandy coasts in tropical seas. The genera have but few species each. They are intermediate in character between the *Ophichthyidæ* and the *Murænesocidæ*. The osteology has not yet been carefully studied, but they will probably be found to be most nearly related to the latter family, if indeed the two should not be, as in Bleeker's arrangement, reunited with the *Leptocephalidæ*. (*Murænidæ*, *Myrina*, Günther, Cat., VIII, 49–53, 1870.)

- *a.* Body elongate, subterete; pectorals present, sometimes minute; anterior nostril tubular; dorsal fin beginning behind head; teeth small.
  - *b.* Dorsal fin beginning behind vent; no teeth on vomer; teeth mostly uniserial; body slender, terete. AHLIA, 172.
  - *bb.* Dorsal fin beginning before the vent; vomer with teeth.
    - *c.* Dorsal beginning at a point about midway between gill opening and vent; pectorals very small; teeth subequal; body slender, terete; the tail much longer than rest of body. MYROPHIS, 173.
- *aa.* Body short, much compressed; pectorals almost invisible; mouth narrow; vomerine teeth none; snout obtuse, depressed; vertical fins well developed, the dorsal beginning behind the gill opening. CHILORHINUS, 174.

172. AHLIA, Jordan & Davis.

Ahlia, JORDAN & DAVIS, Apodal Fishes, 639, 1892, (*egmontis*).

This genus differs from *Myrophis* in the posterior insertion of the dorsal and in the absence of vomerine teeth. (Named for Jonas Nicolas Ahl, of Upsala, whose thesis "De Muræna et Ophichtho," "modestly offered" for the consideration of President Thunberg in 1789, furnishes the beginning of our systematic arrangement of the eels.)

607. AHLIA EGMONTIS (Jordan).

Head small, slender, moderately pointed; anterior nostril in a short tube; posterior large, labial directly behind it; cleft of mouth rather short, extending to beyond the rather large eye, which is more than half length of snout; cleft of mouth $3\frac{1}{6}$ in head; teeth on both jaws subequal, pointed, slightly compressed, arranged in single series, those of both jaws directed somewhat backward; the lower teeth larger and more oblique than the upper; about 4 small fixed canines in front of upper jaw; no teeth on vomer in two specimens examined; tongue not free; lower jaw considerably shorter than upper, its edge considerably curved, concave in outline. Nape somewhat elevated; top of head with large pores. Head $5\frac{1}{5}$ in distance from snout to vent; head and trunk a little shorter than tail; body slender, its greatest depth a little more than length of gape. Pectoral short and broad, slightly longer than snout; the gill opening short, oblique, extending downward and backward from near middle of base of pectoral. Dorsal fin beginning behind vent, at a distance about equal to length of gape; the fin very low in front, becoming gradually higher towards the tip of tail; anal low, but well developed, considerably higher than dorsal, highest anteriorly, uniting with the dorsal around the tail. Dark brown, apparently uniform, somewhat paler below. Length 15 inches. Egmont Key, Florida. One specimen known.

Myrophis egmontis, JORDAN, Proc. Ac. Nat. Sci. Phila., 1884, 44, Egmont Key, Florida. (Type, No. 35086. Coll. Jordan.)

Ahlia egmontis, JORDAN & DAVIS, *l. c.*, 639.

173. MYROPHIS, Lütken.

Myrophis, LÜTKEN, Vidensk. Meddel. Nat. Foren. Kjöbenhavn, 1, 1851, (*punctatus*).

Boby slender, subterete. Pectoral fins small, but present; vertical fins low, surrounding the tail; dorsal beginning before the vent. Vomerine teeth anteriorly in two or three series. Three species of small eels, resembling earthworms, found on the sandy shores of tropical America. (*μῦρος*, Myrus, a genus of eels; *ὄφις*, snake.)

a.	Base of pectoral half width of gill opening; snout very narrow.	PUNCTATUS, 608.
aa.	Base of pectoral as wide as gill opening; snout almost as broad as long.	VAFER, 609.

608. MYROPHIS PUNCTATUS, Lütken.

Base of pectoral fin half width of gill opening; snout very narrow; jaws weak; width of snout between the anterior nostrils less than diameter of eye; width of interorbital space equal to eye; greatest width of head less than that of body behind the gill openings; teeth uniserial on vomer and mandible, biserial on maxillary; head 3 times in trunk, 7 times in the tail; depth of body at gill openings $2\frac{3}{4}$ in head; eye 2 in snout, which is 6 in head; gape $3\frac{1}{2}$ in head; upper jaw projecting. General color light brown, the sides and back punctate with dark brown dots; belly and throat plain, except a little patch of dusky points below the gill openings. West Indian Fauna; coast of Texas to Surinam; common along our Gulf Coast; resembling an earthworm and scarcely larger. (*punctatus*, speckled.)

Myrophis punctatus, LÜTKEN, Vid. Med. Naturh. Foren. Kjöben., 1, 1851, West Indies; JORDAN, Proc. Ac. Nat. Sci. Phila., 1883, 282; JORDAN, Proc. U. S. Nat. Mus., 1884, 33; JORDAN & DAVIS, *l. c.*, 640.

Myrophis longicollis, KAUP, Apodes, 30, 1856, (not *Muræna longicollis* CUVIER, which is *Echelus myrus*).

Myrophis microstigmius, POEY, Repertorio, II, 250, 1867, Cuba; JORDAN & GILBERT, Synopsis, 900, 1883.

Myrophis lumbricus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 261, Galveston, Texas. (Type, No. 30896. Coll. Jordan.) JORDAN & GILBERT, Synopsis, 899, 1883.

609. MYROPHIS VAFER, Jordan & Gilbert.

Base of pectoral fin as wide as the gill opening; snout almost as broad as long; width at the nostrils greater than the interorbital width; dorsal commencing nearer the vent than the gill openings; teeth uniserial on vomer and mandible, biserial on maxillary; head a little less than 3 in the trunk, 5½ in the tail; depth of body at the gill openings 3½ to 4 in head; upper jaw projecting. Color light brown; sides and back with minute brown specks, smaller than in *punctatus*; belly and throat plain. Pacific Coast of Tropical America, from Guaymas to Panama; common. Similar to *M. punctatus*, but the pectorals longer. (*vafer*, sly.)

Myrophis vafer, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 645, Panama. (Type, No. 29681. Coll. Gilbert.) JORDAN, Proc. U. S. Nat. Mus., 1885, 370; JORDAN & DAVIS, *l. c.*, 641.

174. CHILORHINUS, Lütken.

Chilorhinus, LÜTKEN, Vidensk. Meddel. Naturg. Foren. Kjöbenhavn, 1, 1851, (*suensonii*).

Body short, much compressed; mouth narrow; no teeth on vomer; snout depressed, obtuse; pectoral fins very small; vertical fins well developed, the dorsal commencing behind the gill opening. One species known. (*χεῖλος*, lip; *ῥίν*, nostril.)

610. CHILORHINUS SUENSONII, Lütken.

Head and trunk forming $\frac{2}{5}$ of the total length; dorsal fin commencing at a point half way between vent and snout; depth 9 times in the total length; eye 2½ in interorbital width, the latter equaling the muzzle; teeth on palatines biserial; ten teeth in two transverse rows on the nasals; teeth on lower jaw triserial. Color uniform dark brown; throat paler; fins darker margined. (Cope.) St. Croix, West Indies, not known elsewhere. (A personal name.)

Chilorhinus suensonii, LÜTKEN, Vid. Med. Naturg. Foren., 1, 1851, St. Croix; GÜNTHER, Cat., VIII, 52, 1870; COPE, Trans. Amer. Phil. Soc., 1870, 482; JORDAN & DAVIS, *l. c.*, 639.

Family LII. OPHICHTHYIDÆ.

(THE SNAKE EELS.)

This family includes those Enchelycephalous eels which are scaleless, and have the end of the tail projecting beyond the dorsal and anal fins, and without the rudiment of a caudal fin. Anterior nostrils placed in the upper lip, opening downwards; gill openings not confluent; tongue more or less fully adnate to the floor of the mouth. The species are, for the most part, moderate or small in size, and they are very abundant in the tropical seas, especially about the coral reefs. The eggs are numerous, of moderate size, similar to those of ordinary fishes. Genera about 12. Species nearly 100. Most of the known genera are found in America, but less than half the species. Many of the species are singularly colored, the bands or spots heightening the analogy between them and the serpents. (*Murænidæ*, part *Ophichthyina*, Günther, Cat., VIII, 54–90, 1870.)

a. Body without traces of fins anywhere; teeth all small, conical; gill openings near together, subinferior; anterior nostril tubular; tongue scarcely free in front; mouth small.
  b. Gill-slits inferior, converging forward. SPHAGEBRANCHUS, 175.
  bb. Gill-slits small, lateral, placed vertically. VERMA, 176.

aa. Body with distinct fins, at least on the back.

c. Anal fin wholly wanting; no pectoral fin; dorsal fin high, beginning on the head; gill openings subinferior, converging; anterior nostrils tubular; tongue slender, somewhat free in front. LETHARCHUS, 177.

cc. Anal fin well developed; anterior nostril usually in a short tube near tip of snout.

d. Teeth blunt, mostly granular or molar; vomer with teeth; pectoral fins present, small.

e. Dorsal rather high, beginning on the head, before the gill opening. MYRICHTHYS, 178.

ee. Dorsal fin beginning behind the gill opening, the fin usually low. PISOODONOPHIS, 179.

dd. Teeth all pointed, none of them molar; vomer with teeth.

f. Dorsal fin beginning before nape, on anterior part of head; pectoral fin small or wanting.

g. Pectoral fins wholly wanting; body compressed, the dorsal fin high. CALLECHELYS, 180.

gg. Pectoral fins small, but present; body elongate, subterete, the dorsal fin moderate. BASCANICHTHYS, 181.

ff. Dorsal fin beginning more or less behind gill opening.

h. Pectoral fins reduced to a small flap, not longer than eye; teeth small, mostly uniserial; gill openings lateral. QUASSIREMUS, 182.

hh. Pectoral fins well developed, much longer than eye; teeth gill-openings usually lateral, sometimes subinferior.

i. Snout moderate or short, less than one-fourth head, the jaws not produced into a slender beak (as in the European genus *Ophisurus*).

j. Lips not fringed.

k. Teeth subequal, with no elongate canines on jaws or vomer. OPHICHTHUS, 183.

kk. Teeth unequal, some of them long canines, either on vomer or on sides of one or both jaws; mouth large, the snout short, and the eyes more or less superior.

l. Teeth on vomer small, fixed, in two or three series; tail a little longer than rest of body. MYSTRIOPHIS, 184.

ll. Teeth on vomer a series of about four depressible canines; tail much shorter than rest of body. SCYTALICHTHYS, 185.

jj. Lips with a conspicuous fringe of papillæ; canines present on jaws and vomer; jaws rather long, the lower projecting; head depressed; eyes superior; tail shorter than rest of body. BRACHYSOMOPHIS, 186.

175. SPHAGEBRANCHUS, Bloch.

Sphagebranchus, BLOCH, Ichthyologia, IX, 88, pl. 419, 1795, (*rostratus*).*

Cæcilia, LACÉPÈDE, Hist. Nat. Poiss., II, 135, 1800, (*branderiana*=*cæcus*); (not *Cæcilia*, L., a genus of *Batrachia*).

Apterichthys, DE LA ROCHE, Ann. Mus., XIII, 325, 1809, (*cæcus*).

Branderius, RAFINESQUE, Analyse de la Nature, 1815, 93, (*cæcus*).

---

* *Sphagebranchus rostratus*, Bloch, is known only from the original figure and description. According to these the species is allied to *Sphagebranchus selachops*, having similar gill openings, but with the tail scarcely as long as the rest of the body, the head larger, about 2 in body or 5 in total length; snout very sharp; eye moderate. According to Bloch, his type came from the East Indies. Schneider (1801) corrects the locality to "rivers of Surinam." We have no means of knowing which record is correct, until the species is found again.

Ichthyapus, BRISOUT DE BARNEVILLE, Revue Zoölogique, 219, 1847, (*acutirostris*).
Ophisuraphis, KAUP, Apodes, 29, 1856, (*gracilis*).

This genus contains several little-known species of small eels remarkable for showing no trace of fins in the adult stage. The snout projects beyond the small mouth, giving a shark-like profile, and the small teeth are mostly uniserial. The gill-slits are inferior and converging. The name *Sphagebranchus* was based on a species which evidently belongs to the genus. It has, therefore, clear priority over *Ichthyapus* and *Apterichthys*.

This genus is the most simple in structure among the genera of *Ophichthyidæ*, as *Ophichthus* is probably the most specialized. Its loss of fins is doubtless due to degeneration, but it seems nearer the primitive type than *Brachysomophis* or *Ophichthus*. (*σφάξ*, throat; *βράγχια*, gills.)

a. Eyes visible. Tail nearly half longer than head and trunk; gill slits inferior, converging.
  b. Head 6 times in trunk. ANGUIFORMIS, 611.
  bb. Head little more than 4 times in trunk. SELACHOPS, 612.

611. SPHAGEBRANCHUS ANGUIFORMIS (Peters).

Eyes externally visible. Tail nearly one-half longer than head and trunk. Head 6 in trunk, 17 in total length. Flesh-colored, with small black spots. (Peters.) Open Atlantic, near the West Indies; a small eel, once taken. (*anguis*, the slow worm; *forma*, form.)

Ophichthys (*Sphagebranchus*) *anguiformis*, PETERS, Berlin Monatsaber., 1876, 849, Atlantic Ocean, 15° 40′ N., 23° 5′ W.
Sphagebranchus anguiformis, JORDAN & DAVIS, *l. c.*, 615,

612. SPHAGEBRANCHUS SELACHOPS (Jordan & Gilbert).

Eyes well developed. Tail nearly half longer than head and trunk. Head a little more than 4 times in trunk; tail sharp-pointed; snout sharp; cleft of mouth 2½ to 3 in head; gill slits almost horizontal, converging forwards, as in *S. rostratus*, the isthmus equal to eye, which is 2 in snout. General color light brown, slightly dusky on the back and more dusky along the lateral line; head mottled with dusky spots. Rocks about Cape San Lucas; not rare. (*σέλαχος*, shark; *ὤψ*, face.)

Apterichthys selachops, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 356, Cape San Lucas. (Type, No. 4391. Coll. Xantus.)
Ichthyapus selachops, JORDAN, Proc. U. S. Nat. Mus., 1885, 369.
Sphagebranchus selachops, JORDAN & DAVIS, *l. c.*, 615.

176. VERMA, Jordan & Evermann.

Verma, JORDAN & EVERMANN, new genus, (*kendalli*).

Body greatly elongate. Anterior nostrils in a short tube; posterior without tube. Teeth on head of vomer in a Λ-shaped patch; none on shaft. Closely allied to *Sphagebranchus*, but differing from that genus in the transverse position of its gill-slits, which are as in the European genus *Cœcula*. (*vermis*, worm.)

a. Tail but little longer than head and trunk. Head 7½ in trunk; gill slits small, transverse. KENDALLI, 613.

613. **VERMA KENDALLI** (Gilbert).

Head less than ⅕ of trunk, contained 6¾ in trunk, body 1¼ in tail; snout sharp; cleft of mouth 4 in head; gill slits small, inferior, directly transverse (as in *Cœcula imberbis*), the isthmus very narrow, not as wide as eye, which is 2 in snout; tail sharp-pointed; eye before middle of gape. Coloration plain brownish, speckled. Coast of Florida, in rather deep water. (Named for William C. Kendall, assistant in the U. S. Fish Commission.)

Sphagebranchus kendalli, GILBERT, Bull. U. S. Fish Comm., ix, 1889, (1891), 310, off west coast of Florida, 25° 34′ N. 82° 50′ W., in 25 fathoms. (Type, No. 44304. Coll. Kendall.)

177. LETHARCHUS, Goode & Bean.

Letharchus, GOODE & BEAN, Proc. U. S. Nat. Mus., 1882, 437, (*velifer*).

Anal fin wanting; no pectoral fins; dorsal fin well developed, beginning on the head; gill openings subinferior, converging; anterior nostrils tubular; tongue slender. One species known. (*λήθομαι*, to forget; *ἀρχός*, anus, for anal fin.)

614. **LETHARCHUS VELIFER**, Goode & Bean.

Teeth uniserial on jaws and vomer, small and directed inward and backward; snout long and pointed, projecting ⅔ its length beyond the lower jaw; gill openings subinferior, almost horizontal, equal to lower jaw, three times the breadth of the isthmus; nostrils not prominent, without tube; anterior under the tip of snout; lateral line distinct, extending forward in a curve, ending in a pore on the top of the head, just in front of the beginning of the dorsal fin; head 6½ in trunk; tail pointed, 2½ in total length; cleft of mouth 4 in head; snout 9 in head and twice the diameter of the eye. Plum-colored, head lighter, throat pale; dorsal fin white, edged with a broad band of black. Coast of Florida, in rather deep water. Known only from the Snapper Banks off Pensacola and Tampa. (*velum*, sail; *fero*, I bear.)

Letharchus velifer, GOODE & BEAN, Proc. U. S. Nat. Mus., 1882, 437, West Florida. (Type, No. 31458. Coll. Kaiser & Martin.) JORDAN & GILBERT, Synopsis, 896, 1883; JORDAN, Proc. U. S. Nat. Mus., 1884, 33; JORDAN & DAVIS, *l. c.*, 616.

178. MYRICHTHYS, Girard.

Pisoodonophis, KAUP, Apodes, 15, 1856, (in part; not type, as restricted by BLEEKER, which is *P. cancrivorus*).

Myrichthys, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 58, (*tigrinus*).

Ophisurus, SWAINSON, BLEEKER, etc., (not of LACÉPÈDE, nor of RISSO, nor KAUP, who restrict the name to *O. serpens*).

Teeth mostly blunt and molar; pectoral fins small; dorsal beginning on the head before gill opening; otherwise essentially as in *Ophichthus*. Species numerous, found in most tropical seas. Coloration variegated. (*μῦρος*, Myrus; *ἰχθύς*, fish.)

a. Spots on body large, blackish, without pale centers; all of them circular or nearly so; the ground color paler. TIGRINUS, 615.

aa. Spots on body large, black, most of them with a distinct pale center, the ground color paler. OCULATUS, 616.

aaa. Spots on body large, round, nearly whitish in color, the ground color dark. ACUMINATUS, 617.

615. MYRICHTHYS TIGRINUS, Girard.

Head 3½ in trunk, 11 in total length; eye 2½ in snout, situated a little back of middle of gape, which is 3 in head; pectoral measured from top of base, about equal to eye. Coloration brown, with large dark spots, which have not paler centers. Spots on sides of body all circular or nearly so; those on anterior part of head small and numerous; lighter below; belly almost plain; 4 longitudinal rows of round black blotches on each side of body, the two middle series often forming one irregular row, the central row very close to the median and consisting of small spots not much larger than the eye, spots in the uppermost row often running up on the dorsal fin, each dorsal row running forward, terminating in the snout; 8 or 9 spots in each dorsal row from the tip of snout to vertical from gill opening; a row of 5 or 6 spots from gill opening to above eye; two other rows running diagonally downwards and backwards from eye; 7 or 8 spots on each side of snout; jaw with about a dozen spots on each side; dorsal with dark margin; anal plain. Pacific Coast of Mexico, rather common about Mazatlan, occasionally ranging northward, (Adair Bay, Oregon, Girard. (*tigrinus*, like a tiger, in color.)

Myrichthys tigrinus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1859, 58, Adair Bay, Oregon; JORDAN & DAVIS, *l. c.*, 618; JORDAN & GILBERT, Synopsis, 360, 1883.

Ophisurus xysturus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 346, Mazatlan. (Type, Nos. 28142, 28247, and 29642. Coll. Gilbert.)

Pisodontophis xysturus, JORDAN, Bull. U. S. Fish Comm., II, 1882, 106.

616. MYRICHTHYS OCULATUS (Kaup).

Eye 2 in snout; snout 6 in head, and 4 in distance from tip of snout to beginning of dorsal fin; cleft of mouth 3½ in head; head 4 in the trunk, and a little more than 8 in the tail. Spots on body large, dark, most of them with a distinct pale center. Body dark gray above, white below; on each side two series of large roundish dark spots, with pale centers, one row lying along the dorsal fin, the other a little below the lateral line; about 35 spots in each row; a large spot in front of dorsal fin; snout with about 5 spots on each side; lower jaw with small dusky spots; dorsal fin with a dusky edge and with faint dusky blotches; anal plain. Tropical Atlantic, Cuba to Surinam and Cape Verde Islands. (*oculatus*, having eye-like markings.)

Pisoodonophis oculatus, KAUP, Apodes, 22, 1856, Curaçoa.

Ophisurus latimaculatus, POEY, Repertorio, II, 252, pl. 3, fig. 1, 1867, Cuba.

Ophichthys pardalis, GÜNTHER, Cat., VIII, 82, 1870; (not *Ophisurus pardalis*, VALENCIENNES).

Myrichthys oculatus, JORDAN & DAVIS, *l. c.*, 618.

617. MYRICHTHYS ACUMINATUS (Gronow).

Spots on body large, nearly round, and whitish in color; ground color dark brown, pale below; two series of round, whitish blotches on each side of body, about 40 spots in each series; spots somewhat larger and more distinct anteriorly, where their diameter is nearly equal to length of snout; head with irregular, round, whitish spots on each side; dorsal brownish, margined with dusky; other fins pale. Snout 5⅝ in head and twice the diameter of the eye; cleft of mouth 3 in head; head 4 in trunk; head and trunk 1⅔ in tail; dorsal beginning at a point slightly nearer the base of pectorals than eye; pectorals very small, their bases as broad as gill opening. Body extremely elongate, the diameter about ⅓ length of head. West Indies, occasionally northward to Florida Keys. (*acuminatus*, sharp.)

Muræna acuminata,* Gronow, Fishes Brit. Mus., 21, 1854, Insula Div. Eustachii.
Pisodonophis guttulatus, Kaup, Apodes, 21, fig. 10, 1856, Martinique.
Ophisurus longus, Poey, Repertorio, II, 254, 1867, Cuba.
Ophichthys pisavarius, Poey, Anal. Soc. Esp. Hist. Nat., 196, 1875, Cuba.
Ophichthys acuminatus, Günther, Cat., VIII, 83, 1870.
Pisodonophis longus, Jordan & Gilbert, Synopsis, 899, 1883.
Ophisurus acuminatus, Jordan, Cat. Fish N. A., 53, 1885.
Myrichthys acuminatus, Jordan & Davis, *l. c.*, 619.

179. PISOODONOPHIS, † Kaup.

Pisoodonophis, Kaup, Apodal Fishes, 17, 1856, (*boro*); *Pisodontophis*, amended spelling.

Small eels, mostly of the Old World, having the blunt teeth of *Myrichthys* and the backward dorsal of *Ophichthus*. Species slender, plainly colored. (*πίσον*, pea; *ὀδούς*, tooth; *ὄφις*, snake.)

618. PISOODONOPHIS CRUENTIFER, Goode & Bean.

Head 4 times in trunk; length of body about two-thirds that of tail. Cleft of the mouth rather wide, one-third head. Snout conical, depressed. Head snake-like, with powerful muscular enlargements of the cheeks and a constriction behind the head somewhat like that of *Derichthys*. Eye moderate, half snout, one-tenth head. Teeth granular, in conspicuous bands, a small oblong patch on premaxillaries and a long band on vomer. Pectoral fin broad, spatulate, about two-sevenths head. Dorsal beginning far behind tip of pectoral, its distance from tip of snout one-seventh of total length. Dorsal and anal fins of moderate height. Color uniform brownish yellow. Length 16 inches. Two specimens (28938), station 1035 of the U. S. Fish Commission steamer *Fish Hawk*, in N. lat. 39° 57′ W., long. 69° 28′, in 120 fathoms. Four others at nearly same region in 245 fathoms.

"The peculiar and savage physiognomy of this fish suggests at once the idea that it is a parasitic boring form, and in confirmation of this we have specimens taken by the fishermen on Jeffrey's Bank, and also another from New Bedford, taken by Mr. J. H. Thompson from the body of a fish. We have occasionally taken the dried and shriveled remains of a fish apparently closely related to this from salted halibut and codfish." (Goode & Bean.)

---

* We have referred the nominal species, *longus*, *guttulatus*, and *pisavarius* to the synonymy of *acuminatus*, thinking that the alleged differences are matters of individual variation. *Longus* is said to have, in the center of each pale spot, a yellow speck, surrounded by a dark circle. The others are said to lack this central spot, but it may be that it fades in alcohol. *Longus* is said to have the edge of the dorsal darker than the fin. In *guttulatus* and *pisavarius* it is said to be paler.

† Dr. Günther, (VIII, 78), mentions a half-grown eel from Grenada in the West Indies, which he was unable to separate from *Pisoodonophis boro* (Hamilton), of the East Indies and China. It is possible, however, that this specimen really came from China. In *P. boro* the head is 4 times in the very long trunk; the fins are very low and the color is plain brown.

This species is very different from *Pisoodonophis boro*, and may prove the type of a distinct genus. (*cruentifer*, bearing blood, bloody.)

Pisodonophis cruentifer, GOODE & BEAN, Oceanic Ichthyology, 147, fig. 166, 1895, Gulf Stream.

180. CALLECHELYS, Kaup.

Callechelys, KAUP, Apodes, 28, 1856, (*guichenoti*).

This genus contains one American and three East Indian species, agreeing in the elongate, compressed body, absence of pectoral fins, and anterior insertion of the dorsal. In other respects *Callechelys* is close to *Ophichthus*. (*καλός*, beautiful; *έγχελυς*, eel.)

619. CALLECHELYS MURÆNA, Jordan & Evermann.

Depth of body at gill openings a little more than length of upper jaw, which is 3 in head; head 8 in trunk, about 14 in total length; eye small, 2 in snout, placed over the middle of upper jaw; tip of lower jaw extending a little before the front of eye; gill openings small, inferior, sublongitudinal, the distance between them about half the height of one of them; dorsal fin beginning on the head, at a distance behind the angle of the mouth a little more than half the length of upper jaw. Dark olive, closely mottled and spotted with confluent blotches of darker olive and blackish, the spots more distinct anteriorly, posteriorly confluent, so that the tail is nearly plain dusky; belly scarcely paler, dorsal and anal chiefly blackish with pale margins. Snapper Banks off Pensacola; one specimen known. (*Muræna*, from the general resemblance of the species to a young Moray.)

Callechelys muræna, JORDAN & EVERMANN, Proc. U. S. Nat. Mus., 1886, 466, Snapper Banks; JORDAN & DAVIS, *l. c.*, 620. (Type, No. 37996. Coll. Stearns.)

181. BASCANICHTHYS, Jordan & Davis.

Bascanichthys, JORDAN & DAVIS, Apodal Fishes, 621, 1892, (*bascanium*).

This genus is very close to *Callechelys*, from which it differs in the presence of pectorals, the long subterete body, lower fins and plainer coloration. Three species are known. (*Bascanion*, the black snake; *ἰχθύς*, fish.)

a. Pectoral fin a slender rudiment not longer than eye; head about 8 in trunk.
  b. Snout 6 to 7 in head; no distinct spots on body. SCUTICARIS, 620.
  bb. Snout 5½ in head; a series of large spots between dorsal and lateral line. PENINSULÆ, 611.
aa. Pectoral fin nearly as long as snout; head about 10 in trunk. BASCANIUM, 622.

620. BASCANICHTHYS SCUTICARIS (Goode & Bean).

Pectoral fin a slender rudiment about as long as eye; head moderate; body terete, the trunk a little longer than the tail; teeth short, bluntish, recurved, uniserial in each jaw, biserial on vomer; head 8⅔ to 9⅔ in head and trunk, 8 in tail; snout 6 to 7 in head; eye 2 in snout, a little behind the middle of cleft, which is contained in the head 3⅔ times; lower jaw extending forward to middle of snout; distance from tip of snout to beginning of dorsal a little over 2 in head; gill openings vertical, their length about equal to breadth of isthmus; lateral line curved over the opercular region, the pores distant and well separated. Color brown above, lighter below, front of head more or less mottled; dorsal and anal fins pale, without dark margins. West coast of Florida; not rare. (*scutica*, a whip.)

Sphagebranchus scuticaris, GOODE & BEAN, Proc. U. S. Nat. Mus., 1879, 343, Cedar Key. (Type, No. 23636. Coll. Dr. J. H. Velie.)

Sphagebranchus teres, GOODE & BEAN, Proc. U. S. Nat. Mus., 1882, 436, West Florida. (Type, No. 31457. Coll. Kaiser & Martin.)

Cœcula scuticaris, JORDAN & GILBERT, Synopsis, 358, 1883.

Cœcula teres, JORDAN & GILBERT, Synopsis, 897, 1883.

Bascanichthys scuticaris, JORDAN & DAVIS, *l. c.*, 621.

621. BASCANICHTHYS PENINSULÆ (Gilbert).

Head small, $3\frac{3}{7}$ in trunk (without head); eye 12 in head; snout $5\frac{1}{2}$ in head, projecting beyond lower jaw for a distance equaling diameter of eye. Cleft of mouth extending beyond eye, its length (from tip of snout) $3\frac{1}{4}$ in head. Anterior nostril in a long tube (near tip of snout), the posterior on inner side of upper lip opposite front of eye. Teeth in double series on all the dentary bones; those on maxillary, shaft of vomer, and sides of mandible small, bluntly conic; those on head of vomer and front of mandible much broader though little longer, and also very blunt. Eye very small, slightly less than half snout. Gill openings short, vertical, the length of the slit but one-half of the broad isthmus. Vent much in advance of middle of length, the trunk contained $1\frac{7}{13}$ times in the tail. Dorsal fin beginning well forward on top of head, its origin equidistant between gill slit and front of eye. Tip of tail sharp, free from fins for a distance equaling length of snout. Pectoral developed as a short, deep, membranous flap as wide as gill slit; its length less than half its width. Delicate rays are visible with the aid of a lens. Color light yellowish, a series of large, round, brownish black spots nearly as wide as interspaces between lateral line and base of dorsal; a second series of similar but much fainter spots alternating with the first below the lateral line; top and sides of head with similar smaller spots, those on snout the smallest. Lower jaw with dusky mottlings; anal translucent, unmarked. Dorsal with a dusky streak. One specimen $10\frac{1}{2}$ inches long, from La Paz Bay, Gulf of California. (*Peninsulæ*, of the Peninsula.)

Callechelys peninsulæ, GILBERT, Proc. U. S. Nat. Mus., 1891, 548, La Paz Bay. (Coll. Gilbert.)

622. BASCANICHTHYS BASCANIUM (Jordan).

Dark brown, nearly uniform; fins a little paler. Body extremely slender, subterete, its greatest depth little more than two-fifths length of head; head short; snout 7 in head; mouth very small, the lower jaw thin, included, not extending to the anterior nostril, which is in a short tube; teeth short, subconic, bluntish, a little unequal, their points directed backwards; lower teeth nearly uniserial; upper teeth uniserial laterally, partly biserial anteriorly; vomerine teeth forming a rhombic patch. Eye moderate, its length more than half that of snout, its center nearly over middle of upper jaw; cleft of mouth $3\frac{3}{4}$ in length of head. Gill opening vertical, about as wide as isthmus; its upper edge on level of upper base of pectoral; pectoral developed, small, a little broader than long, nearly as long as snout; dorsal fin very low, beginning at a point midway between front of eye and gill opening; anal similar to dorsal. Head 11½ in distance from tip of snout to vent; head and trunk a little longer than tail; head 1⅖; trunk 14⅘. Length of type, 31 inches; Egmont Key, Florida; distinguished from *B. scuticaris* by the very short head. One specimen known. (*Bascanion*, the black snake, which the body much resembles, from *βάσκανος*, malignant.)

Cæcula bascanium, JORDAN, Proc. Ac. Nat. Sci. Phila., 1884, 43, Egmont Key, Florida.
Bascanichthys bascanium, JORDAN & DAVIS, *l. c.*, 621.

182. QUASSIREMUS, Jordan & Davis.

Quassiremus, JORDAN & DAVIS, Apodal Fishes, 622, 1892, (*evionthas*).

This genus contains two species from the Eastern Pacific, differing from *Ophichthus* only in the rudimentary pectoral fins. (*quassus*, obliterated; *remus*, oar.)

a. Body with rather large, yellow spots, each with a black ring, besides black spots of various sizes; pectoral not half as long as eye. NOTHOCHIR, 623.
aa. Body everywhere freckled with small black spots; pectorals about as long as eye. EVIONTHAS, 624.

623. QUASSIREMUS NOTHOCHIR (Gilbert).

Body marked with rather large yellow spots, each with a black ring, and with black spots and blotches of various sizes. Teeth all uniserial; pectorals represented by a small triangular flap, less than ⅓ the diameter of eye and ¼ the gill slit; head 4⅓ in trunk; head and trunk longer than tail by a distance equal to the length of the snout; cleft of mouth 2¼ in head; snout 4 in head; eye ½ of snout, its anterior margin over middle of cleft of mouth; gill slit vertical, lateral 6½ in head. Middle of back with a series of 12 elliptical yellow spots, their length one-half diameter of eye, each spot surrounded by a black ring, coalescent below with a large elliptical black blotch on middle of sides; head closely covered with spots about the size of the eye, around which are reticulations of light yellow. (Gilbert.) San Josef Island, Gulf of California. (*νόθος*, spurious; *χείρ*, hand.)

Ophichthys nothochir, GILBERT, Proc. U. S. Nat. Mus., 1890, 58, San Josef Island, Gulf of California. (Coll. Albatross.)
Quassiremus nothochir, JORDAN & DAVIS, *l. c.*, 623.

624. QUASSIREMUS EVIONTHAS (Jordan & Bollman).

Pectorals very small, about as long as eye; teeth in jaws uniserial, anterior vomerine teeth biserial; head 4¾ in trunk; snout 4½ in head; eye 2⅔ in snout, much nearer angle of mouth than tip of snout; cleft of mouth 2⅘ in head. Color light olive, the entire body covered with numerous small round or oval black spots separated at intervals by a yellowish ground color; in about fifteen places these spots are larger and darker and tend to form cross bands. Hood Island, Galapagos; one specimen known. (*εὖ*, well; *ἰονθός*, freckled; the word from *ἴονθος*, an eruption preceding the growth of the beard.

Ophichthus evionthas, Jordan & Bollman, Proc. U. S. Nat. Mus., 1889, 154, Hood Island, Galapagos Archipelago. (Type, No. 41476. Coll. Albatross.)
Quassiremus evionthas, Jordan & Davis, *l. c.*, 623.

183. OPHICHTHUS, Thunberg & Ahl.

Ophichthus, Thunberg & Ahl, De Muræna et Ophichtho, 1789, (*ophis*).
Congrus, Rafinesque, Caratteri, etc., 62, 1810, (*maculatus*).
Ophisurus, Swainson, Nat. Hist. Classn. Anim., II, 334, 1839, (*pictus* = *maculatus*). (Not of Lacépède; the type of Lacépède, as restricted by Risso, being *serpens.*)
Centrurophis, Kaup, Apodes, 2, 1856, (*spadiceus*).
Pœcilocephalus, Kaup, *l. c.*, 5, (*bonapartei*).
Microdonophis, Kaup, *l. c.*, 6, (*altipinnis*).
Cæcilophis, Kaup, *l. c.*, 6, (*compar*).
Herpetoichthys, Kaup, *l. c.*, 7, (*ornatissimus*).
Elapsopsis, Kaup, *l. c.*, 9, (*versicolor*).
Murænopsis, Kaup, *l. c.*, 11, (*ocellatus*). (The name wrongly accredited to Le Sueur.)
Scytalophis, Kaup, *l. c.*, 13, (*magnioculis*).
Leptorhinophis, Kaup, *l. c.*, 14, (*gomesii*).
Cryptopterus, Kaup, Aale Hamburg, 1859, (*puncticeps*).
Uranichthys, Poey, Repertorio, II, 256, 1867, (*havannensis*).
Oxyodontichthys, Poey, Anales Soc. Nat. Hist. Esp., 254, 1880, (*macrurus*).
Ophichthys, Bleeker, Günther, and of recent authors generally.

This genus contains all the Ophisuroid eels which have sharp teeth, no marked canines, well-developed pectoral fins, and the dorsal inserted behind the head. The species are very numerous in the tropical seas, and many attempts have been made to split the group into smaller genera. Notwithstanding the great differences when extremes are compared, these small genera can not be well defined. (*ὄφις*, snake; *ἰχθύς*, fish; hence more correctly written *Ophichthys.*)

a. Teeth of upper jaw in 2 or 3 series.
b. Teeth of lower jaw uniserial or nearly so; vomerine teeth in 1 series or slightly biserial in front.
Cryptopterus, (κρυπτός, concealed; πτερόν, fin):
c. Coloration uniform or nearly so; teeth of lower jaw not quite uniserial; tail half longer than rest of body. PUNCTICEPS, 625.
Ophichthus:
cc. Coloration not uniform; anterior teeth slightly enlarged; eye rather large, nearly median.
d. Sides of body with large, round, black spots; head with smaller ones; dorsal inserted opposite tip of pectorals. HAVANNENSIS, 626.
dd. Sides of body with large, round, whitish spots; dorsal inserted behind tip of pectorals. RETROPINNIS, 627.
bb. Teeth of lower jaw in 2 to 4 series.
Murænopsis, (*Muræna;* ὄψις, appearance):
e. Vomerine teeth in one row; anterior teeth of jaws or vomer sometimes enlarged; teeth in both jaws biserial, those of the inner series sometimes small and turned inward.
f. Spots on sides of body large and whitish, never black.
g. Dorsal beginning an eye's diameter behind tip of pectoral. GUTTIFER, 628.
gg. Dorsal beginning over or just before tip of pectoral. OCELLATUS, 629.
ff. Spots on sides of body large and black; tail half longer than rest of body. TRISERIALIS, 630.
Scytalophis, (σκυτάλη, viper; ὄφις, snake):
ee. Vomerine teeth biserial throughout; teeth in both jaws biserial, subequal; no canines. Color plain brownish.

h. Eye large, more than half length of snout.
  i. Head rather short, 2½ to 3 in trunk.
    j. Pectoral about as long as cleft of mouth, which is 2⅔ in head. GOMESII, 631.
    jj. Pectorals longer than cleft of mouth, which is 2½ in head. ZOPHOCHIR, 632.
  ii. Head long, 1¾ to 2¼ in trunk; pectoral a little longer than gape. MAGNIOCULIS, 633.
hh. Eye small, 2½ in snout; gill openings narrow; anterior nostril with a long tube; pectoral longer than gape. PARILIS, 634.

Subgenus CRYPTOPTERUS, Kaup.

625. OPHICHTHUS PUNCTICEPS (Kaup).

Teeth of upper jaw in 2 or 3 series. Mandibular teeth not quite uniserial, some in front forming a second series; dorsal and anal fins disappearing for some distance before their termination near end of tail; pectoral fin well developed; dorsal fin commencing at a short distance behind end of pectoral; tail ⅗ of total length; eye of moderate size; cleft of mouth of moderate width. Coloration uniform. (Kaup per Günther.) Caribbean Sea, at Puerto Cabello. (*punctus*, speckled; *-ceps*, head.)

Cryptopterus puncticeps, KAUP, Aale Hamb. Mus., II, pl. 1, fig. 2, 1859, Puerto Cabello.
Ophichthys puncticeps, GÜNTHER, Cat., VIII, 60, 1870; JORDAN & DAVIS, *l. c.*, 629.

Subgenus OPHICHTHUS.

626. OPHICHTHUS HAVANNENSIS (Bloch & Schneider).

Teeth of upper jaw in 2 or 3 series; lower teeth uniserial; vomerine teeth nearly or quite uniserial. Sides of body with one or more series of large, round, black spots; brown; head with numerous small dark spots and longitudinal folds; a series of large, round, dark spots along the side, the interspaces as wide as the spots; another series of alternate smaller spots along the back, and another along the sides of abdomen; fins yellowish, dorsal with a series of brown spots along the edge; eye large, looking upwards, 1⅗ in snout; teeth moderate, those in front of upper jaw somewhat canine-like; pectoral fin well developed, its extremity nearly opposite to the origin of the dorsal fin; tail longer than rest of body. West Indies, apparently not common, and not lately taken outside of Cuba. It is possible that this species is the true *Ophichthus ophis*, but this identification is not certain. (*havannensis*, living at Havana.)

? *Serpens marinus maculosus*, WILLUGHBY, Hist. Pisc., tab. G 9, 1686, no locality.
? *Muræna ophis*, LINNÆUS, X, 244, 1758, (after WILLUGHBY); (may be identical with *Ophichthus regius*, a St. Helena species, likewise spotted with black).
Innominado, PARRA, Dif. Piezas Hist. Nat., pl. 37, fig. 2, 1787, Havana.
Muræna havannensis, BLOCH & SCHNEIDER, Syst. Ich., 491, 1801, (after PARRA).
? *Ophisurus guttatus*, CUVIER, Règne Animal, 232, 1817, Surinam; (after BLOCH, pl. 154).
? *Muræna maculosa*, CUVIER, *l. c.*, Surinam; (after *Ophisurus ophis*, LACÉPÈDE, which is based on BLOCH, pl. 154).
Herpetoichthys sulcatus, KAUP, Apodes, 8, fig. 5, (not 6), 1856, locality unknown.
Uranichthys brachycephalus, POEY, Repertorio, II, 257, 1867, Cuba.
Uranichthys havannensis, POEY, Repertorio, II, 257, 1866.
Ophichthys havannensis, GÜNTHER, Cat., VIII, 67, 1870.

627. OPHICHTHUS RETROPINNIS (Eigenmann).

Sides of body with round whitish spots between darker areas; color light olivaceous, with about 20 oblong dark blotches along the median line of body and tail, the interspaces between these each a round pale spot about as large as eye. Dorsal inserted 1⅕ length of pectorals behind the tips of pectorals; pectorals 2½ in distance from snout to their base; eye 1⅓ in snout, equal to interorbital space; cleft of mouth 3 in head; head 9 in length; gill opening 5 in head; maxillary biserial; mandibular teeth uniserial; vomer with about 15 teeth. Snapper Banks off Pensacola. Close to *O. ocellatus*, but the dentition different. (*retropinnis*, having backward fins.)

Ophichthys retropinnis, EIGENMANN, Proc. U. S. Nat. Mus., 1887, 116, Snapper Banks off Pensacola. (Type, No. 38054. Coll. Stearns.)
Ophichthus retropinnis, JORDAN & DAVIS, *l. c.*, 630.

Subgenus MURÆNOPSIS, Kaup.

628. OPHICHTHUS GUTTIFER (Bean & Dresel).

Teeth in both jaws biserial; the teeth of the inner series sometimes small and turned inward. Vomerine teeth in one row; anterior teeth of jaws or vomer sometimes a little enlarged. Dorsal beginning behind the tip of the pectoral, at a distance equal to diameter of eye. Head 2⅔ in trunk, 4⅔ in tail; pectoral fin shorter than in *ocellatus*, 3½ in head; eye 1½ in snout; cleft of mouth 2⅓ in head. Color very much as in *ocellatus*, but paler; rather light brown above, pale below, with about 20 round pale spots along the lateral line; lower jaw and throat rather pale, dusted with brown dots; pectoral pale, with a dusky border; a line of small white spots across the occiput, and a shorter but similar row on each side of head. Snapper Banks off Pensacola, Florida; close to *O. ocellatus*, the dentition the same, the dorsal farther back. (*gutta*, spot; *fero*, I bear.)

Ophichthys guttifer, BEAN & DRESEL, Proc. Biol. Soc. Wash., 1882, 100, Snapper Banks; JORDAN, Cat. Fish. N. A., 53, 1885. (Type, No. 32647. Coll. Stearns.)
Ophichthus guttifer, JORDAN & DAVIS, *l. c.*, 630.

629. OPHICHTHUS OCELLATUS (Le Sueur).

Teeth in both jaws biserial, those in front a little enlarged; vomerine teeth in one row. Dorsal fin beginning over or just before tip of pectoral. Color rather dark brown above, lighter below, with about 20 round whitish spots along the side, averaging more than half diameter of eye; dorsal fin commencing over or a little before tip of pectoral, light-colored, with a narrow dark margin; anal light yellow; a row of small white spots across the top of head, sometimes coalescent into a band, and one or more similar but shorter rows on each side of head; pectoral decidedly dusky; jaws, throat, and chin dusted with brown dots. Vomer with about 15 teeth, the anterior inclined to form a double series; tail ½ a head's length longer than head and trunk; head 2⅚ in trunk; eye 1¾ in snout; snout 5½ in head; cleft of mouth 2½ in head; pectoral 2¾ in head. West Indian Fauna, south to Brazil, north to Pensacola; rather common. (*ocellatus*, with eye-like spots.)

Murænophis ocellatus, Le Sueur, Journ. Ac. Nat. Sci. Phila., v, 1825, 108, pl. 4, fig. 3, South America.
Ophisurus remiger, Valenciennes, in D'Orbigny Voy. Amér. Mérid., Poiss., pl. 12, fig. 2, 1839.
Ophichthys ocellatus, Günther, Cat., viii, 68, 1870; Jordan & Gilbert, Synopsis, 359, 1883.
Herpetoichthys ocellatus, Goode & Bean, Proc. U. S. Nat. Mus., 1879, 155.
Ophichthus ocellatus, Jordan & Davis, *l. c.*, 630.

630. OPHICHTHUS TRISERIALIS (Kaup).

Teeth in both jaws uniserial, the anterior more or less enlarged; vomerine teeth in one row. Body terete, the tail $1\frac{1}{2}$ times the length of head and trunk; head flattish; mouth broad, its width as great as distance between the nostrils or as interorbital space; gill openings vertical, well separated; dorsal fin beginning a little before tip of pectoral; head $2\frac{2}{3}$ in trunk, $5\frac{1}{2}$ in tail; pectoral fin $2\frac{3}{4}$ to $3\frac{1}{4}$ in head, about equal to lower jaw; cleft of mouth $2\frac{3}{5}$ in head; gill openings less than one-half the pectorals, less than eye, $1\frac{1}{2}$ in isthmus; eye $1\frac{1}{2}$ in snout, $2\frac{2}{3}$ in cleft of mouth; teeth rather strong, one or two in front of upper jaw almost canine-like; vomerine teeth small. Color light brown; a row of rather large round black blotches above the lateral line; a series of smaller spots on each side of dorsal, alternating with the large blotches; a row of submarginal spots along the dorsal fin; anal fin plain; top and sides of head with smaller spots; in adults a faint, dusky shade across the pectoral; lower parts pale; longitudinal wrinkles on throat conspicuous. Pacific Coast of Tropical America, rather common, from Lower California to the Galapagos. (*triserialis*, three-rowed.)

Murænopsis triserialis, Kaup, Apodes, 12, 1856, Pacific.
Herpetoichthys callisoma, Abbott, Proc. Ac. Nat. Sci. Phila., 1860, 475, locality unknown.
Ophisurus californiensis, Garrett, Proc. Ac. Nat. Sci. Cal., 1863, 66, Coast of Lower California.
Ophichthus rugifer, Jordan & Bollman, Proc. U. S. Nat. Mus., 1889, 155, Charles Island, Galapagos; young with longer pectorals. (Type, No. 41428. Coll. Albatross.)
Ophichthys triserialis, Günther, Cat., viii, 58, 1870; Streets, Bull. U. S. Nat. Mus., vii, 55, 1877; Jordan & Gilbert, Proc. U. S. Nat. Mus., 1880, 457; Jordan & Gilbert, Synopsis, 359, 1883.
Ophichthus triserialis, Jordan & Davis, *l. c.*, 631.

Subgenus SCYTALOPHIS, Kaup.

631. OPHICHTHUS GOMESII (Castelnau).

(Sea Serpent.)

Vomerine teeth biserial throughout; teeth in both jaws biserial, subequal, no canines; pectoral $2\frac{1}{5}$ to $2\frac{3}{5}$ in head, about as long as cleft of mouth, which is $2\frac{2}{3}$ in head. Body terete; the head rather short, about $2\frac{2}{3}$ ($2\frac{1}{2}$ to 3) in trunk; the head and trunk $1\frac{5}{7}$ ($1\frac{1}{4}$ "*chrysops*" to $1\frac{9}{10}$ "*macrurus*") in the tail; snout rather short, pointed; interorbital space broad, equal to eye, which is about $1\frac{1}{2}$ in snout; nasal tubes short; dorsal inserted behind middle of pectoral; diameter of gill opening equal to eye, $1\frac{1}{2}$ in the isthmus, 3 in the pectoral. Olive brown above, the coloration caused by innumerable brown points on a yellowish ground; light yellow below; pectoral dusky, dark along the upper edge; lower jaw with dusky markings; dorsal and anal fin translucent, with dark margins; pores on jaws and head conspicuous. South Carolina to Rio Janeiro, generally common, especially about the Florida Keys and Cuba. The variations in the length of the trunk and tail have given rise to various nominal species. One of these (*macrurus*, Poey) with the head and trunk $1\frac{4}{5}$ to $2\frac{1}{8}$ in the tail instead of $1\frac{1}{2}$ to $1\frac{5}{7}$ as usual in *gomesii* may be a tangible variety, or possibly a species. (Named for Dr. Ildefonso Gomes, who cured Castelnau of a dangerous malady in Rio Janeiro.*)

Ophisurus gomesii, Castelnau, Anim. Amér. Sud., 84, pl. 44, fig. 2, 1855, Rio Janeiro.
Ophisurus chrysops, Poey, Memorias, II, 321, 1867, Havana.
Oxydontichthys brachyurus, Poey, Synopsis, 426, 1868; and Poey, Enumeratio, II, 155, 1875, Havana.
Oxyodontichthys macrurus, Poey, Anal. Soc. Hist. Nat. Esp., 254, 1880, Havana.
Oxydontichthys limbatus, Poey, Anal. Soc. Hist. Nat. Esp., 254, 1880, Havana, (name a substitute for *brachyurus*).
Ophichthys gomesii, Günther, Cat., VIII, 60, 1870.
Ophichthys chrysops, Jordan & Gilbert, Synopsis, 898, 1883.
Ophichthus gomesi, Jordan & Davis, *l. c.*, 632.

632. OPHICHTHUS ZOPHOCHIR (Jordan & Gilbert).

Dentition as in *O. gomesii*. Pectoral longer, 2 to $2\frac{1}{5}$ in head, longer than the cleft of the mouth, which is $2\frac{1}{2}$ in head. Tail very nearly twice as long as rest of body; snout rather long; interorbital space narrow, less than eye; nasal tubes rather long, flattened, the edge uneven; dorsal commencing over or in front of the middle of pectoral; head $2\frac{1}{3}$ in trunk; head and trunk a little more than half the tail; pectoral fin $2\frac{1}{5}$ in head; eye $1\frac{1}{2}$ in snout, $\frac{1}{2}$ greater than interorbital width; gill opening less than eye, $1\frac{1}{4}$ in isthmus. Color brown above, light yellow below; opercular regions, lower jaw, throat, and pectoral dusky; dorsal and anal edged with black. Pacific Coast of Mexico, Guaymas to Acapulco; rather common. Close to *O. gomesii*, but the pectoral longer. (*ζόφος*, darkness; *χείρ*, hand (pectoral fin).)

Ophichthys zophochir, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1881, 347, Mazatlan. (Type, Nos. 28280, 28277, 29220, and 29239. Coll. Gilbert.) Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 623.
Ophichthus zophochir, Jordan & Davis, *l. c.*, 633.

633. OPHICHTHUS MAGNIOCULIS (Kaup).

Dentition of *O. gomesii*, but the head rather long, $1\frac{3}{4}$ to $2\frac{1}{5}$ in trunk. Tail long, about $2\frac{1}{5}$ times length of rest of body; pectoral $2\frac{1}{3}$ in head; dorsal inserted over middle of pectoral; gape $2\frac{2}{5}$ in head; head $1\frac{3}{4}$ in trunk; eye about $2\frac{3}{4}$ in snout. Blackish, paler below; dorsal and anal yellowish brown, dotted and bordered with black. West Indies to Brazil, scarce; our specimen from Aspinwall. (*magnus*, great; *oculus*, eye.)

Scytalophis magnioculis, Kaup, Apodes, 13, f. 7, 1856, St. Croix; Brazil.
Ophichthys magnioculis, Günther, Cat., VIII, 59, 1870.
Ophichthus magnioculis, Jordan & Davis, *l. c.*, 633.

---

*Je dédie cette espèce à M. le docteur Ildefonso Gomes, comme un témoignage de ma reconnaissance pour les soins désintéressés qu'il m'a donnés à Rio de Janeiro en concurrence avec mon ami le docteur Weddell, pendant la dangereuse maladie dont j'y fus atteint (Francis de Castelnau).

634. OPHICHTHUS PARILIS* (Richardson).

Dentition as in *O. gomesii.* Eye small, about 2⅓ in snout; gill openings not very wide, approaching nearer together than usual in this genus; anterior nostril with an elongate tapering tube; head 2 in trunk; cleft of mouth 2⅔ in head; eye 2½ in snout; pectoral 2¼ in head; dorsal fin rather low, commencing above posterior third of pectoral; tail twice as long as rest of body. Coloration uniform. (Günther.) Cuba to Brazil; not common. (*parilis*, like.)

Ophisurus parilis, RICHARDSON, Voyage Erebus & Terror, 105, 1844, West Indies.

Ophichthys pauciporus, POEY, Repertorio, II, 255, pl. 3, fig. 5, 1868, Cuba; GÜNTHER, Cat., VIII, 60, 1870.

Ophichthys parilis, GÜNTHER, Cat., VIII, 59, 1870.

Ophichthus parilis, JORDAN & DAVIS, *l. c.*, 634.

184. MYSTRIOPHIS, Kaup.

Mystriophis, KAUP, Apodes, 10, 1856, (*rostellatus*).

Crotalopsis, KAUP, Abhandl. Naturwiss. Verein Hamburg, IV, 12, 1860, (*punctifer*).

Echiopsis, KAUP, Abhandl. Natur. Verein Hamburg, IV, 13, 1860, (*intertinctus*).

Macrodonophis, POEY, Repertorio, II, 251, 1867, (*mordax*).

This genus contains three or four species of black-spotted eels, distinguished from *Ophichthus* by the presence of strong canines in the large mouth. The vomerine teeth, as in *Ophichthus*, are small and fixed. The species differ considerably from each other and all are nearly related to such species of *Ophichthus* as *triserialis* and *havannensis*. The value to be assigned to *Mystriophis* is therefore doubtful. Our species belongs to the subgenus *Echiopsis*, (ἔχις viper; ὄψις, appearance), in which the jaws are narrowed forwards, not expanded at tip. (*μυστρίον*, a spoon, from the form of the snout in *M. rostellatus*; ὄφις, snake.)

Subgenus ECHIOPSIS, Kaup.

635. MYSTRIOPHIS INTERTINCTUS (Richardson).

Jaws narrow and not expanded at tip. Vomerine teeth small, fixed; in one to three series. Teeth in jaws biserial; long canines in front of jaws; outer teeth of upper jaw unequal, some of them canine; vomerine teeth in two series, these sometimes partly coalescing (sometimes, var. *punctifer*, partly divided into three); lower jaw scarcely included; pectoral fin about 5 in head; tail a little longer than rest of body; dorsal commencing behind tip of pectoral, distance equal to about length of same; isthmus equal to ⅔ the gill openings, which are large, close together, and subinferior, anterior in position; head 2⅓ to 2⅚ in trunk; eye small, 1½ to 2 in snout; gape 2¼ in head; snout 3 in cleft of mouth, 7 in head. Dark brown above, paler below, side with two rows of large round or ovate black spots, the upper row close to the dorsal fin, the lower row below the lateral line; besides these some smaller spots, also black; head a little darker than the body, the spots smaller and numerous, some larger ones below eye; dorsal and anal with dark borders formed by spots; pectoral black at tip, the remainder more or less dusky. West Indian Fauna, north to Pensacola; rather common; variable.* (*inter*, between; *tinctus*, colored.)

---

* Possibly two species are included by us under *parilis*. In *parilis* the insertion of the dorsal is before the end of the pectoral; in the type of *pauciporus* the dorsal is said to be inserted behind tip of pectoral; no other differences appear.

Ophisurus intertinctus, Richardson, Voy. Erebus & Terror, Fishes, 102, 1844, West Indies.
Ophisurus sugillatus, Richardson, Voy. Erebus & Terror, 103, 1844, probably West Indies.
Crotalopsis punctifer, Kaup, Abhandl. Wiss. Verein Hamb., IV, 2, 12, pl. 1, fig. 3, 1860, Puerto Cabello.
Conger mordax, Poey, Memorias, II, 319, 1860, Cuba.
Ophichthys schneideri, Steindachner, Ich. Beitr., VIII, 66, 1879, Brazil.
Macrodonophis mordax, Poey, Repertorio, II, 252, 1868.
Ophichthys punctifer, Günther, Cat., 56, 1870.
Ophichthys intertinctus, Günther, Cat., VIII, 57, 1870; Jordan, Proc. Ac. Nat. Sci. Phila., 1884, 43; Jordan, Cat. Fish. N. A., 53, 1885; Jordan & Davis, *l. c.*, 635.
Crotalopsis mordax, Goode & Bean, Proc. U. S. Nat. Mus., 1879, 344.

185. SCYTALICHTHYS, Jordan & Davis.

Scytalichthys, Jordan & Davis, Apodal Fishes, 635, 1892, (*miurus*).

This genus contains a single species allied to *Mystriophis*, but distinguished by the presence of movable canines on the vomer, and by the very short tail. (*σκυτάλη*, viper; *ἰχθύς*, fish.)

636. SCYTALICHTHYS MIURUS (Jordan & Gilbert).

Vomerine teeth in one series of about 4 slender depressible canines; tail very short, much shorter than rest of body. Dorsal fin inserted well behind tip of pectorals; gill opening midway between eye and beginning of dorsal fin; pectoral fin very short, as long as snout, 10 in head; snout short, 4 in cleft of mouth; head depressed and pointed, the mouth large; teeth long, those on vomer and side of lower jaw canine-like; teeth of upper jaw biserial, rather small; lower teeth uniserial; vomerine teeth uniserial; eye small, placed well forward; gill openings small, transverse, inferior, as in *Cœcula imberbis*, the slit as long as snout and wider than isthmus; head $4\frac{3}{5}$ in the very long trunk; tail $1\frac{4}{7}$ in rest of body; cleft of mouth $2\frac{1}{5}$ in head. Coloration light yellowish, a series of roundish dark brown blotches on each side of body, the two series alternating; two alternating series of small half blotches on the back, these coalescing into one on median line before dorsal; head with small, dark spots; sides of lower jaw spotted; fins pale. Length 1 foot. Cape San Lucas; two specimens known. (*μείουρος*, curtailed, from the short tail.)

Ophichthys miurus, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 357, Cape San Lucas. (Type, No. 2304. Coll. Xantus.)
Mystriophis miurus, Jordan & Davis, *l. c.*, 636.

186. BRACHYSOMOPHIS, Kaup.

Brachysomophis, Kaup, Apodes, 9, 1856, (*horridus*).
?*Achirophichthys*, Bleeker, Poissons Inéd. Murènes, Ned. Tijdschr. Dierk., II, 42, (*typus* = young).

---

* Possibly more than one species is here included. *Schneideri* is said to have the vomerine teeth biserial, while in "*punctifer*" (*mordax*) they are triserial. In the true *intertinctus* the teeth are biserial in front and uniserial behind, while in *sugillatus* the vomerine teeth are said to be uniserial. In *sugillatus*, the pectoral is said to be longer than in *intertinctus*, as long as eye and snout. Our specimens have the teeth biserial or partly triserial in front. Probably all belong to one species. If two species exist they may stand as *intertinctus* and *punctifer*.

This genus differs from *Mystriophis* chiefly in the presence of a conspicuous fringe of papillæ on the lips. The vomerine teeth are canine as in *Scytalichthys.* Species East Indian, one being recorded from the Galapagos. (*βραχύς*, short; *σῶμα*, body; *ὄφις*, snake.)

637. BRACHYSOMOPHIS CROCODILINUS (Bennett).

Teeth unequal in size; maxillary teeth in a double row, those of the inner row stronger and less numerous than the outer; vomerine and mandibular teeth uniserial, large canine teeth; head 3 in trunk; snout extremely short and rather flattened, scarcely twice as long as eye, which is small and situated in the anterior ninth of the length of the head; vertical fins moderately well developed; distance between the origin of dorsal fin and gill opening 2½ in head; pectoral small; body longer than tail. Upper parts brownish, minutely dotted with darker; a series of black pores along the lateral line, sometimes a whitish line across the occiput. (Günther.) East Indies, a specimen recorded by Günther from the Galapagos. (*crocodilinus*, like a crocodile.)

Ophisurus crocodilinus, Bennett, Proc. Zoöl. Soc. Lond., 1833, 32, Mauritius.
Brachysomophis horridus, Kaup, Apodes, 9, fig 6, 1856, Otaheite.
? *Achirophichthys typus*, Bleeker, Ned. Tijdschr. Dierk., 42, Celebes.
Ophichthys crocodilinus, Günther, Cat., VII, 64, 1870.
Brachysomophis crocodilinus, Jordan & Davis, *l. c.*, 636.

Suborder COLOCEPHALI.

The characters of this group are given on page 346. Three families are now recognized. (*κόλος*, defective; *κεφαλή*, head.

Family LIII. MURÆNIDÆ.

(The Morays.)

The *Murænidæ* represent the most degenerate type of eels so far as the skeleton is concerned, and they are doubtless the farthest removed from the more typical fishes from which the eels have descended. The essential characters of the family are thus stated by Dr. Gill:

> Colocephalous Apodals with conic head, fully developed opercular apparatus, long and wide ethmoid, posterior maxillines, pauciserial teeth, roundish, lateral branchial apertures, diversiform vertical fins, pectoral fins (typically) suppressed, scaleless skin, restricted interbranchial slits, and very imperfect branchial skeleton, with the fourth branchial arch modified, strengthened, and supporting pharyngeal jaws.

The Morays may be readily distinguished from the other eels by their small round gill openings and by the absence of pectorals. The body and fins are covered by a thick, leathery skin, the occipital region is elevated through the development of the strong muscles which move the lower jaw, and the jaws are usually narrow and armed with knife-like or else molar teeth. The Morays inhabit tropical and subtropical waters, being especially abundant in crevices about coral reefs. Many of the species reach a large size, and all are voracious and pugnacious. The coloration is usually strongly marked, the color cells being highly specialized. We exclude from the *Murænidæ* the genus *Myroconger*, from St. Helena, which has pectoral fins, and is probably a type of a distinct family. The remaining species are referable to ten or twelve genera, most of which are found in America. About 120 species are known. The *Murænidæ* without fins are the simplest in structure, but their characters are those of degradation, and they are farther from the primitive stock than such genera as *Muræna* or *Enchelycore.*

(*Murænidæ Engyschistæ*, GÜNTHER Cat., VIII, 93–136; order *Colocephali*, COPE, Trans. Amer. Phil. Soc., 1870, 456.)

a. Vertical fins well developed, the dorsal beginning before the vent.
  b. Posterior nostril an oblong slit; anterior in a short tube; teeth all pointed; dorsal beginning above the gill opening; canine teeth strong; tail moderate. ENCHELYCORE, 187.
  bb. Posterior nostril circular, with or without tube; tail moderate, not twice as long as trunk; body not excessively elongate.
    c. Teeth all, or nearly all, acute, none of those in the jaws obtuse or molar-like.
      d. Anterior nostrils without tube; vomerine teeth in many series; lips with a free fold. PYTHONICHTHYS, 188.
      dd. Anterior nostrils each with a long tube; vomerine teeth in one or two series; lips continuous with skin of head.
        e. Posterior nostrils without tube, the margin sometimes slightly raised.
          f. Dorsal fin inserted behind the head, over or behind the gill opening. RABULA, 189.
          ff. Dorsal fin inserted on the head, considerably before gill opening. LYCODONTIS, 190.
        ee. Posterior nostrils as well as anterior each in a conspicuous tube. MURÆNA, 191.
    cc. Teeth mostly obtuse, molar-like; only anterior nostrils tubular; cleft of mouth rather short; dorsal beginning before the gill opening. ECHIDNA, 192.
Vertical fins rudimentary, confined to the end of the tail (often appreciable only on dissection, or altogether wanting); teeth rather small, pointed, subequal, in several series; posterior nostril round, with a short tube, or none.
  g. Cleft of the mouth short, not half length of head; snout moderate, about half the gape; tail about as long as trunk. UROPTERYGIUS, 193.
  gg. Cleft of the mouth long, nearly half head; snout very short, less than one-fourth the gape; tail very short, about half rest of body. CHANNOMURÆNA, 194.

187. ENCHELYCORE, Kaup.

Enchelycore, KAUP, Apodes, 72, 1856, (*euryrhina*).

Posterior nostril an oblong slit, otherwise essentially as in *Lycodontis.* One species known. (*ἔγχελυς*, eel; *κόρη*, girl; the application not evident.)

638. ENCHELYCORE NIGRICANS (Bonnaterre).

Snout narrow, rather produced, 2⅜ in gape; the jaws cannot be shut in adult examples. Teeth of upper jaw biserial, the inner series of very long and slender depressible canines; long canines not movable in front of each jaw; lateral teeth of lower jaw slender, subequal, sharp, and recurved; vomerine teeth small, uniserial, developed posteriorly; eye moderate, 2 in snout; gape 2 in head; dorsal beginning above the gill opening; tail slightly longer than rest of body; head 3 to 3¼ in trunk. Uniform black or dark brown, sometimes faintly marbled with darker; angle of mouth slightly darker; gill opening pale. West Indies, rather common. (*nigricans*, blackish.)

Muræna unicolor maxillis elongatus teretiusculis, inferiore longiore, etc., GRONOW, Zoöphy., 1, 163, 1763, South America.

Muræna nigricans, BONNATERRE, Encycl. Meth. Ichth., 34, 1788, (after GRONOW).
Muræna anguina, GRONOW, Catalogue Fishes, 18, 1854, South America.
Enchelycore euryrhina, KAUP, Apodes, 73, 1856, no locality.
Gymnothorax nigrocastaneus, COPE, Trans. Amer. Phil. Soc., 1870, 483, St. Martins.
Gymnothorax umbrosus, POEY, Ann. Lyc. Nat. Hist. N. Y., 1874, 67, Havana.
Enchelycore nigricans, GÜNTHER, Cat., VIII, 135, 1870; JORDAN & DAVIS, *l. c.*, 588.

188. PYTHONICHTHYS, Poey.

Pythonichthys, POEY, Repertorio, II, 265, 1867, (*sanguineus*).

This genus is based on a single West Indian species, which apparently differs from *Lycodontis* only in the entire absence of nasal tubes. The species is deep red in color, and inhabits deeper water than usual among the Morays. (*πύθων*, a large snake; *ἰχθύς*, fish.)

639. PYTHONICHTHYS SANGUINEUS, Poey.

Body terete, slim; the depth contained 40 times in total length; nostrils in a line between eye and tip of snout, about as long as eye; lips full, each with a fold; dorsal commencing a little before gill opening; teeth in jaws biserial; those of upper jaw small and numerous, sharp-pointed; outer row of teeth a little larger and less numerous than inner; inner row of teeth in lower jaw granular; teeth on vomer pluriserial, small; eye very small, 6 in snout, 12 in gape; gape 3 in head; head 2 in trunk; tail $2\frac{2}{3}$ times rest of body. Color uniform blood-red. (Poey.) Coast of Cuba, in rather deep water; rare. (*sanguineus*, blood red.)

Pythonichthys sanguineus, POEY, Repertorio, II, 265, pl. 2, fig. 7, 1867, Cuba; JORDAN & DAVIS, *l. c.* 589.
Muræna sanguinea, GÜNTHER, Cat., VIII, 126, 1870.

189. RABULA, Jordan & Davis.

Rabula, JORDAN & DAVIS, Apodal Fishes, Rept. U. S. Fish Comm., VIII, 1888, (1892), 589, (*aquædulcis*).

This genus differs from *Lycodontis* only in the posterior insertion of the dorsal fin, which begins over or behind the gill opening. The five known species have so little in common that the value of the character which separates them from *Lycodontis* is rather uncertain. (*Rabula*, a wrangler.)

a. Dorsal fin inserted far back, nearer vent than gill opening. Dark brown, with diffuse yellowish spots and marblings. AQUÆ-DULCIS, 640.
aa. Dorsal fin inserted over or slightly behind gill opening.
  b. Teeth in both jaws uniserial; color yellowish brown, with dark reticulations and yellow spots. MARMOREA, 641.
  bb. Teeth of upper jaw uniserial; tail longer than rest of body; color purplish brown, nearly plain.
    c. Jaws with curved commissure, and hence not capable of being completely closed; some of the teeth serrate; head small, bluntish; tail a little longer than rest of body. PANAMENSIS, 642.
    cc. Jaws with straightish commissure, and hence capable of being closed; tail half longer than rest of body. LONGICAUDA, 643.

640. RABULA AQUÆ-DULCIS (Cope).

Dorsal fin inserted far back, nearer vent than gill opening. Eye moderate, over middle of gape; lower teeth uniserial, with canines in front; upper teeth biserial, the outer teeth small; vomer with strong canines in front, the posterior teeth small, uniserial; posterior nostril nearer eye than anterior one. Insertion of dorsal 1¼ lengths of the head before vent, much nearer vent than gill opening. Tail longer than rest of body by the length of the jaw. Head 3 in trunk; gape 2⅔ in head; eye 2 in snout. Color much as in *Lycodontis mordax*, dark brown with irregular diffuse yellowish spots smaller than eye, which run together into irregular marblings; gill opening small, slightly dark; fins nearly plain; belly without dark cross lines; teeth entire. Two specimens known, the one (No. 6673, U. S. N. M.), said to be from San Diego, the type from Rio Grande in Costa Rica. It is probably not a fresh water species. (*aquæ-dulcis*, of the fresh water.)

Muræna aquæ-dulcis, COPE, U. S. Geol. Surv. Montana, etc., 474, 1871, (1872), Rio Grande, near San José, Costa Rica.
Gymnothorax aquæ-dulcis, JORDAN & DAVIS, *l. c.*, 598.

641. RABULA MARMOREA (Valenciennes).

Dorsal inserted over or slightly behind gill opening. Teeth in upper jaw uniserial; (dorsal fin in figure beginning a short distance behind gill opening). Color yellowish brown with dark reticulations, the longitudinal branching streaks studded with oblong yellow spots; spots on belly large, those on throat confluent; dorsal and anal yellowish brown with darker clouds; teeth all uniserial. (Valenciennes.) Galapagos Islands; a doubtful species, perhaps based on *Muræna lentiginosa*, or *Rabula aquæ-dulcis*. (*marmoreus*, marbled.)

Murænophis marmoreus, VALENCIENNES, Voy. Vénus, Zoöl., 347, pl. 10, fig. 1, 1855, Galapagos.
Gymnothorax marmoreus, JORDAN & DAVIS, *l. c.*, 598.

642. RABULA PANAMENSIS (Steindachner).

Teeth of upper jaw biserial; jaws capable of being completely closed; some of the teeth serrate; outer teeth of jaws thickish, bent abruptly backward at tip, the posterior margin below distinctly serrate; lower jaw strongly bent upward towards the tip, the largest teeth on the bent anterior part of the jaws; teeth of the inner row above long, slender, and movable, twice as large as the outer teeth; teeth of inner row of lower jaw slender (all lost in specimen examined); vomerine teeth small, uniserial, blunt (slender and sharp according to Steindachner); head small, bluntish, 7½ in body; tail a little longer than rest of body; gape 2⅓ in head; eye 1⅓ in snout; dorsal beginning over gill opening. Color dark bluish black, brownish on tail; pores on jaws whitish. Pacific Coast of Central America; a small species, not common; our specimen from Panama.

Muræna panamensis, STEINDACHNER, Ichth. Beit., v, 19, 1876, Panama.
Sidera panamensis, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 623.
Gymnothorax panamensis, JORDAN & DAVIS, *l. c.*, 598.

643. RABULA LONGICAUDA (Peters).

Teeth of upper jaw biserial; jaws with straightish commissure and hence completely closing; teeth all entire. Tail about half longer than rest of body; dorsal beginning a little behind gill opening; vomerine teeth slender and rather long; teeth in two series in each jaw; those of the inner series largest and movable; anterior canines enlarged; outer teeth of upper jaw bluntish and turned backward as in *R. panamensis*; snout short, bluntish; eye large; head 2¾ in trunk, 8⅔ in total; gape short. Color purplish brown, finely mottled with darker, the markings faint. Tropical Atlantic off the West Indies; two small specimens recorded. (*longus*, long; *cauda*, tail.)

Muræna longicavda, Peters, Berliner Monatsberichte, 1876, 850, Open Atlantic, with *Sphagebranchus anguiformis*.

Gymnothorax longicauda, Jordan & Davis, *l. c.*, 599.

190. LYCODONTIS, McClelland.

Lycodontis, McClelland, Calcutta Journ.* Nat. Hist., v, No. xviii, 1844, 173, (*literata = tile*).

Thærondotis, McClelland, *l. c.*, v, No. xviii, 1844, 174, (*reticulata = tessellata*).

Sidera, Kaup, Apodes, 70, 1856, (*pfeifferi*).

Eurymyctera, Kaup, *l. c.*, 72, (*crudelis*).

Polyuranodon, Kaup, *l. c.*, 96, (*kuhli = polyuranodon*).

Tæniophis, Kaup, Aale Hamburg Mus., Nachtrage, 10, 1859, (*westphali = funebris*).

Priodonophis, Kaup, Aalenähnliche Fische Hamburg Museum, 22, 1859, (*ocellatus*).

Neomuræna, Girard, U. S, Mex. Bound. Surv., Fishes, 76, 1859, (*nigromarginata = ocellatus*).

Pseudomuræna, Johnson, Proc. Zoöl. Soc. London, 1860, 167, (*madeirensis*).

Gymnothorax, Günther, Cat,, viii, 100, 1870, (*meleagris*, etc.).

This genus, as here understood, comprises the great bulk of the *Murænidæ*, including all the species with sharp teeth, the body normally formed, the anterior nostrils only tubular, and the dorsal fin beginning on the head. *Priodonophis* with serrated teeth has been recognized as a distinct genus by Bleeker, but the character in question disappears by degrees and seems not to be suitable for generic distinction. The Morays of this genus are everywhere abundant in the tropical seas, where some of them reach a great size. They are the most active and voracious of the eels, often showing much pugnacity. Most of them live in shallow water about rocks or reefs. (λύκος, wolf; ὀδούς, tooth.)

Lycodontis:

a. Teeth all entire, with no serrations anywhere, and none of them with basal lobes.

b. Body without black transverse bands, or very large, irregularly placed black spots.

c. Body without small, round, bluish white or yellow spots, the spots, if any, blackish or dull grayish; dorsal without distinct paler margin, or with merely the very edge whitish.

d. Dorsal with a distinct black margin; anal with a pale edge; teeth uniserial.

e. Color nearly plain brown, finely freckled; 13 teeth on side of lower jaw; tail equal to head and trunk. verrilli, 644.

ee. Color brownish, finely mottled with darker brown; 22 teeth on sides of lower jaw; tail longer than head and trunk. vicinus, 645.

dd. Dorsal without distinct, darker margin, its border colored nearly or quite like rest of fin.

f. Body and tail covered with close-set dark points; tail longer than rest of body. virescens, 646.

---

* There is in America only one complete set of the Calcutta Journal of Natural History, and that is in the Library of the Academy of Natural Sciences of Philadelphia. In Vol. v of this Journal is found McClelland's paper upon the Apodal Fishes of Bengal, in which several new generic and specific names are proposed. We are indebted to Mr. Witmer Stone, of the Philadelphia Academy, for kindly transcribing portions of that paper for us.

According to Mr. Stone the name *Lycodontis* occurs on page 173, of Vol. v, and three species are assigned to it, viz: *literata* (= *tile*, p. 112, Vol. viii, of Günther's Catalogue), *punctata* (= *tile*, ibid. Günther), and *longicaudata* (= *sathele*, p. 126, Günther).

The name *Thærodontis* occurs, with diagnosis, on page 174, one page later than *Lycodontis*, and but one species, *reticulata* (= *tessellata*, *p.* 106, Günther). Of these two names, *Lycodontis* must take precedence of *Thærodontis*.

ff. Body and tail not covered with close-set dark points.

g. Color olivaceous or brownish, with conspicuous markings, marblings or spots darker than the ground color; belly without distinct transverse lines, marked like the back and sides; tail slightly longer than rest of body.

h. Dark markings forming narrow reticulations, never rounded spots; these reticulations dark lilac in color, covering back and sides, some of them enclosing irregular polygons. POLYGONIUS, 647.

hh. Dark markings in the form of rounded spots, more or less confluent, sometimes obscuring the pale ground color. MORINGA, 648.

gg. Color dark brown, dark green, or blackish, either plain or with faint markings.

i. Belly with black, wavy, transverse lines; no dark lines along dorsal fin. MORDAX, 649.

ii. Belly without black transverse lines; dorsal and anal with dark longitudinal streaks; body nearly plain dark olive brown. FUNEBRIS, 650.

ggg. Color brownish black with irregular pale grayish spots of various sizes; margin of anal not pale; cleft of mouth less than half head. SANCTÆ-HELENÆ, 651.

cc. Body with distinct small spots, blue, white, or yellow.

j. Dorsal and anal without distinct colored margin; pale spots mostly smaller than eye.

k. Teeth of upper jaw uniserial.

l. Vomerine teeth uniserial; spots irregular, few, and scattered; dorsal colored like back. DOVII, 652.

ll. Vomerine teeth biserial; entire body covered with small blue dots; dorsal with vertical bluish streaks. CONSPERSUS, 653.

kk. Teeth of upper jaw biserial; body with small yellow spots.

m. Vomerine teeth uniserial, mostly small and rounded; color nearly uniform from head to tail; spots innumerable. MILIARIS, 654.

mm. Vomerine teeth biserial, small and rounded; color dark brown, with yellow points excessively numerous. ELABORATUS, 655.

jj. Dorsal with a blackish border, interrupted with white; anal with white markings; body with close-set, irregular pale spots. OBSCURATUS, 656.

bb. Body with about 20 black, transverse rings, about three times the breadth of the interspaces; tail a little longer than rest of body. CHILEVASTES, 657.

PRIODONOPHIS, (πρίων, saw; ὀδούς, tooth; ὄφις, snake):

aa. Teeth serrate, more or less.

n. Color brown, with irregular light yellowish spots irregularly placed; dorsal with large, dark spots on its edge, these sometimes obsolete, usually running together to form a continuous dark band; anal black-edged; teeth large, uniserial, the larger ones serrate; mouth nearly closing. OCELLATUS, 658.

Subgenus LYCODONTIS.

644. LYCODONTIS VERRILLI (Jordan & Gilbert).

Teeth all entire. Color nearly plain brown, finely freckled; teeth uniserial, about 13 on side of lower jaw; vomerine teeth small, in a short row posteriorly; eye near angle of mouth, 3 in snout; head 3¼ in trunk; tail about equal to head and trunk; color light chestnut brown, finely freckled, but without distinct spots; dorsal with a conspicuous edge of blackish, the margin narrowly white; anal edged with white. Panama; one specimen known, in the museum of Yale University. (Named for Prof. Addison E. Verrill, of Yale University, a well-known naturalist.)

Sidera verrilli, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 623, Panama. (Coll. Prof. Bradley.)

Gymnothórax verrilli, JORDAN & DAVIS, *l. c.*, 599.

645. LYCODONTIS VICINUS (Castelnau).

Teeth all entire, uniserial; lower jaw with about 22 teeth on each side; canines well developed; gill openings narrower than the eye; eye large, 2 in snout, which is long, narrow and pointed; mouth capable of being completely closed; cleft of mouth 2 to 2⅓ in head; head long, about half length of trunk; tail longer than rest of body by about ⅝ length of head. Brown everywhere, finely mottled with darker brown or purplish; angle of mouth dusky; dorsal with a dusky edge, the fin marked with dark streaks as in *L. funebris*; anal edged with whitish; black spot at gill opening faint or obsolete. Tropical Atlantic, Cuba to Africa and Brazil; rather scarce; our specimen from Bahia. (*vicinus*, near; to *L. moringa.*)

Murænophis vicina, CASTELNAU, Anim. Amér. Sud, Poiss., 81, pl. 42, fig. 4, 1855, Bahia.

Gymnothorax versipunctatus, POEY, Enumeratio, 156, 1875, Cuba.

Thyrsoidea maculipinnis, KAUP, Apodes, 86, 1856, Gold Coast.

Muræna vicina, GÜNTHER, Cat., VIII, 121, 1870.

Muræna maculipinnis, GÜNTHER, Cat., VIII, 124, 1870.

Gymnothorax vicinus, JORDAN, Proc. U. S. Nat. Mus., 1890, 315; JORDAN & DAVIS, *l. c.*, 600.

Thyrsoidea cornura, KAUP, Aale Hamb. Mus., 26, 1859.

Thyrsoidea marginata, KAUP, *l. c.*, 24.

646. LYCODONTIS VIRESCENS (Poey).

Teeth uniserial, entire; gill opening larger than eye; tail longer than rest of body; depth of body 13⅝ in length; head 3 in trunk; cleft of mouth not quite half head. Olivaceous; head and tail with close-set dark points most distinct about gill opening; snout chestnut; dorsal mottled with gray and yellow, without distinct darker margin, its border colored like the fin; anal with a yellow border. Cuba; unknown to us. (Poey.) (*virescens*, greenish.)

Gymnothorax virescens, POEY, Enumeratio, 156, 1875, Cuba; JORDAN & DAVIS, *l. c.*, 600.

647. LYCODONTIS POLYGONIUS (Poey).

Teeth uniserial, stout, and strong, not close set; eye 2½ in snout; cleft of mouth 2 to 2½ in head; head 2½ in trunk, 3½ in tail, the tail slightly longer than rest of body. Dark markings forming narrow reticulations, never rounded spots; body and tail light olive, everywhere covered with reticulations of dark lilac, the patches of ground color inclosed by the ultimate reticulations, mostly smaller than pupil; some of the reticulations more conspicuous and inclosing irregular polygons or squares considerably larger than eye; the lines are so branched that these markings are not easily traceable; margin of anal broadly yellowish; a trace of a pale line on edge of dorsal. Cuba; two specimens known, both examined by us. (*polygonius*, πολυγώνιος, with polygons.)

Gymnothorax polygonius, POEY, Ann. N. Y. Lyc. Nat. Hist., 68, 1870, Havana; JORDAN & DAVIS, *l. c.*, 600.

Sidera vicina, JORDAN, Proc. U. S. Nat. Mus., 1886, 34, (not *Murænophis vicinus*, CASTELNAU.)

648. LYCODONTIS MORINGA (Cuvier).

(COMMON SPOTTED MORAY; HAMLET.)

Teeth uniserial, irregular in size in the jaws, those in the front of the mouth long, slender canines; vomer with one or two large, depressible teeth in front and usually a row of small teeth behind; eye rather large, about 2 in snout (2¾ to 3 in dark specimens, the pigment encroaching on the cornea, so that the eye seems notably smaller); cleft of mouth 2¼ in head; head 2 to 3 in trunk; tail usually a little longer than the head and trunk. Dark markings in the form of rounded spots, which are more or less confluent, sometimes reducing the pale ground color to narrow reticulations on a surface of black; ground color yellowish, the body covered with brown or black spots of varying size, never much smaller than the pupil of the eye, and sometimes so largely confluent as to make the ground color appear as yellow reticulations on a face of black; relative extent of light and dark markings subject to very great variations; spots on head and snout generally smaller; each pore on lower jaw generally placed in a large pale spot; dorsal and anal fins spotted like the body; margin of anal fin narrowly yellowish, this marking obliterated in dark specimens. West Indies, Pensacola to Rio Janeiro and St. Helena; very common, and very variable in amount of dark coloration, although the pattern of markings is very constant. The most abundant eel in the West Indies. (*Moringa*, a Portuguese corruption of Moray or *Muræna*.)

Muræna maculata nigra, (the Black Moray), CATESBY, Nat. Hist. Carolina, pl. 21, 1738, Bahamas.

?? *Gymnothorax afer*, BLOCH, Ich., pl. 417, 1795, Africa.

Gymnothorax rostratus, AGASSIZ, Spix, Pisc. Bras., 91, pl. 50 a, 1830, Brazil.

Muræna moringua, RICHARDSON, Voy. Erebus and Terror, Fishes, 89, 1844, Jamaica.

Muræna punctata, GRONOW, Catalogue Fishes, 18, 1854, North America.

Murenophis curvilineata, CASTELNAU, Anim. Amér. Sud, Poiss., 81, pl. 42, fig. 2, 1855, Rio Janeiro.

Murenophis caramura, CASTELNAU, Anim. Nouv. Rares, Amérique du Sud, 85, pl. 43, fig. 1, 1855, Bahia.

Gymnothorax flavoscriptus, POEY, Enumeratio, 158, 1875, Cuba.

Gymnothorax picturatus, POEY, Anal. Soc. Esp. Hist. Nat., 257, 1880, Cuba.

Sidera moringa, JORDAN, Proc. U. S. Nat. Mus., 1884, 111.

Gymnothorax moringua, JORDAN & DAVIS, *l. c.*, 601.

649. LYCODONTIS MORDAX (Ayres).

(CONGER EEL OF CALIFORNIA.)

Snout short, narrow, and pointed. Occipital region becoming fleshy and much elevated with age. Tail forming not quite half the total length. Head 7 in length, 2⅓ to 3⅕ in trunk; tube of anterior nostril half as long as the eye; posterior nostril with a slight border. Eye above the middle of the gape, 2¼ to 3¼ in snout, which is 6½ in rest of head. Gape 2½ to 3¼ in head. Gill opening slightly larger than eye. Sides of the upper jaw with two series of teeth posteriorly, the outer series of small, close-set, recurved, triangular teeth, which are immovable; inner teeth about 5, similar, but larger, depressible; a groove between the two series; in front of these, continuous with the outer series, are 3 fixed, knife-shaped teeth, then a movable tooth, then 3 fixed teeth; on the middle line of vomer 3 depressible fangs, the posterior the largest of the teeth; in the lower jaw a single series, corresponding to the outer series in the upper jaw, some of the front teeth enlarged and fixed. Dark brown, vaguely reticulated with narrow, paler markings and spots; a round dark blotch about gill opening; lower side of head and throat with about 15 dark lengthwise streaks; belly with similar streaks running crosswise; dark line on each side of base of anal, with short cross branches. Reaches a length of five feet. Point Concepcion to Cerros Island; abundant about the Santa Barbara islands, remarkable for its ferocity. A food fish of some importance. (*mordax*, prone to bite.)

Muræna mordax, AYRES, Proc. Ac. Nat. Sci. Cal., 1859, 30, Cerros Island; JORDAN & GILBERT, Synopsis, 356, 1883; JORDAN, Proc. U. S. Nat. Mus., 1880, 30.

Sidera mordax, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1883, 210.

Gymnothorax mordax, JORDAN & DAVIS, *l. c.*, 610.

650. LYCODONTIS FUNEBRIS (Ranzani).

(BLACK MORAY; MORENA VERDE.)

Tail a little longer than head and trunk. Teeth uniserial in the jaws in the adults; teeth on vomer uniserial (var. *? erebus*), or biserial (*funebris*); long, depressible canines on front of vomer; eye 2 to 2½ in snout, above middle of gape; cleft of mouth 2½ in head; head 2½ in trunk. Color dark olive brown, nearly plain, paler on throat, sometimes with very faint darker marblings; dorsal and anal fins with dark lines running longitudinally; belly without black transverse lines. Jaws not completely closing. Tropical America, on both coasts; the largest of our eels, reaching 5 or 6 feet or more; extremely ferocious; common from Florida Keys to Rio Janeiro, and from Gulf of California to Panama.* A very similar species (*prasinus*) regarded by Dr. Günther as the same, occurs in the East Indies. (*funebris*, funereal, from its dark color.)

Muræna maculata nigra et viridis, (*The Moray*), CATESBY, Nat. Hist. Carolina, pl. 20, 1738, Bahamas.

Gymnothorax funebris, RANZANI, Nov. Comm. Ac. Sc. Inst. Bonon., IV, 76, 1840, Brazil; JORDAN & DAVIS, *l. c.*, 603.

Muræna lineopinnis, RICHARDSON, Voy. Erebus & Terror, Fish., 89, 1844, Puerto Cabello.

Tæniophis westphali, KAUP, Aale Hamburg Mus. Nachtrag., 1, 1859.

Thyrsoidea aterrima, KAUP, Aale Hamburg Mus., 22, 1859.

Sidera castanea, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 647, Mazatlan. (Type, Nos. 28246, 29535, and 29591. Coll. Gilbert.)

Muræna afra, GÜNTHER, Cat., VIII, 123, 1870, (not after Bloch, which is more like *moringa*).

Muræna aterrima, GÜNTHER, Cat., VIII, 124, 1870.

Sidera funebris, BEAN & DRESEL, Proc. U. S. Nat. Mus., 1884, 169.

---

* *Lycodontis castaneus* of the Pacific is probably distinct from *Lycodontis funebris*.

651. LYCODONTIS SANCTÆ-HELENÆ (Günther).

Cleft of mouth less than half of head; teeth of jaws irregularly biserial; vomerine teeth biserial; snout rather produced and narrow; eye situated above the middle of gape, 2½ in snout; cleft of mouth contained 2¼ in head; head 2½ in trunk; tail longer than rest of body. Brownish black, with numerous rather irregular pale grayish spots, the largest about the size of the eye, the smallest mere dots; each spot again marbled with darker, the smaller and larger spots mixed together. (Gunther.) Tropical Atlantic, recorded from St. Helena and the Bermudas.

Muræna sanctæ-helenæ, Günther, Cat., VIII, 115, 1870, St. Helena. (Coll. J. C. Melliss); Bean, Proc. U. S. Nat. Mus., 1880, 113.
Gymnothorax sanctæ-helenæ, Jordan & Davis, *l. c.*, 602.

652. LYCODONTIS DOVII (Günther).

(Morena Pintita.)

Teeth all uniserial, those on lower jaw small, compressed, directed backwards; front of lower jaw with several canines; upper with some fixed canines among the other teeth; head 2 to 2½ in trunk; cleft of mouth 2 to 2½ in head; tail longer than body. Brownish or blackish, with small round bluish or yellowish spots, ocellated or not, these spots scattered, irregular in position, and smaller than eye; dorsal colored like the back. Gulf of California to the Galapagos; rather scarce; variable. (Named for Captain John M. Dow.)

Muræna dovii, Günther, Cat., VIII, 103, 1870, Panama. (Coll. Capt. Dow.)
Muræna pintita, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1881, 346, Mazatlan. (Type, No, 28311. Coll. Gilbert.)
Sidera dovii, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1883, 209.
Gymnothorax dovii, Jordan & Davis, *l. c.*, 604.

653. LYCODONTIS CONSPERSUS (Poey).

Vomerine teeth biserial; mandible with about 17 teeth on each side. Head 2½ in trunk; tail but little longer than rest of body. Entire body covered with small blue dots one-sixth diameter of eye, the distance between them being equal to diameter of eye; front and top of head without dots; dorsal with vertical cross streaks of bluish. (Poey.) Cuba to Rio Janeiro. (*conspersus*, speckled.)

Murænophis punctata, Castelnau, Anim. Nouv. Rares Amér. Sud, 82, 1855, Rio Janeiro; (not *Gymnothorax punctatus*, Bloch).
Gymnothorax conspersus, Poey, Repertorio, II, 259, 1868, Cuba; Jordan & Davis, *l. c.*, 604.
Muræna conspersa, Günther, Cat., 102, 1870.

654. LYCODONTIS MILIARIS (Kaup).

Teeth of upper jaw biserial. Vomerine teeth uniserial, mostly small and rounded. Teeth biserial, except on vomer and side of mandible; canines small; mouth can be shut completely; gill opening as wide as eye; eye 2 in snout; cleft of mouth 2½ in head; head 2½ in body; tail rather longer than rest of body. Color nearly uniform from head to tail; brown or black, entirely covered with innumerable yellowish dots, the largest the size of a small pin head. (Günther.) West Indies. (*miliaris*, in thousands, referring to the spots.)

Thrysoidea miliaris, KAUP, Apodes, 90, 1856, Martinique.

Muræna multiocellata, POEY, Memorias, II, 324, 1860, Cuba; based on specimens with smaller spots than usual.

Gymnothorax scriptus, POEY, Repertorio, II, 261, 1868, Cuba.

Muræna miliaris, GÜNTHER, Cat., VIII, 100, 1870.

Gymnothorax miliaris, JORDAN & DAVIS, *l. c.*, 604.

655. LYCODONTIS ELABORATUS (Poey).

Vomerine teeth biserial, small, and bluntly rounded. Mouth not closing completely; teeth of upper jaw biserial, those of the inner series larger; teeth of the lower jaw biserial anteriorly; eye over middle of gape, 2¼ in snout; head 2⅞ in trunk, 4¼ in tail, which is a little longer than rest of body; gill opening large. Color dark brown, faintly mottled with darker, the whole body, including fins, covered with points of clear yellow, those on the head close-set and minute, like needle points, but as large as a pin head on the tail; (middle of body with intricate markings of yellow, in the form of linear dashes, according to Poey; none shown on our specimen). Cuba; two specimens recorded. (*elaboratus*, labored over, from the markings.)

Muræna elaborata, POEY, Memorias, II, 323, 1860, Cuba; POEY, Repertorio, II, 262, 1868.

Gymnothorax elaboratus, JORDAN & DAVIS, *l. c.*, 605.

656. LYCODONTIS OBSCURATUS (Poey).

Anterior teeth of upper jaw long and sharp, the rest small and in one series; vomerine teeth in one row, three large canines in front, the rest small; teeth on lower jaw small, with two longer ones on each side in front; head 2½ in trunk; cleft of mouth 2 in head; tail a head's length longer than the rest of the body. Body marbled with brown on a greenish ground, dark enough to almost obscure the marblings, which are composed of close-set spots as large as the pupil, often bordered on one side with a white edging, the spots sometimes being all white; dorsal fins with a blackish border, sometimes interrupted with white; anal all black, with a white border. (Poey.) Cuba; not seen by us. (*obscuratus*, darkened.)

Gymnothorax obscuratus, POEY, Ann. N. Y. Lyc. Nat. Hist., IX, 1870, 320, Cuba; JORDAN & DAVIS, *l. c.*, 605.

657. LYCODONTIS CHLEVASTES (Jordan & Gilbert).

Head with 3½ rings which do not meet below; tip of snout in one ring, the top and front of snout on median line pale. Upper teeth biserial, the rest uniserial; dentary with about 14 teeth on each side; eye 2 in snout, midway between tip of snout and angle of mouth; head 2⅔ in trunk; head and trunk a little shorter than tail; mouth completely closing. Color pale yellowish brown, with about 20 blackish rings, which are usually three times the breadth of the interspaces; these rings broadest above, extending over the fins; tip of tail black. Galapagos Islands; one specimen known; a remarkably handsome species. (χλευαστής, a harlequin.)

Sidera chlevastes, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1883, 208, Galapagos. (Type, No. 20385. Coll. Capt. Herendeen.)

Gymnothorax chlevastes, JORDAN & DAVIS, *l. c.*, 605.

Subgenus PRIODONOPHIS, Kaup.

658. LYCODONTIS OCELLATUS (Agassiz).

(SPOTTED MORAY.)

Teeth all uniserial in jaws, rather large and strong, the posterior edge of the larger teeth serrate, like the teeth of a shark; vomer with few small teeth or none; jaws nearly or quite closing; head 2 to 2½ in trunk, 3½ to 4½ in tail; eye 1¼ to 1¾ in snout; cleft of mouth 2½ to 3 in the head; tail a little longer than rest of body. Color brown above, lighter below, with irregular light yellowish spots, variable in size and sometimes so thickly placed that the ground work appears as brown reticulations; dorsal fin with large dark spots on the edge, the spots often running together, so as to form a black band (or sometimes obsolete); anal fin with a dark edge.

In typical specimens, (var. *ocellatus*), the spots are of moderate size, much larger than pupil, rounded and yellowish in color, subequal and not so wide as the interspaces; cheeks coarsely spotted. West Indian Fauna. Pensacola to Rio Janeiro; a small species, rarely exceeding 18 inches in length; abundant and variable. (*ocellatus*, with eye-like spots.)

Gymnothorax ocellatus, AGASSIZ, Spix, Pisc. Brasil, 91, pl. 50 b, 1828, Brazil; GOODE & BEAN, Proc. U. S. Nat Mus., 1879, 344; JORDAN & DAVIS, *l. c.*, 606.

Priodonophis ocellatus, POEY, Synopsis, 427, 1868.

Muræna ocellata, GÜNTHER, VII, 102, 1870; JORDAN & GILBERT, Synopsis, 356, 1883.

Represented in deeper water off Cuba and the Pensacola Snapper Banks by

658a. LYCODONTIS OCELLATUS SAXICOLA (Jordan & Davis).

Edge of dorsal and anal with confluent black blotches, forming a dark margin to the fin, the anal chiefly black. Dark ground color forming reticulations around roundish and polygonal pale spots of various sizes, these larger on the tail, the spots everywhere much wider than the interspaces. Otherwise similar to the typical *ocellatus*. (*saxum*, rock; *colo*, I inhabit.)

Muræna meleagris, QUOY & GAIMARD, Voy. Freycinet, Zoöl., 245, pl. 52, fig. 2, 1824, (not of SHAW).

Gymnothorax ocellatus saxicola, JORDAN & DAVIS, *l. c.*, 606, Snapper Banks off Pensacola.

Priodonophis meleagris, POEY, Repertorio, II, 262, 1867.

Sidera ocellata, JORDAN, Proc. Ac. Nat. Sci. Phila., 1882, 42.

Muræna ocellata, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1884, 260.

Replaced in shallow, sandy bays (Pensacola Bay; St. Joseph Island, Texas) by

658b. LYCODONTIS OCELLATUS NIGROMARGINATUS (Girard).

Spots very small, stellate, not much larger than pupil; spots whitish; cheeks finely spotted like the rest of the body; body slender, a dusky shade along sides; fins chiefly black. Otherwise similar to var. *ocellatus*. (*niger*, black; *marginatus*, edged.)

Neomuræna nigromarginata, GIRARD, U. S. and Mex. Bound. Surv., 76, pl. 41, 1859, **St. Joseph Island, Texas.** (Coll. Würdemann).

Sidera nigromarginata, JORDAN & EVERMANN, Proc. U. S. Nat. Mus., 1886, 473.

Gmnothorax occellatus nigromarginatus. JORDAN & DAVIS, *l. c.*, 606.

191. MURÆNA (Artedi) Linnæus.

(MORAYS.)

Muræna, ARTEDI, Gen. Pisc., 23, 1738, (in part; includes all eels).

Muræna, KLEIN, Hist. Nat. Pisc., 28, 1742, (in part; includes all eels without pectoral fins).

Muræna, LINNÆUS, x, 243, 1758, (*helena*, etc., includes all eels).

Muræna, THUNBERG & AHL, De Muræna et Ophictho, 6, 1789, (restricted to *helena*, etc., includes species without pectoral fins).

Gymnothorax, BLOCH, Ichthyologia, 1795, Morays, (*reticularis*).

Muræna, GÜNTHER, and of authors generally, (not of BLEEKER).

Murænophis, LACÉPÈDE, Hist. Nat. Poiss., v, 630, 1803, (*helena*, etc.).

Limamuræna, KAUP, Apodes, 95, 1856, (*guttata*).

This genus as now restricted contains some ten species found in the tropical seas, distinguished from *Lycodontis* and from the rest of the family by the presence of two pairs of nasal barbels. The name *Muræna*, originally applied to all eels, should be restricted to the group typified by *Muræna helena*. It was first limited by Thunberg & Ahl, in 1789, to the eels with out pectoral fins, those with such fins being set off as *Ophichthus*. (Μύραινα, (Moray), ancient name of *Muræna helena*.)

a. Teeth of upper jaw in one series;[*] all the teeth uniserial in the adult, those of the upper jaw sometimes biserial in the young.

b. Mouth capable of being completely closed.

c. Body with round pale spots, most numerous on belly and tail, the ground color dark brown; gill opening black. INSULARUM, 659.

cc. Body with many very fine yellow spots, the ground color brown, with three rows of diffuse yellow blotches. ARGUS, 660.

bb. Mouth not closing completely, the jaws curved along the gape; body with well-defined reticulations, inclosing yellowish spots; gill opening black. RETIFERA, 661.

aa. Teeth of sides of upper jaw biserial, those of the inner series larger and farther apart; jaws capable of being completely closed.

d. Body scantily spotted, the spots obscure and whitish; gill opening largely black. MELANOTIS, 662.

dd. Body profusely spotted, the spots light yellow, edged with brown; gill opening merely dusky. LENTIGINOSA, 663.

659. MURÆNA INSULARUM, Jordan & Davis.

Mouth capable of being completely closed, the jaws being nearly straight along the commissure. Teeth all uniserial, entire, directed backwards, most of them movable; lower teeth 12 on each side, rather remote and comparatively large; no larger canines in front of upper jaw; teeth of upper jaw subequal, about 12 on each side, those in front smallest; vomerine teeth small, uniserial, directed backward; posterior nasal tubes well developed, nearly as large as anterior; dorsal beginning before gill opening; eye over middle of gape, 2⅓ in snout; snout 2 in gape; head 2½ in trunk; gape 2¼ in head; head and trunk a trifle shorter than tail. Color very dark leather-brown or almost black; throat marbled with paler; a black spot around gill opening; dorsal mottled with grayish; posterior part of body with a few scattered round grayish spots about as large as pupil; these irregular in size and position and rather faint, most numerous around vent and on anal fin; sides of tail nearly or quite plain; angle of mouth dark. Length 20 inches. Galapagos Islands; one specimen known; resembling the European *Muræna helena*, but less mottled and more distinctly spotted. (*insularum*, of the islands.)

---

[*] Character not verified in *Muræna argus*, which may belong to *aa*.

Muræna insularum, JORDAN & DAVIS, Apodal Fishes, 609, 1892, Chatham Island. (Type, No. 38300. Coll. Dr. W. H. Jones.)

660. MURÆNA ARGUS (Steindachner).

Jaws capable of being completely closed. Teeth all uniserial; those of upper jaw strong, sharp-pointed, recurved; vomerine teeth much smaller, preceded by two long canines; head 6½ in total length; eye 2½ in snout; snout 5½ in head. Body with three rows of diffuse yellow blotches, including fine spots. Color clear brown with a reddish tinge; very small yellow spots covering head, body and fins, mixed here and there with larger spots; large yellowish blotches arranged in three rows along the body; the lower row fainter than upper. (Steindachner.) Altata, west coast of Mexico; not seen by us. (*Argus*, the hundred-eyed, from the innumerable spots.)

Gymnothorax (*Limamuræna*) *argus*, STEINDACHNER, Ich. Notizen, x, 17, pl. IV, 1870, Altata.
Muræna argus, JORDAN & DAVIS, *l. c.*, 610.

661. MURÆNA RETIFERA, Goode & Bean.

Vomerine teeth small, sharp; teeth all uniserial, large and strong in the jaws; those in front not enlarged; head 2¾ to 3 in trunk; tail a little longer than rest of body. Jaws curved along the gape so that they can not be completely closed. Body covered by well-defined reticulations, inclosing light yellowish brown spots, which posteriorly are arranged in groups of 5 to 8; gill opening largely black, within a conspicuous dark blotch; angle of mouth with a dark spot; inside of mouth with yellowish brown spots. Coast of South Carolina, in rather deep water, occasionally brought to the Charleston markets. (*rete*, net; *fero*, I bear.)

Muræna retifera, GOODE & BEAN, Proc. U. S. Nat. Mus., 1882, 435, off Charleston. (Type No. 31393. Coll. C. C. Leslie.) JORDAN & GILBERT, Synopsis, 894, 1883; JORDAN, Cat. Fish. N. A., 51, 1885; JORDAN & DAVIS, *l. c.*, 610.

662. MURÆNA MELANOTIS (Kaup).

Cleft of mouth 2½ to 2⅓ in head; head 2¼ to 2½ in trunk; tail a little longer than rest of body; teeth of upper jaw anteriorly in two rows, the inner teeth larger and farther apart; canines moderate. Color dark brown with many small obscure whitish spots, these sometimes over whole body, sometimes confined to head and back anteriorly; belly plain brown; dark spot on gill opening and at angle of mouth always conspicuous; a pale spot on base of lower jaw before the dark one. Tropical Atlantic, from Africa to South America, its range in the West Indies uncertain, from confusion with other species. (*μέλας*, black; *οὐς*, ear.)

Limamuræna melanotis, Kaup, Aale Hamb. Mus., 27, pl. 4, fig. 3, 1859.

Muræna melanatis, Günther, Cat., viii, 98, 1870; Steindachner, Fische Afrikas, 33, 1881; Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 624; Jordan & Gilbert, Synopsis, 355, 1883.

Muræna melanotis, Jordan & Davis, *l. c.*, 610.

663. MURÆNA LENTIGINOSA, Jenyns.

(Morena Pinta.)

Teeth of upper jaw biserial, the inner series of depressible canines; teeth on lower jaw and vomer uniserial; eye 2 to 2½ in snout, situated over the middle of gape; cleft of mouth 2½ to 3 in head; head 2 to 2⅖ in trunk. Jaws capable of being completely closed. Body profusely spotted; angle of mouth with little or no black; gill opening dusky; general color brown, the body with light yellow, distinctly brown-edged spots, which are about as large as pupil, sometimes larger; towards the end of tail the dark edgings form brown spots; snout, jaws, and belly spotted, as also the dorsal and anal; a faint dusky bar from base of dorsal to behind cleft of mouth; spots more numerous around gill openings. Pacific Coast of America from Gulf of California to Galapagos; generally common, varying considerably in shade of color. (*lentiginosus*, freckled.)

Muræna lentiginosa, Jenyns, Voy. Beagle, Zoöl., 143, 1842, Galapagos Islands; Günther, Cat., viii, 99, 1870.

Muræna pinta, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1881, 345, Mazatlan. (Type, No. 28238. Coll. Gilbert.) Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 371; Jordan & Gilbert, ibid, 381; Jordan & Davis, *l. c.*, 610.

192. ECHIDNA, Forster.

Echidna, Forster, Enchiridion, 31, 1778, (*variegata*).

Gymnomuræna, Lacépède, Hist. Nat. Poiss., v, 648, 1803, (*doliata* = *marmorata*).

Gymnopsis, Rafinesque, Analyse Nature, 1815, 93, (*doliata*).

Megaderus, Rafinesque, *l. c.*, 93, (*variegata*).

Molarii, Richardson, Voyage Erebus & Terror, 79, 1844, (*ophis* = *nebulosa*).

Pœcilophis, Kaup, Apodes, 98, 1856, (*catenatus*).

Gymnomuræna, Kaup, Apodes, 98, 1856, (*variegata* = *nebulosa*).

This well-marked genus is distinguished from the other Morays by the blunt teeth. The name *Echidna* was suggested for this group of eels long before its application by Cuvier to a genus of Australian Monotremes. There are some 12 or 15 species of *Echidna*, most of them belonging to the Western Pacific. This genus represents the highest degree of specialization among the Morays, as *Uropterygius* represents the extreme of degradation. (ἔχιδνα, ἔχις, viper.)

a. Color dark, with small, round yellowish spots; teeth subequal, bluntish, less obtuse than in *E. catenata*, mostly uniserial; dorsal high, beginning over gill opening; head 2¾ in trunk; tail about a snout's length shorter than rest of body. nocturna, 664.

aa. Color brownish, marbled and barred with paler; head 3 to 3¼ in trunk, 3½ in tail. catenata, 665.

664. ECHIDNA NOCTURNA (Cope).

Teeth subequal, bluntish, less obtuse than in *E. catenata*, mostly uniserial; dorsal high, beginning over gill opening; head short and blunt, the small eye half the snout; head 2¾ in trunk; cleft of mouth 3 in head;

tail about a snout's length shorter than rest of body. Color dark brown, with small, round, yellow spots, smaller than pupil, like pin points, scattered evenly and sparsely over the body; spots with blackish margins; lower jaw mottled. Pacific coast of Mexico, the two known specimens from Rio Grande, Costa Rica, and from Cape San Lucas. Cope says of his specimen that the anal fin is a little more than one-third the total length, which is not true of the one here described. (*nocturnus*, nocturnal, black.)

Pœcilophis nocturnus, Cope, U. S. Geol. Surv. Mont., 474, 1871 (1872), Rio Grande, at San José, Costa Rica. (Coll. Dr. Van Patton.)
Echidna nocturna, Jordan & Davis, *l. c.*, 612.

665. ECHIDNA CATENATA (Bloch).

Head 3 to 3¼ in trunk, 3½ in tail; eye small, 1½ to 2 in snout; cleft of mouth 3 to 3½ in head; tail a trifle longer than rest of body; teeth of upper jaw more or less biserial. Color, brownish black, marbled or reticulated with light yellow or white, the light markings sometimes forming narrow irregular crossbars; under the jaw and on the belly the light yellow often predominates, inclosing dark spots. West Indies, from Bermuda to Surinam; a small species, generally common; our specimens from San Lucia. (*catenatus*, chained, from the chain-like cross bands.)

Muræna seu conger brasiliensis, Seba, Thesaurus, II, 72, pl. 69, figs. 4, 5, 1738, Brazil.
Gymnothorax catenatus, Bloch, Ausl. Fische, XII, 74, pl. 415, fig. 1, 1795, Coromandel; an error.
Muræna sordida, Cuvier, Règne Animal, Ed. 1, 233, 1817, after Seba.
Murænophis catenula, Lacépède, V, 628 and 641, 1803, after Bloch, Palmerston Island.
Murænophis undulata, Lacépède, V, 629, pl. 292, 1803.
Muræna alusis, Bleeker, Act. Soc. Sc. Ind. Neerl., 67, 1855.
Echidna flavoscripta, Poey, Repertorio, II, 264, Cuba.
Echidna fuscomaculata, Poey, Repertorio, II, 263, 1868, Cuba.
Muræna catenata, Günther, Cat., VIII, 130, 1870; Goode, Bull. U. S. Nat. Mus., V., 73, 1876; Jordan, Proc. U. S. Nat. Mus., 1889, 647.
Echidna catenata, Jordan & Davis, *l. c.*, 612.

193. UROPTERYGIUS, Rüppell.

Gymnomuræna, Lacépède, Hist. Nat. Poiss., V, 618, 1803, (*doliata*; *marmorata*). (Restricted first by Kaup, in 1856, to *doliata*, which is a species of *Echidna*.)
Icthyophis, Lesson, Voyage de la Coquille, II, 120, 1830, (*pantherinus* = *marmoratus*; not of Fitzinger, 1829, a genus of reptiles).
Uropterygius, Rüppell, Neue Wirbelthiere, Fische, 83, 1838, (*concolor*).
Murænoblenna, Kaup, Apodal Fishes, 97, 1856, (*tigrina*), (not of Lacépède, 1803, which is *Myxine*).
Gymnomuræna, Bleeker, Günther, etc., (not of Lacépède, as restricted by Kaup).
Scutica, Jordan & Evermann, new subgenus, (*necturus*).

This genus contains several species of small Morays, distinguished by the apparent absence of fins. The teeth are small, pointed, and subequal, and the cleft of mouth of moderate size. In spite of its simplicity of structure, it is not by any means a primitive type, but a further degeneration from the form of *Lycodontis* and *Muræna*. Our species (with *U. tigrinis*) differs from the type of *Uropterygius* in having only the anterior nostrils tubular. This may define a new subgenus, *Scutica* (*scutica*, a whip). (*οὐρά*, tail; *πτέρυξ*, fin.)

Subgenus SCUTICA, Jordan & Evermann.

666. UROPTERYGIUS NECTURUS (Jordan & Gilbert).

Teeth in jaws biserial, outer teeth small, close together; inner row composed of long depressible canines, not close-set, vomerine teeth uniserial; a pore situated just above the posterior nostril; tail rather acute with a very slight dorsal fold, more conspicuous in old specimens, its tip in young specimens white; caudal fin obsolete; eye 2 to 2½ in snout; cleft of mouth 2½ to 2⅓ in head; head 3⅓ in trunk; tail ⅓ longer than rest of body. Anterior nostril with a short tube; posterior without tube, situated directly over the eye. Body dark brown above; below paler, with small, dark freckles and pale spots; under side of lower jaw light colored with brown and whitish blotches. Length 12 inches. Gulf of California; not rare. (*νήκτης*, swimmer; *οὐρά*, tail.)

Gymnomuræna nectura, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 356, Cape San Lucas. (Type, No. 15442. Coll. Xantus.)

Muræenoblenna nectura, JORDAN, Cat. Fish. N. A., 51, 1885.

Uropterygius necturus, JORDAN & DAVIS, *l. c.*, 586.

194. CHANNOMURÆNA, Richardson.

Channo-Muræna, RICHARDSON, Voyage Erebus and Terror, 96, 1844, (*vittata*).

This genus is near *Uropterygius*, differing chiefly in the size of the gape, the cleft of the mouth being nearly half the length of the head; the snout is very short, the tail also abbreviated, and there are no evident fins. Species few, gaily colored. (*χάννη*, from *χαίνω*, to yawn; *Muræna*.)

667. CHANNOMURÆNA VITTATA (Richardson).

Fins wanting. Lower jaw projecting; teeth slender, subequal, directed backward; teeth in lower jaw in two series, pointed backwards, the inner teeth the largest, and movable; teeth in upper jaw in three series, the two inner series larger and more or less movable; vomerine teeth in a band, thick-set anteriorly, posteriorly biserial. Eye 1½ in snout, situated in the anterior third of gape; snout 4½ in gape; gape 2 in head; head about 4 in trunk, 2⅔ in tail. Color pale yellowish brown, with about 15 irregular broad chocolate-colored cross bands varying in width, sometimes interrupted, sometimes bifurcated, some of them forming complete rings, the pale interspaces usually edged with lighter yellowish. Coast of Cuba; rare. (*vittatus*, striped.)

Raro, PARRA, Dif. Piezas, Hist. Nat., 66, pl. 30, fig. 3, 1780, Havana.

Ichthyophis vittatus, RICHARDSON, Voy. Sulph., Fish., 114, pl. 53, figs. 7–9, 1844, locality uncertain; RICHARDSON, Voyage Erebus and Terror, Fishes, 96, 1844.

Channomuræna cubensis, POEY, Repertorio, II, 266, pl. 3, fig. 6, 1867, Cuba.

Gymnomuræna vittata, GÜNTHER, Cat., VIII, 134, 1870.

Order R. LYOMERI.

(THE GULPERS.)

Fishes with 5 or 6 branchial arches, far behind the skull and none modified as branchiostegal or pharyngeal; an imperfectly ossified cranium articulating with the first vertebra by a basi-occipital condyle alone; only 2 cephalic arches, both freely movable, (1) an anterior dentigerous one—the maxillary, and (2) the suspensorial, consisting of the hyomandibular and quadrate bones; no palatine bones nor distinct posterior bony elements to the mandible; an imperfect scapular arch remote from the skull; vertebræ separately ossified but imperfect. (Gill and Ryder.)

This order consists of eel-shaped fishes found in the deep seas. It is apparently a degraded type, perhaps an offshoot from some eel-like form. It is characterized by a general looseness of structure and lack of specialization, unique among the true fishes. "The branchial arches are reduced to very simple bars, on the side of the œsophagus, and have no connection with the cranium; the palato-pterygoid arch is entirely wanting; the suspensorium for the lower jaw is composed of only two pieces, the hyomandibular and the quadrate, of an elongate, subcylindrical form and connected with the skull by a movable joint which allows it to be swung in all directions."

These fishes have very singular pedunculated appendages in place of the lateral line. "The entire organization is peculiar, to the extent of anomaly, and our old conceptions of the characteristics of a fish require to be modified in the light of our knowledge of such strange beings." (Gill.) Dr. Gill is disposed to regard the various records as indicating the existence of two distinct families, *Saccopharyngidæ* and *Eurypharyngidæ*, each represented in our waters by one species. (*λύω*, to loosen; *μέρος*, part.)

Family LIV. SACCOPHARYNGIDÆ.

(THE GULPERS.)

Lyomeri with the branchio-anal portion much longer than the rostro-branchial; the tail excessively elongate and attenuated; the cranium unknown; the eyes antero-lateral; the maxillary bones moderately extended backwards (in comparison with the Eurypharyngidæ), and apparently not closable against each other; enlarged teeth in one or both jaws; the dorsal and anal fins feebly developed, the pectorals small but broad. Body eel-shaped, the bones deficient in inorganic matter; muscles feebly developed, except those connected with swallowing. Jaws very elongate, the gape, pharynx, and stomach capable of great distension. The trunk moderate, with the vent at its end; snout very short, one nostril on each side in front of the very small eye; maxillary and mandible slender, armed with feeble teeth in one or two series; roof of mouth toothless. Gill openings far behind cranium, placed low; gills very short, and small. Tail excessively elongate, band-shaped, tapering to a point. Dorsal and anal low, rudimentary. Pectorals present, small but broad. Deep seas, but few specimens being on record. These have been referred to three species and two genera, but the assigned distinctive characters of genera and species are all doubtful.

195. SACCOPHARYNX, Mitchill.

Saccopharynx, MITCHILL, Ann. Lyc. Nat. Hist. N. Y., 1824, 82, (no specific name; the type afterwards called *S. flagellum*).

Ophiognathus, HARWOOD, Philos. Trans., 1827, 277, (*ampullaceus*).

Supposed characters of the genus indicated above. (*σάκκος*, sack; *φάρυγξ*, pharynx, the inflated throat resembling the sack of a pelican.)

668. SACCOPHARYNX AMPULLACEUS (Harwood).

Both jaws armed with slender, curved, widely set teeth, biserial, or their points in one irregular series, directed inwards. Length of jaws from $\frac{1}{3}$ to $\frac{1}{7}$ that of body, from tip of snout to vent. Dorsal fin commencing a long way behind head, a short distance in front of vent; like the anal, it may or may not reach the tail, which ends in an extremely delicate and thin filament. Pectoral fin very short, but broad, and with about 30 very thin rays. Gill opening an elongate slit; black, with a bluish white line along base of dorsal, and sometimes of anal also. Length of largest specimen about 6 feet, 14+58 inches, the tail 4 times length of trunk. Atlantic Ocean, in deep water. Four specimens known, three of these brought to the surface by having swallowed a fish too large for the capacity of the stomach. (Günther.) (*ampulla*, a flask.)

Saccopharynx, MITCHILL, Ann. Lyc. Nat. Hist. N. Y., 1824, 82, Open Atlantic.

Ophiognathus ampullaceus, HARWOOD, Phil. Trans., 1827, 52, Atlantic.

Saccopharynx flagellum, CUVIER, Règne Anim., Ed. 2, II, 355, 1829, Atlantic; after MITCHILL; GÜNTHER, Cat., VIII, 22, 1870; GÜNTHER, Deep-Sea Fishes, Challenger, 256, 1887; JORDAN & GILBERT, Synopsis, 365, 1883; GILL & RYDER, Proc. U. S. Nat. Mus., 1883, 271.

Saccopharynx chordatus, STORER, Synopsis, Fishes N. A., 237, 1846, Open Atlantic; after MITCHILL.

Family LV. EURYPHARYNGIDÆ.

Lyomeri with the branchio-anal portion much shorter than the rostrobranchial; the tail very elongate and moderately attenuated backwards; head flat above, and with a transverse rostral margin, at the outer angles of which the eyes are exposed; maxillaries excessively elongated backwards, parallel, and closing against each other as far as the articulation of the 2 suspensorial bones; with minute teeth on each jaw; dorsal and anal fins well developed and continued nearly to the end of the tail; the pectoral fins minute, narrow. (Gill & Ryder.) Deep-sea fishes; 2 genera* and two species known.

196. GASTROSTOMUS, Gill & Ryder.

Gastrostomus, GILL & RYDER, Proc. U. S. Nat. Mus., VI, 1883, 271, (*bairdii*).

Cranium abbreviated and little or no longer than broad, the dentigerous bones almost seven times as long as the cranium; minute, acute, conic teeth, depressed inwards in a very narrow band on the jaws; no enlarged teeth at extremity of mandible; tail with an eradiate membrane under its terminal portion. (Gill & Ryder.) (*γαστήρ*, stomach; *στόμα*, mouth.)

669. GASTROSTOMUS BAIRDII, Gill & Ryder.

Jaws with minute, acute, conical teeth, depressed inwards, in a very narrow band, without fangs at the end of lower jaw. Length of jaws more than half body, measured from snout to vent. Origin of dorsal nearer to tip of snout than to front of anal; neither dorsal nor anal reaching tip of tail; gill openings narrow. Black, with no whitish streak along base of dorsal. Length 18½ inches, the body 6½ inches. Deep water off Newfoundland banks, 389 to 1,467 fathoms; also taken in Davis Strait. (Named for Spencer Fullerton Baird.)

---

* The supposed genus and species, *Eurypharynx pelecanoides*, Vaillant, (Comptes Rendus, 1882, 1226) from deep water off Morocco, has the jaws about half length of body to vent, both jaws with feeble dental granulations, and the lower jaw with two fangs in front.

Gastrostomus bairdii, GILL & RYDER, Proc. U. S. Nat. Mus., VI, 1883, 271, off the Grand Banks of Newfoundland. (Type, Nos. 33294, 33295, and 33386. Coll. Albatross.)

Order S. ISOSPONDYLI.

(THE ISOSPONDYLOUS FISHES.)

Soft-rayed fishes with the anterior vertebræ simple, unmodified and without auditory ossicles; symplectic present; no interclavicles; opercular bones distinct; pharyngeal bones simple above and below, the lower not falciform. Mesocoracoid[*] arch always well developed, as in the *Ostariophysi* and the Ganoids, forming a bridge from the hypercoracoid to the hypocoracoid. Bones of jaws developed, the maxillary broad, always distinct from premaxillary, and forming part of margin of upper jaw; no barbels. Shoulder girdle well developed and connected with the cranium by a bony post-temporal. Gills 4, a slit behind the fourth. Air bladder, if present, with a pneumatic duct. Dorsal and anal fins without true spines. Ventral fins abdominal, sometimes wanting. Scales usually cycloid, sometimes ctenoid; occasionally wanting. No developed photophores. Adipose fin present or absent. A large group comprising most of the marine soft-rayed fishes, excepting those found in the deep sea, these composing the degenerate group called *Iniomi*. Some of the forms, as *Elopidæ*, *Albulidæ*, etc., show analogies with the Ganoid allies of the *Cycloganoidea*. This seems to indicate the probable descent of the *Isospondyli* from a Ganoid stock, but probably not from the same part of the Ganoid series as that from which the *Ostariophysi* have sprung. (*ἴσος*, equal; *σπόνδυλος*, vertebræ.)

CLUPEOIDEA:

a. Adipose fin none.

b. Dorsal fin inserted more or less before anal (rarely slightly behind it); shore fishes or river fishes, usually silvery in coloration and with the skeleton firm; air bladder well developed.

c. Gular plate present, between branches of lower jaw; mouth large; teeth present, all pointed; axillary scales and sheaths large. ELOPIDÆ, LVI.

cc. Gular plate none.

d. Lateral line well developed.

e. Teeth present, no accessory branchial organ.

f. Mouth small, horizontal; posterior part of tongue and roof of mouth covered with course paved teeth. ALBULIDÆ, LVII.

ff. Mouth large, the teeth all pointed, some of them canine, none paved or molar. HIODONTIDÆ, LVIII.

ee. Teeth none; an accessory branchial organ behind gill cavity. CHANIDÆ, LIX.

dd. Lateral line wanting; no gular plate.

g. Mouth small, inferior, toothless, the maxillary simple or nearly so; stomach gizzard-like. DOROSOMIDÆ, LX.

---

[*] Precoracoid of Cope; "Spangenstück" of Gegenbaur.

gg. Mouth moderate, terminal, the maxillary of about three pieces; stomach not gizzard-like. CLUPEIDÆ, LXI.

ggg. Mouth subinferior, very large, below a tapering, pig-like snout; maxillary very long. ENGRAULIDIDÆ, LXII.

bb. Dorsal fin posterior, opposite anal; deep-sea fishes, of loose organization; mostly blackish in color; mouth small, with small pointed teeth; air bladder wanting. ALEPOCEPHALIDÆ, LXIII.

SALMONIDEA:

aa. Adipose fin well developed; oviducts none, the large eggs usually falling into the cavity of the abdomen before extrusion; air bladder well developed.

h. Stomach siphonal, not having the form of a blind sac; pyloric cœca many; branchiostegals rather numerous.

i. Parietals separated by the supraoccipital; dorsal fin moderate, the simple rays in front few in number. SALMONIDÆ, LXIV.

ii. Parietals in contact, not separated by a supraoccipital; dorsal fin very long and high, the simple rays in its anterior half very numerous. THYMALLIDÆ, LXV.

hh. Stomach cœcal, of the form of a blind sac; pyloric cœca generally few.

j. Branchiostegals 6 or more; gill membranes separate. ARGENTINIDÆ, LXVI.

jj. Branchiostegals 3 or 4; body subterete; mouth small. MICROSTOMIDÆ, LXVII.

Family LVI. ELOPIDÆ.

(THE TARPONS.)

Body elongate, more or less compressed, covered with silvery, cycloid scales; head naked. Mouth broad, terminal, the lower jaw prominent. Premaxillaries not protractile, short, the maxillaries forming the lateral margins of the upper jaw; maxillary composed of about three pieces, extending backward beyond the eye; an elongate bony plate between the branches of the lower jaw (analogous to the gular plate in *Amia* *); bands of villiform teeth in both jaws and on vomer, palatines, pterygoids, tongue, and base of skull; no large teeth. Eye large, with an adipose eyelid. Opercular bones thin, with expanded membranaceous borders; a scaly occipital collar. Gill membranes entirely separate, free from the isthmus. Branchiostegals numerous, (29 to 35). Gill rakers long and slender. Pseudobranchiæ present or absent. Belly not keeled nor serrated, rather broad and covered with ordinary scales. Lateral line present. Dorsal fin inserted over or slightly behind ventrals; caudal fin forked; no adipose fin; dorsal and anal depressible into a sheath of scales; pectorals and ventrals each with a long accessory scale. Parietal bones meeting along top of head. Pyloric cœca numerous. Genera three, species about five, forming two well-marked subfamilies, both widely distributed in the tropical seas. The species are not much valued as food, the flesh being dry and bony. (*Clupeidæ*, group *Elopina*, Günther, Cat., VII, 469–471, 1868.)

MEGALOPINÆ:

a. Pseudobranchiæ none; body oblong, covered with large scales; anal fin larger than dorsal; last ray of dorsal produced in a long filament.

b. Dorsal fin inserted notably behind insertion of ventrals. TARPON, 197.

ELOPINÆ:

aa. Pseudobranchiæ large; body elongate, covered with small scales; anal fin smaller than dorsal; last ray of dorsal not produced in a filament. ELOPS, 198.

---

*The gular plate suggests the similar structure seen in *Amia*, but its homology is not proved. Although the Clupeiform fishes are probably descended from Ganoids related to *Amia*, there may be no closer relation between *Amia* and *Elops* or *Megalops*, than between *Amia* and *Clupea*.

197. TARPON, Jordan & Evermann.

(Grande Écaille.)

Tarpon, Jordan & Evermann, new genus, (*atlanticus*).

Body oblong, compressed, covered with very large, thick, silvery, cycloid scales; belly narrow, but not carinated, its edge with ordinary scales. Mouth large, oblique, the lower jaw prominent; maxillary broad, extending beyond the eye. Villiform teeth on jaws, vomer, palatines, tongue, sphenoid, and pterygoid bones. Eye very large, with an adipose eyelid. Lateral line nearly straight, its tubes radiating widely over the surface of the scales. Branchiostegals 23. Pseudobranchiæ wanting. Gill rakers long and slender. Dorsal fin short and high, inserted behind the ventrals (over the ventrals in *Megalops*), its last ray elongate and filamentous as in *Megalops, Dorosoma*, and *Opisthonema*; anal fin much longer than dorsal, falcate, its last ray produced; caudal widely forked; pectorals and ventrals rather long; anal with a sheath of scales; dorsal naked; caudal more or less scaly; a collar of large scales at the nape. Vertebræ about 57 (28 + 29). Size very large, the largest of the herring-like fishes.

The posterior insertion of the dorsal fin distinguishes the single species of *Tarpon* from the East Indian *Megalops cyprinoides*, a fish of similar habit, in which the dorsal is inserted above the ventrals. (*Tarpon* or *Tarpum*, the common name in Florida, probably of Indian origin.)

• 670. TARPON ATLANTICUS (Cuvier & Valenciennes).

(Tarpon; Tarpum; Grande Écaille; Silver-fish; Sabalo; Savanilla; Savalle.)

Head 4; depth $3\frac{4}{5}$. D. 12; A. 20; lateral line 42; branchiostegals 23. Body elongate, compressed, little elevated. Dorsal filament longer than head. Mouth large, the maxillary extending beyond eye. Uniform bright silvery, the back darker. Length 6 feet. Long Island to Brazil; common on our southern coasts, but probably not breeding north of Cuba; noted for the great size of its scales, which are used in ornamental work. It reaches a weight of 30 to 110 pounds. It is not much valued for food, although much appreciated by anglers. "An immense and active fish, preying eagerly on schools of small fry, in pursuit of which it ascends fresh-water rivers quite a long distance." (Stearns.) It is often dangerous to seine fishermen, leaping over or through the nets with great force.

Megalops atlanticus, Cuvier & Valenciennes, Hist. Nat. Poiss., xix, 398, 1846, Guadeloupe; San Domingo; Martinique; Porto Rico.

Megalops elongatus, Girard, Proc. Ac. Nat. Sci. Phila., 1858, 224, Long Island.

Megalops thrissoides, Günther, Cat., vii, 472, 1868, and of most authors; but the name *Clupea thrissoides*, Bloch & Schneider, belongs to the East Indian *Megalops cyprinoides*; Jordan & Gilbert, Synopsis, 262, 1883.

198. ELOPS, Linnæus.

Elops, Linnæus, Syst. Nat., Ed. xii, 518, 1766, (*saurus*).

Mugilomorus, Lacépède, Hist. Nat. Poiss., v, 398, 1803, (*anna-carolina*).

Trichonotus, Rafinesque, Analyse de la Nature, 1815, 88, (*anna-carolina*); substitute for *Mugilomorus*, considered objectionable.

Body elongate, covered with thin, small, silvery scales. Dorsal fin slightly behind ventrals, its last rays short, the fin depressible into a sheath of scales; anal fin smaller, similarly depressible; pectorals and ventrals moderate, each with a long accessory scale. Opercular bones thin, with expanded, membranaceous borders; a scaly occipital collar. Lateral line straight, its tubes simple. Pseudobranchiæ present, large. Vertebræ 43 + 29 = 72. Large fishes of the open seas, remarkable for the development of scaly sheaths. The young are ribbon-shaped and elongate, passing through a series of changes like those seen in *Albula*. (*ἔλοψ*, name of some sea fish; a swordfish or sturgeon; from *ἐλαύνω*, to drive or move.)

671. ELOPS SAURUS, Linnæus.

(TEN-POUNDER; JOHN-MARIGGLE; BONY-FISH; BIG-EYED HERRING; MATAJUELO REAL; CHIRO; LISA FRANCESA.)

Head 4¼; depth 5 to 6; eye large, 4 to 5. D. 20; A. 13; V. 15; B. 30; scales 12–120–13. Gular plate 3 to 4 times as long as broad. Length 3 feet. Tropical seas; abundant and very widely distributed. Common in America, north to Carolina and the Gulf of California; straying on the Atlantic Coast to Long Island. (*saurus*, *σαῦρος*, lizard.)

Elops saurus, LINNÆUS, Syst. Nat., Ed. XII, 518, 1766, Carolina; GÜNTHER, Cat., VII, 470, 1868; JORDAN & GILBERT, Synopsis, 261, 1883, and of most authors.

Elops purpurascens, RICHARDSON, Ichth. China, 311, 1846, China.

Family LVII. ALBULIDÆ.

(THE LADY-FISHES.)

Body rather elongate, little compressed, covered with rather small, brilliantly silvery scales; head naked. Snout conic, subquadrangular, shaped like the snout of a pig, and overlapping the small, inferior, horizontal mouth. Maxillary rather strong, short, with a distinct supplemental bone, slipping under the membranous edge of the very broad preorbital; premaxillaries short, not protractile. Lateral margin of upper jaw formed by the maxillaries; both jaws, vomer, and palatines with bands of villiform teeth; broad patches of coarse, blunt, paved teeth on the tongue behind and on the sphenoid and pterygoid bones. Eye large, median in head, with a bony ridge above it, and almost covered with an annular adipose eyelid. Opercle moderate, firm; preopercle with a broad, flat, membranaceous edge, which extends backward over the base of the opercle. Pseudobranchiæ present. Gill rakers short, tubercle-like. Gill membranes entirely separate, free from the isthmus; branchiostegals about 14; a fold of skin across gill membranes anteriorly, its posterior free edge crenate; no gular plate. Lateral line present. Belly not carinate, flattish, covered with ordinary scales. Dorsal fin moderate, in front of ventrals, its membranes scaly; no adipose fin; anal very small; caudal widely forked. Pyloric cœca numerous. Parietal bones meeting along top of head. Vertebræ numerous, 42 + 28 = 70. A single species known, found in all warm seas. In this, and probably in related families, the young pass through a metamorphosis, analogous to that seen in the Conger Eels. They are for a time elongate, band-shaped, with very small head and loose transparent tissues. From this condition they become gradually shorter and more compact, shrinking from 3 or 3½ inches in length to 2 inches. According to Dr. Gilbert, this process, like that seen in various eels, is a normal one, through which all individuals pass. In the Gulf of California, where these fishes abound, these band-shaped young are often thrown by the waves on the beach in great masses. (*Clupeidæ*, group *Albulina*, Günther, Cat., VII, 468, 469, 1868.)

199. ALBULA (Gronow) Bloch & Schneider.

(Lady-fishes.)

Conorhyncus, Nozeman, Act. Select, III, 382, 1757, (nonbinomial).
Albula, Gronow, Zoöphyl., 102, 1763, (nonbinomial).
Albula, Bloch & Schneider, Syst. Ichth., 432, 1801, (*conorhyncus* = *vulpes*).
Butyrinus, Lacépède, Hist. Nat. Poiss., v, 45, 1803, (*banana* = *vulpes*).
Glossodus, Cuvier, in Agassiz, Spix, Pisc. Bras., 48, 1829, (*forskâli* = *vulpes*).

Characters of the genus included above. (Latin *albus*, white.)

672. ALBULA VULPES (Linnæus).

(Lady-fish; Bone-fish; Macabí; Sanducha; Banana-fish.)

Head 3¾; depth 4. D. 15; A. 8; scales 9–71–7. Upper lobe of caudal the longer. A broad band of peculiar, elongate, membranaceous scales along middle line of back; accessory ventral scale large. Brilliantly silvery; olivaceous above; back and sides with faint streaks along the rows of scales; fins plain; axils dusky. Length 18 inches to 3 feet. Tropical seas, on sandy coasts, almost universally distributed and generally abundant, ranging northward on our coasts to San Diego and Long Island. A beautiful and active fish, in most places little valued as food, but in some regions, as Key West, highly appreciated. (*vulpes*, fox.)

Family LVIII. HIODONTIDÆ.

(The Moon-eyes.)

Body oblong, much compressed, covered with moderate-sized, brilliantly silvery, cycloid scales. Head naked, short, the snout blunt. Mouth moderate, oblique, terminal, the jaws about equal. PremaxilIaries not protractile. Maxillary small, slender, without evident supplemental bone, articulated to the end of the premaxillary, and forming the lateral margin of the upper jaw. Dentition very complete; premaxillary and dentary bones with small, wide-set, cardiform teeth; maxillaries with feeble teeth; a row of strong teeth around the margin of the tongue, the anterior canine and very strong; between these is a band of short, close-set teeth; vomer with a long, double series of close-set, small teeth; similar series on the palatines, sphenoid and pterygoids; sides of lower jaw fitting within the upper, so that the dentaries shut against the palatines. Eye very large, the adipose eyelid not much developed. Preorbital very narrow. Nostrils large, those of each side close together, separated by a flap. Gill membranes not connected, free from the isthmus, a fold of skin covering their base. No gular plate. Branchiostegals 8 to 10. Gill rakers few, short, and thick. Pseudobranchiæ obsolete. Lateral line distinct, straight. Belly not serrated. Dorsal fin rather posterior; anal elongate, low; ventrals well developed; caudal strongly forked; no adipose fin. Stomach horseshoe-shaped, without blind sac; one pyloric cœcum. Vertebræ about 60. Air bladder large. No oviducts, the eggs falling into the cavity of the abdomen before exclusion. A single genus, with three species, inhabiting the fresh waters of North America; handsome and gamy fishes, of little value as food. (*Hyodontidæ*, Günther, Cat., vii, 375, 376, 1868.)

200. HIODON, Le Sueur.

(Moon-eyes.)

Hiodon,* Le Sueur, Journ. Ac. Nat. Sci. Phila., i, 1818, 334, (*tergisus*).
Glossodon,* Rafinesque, Amer. Monthly Mag., ii, September, 1818, 354, (*harengoides*).
Amphiodon, Rafinesque, Journ. de Physique, 421, 1819, (*alosoides*).
Clodalus, Rafinesque, Ichth. Oh., 43, 1820, (*clodalus* = *tergisus*).
Glossodon, Heckel, Russeggers Reisen, i, 1033, 1842, (*smithii* = *alosoides*).
Elattonistius, Gill & Jordan, Bull. U. S. Nat. Mus., x, 68, 1877, (*chrysopsis* = *alosoides*).
Hyodon, corrected orthography.

---

*It is not certain which of these two names, *Hiodon* and *Glossodon*, has precedence of date. *Hiodon* is in common use and was accompanied by a much better description than Rafinesque usually furnished. We therefore retain it.

Generic characters included above. (*ὑοειδής*, hyoid; *ὀδούς*, tooth; "hyoid" is the bone shaped like the letter Υ, forming the base of the tongue.)

AMPHIODON (ἀμφί, both ; ὀδούς, tooth) :
  a. Belly in front of ventrals carinated ; dorsal with 9 developed rays. ALOSOIDES, 673.
HIODON :
  aa. Belly in front of ventrals not carinated ; dorsal with 11 or 12 developed rays.
    b. Belly behind ventrals carinated ; eye 3 in head. TERGISUS, 674.
    bb. Belly nowhere carinated ; eye 2½ in head. SELENOPS, 675.

Subgenus AMPHIODON, Rafinesque.

673. HIODON ALOSOIDES (Rafinesque).

(LA QUESCHE ; NACCAYSH.)

Head 4½; depth 3½; eye 3½. D. 9; A. 32; scales 6-56-7. Body closely compressed, becoming deep in the adult, the ventral edge everywhere carinated. Maxillary reaching to beyond middle of eye. Caudal peduncle rather stouter than in *H. tergisus*, and the fin not so deeply forked. Back less arched and snout blunter than in the other species, the mouth larger and more oblique. Pectorals longer and ventrals shorter than in *H. tergisus*. Bluish; sides silvery, with golden luster. Ohio River and north to the Saskatchewan; common northwestward. (*Alosa*, shad; *εἶδος*, like.)

Amphiodon alosoides, (misprinted *alveoides*), RAFINESQUE, Journ. Phys., Paris, 421, 1819, Ohio R.
Hyodon amphiodon, RAFINESQUE, Ichth. Oh., 42, 1820, Ohio River near the Falls.
Hyodon chrysopsis, RICHARDSON, Fauna Bor.-Amer., III, 232, 1836, Cumberland House, Saskatchewan River ; JORDAN, Bull. U. S. Nat. Mus., X, 68, 1877.
Hyodon alosoides, JORDAN & GILBERT, Synopsis, 259, 1883.

Subgenus HIODON.

674. HIODON TERGISUS, Le Sueur.

(MOON EYE ; TOOTHED HERRING.)

Head 4⅓; depth 3; eye 3. D. 12; A. 28; scales 5-55-7. Vertebræ 30 + 31 = 61. Body oblong, moderately compressed. Eye large, the maxillary barely reaching its middle. Pectoral fins not reaching ventrals, the latter just short of vent. Belly behind ventrals somewhat carinate, but not before ventrals. Color brilliantly silvery, olive-shaded above. Length 12 inches. Great Lakes and the Mississippi Valley; north to Assiniboine River; abundant in the larger streams. One of our handsomest fishes, not valued as food, the flesh being dry and full of small bones. (*tergisus*, scoured or polished.)

Hiodon tergisus,* LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1818, 364, Ohio River.
Glossodon harengoides,* RAFINESQUE, Amer. Month. Mag., II, September, 1818, 354, Ohio River.
Glossodon heterurus, RAFINESQUE, *l. c.*, 1818, 354, Falls of Ohio River.
Hiodon clodalus, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1818, 367, Ohio River at Pittsburg.
Hyodon vernalis, RAFINESQUE, Ich. Oh., 42, 1820, Ohio River.
Cyprinus (*Abramis ?*) *smithii*, RICHARDSON, Fauna, Bor.-Amer., III, 110, 1836, Richelieu River.
Hyodon claudalus, CUVIER & VALENCIENNES, His. Nat. Poiss., XIX, 313, 1846; after LE SUEUR.
Hyodon tergisus, GÜNTHER, Cat., VII, 375, 1868; JORDAN, Bul. U. S. Nat. Mus., X, 68, 1877; JORDAN & GILBERT, Synopsis, 259, 1883.

---

* We do not know which of the nearly synchronous specific names *tergisus* and *harengoides* is entitled to precedence. *Tergisus* is in common use, was accompanied by a better description and is a better name.

675. HIODON SELENOPS, Jordan & Bean.

Head $4\frac{1}{8}$; depth 4; eye $2\frac{1}{2}$. D. 12; A. 27; lateral line 50. Body more elongate than in the other species of *Hiodon*, little compressed, not much elevated, the belly nowhere carinate. Eye very large. Pectorals not reaching to ventrals. Coloration clear silvery. Tennessee, Cumberland, and Alabama rivers, scarce; recorded from Nashville, Chattanooga, and Montgomery. (*σελήνη*, moon; *ὤψ*, eye.)

Hyodon selenops, Jordan & Bean, Bull. U. S. Nat. Mus., x, 67, 1877, Chattanooga, Tenn. (Type, No. 19844); Jordan & Gilbert, Synopsis, 260, 1883.

Family LIX. CHANIDÆ.

(The Milk Fishes.)

Body oblong, compressed, covered with small, firm, adherent scales. Lateral line distinct. Abdomen broad and flattish. Snout depressed; mouth small, anterior, the lower jaw with a small symphyseal tubercle; no teeth; premaxillary joined to upper anterior edge of maxillary. Eye with an adipose eyelid. Gill membranes broadly united, free from the isthmus. Branchiostegals 4; pseudobranchiæ well developed; an accessory branchial organ in a cavity behind the gill cavity. Dorsal fin opposite the ventrals; anal fin shorter than dorsal. Mucous membrane of œsophagus raised into a spiral fold; intestine with many convolutions. Coloration silvery. Vertebræ about 45. Large fishes of the warmer parts of the Pacific. One genus and three species known. (*Clupeidæ*; group *Chanina*, Günther, Cat., VII, 473, 1868.)

201. CHANOS, Lacépède.

Chanos, Lacépède, Hist. Nat. Poiss., v, 395, 1803, (*arabicus*).
Lutodeira (Kuhl) Rüppel, Neue Wirbelthiere Abyssinia, 18, 1835, (*chanos*).
Ptycholepis, Gray, Dieffenbach's Travels in New Zealand, II, 218, about 1842, (*salmoneus*).

Characters of the genus included above. (*χάνος*, name in modern Greek, from *χάνος*, the open mouth.)

676. CHANOS CHANOS (Forskål).

(Milk-fish; Sabalo; Awa; Chani; Anged.)

Head $4\frac{2}{5}$; depth 4. D. II, 12; A. II, 9; scales 12–86–14. Vertebræ $19 + 26 = 45$; snout $3\frac{1}{2}$; eye $3\frac{1}{2}$; maxillary $4\frac{1}{3}$. Pectoral $1\frac{3}{5}$; ventral $1\frac{4}{5}$; caudal $\frac{1}{3}$ longer than head; dorsal $1\frac{1}{4}$ in head. B. 4. Aspect of a large Cyprinoid. Body elliptical, moderately compressed, the caudal peduncle slender. Head pointed, rounded above. Eye and side of head covered by a large transparent, imperforate adipose eyelid. Mouth small, terminal toothless, transverse, the lower jaw included; maxillary broad, slipping under the adipose preorbital, without supplemental bone. Opercle truncate behind. Pseudbranchiæ very large. Gill rakers fine and flexible, very close set, rather long. Bones of gill rakers flexible. Gill arches all connected by membrane. Lateral line well developed. Scales firm, cycloid, with strongly marked longitudinal striæ. Scales rather large, hard, firm, enamelled, becoming bony when dry, used by the Indians for ornamental work. Dorsal inserted somewhat nearer snout than base of caudal, before ventrals, its first ray falcate, its last produced in a short filament, longer than pupil; base of fin with a large scaly sheath; pectoral and ventral with scaly axillary appendage; anal similar to dorsal but much smaller; pectorals and ventrals rather small; caudal very long, forked to the base, its lobes subequal, straight; base of fin with small scale; ventrals somewhat falcate. Color greenish above, the sides brilliantly silvery, fins more or less darkened; inside of ventrals and pectorals blackish. Length 2 to 5 feet. Pacific and Indian oceans, on sandy shores, north to the Hawaiian Islands and to the Gulf of California, where it is abundant; a food fish of some importance; occasionally entering streams.

Mugil chanos, FORSKÅL, Descr. Anim., 74, 1775, Red Sea at Djidda, Arabia.
Mugil salmoneus (FORSTER) BLOCH & SCHNEIDER, Syst. Ichth., 121, 1801, Pacific Ocean.

Chanos mento, Isle of France, *chloropterus*, Madipolam, *nuchalis*, Vigazapatam, *orientalis*, Japan, and *cyprinella*, Hawaiian Islands, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XIX, 194, 198, 1846.
Chanos indicus, BLEEKER, Verh. Bat. Gen., XXIV, 11, 1852, East Indies.
Chanos salmoneus, GÜNTHER, Cat., VII, 473, 1868.

Family LX. DOROSOMIDÆ.

(THE GIZZARD SHADS.)

Body short and deep, strongly compressed, covered with thin, deciduous, cycloid scales. Belly compressed to an edge, which is armed with bony serratures. Head naked, short, rather small. Mouth small, inferior, oblique, overlapped by the blunt snout; no teeth; maxillary narrow and short, with a single supplemental bone, not extending to opposite middle of eye, and forming but a small portion of lateral margin of upper jaw; mandible short and deep, its rami enlarged at base; premaxillaries not protractile. Gill rakers slender, exceedingly numerous, not very long, similar on all the arches. Gill membranes not united, free from the isthmus; branchiostegals about 6; pseudobranchiæ large. An adipose eyelid. No lateral line. Dorsal fin about midway of the body, usually behind ventrals. Pectorals and ventrals moderate, each with an accessory scale. Anal very long and low; caudal forked. No adipose fin. Vertebræ 49. Stomach short, muscular, like the gizzard of a fowl. A single genus in our waters; species about 10. Mud-eating fishes of the coasts and rivers of warm regions, of little value as food. The family is very close to the *Clupeidæ*, the distinguishing characters being not of great importance. (*Clupeidæ*, group *Chatoëssina* Günther, Cat., VII, 406–411, 1868.)

202. DOROSOMA, Rafinesque.

(GIZZARD SHAD.)

Dorosoma, RAFINESQUE, Ichth. Oh., 39, 1820, (*notata* = *cepedianum*).
Chatoëssus, CUVIER, Règne Animal, Ed. 2, Vol. II, 320, 1829; in part, (includes *Opisthonema*, etc.).
Chatoëssus, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 94, 1848, (*cepedianus*).

Characters of the family, with the addition that the last ray of the dorsal is prolonged and filiform as in *Opisthonema*, *Megalops*, and *Tarpon*.

a character which separates *Dorosoma* from the Asiatic genus *Anodontostoma.* (*δόρυ*, lance; *σῶμα*, body; in allusion to form of body in the young.)

a. Anal rays 30 to 33; lower jaw included. CEPEDIANUM, 677.
aa. Anal rays 20 to 25; jaws subequal.
  b. Dorsal fin inserted just behind ventrals; 9 scutes behind ventrals. MEXICANUM, 678.
  bb. Dorsal fin inserted just before ventrals; 12 scutes behind ventrals. PETENENSE, 679.

677. DOROSOMA CEPEDIANUM (Le Sueur).

(GIZZARD SHAD; HICKORY SHAD.)

Head $4\frac{1}{3}$; depth $2\frac{1}{2}$; eye $4\frac{1}{2}$. D. 12; A. 31; scales 56–23; scutes 17 + 12. Body deep, compressed, the back elevated in the adults. Dorsal about median, slightly behind ventrals, its filamentous ray about as long as head, sometimes longer, sometimes shorter. Caudal widely forked, the lower lobe the longer. Silvery; bluish above; young with a round dark spot at the shoulder; tips of ventrals and edge of anal often dusky. Length 15 inches. Cape Cod to Mexico; abundant southward, entering all rivers, and permanently resident (var. *heterurum*) everywhere in the Mississippi Valley in the larger streams; also introduced into Lake Michigan and Lake Erie, and landlocked in ponds from New Jersey to Texas. A handsome fish, of no value as food. (Named for Bernard Germain Étienne de la Ville sur Illon, Comte de La Cépède (1756–1825), known as Citoyen Lacépedè during the French Revolution; a brilliant and most industrious writer, who compiled his great Histoire Naturelle des Poissons under most difficult conditions during the French revolution.)

Megalops cepediana, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1818, 361, **Delaware and Chesapeake bays.**

Chatoëssus ellipticus, KIRTLAND, Report Zoöl. Ohio, 169, 1839, **Ohio River.**
Dorosoma insociabilis, ABBOTT, Proc. Ac. Nat. Sci. Phila., 1860, 365, **Sturgeon Pond, Trenton, New Jersey.**
Chatoëssus cepedianus, GÜNTHER, Cat., VII, 409, 1868.
Dorosoma cepedianum, JORDAN & GILBERT, Synopsis, 271, 1883.

Represented along coast and in lower courses of rivers of Texas by

677a. DOROSOMA CEPEDIANUM EXILE, Jordan & Gilbert.

Body elongate, the depth about one-third the length. (*exilis*, slender.)

Dorosoma cepedianum exile, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 585, **Galveston.** (Type, No. 30913. Coll. Jordan.)

678. DOROSOMA MEXICANUM (Günther)

Head $3\frac{1}{5}$; depth $2\frac{3}{4}$; eye 4. D. 14; A. 25; scales 40–13. Maxillary extending to below front of eye, which is equal to snout; jaws equal. Dorsal inserted just behind ventrals, its filament reaching end of anal; nine scutes behind ventrals. Silvery, with a small black humeral spot. East coast of Mexico. (Günther.)

Chatoëssus mexicanus, GÜNTHER, Cat., VII, 409, 1868, **Mexico.** (Coll. M. Sallé.)
Dorosoma mexicanum, JORDAN & GILBERT, Synopsis, 887, 1883.

679. DOROSOMA PETENENSE (Günther).

Head 3½; depth 2¾; eye 3½. D. 14 or 15; A. 20 to 23; lateral line 40. Maxillary extending to below front of eye, which is longer than snout; jaws equal. Dorsal inserted slightly in advance of ventrals and nearer tip of snout than base of caudal, its filament reaching end of anal; 12 scutes behind ventrals. Silvery, with a small, round black humeral spot. Lake Peten, Yucatan. (Günther.)

Chatoëssus petenensis, GÜNTHER, Cat., VII, 408, 1868, Lake Peten, Yucatan. (Coll. Salvin.)

Family LXI. CLUPEIDÆ.

(THE HERRINGS.)

Body oblong or elongate, more or less compressed, covered with cycloid or pectinated scales. Belly sometimes rounded, sometimes compressed, in which case it is often armed with bony serratures. Head naked, usually compressed. Mouth rather large, terminal, the jaws about equal; maxillaries forming the lateral margins of the upper jaw, each composed of about three pieces. Premaxillaries not protractile; teeth mostly small, often feeble or wanting, variously arranged. Adipose eyelid present or absent. Gill rakers long and slender; gill membranes not connected, free from the isthmus. No gular plate. Gills 4, a slit behind the fourth. Branchiostegals usually few (6 to 15). Posterior lower part of opercular region often with an angular emargination, the tips of the larger branchiostegals being abruptly truncate. Pseudobranchiæ present. No lateral line. Dorsal fin median or somewhat posterior, rarely wanting. No adipose fin. Ventrals moderate or small (wanting in *Pristigaster*). Anal usually rather long; caudal fin forked. Vertebræ 40 to 56. Genera about 30; species 150; inhabiting all seas, and usually swimming in immense schools; many species ascend fresh waters, and some remain there permanently. The northern and fresh-water species, as in many other families, differ from the tropical forms in having a larger number of vertebral segments. (*Clupeidæ*, groups *Clupeina* and *Dussumieriina*, Günther, Cat., VII, 413–467, 1868.)

DUSSUMIERIINÆ:

a. Belly rounded, covered with ordinary scales; supplemental bones of maxillary very narrow; anal fin short.

b. Ventral small; teeth small, persistent, on jaws, vomer, palatines, pterygoids, and tongue.

c. Scales of breast not forming a corselet.

d. Species very small, with the teeth minute; a silvery lateral band; the dorsal short, of 11 to 16 rays; ventrals inserted nearly under its front. JENKINSIA, 203.

dd. Species of moderate size, with moderate teeth; no silvery lateral band; the dorsal long, of 18 to 20 developed rays; the ventrals inserted much behind dorsal, much nearer base of caudal than tip of snout. ETRUMEUS, 204.

cc. Scales of breast adherent, forming a ventral corselet, which covers the closed pectoral fins, except the upper edge and tip. PERKINSIA, 205.

aa. Belly compressed, armed with bony serræ; supplemental bones of maxillary broad.

CLUPEINÆ:

e. Anal fin moderate, of 15 to 25 rays; dorsal inserted nearly opposite ventrals.
  f. Scales with their posterior margins entire and rounded; intestinal canal of moderate length.
    g. Last ray of dorsal not produced.
      h. Vertebræ about 50 in number (46 to 56); species of northern regions.
        i. Vomer with teeth; ventral scutes weak, ventrals below middle of dorsal; vertebræ 50 to 56. CLUPEA, 206.
        ii. Vomer without teeth.
          j. Ventral scutes very weak, the belly more or less rounded; vertebræ about 52; ventrals under middle of dorsal. CLUPANODON, 207.
          jj. Ventral scutes strong, the belly compressed; vertebræ 46 to 50; ventrals below or slightly behind front of dorsal.
            k. Premaxillaries meeting at a large angle, so that the tip of upper jaw does not appear to be notched; cheeks longer than deep. POMOLOBUS, 208.
            kk. Premaxillaries meeting in front at a very acute angle, so that the emarginate front of the upper jaw receives the slender tip of the lower; fore part of cheeks very deep, deeper than long; jaws toothless. ALOSA, 209.
      hh. Vertebræ about 42 (40 to 44); tropical species with the scales large and usually firmly attached; ventrals inserted under middle of dorsal; adipose eyelid obsolete. SARDINELLA, 210.
    gg. Last ray of dorsal produced in a long filament; scales large, not firmly attached; otherwise essentially as in *Clupanodon.* OPISTHONEMA, 211.
  ff. Scales with their posterior margins vertical, and pectinate or fluted; head very large; no teeth; intestines elongate; herbivorous. BREVOORTIA, 212.

PRISTIGASTERINÆ:

ee. Anal fin very long, of more than 30 rays; dorsal fin inserted behind ventrals.
  l. Teeth not all villiform; both jaws with strong canines; ventrals present, very small. CHIROCENTRODON, 213.
  ll. Teeth all villiform; no canines.
    m. Ventral fins present. ILISHA, 214.
    mm. Ventral fins wanting.
      n. Dorsal fin present, inserted behind front of anal; belly not very convex in outline.
        o. Maxillary not greatly produced backward, not extending behind eye. OPISTHOPTERUS, 215.
        oo. Maxillary much produced backward, extending behind eye. ODONTOGNATHUS, 216.
      nn. Dorsal fin inserted in front of anal; maxillary short; abdomen excessively convex in profile, so that the body is very deep. PRISTIGASTER, 217.

203. JENKINSIA, Jordan & Evermann.

Jenkinsia, JORDAN & EVERMANN, new genus, (*stolifera*).

Very small species, closely allied to *Etrumeus*, but with minute teeth and a silvery lateral band; the dorsal with less than eighteen rays, the ventrals inserted below or just behind it. American. (Named for Dr. Oliver Peebles Jenkins, Professor of Physiology in Leland Stanford Junior University, in recognition of his work on the fishes of Mexico and the Hawaiian Islands.)

a. Dorsal inserted a little nearer caudal than tip of snout, the ventrals just behind it; dorsal rays about 16; anal 11. ACUMINATA, 680.
aa. Dorsal inserted midway between snout and base of caudal; dorsal rays 14; anal 15. LAMPROTÆNIA, 681.
aaa. Dorsal inserted nearer snout than base of caudal; dorsal rays 11; anal 17. STOLIFERA, 682.

680. JENKINSIA ACUMINATA (Gilbert).

Head 3½; depth 6; eye 4⅕. D. 16 or 17; A. 10 or 11; scales about 60. Body slender, the belly rounded. Eye small, 1⅖ in snout in specimens of 1½ inches in length; snout acuminate, as long as maxillary, 3 in head. Teeth evident in both jaws and on maxillary, vomer, and palatines. Front of dorsal nearer base of caudal than tip of snout; ventrals inserted behind dorsal, slightly nearer base of caudal than base of pectorals. Translucent, with a faint trace of a narrow lateral silvery band, above which is a line of dark specks; black specks on bases of vertical fins. Length 1½ inches. Gulf of California, at 22 fathoms. (Gilbert.)

Etrumeus acuminatus, GILBERT, Proc. U. S. Nat. Mus., 1890, 56, Gulf of California. (Coll. Gilbert.)

681. JENKINSIA LAMPROTÆNIA (Gosse).

Head 3¾; depth 6. D. 14; A. 15. Snout conical, as long as eye; jaws even. Maxillary narrow, reaching front of eye; minute teeth on jaws, vomer, and palatines. Front of dorsal midway between tip of snout and base of caudal; ventrals below its posterior half. A well-defined silvery lateral band. Jamaica. (Günther.) (*λαμπρός*, shining; *ταινία*, band.)

Clupea lamprotænia, GOSSE, Naturalist's Sojourn Jamaica, 291, pl. 1, fig. 2, 1851, Jamaica.
(*Spratelloides*) *lamprotænia*, GÜNTHER, Cat., VII, 465, 1868.

682. JENKINSIA STOLIFERA (Jordan & Gilbert).

Head 3¾; depth 5½; eye 2½. D. 11; A. 17; scales caducous, about 36. Body elongate, slender, moderately compressed. Snout sharp, tapering, the jaws equal, the maxillary 2½ in head, reaching slightly beyond front of eye. Teeth minute, evident in both jaws. Eye large. Dorsal high, inserted at a point slightly nearer snout than base of caudal; ventrals under fourth dorsal ray, nearly half head, and slightly shorter than pectorals. Translucent green; sides with a silvery band as in *Stolephorus*, one-fourth depth of body, a little broader than pupil; a double row of dots along back before dorsal and a single row behind; fins pale. Length 2 inches. Gulf of Mexico from Key West to Yucatan. A small silvery fish, very abundant in schools in the surf with *Stolephorus brownii*, a species it much resembles in form and coloration. (*στολή*, *stole*, a stole or white band worn by priests; *fero*, I bear.)

Dussumieria stolifera, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1884, 25, Key West. (Type, No. 34964. Coll. Jordan.)

204. ETRUMEUS, Bleeker.

Etrumeus, BLEEKER, Verh. Bat. Gen., XXV, Japan, 58, 1853, (*micropus*, a Japanese species).

Body rather elongate, somewhat compressed, the abdomen rounded and without serratures. Mouth terminal, of moderate width, formed as in *Clupea*, but the maxillary more slender. Teeth moderate, in patches on jaws, palatines, pterygoids, and tongue. Scales cycloid, entire, very deciduous. Branchiostegals numerous, very slender. Ventrals inserted posteriorly, entirely behind dorsal; the dorsal fin rather long, of 18 to 20 rays; anal low, of moderate length. Pseudobranchiæ well developed; pyloric cœca numerous. No silvery lateral stripe. Few species. Asiatic and American. (*Ikan Etrumei*, a Japanese name of *Etrumeus micropus*.)

683. ETRUMEUS SADINA (Mitchill).

(ROUND HERRING.)

Head 4; depth 6. D. 18; A. 13. Body terete and fusiform. Mouth small, maxillary reaching front of orbit. Vomerine teeth present. Eye large, equal to snout. Fins all very small, the ventrals entirely behind dorsal; the dorsal inserted considerably nearer tip of snout than base of caudal. Axillary scales very long. Olivaceous above, silvery on sides and below, no distinct lateral band. Length 10 inches. Cape Cod to the Gulf of Mexico, on sandy shores; not rare southward. (*Sadina*, a diminutive from Shad; Mitchill called the fish the "New York Shadine.")

Clupea sadina, MITCHILL, Trans. Lit. and Phil. Soc., I, 1815, 457, New York.
Alosa teres, DE KAY, New York Fauna: Fishes, 262, 1842, New York.
Etrumeus teres, GÜNTHER, Cat., VII, 467, 1868; JORDAN & GILBERT, Synopsis, 263, 1883.

205. PERKINSIA, Rosa Smith Eigenmann.

Perkinsia, ROSA SMITH EIGENMANN, Amer. Nat., February, 1891, 153, (*othonops*).

Like *Etrumeus*, except that the pectoral and ventral fins are shielded, the scales of the breast adherent, forming a ventral buckler, which covers the closed pectoral fins, leaving only the dorsal edge and the extreme tip of the fins visible; the closed ventrals likewise slip under a posterior buckler; axillary scales very large, that of pectoral extending nearly to its tip, that of ventral reaching slightly farther than the fin. Caudal deeply forked, the lateral scales extending continuously on the center of the fin almost to margin of middle rays. Adipose eyelid covering the eye wholly without pupillary slit. One species, from California. (Named for Hon. George C. Perkins, then governor of California, a patron of scientific investigation.)

684. PERKINSIA OTHONOPS, R. S. Eigenmann.

Head 4; depth 5; eye 3. D. 17; A. 10; scales 50. Head compressed forward; eye longer than snout; interorbital space $4\frac{1}{2}$ in head. Occiput with ridges forming a **W**, the top of head with a lanceolate, depressed area anteriorly, a median ridge and a triangular area between it and anterior part of the **W**. Maxillary 3 in head, not reaching pupil, the supplemental bone very narrow. Cheeks, opercles, and humeral scale with branching mucous canals; isthmus triangular, the gill covers not emarginate below. Scales large, deciduous. Teeth as in *Etrumeus sadina*. Pseudobranchiæ exposed Gill rakers long and slender. Insertion of dorsal midway between tip of snout and end of anal; anal small. Ventrals short, $3\frac{1}{2}$ in head, entirely behind dorsal; pectorals $1\frac{3}{5}$. Steel-blue, sides silvery; upper fins dusky; ventrals with median dusky blotch; inner surface of pectorals blackish. Length 12 inches. Point Loma, San

Diego; one specimen known. (Eigenmann.) Evidently very close to *Etrumeus* and *Dussumieria*. (*ὀθόνη*, veil; *ὤψ*, eye.)

Perkinsia othonops, Rosa Smith Eigenmann, Amer. Nat., 1891, 153, San Diego, California.

206. CLUPEA (Artedi) Linnæus.

(Herrings.)

Clupea (Artedi) Linnæus, Syst. Nat., Ed. x, 1758, 317, (*harengus*).
Rogenia, Cuvier & Valenciennes, Hist. Nat. Poiss., xx, 340, 1847, (*alba*, "the Whitebait," the young of *harengus*).

True Herrings with the body elongate, numerous vertebræ, the ventral serratures weak, and an ovate patch of small but persistent teeth on the vomer. The few species belong to the northern seas, where the number of individuals is inordinately great, exceeding perhaps those of any other genus of fishes. Not anadromous, spawning in the sea. (*Clupea*, herring.)

a. Belly serrate both before and behind ventrals; anal rays 17. HARENGUS, 685.
aa. Belly serrate behind ventrals only; anal rays about 14. PALLASII, 686.

685. CLUPEA HARENGUS, Linnæus.

(Common Herring.)

Head 4½; depth 4½; eye 4. D. 18; A. 17; lateral line 57; ventral scutes 28 + 13; vertebræ 56. Body elongate, compressed. Scales loose. Cheeks longer than high, the junction of the mandible and preopercle under middle of eye. Maxillary extending to middle of eye; upper jaw not emarginate; lower jaw much projecting. Vomer with an ovate patch of small permanent teeth; palatine teeth minute, if present; tongue with small teeth; jaws with or without minute teeth. Gill rakers very long, fine, and slender, about 40 on the lower part of the arch. Eye longer than snout. Dorsal inserted rather behind middle of body, in front of ventrals. Pectorals and ventrals short; anal low. Abdomen serrated in front of ventrals as well as behind, the serratures weak. Bluish; silvery below, with bright reflections. Peritoneum dusky. Length 16 inches. North Atlantic Ocean; abundant on the coasts both of Europe and America, chiefly north of Cape Hatteras where it is known as Labrador herring; the young are canned as sardines at Eastport, Me., and elsewhere.[*] Spawns in the sea. (Eu.) (*harengus*, low Latin for Herring, the word allied to the German *Heer*, army, a fish that swims in armies.)

Clupea harengus, Linnæus, Syst. Nat., Ed. x, 1758, 317, Seas of Europe; Günther, Cat., vii, 415, 1868; Jordan & Gilbert, Synopsis, 265, 1883.

Clupea elongata, Le Sueur, Journ. Ac. Nat. Sci. Phila., i, 1817, 234, Massachusetts.

---

[*] The herring is abundant only to the north of Cape Cod. Mr. W. C. Kendall reports that it is occasionally taken about Fortress Monroe. It is rare on the coast of Maryland, being, according to Uhler and Lugger, more common after a severe winter.

Clupea latulus, CUVIER, Règne Anim., Ed. 2, Vol. II, 318, 1829, Whitebait.

Clupea leachi, YARRELL, Zool. Journ., v, 1829, 277, pl. 12, England.

Clupea lineolata, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 256, 1847, locality unknown.

Rogenia alba, CUVIER & VALENCIENNES, the young form known as Whitebait, England.

686. CLUPEA PALLASII, Cuvier & Valenciennes.

(CALIFORNIA HERRING.)

Head 4⅓; depth 4. D. 16; A. 14; lateral line 52. Lower jaw strongly projecting; upper jaw not emarginate. Belly scarcely compressed in front of ventrals, serrate only between ventrals and anal. Gill rakers very long and slender. Vomerine teeth weaker than in *C. harengus*; usually a few teeth on tongue and premaxillary. Vertebræ also fewer, $30 + 20 = 50$. Insertion of dorsal slightly nearer front of eye than base of caudal. Bluish above; sides and below silvery; peritoneum dusky. Length 18 inches. Pacific Coast from Kamchatka to San Diego; very similar to *C. harengus*, and equally abundant. Not entering rivers southward. (Named for Petrus Simon Pallas, of St. Petersburg, naturalist and explorer, author of the excellent Zoographia Rosso-Asiatica, 1811.)

Clupea harengus, Var., PALLAS, Zoogr. Rosso.-Asiat., III, 209, 1811, Kamchatka.

Spratelloides bryoporus, COPE, Proc. Amer. Philos. Soc., 1873, 25, Sitka; JORDAN & GILBERT, Synopsis, 264, 1883.

207. CLUPANODON, Lacépède.

(TRUE SARDINES.)

Clupanodon, LACÉPÈDE, Hist. Nat. Poiss., v, 468, 1803, (*pilchardus*, etc.).*

Thrissa, RAFINESQUE, Analyse de la Nature, 1815, 88; substitute for *Clupanodon*, regarded as an objectionable name.

Sardinia, POEY, Memorias, II, 311, 1860, (*pseudohispanica*).

This genus is close to *Clupea*, which it resembles in the elongate form and weak ventral serratures. Vomer toothless, the teeth in the jaws mostly weak. Scales thin, deciduous. Adipose eyelid present. Gill rakers very numerous. Species about 6, chiefly confined to the two temperate zones, all closely related to the European Sardine, *Clupanodon pilchardus*, and agreeing with it in the rich and delicate flesh; less firm than that of related species, and much richer in oil. Species marine, not anadromous. Very close to *Pomolobus*, as also to *Clupea*, and perhaps the three should be reunited. (*Clupea*, herring; ἀνοδούς, without teeth; this genus being supposed to differ from *Clupea* by the absence of teeth.)

---

* "Six species are referred by Lacépède to this genus [*Clupanodon*], viz: *thrissa*, L., (*Opisthonema*, Gill), *nasica*, Lac., (*nasus*, Bloch), (*Dorosoma*, Raf.), *pilchardus*, L., (*Sardinia*, Poey), *sineusis*, L., (*Clupeonia*, C. & V.), *africanus*, Bloch, (*Pellona*, C. & V.), *jussieu*, Lac., (*Clupeonia*, C. &. V.). One of these, *Pellona africana*, does not conform to the definition and should be excluded. All the others (except *Dorosoma nasus*) are very closely related and are probably all representatives of sections of the genus *Clupea*, rather than of distinct genera. The name *Clupanodon* is prior to all of these and must take the place of one of them. So far as we know it has never been formally restricted. It seems to us better to consider *C. jussieui* as the type of *Clupanodon* and to substitute *Clupanodon* for *Clupeonia*."—(*Jordan & Gilbert*, *l. c.*).

Inasmuch as the genus *Sardinia* is of later date than any of the others included under *Clupanodon*, the name *Clupanodon* must be used for its type instead of letting it take the place of *Clupeonia* as above suggested. This arrangement accords with the views of Dr. Gill.

a. Opercles conspicuously striate; side with a series of round black spots on level of eye, these obsolete with age; no teeth in jaws. California. CÆRULEUS, 687.

aa. Opercles scarcely striate; sides without black spots; minute teeth on tongue and lower jaw. West Indian. PSEUDOHISPANICUS, 688.

687. CLUPANODON CÆRULEUS (Girard).

(CALIFORNIA SARDINE.)

Head 4; depth 5. D. 14; A. 17; lateral line 53; scutes 18 + 14. Vertebræ about 50. Body slender, subfusiform, slenderer and less compressed than a herring, the back rather broad. Ventral serratures very weak. Maxillary reaching nearly to middle of eye. Adipose eyelids present, each covering nearly $\frac{1}{3}$ of eye. Mandible little projecting, the tip included. No teeth in mouth. Gill rakers longer than eye, very slender and numerous, close-set, some 50 or 60 on lower limb of arch. Opercle truncate behind, the edge vertical, the upper half with conspicuous branching tubes and striæ, the lower with about 7 long striæ extending downward and backward; top of head with bony striæ. A frill of enlarged scales with dendritic striæ about nape and shoulder. Insertion of dorsal considerably nearer snout than base of caudal. Dorsal small, its free edge concave; pectorals and ventrals with sheathing scales; anal small and low, its last two rays enlarged, forming a sort of finlet. Dark-bluish above; silvery below; a series of round black spots on the level of the eye, running backward, bounding the dark color of the back; similar smaller spots above, forming lines along the rows of scales; these spots sometimes obscure or wanting, especially in old examples; tip of lower jaw yellow; lower part of dorsal yellowish; peritoneum black. Flesh darker than that of the herring and more oily. Length 12 inches. Pacific Coast from Puget Sound to Magdalena Bay; abundant on California coast; spawning in the sea. An excellent food-fish. It resembles the European Sardine (*Clupanodon pilchardus*), but has no teeth, and the belly is less strongly serrate. We have not been able to compare the California Sardine with *Clupanodon sagax*[*] from Chili. (*cæruleus*, blue.)

Maletta cærulea,[†] GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 138, San Francisco.

Alausa californica, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 281, California.

Clupea sagax, GÜNTHER, Cat., VII, 443, 1868; not of JENYNS;[‡] JORDAN & GILBERT, Synopsis, 965, 1883.

688. CLUPANODON PSEUDOHISPANICUS (Poey).

(SARDINA DE ESPAÑA, BANG.)

Head 4; depth $3\frac{3}{4}$ to $4\frac{1}{2}$; eye $3\frac{3}{4}$. D. 16; A. 16; scales about 45. Vertebræ 46 to 48. Body slender, little compressed, the belly scarcely carinated, its scutes not prominent; mouth small, the maxillary not quite reaching pupil, $2\frac{3}{5}$ in head; gill rakers very long, slender, and numerous, 30 to 40 below angle, the longest $\frac{2}{3}$ eye. Lower jaw with a few feeble teeth; some minute teeth on tongue. Cheeks much longer than deep, their depth below eye $\frac{2}{3}$ eye. Adipose eyelid well developed. Opercle with very faint striæ, preopercle with very few. Caudal well forked, the lower lobe as long as head and a little longer than the upper; ventrals inserted nearly below middle of dorsal, a little nearer base of caudal than tip of snout; pectoral $1\frac{1}{3}$ in head, a conspicuous sheath of scales at base. Color bluish, with no distinct markings, sides golden and silvery; peritoneum dusky; opercle dusky within. Intestine $1\frac{1}{2}$ length of body. Length 8 inches. Gulf of Mexico; abundant about Cuba, and not rare in rather deep water off Pensacola and Tampa; also occasionally northward as far as Cape Cod; sometimes taken in abundance at Woods Holl, Mass. (William C. Kendall.) Closely allied to the European Sardine or pilchard (*Clupanodon pilchardus*, L.), but distinguished by the absence of radiating striæ on the opercles, these conspicuous in the true Sardine. (*ψευδής*, false; *ἱσπανικός*, Spanish; the false Spanish Sardine.)

---

[*] Very few species of shore fishes are, however, common to the faunæ of California and Chili, and as this sardine is not found on the intervening coast of Mexico, it is best to regard *cærulea* as distinct from *sagax* until positively shown to be identical.

[†] The name *cærulea* is preoccupied in *Clupea*, but not in *Clupanodon*.

[‡] *Clupea sagax*, JENYNS, Zoöl. Beagle, Fishes, 134, 1842, Lima, San Lorenzo Island; *Alosa musica*, GIRARD, U. S. Nav. Astr. Exped., 246, 1855, Chili; *Alosa fimbriata*, KNER & STEINDACHNER, S. A. K. Wiss. Wien, 1866, f. 15, Chili.

Sardinia pseudohispanica, POEY, Memorias, II, 311, 1860, Cuba; GÜNTHER, Cat., VII, 442, 1868; JORDAN & GILBERT, Synopsis, 887, 1883.

Clupea pseudohispanica, KENDALL & SMITH, Bull. U. S. Fish Comm., XIV, 1894, 17.

208. POMOLOBUS, Rafinesque.

(ALEWIVES.)

Pomolobus, RAFINESQUE, Ichth. Oh., 38, 1820, (*chrysochloris*).

Spratella, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 356, 1847, (*pumila* = young of *Clupea sprattus*).

Meletta, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 366, 1847 (*vulgaris* = *sprattus*).

Alausella, GILL, Proc. Ac. Nat. Sci. Phila., 1861, 35, (*parvula* = *pseudoharengus*).

Body oblong, more or less compressed. Mouth moderate, terminal, the jaws about equal, or the lower projecting, the upper scarcely notched at tip. Teeth feeble, variously placed, probably never wholly absent; mandibles very deep at base, shutting within the maxillaries. Gill rakers more or less long and slender, numerous. Adipose eyelid present. Scales thin, cycloid, deciduous, entire, rounded posteriorly. Cheeks with the free portion longer than deep. Dorsal fin rather short, nearly median, beginning in advance of ventrals, its posterior ray not prolonged in a filament; ventral present; anal moderate. Belly compressed, strongly serrated before and behind ventrals. Flesh rather dry and poor, less oily than in *Clupanodon*. Vertebræ 46 to 55 in number, usually 50. Species numerous, mostly anadromous, the typical species confined to the northern seas, and mostly anadromous. All the northern species agree in having a larger number of vertebræ than is found in the tropical species which constitute the genus *Sardinella*. If this rule holds with the species in other regions, probably those tropical forms usually referred to *Clupea*, constituting the subgenus *Kowala*, etc., should be regarded as distinct alike from *Clupea* and *Pomolobus*. *Pomolobus* is very close to *Clupea*, with which it may perhaps need to be reunited. It seems to us best to regard the true herring, shad, alewife, and sardine as distinct generic groups, although the characters of the dentition on which Valenciennes chiefly relied for distinction have scarcely any value. (*πῶμα*, opercle; *λόβος*, lobe.)

a. Teeth in jaws present, those on tip of both jaws mostly persistent; adipose eyelid moderate; peritoneum pale. CHRYSOCHLORIS, 689
aa. Teeth in jaws disappearing with age.
  b. Peritoneum pale.
    c. Head long, about 4 in length; form rather elliptical. MEDIOCRIS, 690.
    cc. Head shorter and heavier, about $4\frac{2}{3}$ in length; body heavier forward. PSEUDOHARENGUS, 691.
  bb. Peritoneum black; fins low. ÆSTIVALIS, 692.

689. POMOLOBUS CHRYSOCHLORIS, Rafinesque.

(SKIPJACK; BLUE HERRING.)

Head $3\frac{3}{4}$; depth $3\frac{3}{4}$; eye shorter than snout, $4\frac{1}{3}$ in head. D. 16; A. 18; lateral line 52; ventral scutes 20 + 13. Body elliptical, highest near the middle, much compressed. Head rather slender and pointed, its upper profile straight. Lower jaw strongly projecting, its tip entering the profile; upper jaw emarginate; premaxillary, and often tip of lower jaw, with moderate-sized persistent teeth; maxillary large, reaching to opposite posterior part of eye. Eye large, well covered by adipose eyelid. Fins moderate. Caudal peduncle slender, the caudal widely forked. Gill rakers comparatively few, short, stout, and coarse, about 23 below the angle of the arch. Opercles with radiating and branching striæ. Brilliant blue above; sides silvery, with golden reflections; no dark spots behind opercle. Peritoneum pale. Length 15 inches. Gulf of Mexico and Mississippi Valley; abundant; resident in all the larger streams, and introduced through the canals into Lake Erie and Lake Michigan. A handsome fish, but worthless for food, as it is lean and bony. As ordinarily seen, it is strictly a fresh-water species, but in the Gulf of Mexico, in rather deep water, specimens of large size and excessively fat, are taken. (*χρυσός*, gold; *χλωρός*, green.)

Pomolobus chrysochloris, RAFINESQUE, Ichth. Oh., 38, 1820, Ohio River.
Meletta suœrii, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 375, 1847, Wabash River.
Clupea chrysochloris, JORDAN & GILBERT, Synopsis, 266, 1883.

690. POMOLOBUS MEDIOCRIS (Mitchill).

(HICKORY SHAD; TAILOR HERRING; FALL HERRING; MATTOWACCA.)

Head 4; depth $3\frac{3}{8}$. D. 15; A. 21; lateral line 50; ventral scutes 20 + 16. Head comparatively long, the profile straight and not very steep, form more elliptical than in the others, and less heavy forward. Lower jaw considerably projecting; upper jaw emarginate. Opercles rather less emarginate below and behind than in *P. pseudoharengus*. Fins low; dorsal fin inserted nearer snout than base of caudal. Bluish silvery; sides with rather faint longitudinal stripes. Peritoneum pale. Length 24 inches. Cape Cod to Florida; rather common; not highly valued as a food-fish; not ascending streams to spawn. (*mediocris*, mediocre.)

Clupea mediocri, MITCHILL, Trans. Lit. and Phil. Soc. N. Y., I, 1815, 450, New York; JORDAN & GILBERT, Synopsis, 266, 1883.

691. POMOLOBUS PSEUDOHARENGUS (Wilson).

(ALEWIFE; BRANCH HERRING; GASPEREAU; WALL-EYED HERRING; BIG-EYED HERRING; ELLWIFE.)

Head 4⅔; depth 3⅓; eye 3½. D. 16; A. 19; lateral line 50; scutes 21 + 14. Body rather deep and compressed, heavy forward. Head short, nearly as deep as long, the profile somewhat steep and slightly depressed above the nostrils. Maxillary extending to posterior margin of pupil. Lower jaw somewhat projecting; upper jaw emarginate. Eye large, slightly longer than snout. Gill-rakers long, 30 to 40 below the angle of the arch, shorter and stouter than in *A. sapidissima*. Lower lobe of caudal the longer. Dorsal fin high, a little higher than long, its height 6½ in length of body. Bluish above; sides silvery; indistinct dark stripes along the rows of scales; a blackish spot behind opercle. Peritoneum pale. Atlantic Coast of the United States; abundant; entering streams to spawn; also landlocked in the lakes of western New York (var. *lacustris*), and in Lake Ontario where it is excessively abundant and where great multitudes sometimes die in early summer. (*ψευδής*, false; *harengus*, herring.)

Clupea pseudoharengus, WILSON, Rees's Encycl., IX, about 1811, probably Philadelphia.

Clupea vernalis,* MITCHILL, Rept. Fishes N. Y., 22, 1814, and in Trans. Lit. & Phil. Soc. N. Y., I, 1815, 454, New York.

Clupea vernalis, JORDAN & GILBERT, Synopsis, 267, 1883.

692. POMOLOBUS ÆSTIVALIS (Mitchill).

(GLUT HERRING; BLUE-BACK; BLACK-BELLY; SUMMER HERRING; KYACH; SAW-BELLY.)

Head 5; depth 3½. Similar to the preceding, from which it is best distinguished by the black peritoneum. Body more elongate, the fins lower and the eyes smaller, the back darker. First ray of dorsal not equal to base of fin. Atlantic Coast, appearing later than the preceding; less abundant northward, and less valuable as a food-fish, perhaps ranging farther southward. In the Southern States, more abundant than the preceding, from which few fishermen* distinguish it with certainty. (*æstivalis*, of the summer.)

---

* According to Dr. Gill, the paper of Alexander Wilson in Rees's Cyclopedia, was published before 1814, the date of Mitchill's name *vernalis*. See McDonald in Goode, Nat. Hist. Aquat. Anim., 580, 594, 1884.

209. ALOSA, Cuvier.

(THE SHAD.)

Alosa, CUVIER, Règne Animal, Ed. 2, II, 319, 1829, (*alosa*).
Alausa, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 389, 1847, (*vulgaris*).

Body deep, compressed, deeper than in related American genera, the head also deep, the free portion of the cheeks deeper than long; jaws wholly toothless; upper jaw with a sharp, deep notch at tip, the premaxillaries meeting at a very acute angle. Vertebræ 56 (in *Alosa alosa*), otherwise as in *Pomolobus*, to which genus *Alosa* is very closely allied. Species three, of the North Atlantic, ascending rivers; highly valued as food-fishes, although very full of small bones, the flesh white and rich, but not oily. (*Alosa*, Saxon *Allis*, old name of the European Shad, *Alosa alosa*.)

693. ALOSA SAPIDISSIMA (Wilson).

(COMMON SHAD; AMERICAN SHAD; NORTH RIVER SHAD; POTOMAC SHAD.)

Head 4¼; depth 3. D. 15; A. 21; lateral line 60; ventral scutes 21 + 16. Body comparatively deep. Mouth rather large, the jaws about equal, the lower fitting into a notch in the tip of the upper; no teeth. Preorbital moderate; cheeks much deeper than long, the preopercle extending little forward, joining the mandible at a point rather behind the eye. Gill rakers extremely long and slender, much longer than eye, about 60 below the angle of the arch, the number smaller in specimens from the Gulf of Mexico, which perhaps represent a tangible variety. Fins small; dorsal much nearer snout than base of caudal. Peritoneum white. Bluish above; sides white and silvery; a dark spot behind opercle, and sometimes several along the line dividing the color of the back from that of the sides; axil dusky. Length 2½ feet. Atlantic Coast of the United States from the Mirimachi to the Alabama, ascending rivers in spring to spawn. One of the most important of our food-fish, of most excellent flavor, though with many small bones. Also introduced by the United States Fish Commission on the Pacific Coast, where it is now abundant from Monterey northward. Specimens from the Gulf of Mexico are smaller, and have shorter and fewer gill rakers, constituting a slight variety. (*sapidissima*, most delicious.)

---

* "Their judgment is by no means infallible, for I have had them frequently sort out into two piles, the fishes which they distinguish under these names, and found that their discrimination was not at all reliable. The features to which they mainly trust in the determination of *P. æstivalis* are the bluer color of the back and the greater serration of the ventral ridge," both of these characters varying with the condition of the specimen itself. (Goode.)

Clupea sapidissima, Wilson, in Rees's New Cyclopedia, IXg., no pagination nor date, but prior to 1812,* no locality, but probably Philadelphia; Rafinesque, Amer. Month. Mag., Vol. II, 1817, 205, tributaries of Atlantic Ocean; Jordan & Gilbert, Synopsis, 267, 1883.
Clupea indigena, Mitchill, Trans. Lit. & Phil. Soc. N. Y., I, 1815, 454, (very young), New York.
Alosa præstabilis, De Kay, New York Fauna: Fishes, 255, pl. 15, fig. 41, 1842, New York.
Alosa sapidissima, of many American writers.

210. SARDINELLA, Cuvier & Valenciennes.

(Scaled Sardines.)

Sardinella, Cuvier & Valenciennes, Hist. Nat. Poiss., XX, 261, 1847, (*aurita*).
Harengula, Cuvier & Valenciennes, Hist. Nat. Poiss., XX, 280, 1847, (*latula*).
Clupeonia, Cuvier & Valenciennes, Hist. Nat. Poiss., XX, 345, 1847, (*jussieui*).
Kowala, Cuvier & Valenciennes, Hist. Nat. Poiss., XX, 362, 1847, (*thoracata* = *kowal*).
Lile, Jordan & Evermann, new subgenus, (*stolifera*).

Small herrings of the tropical seas, with the vertebræ in reduced number, about 40 to 44, and with the scales large, usually firm and adherent, often crossed by vertical striæ. Ventral scutes strong, 25 to 35 in number. Adipose eyelid obsolete. Lower jaw projecting; upper jaw somewhat emarginate; teeth weak. Ventrals inserted behind front of dorsal. Body compressed; cheeks not deep; gill rakers long and numerous; otherwise essentially as in *Pomolobus*. The genus *Sardinella*, as here understood, covers a wide diversity of forms and may be divisible into several genera when the anatomy of the species is better known. (*Sardinella*, diminutive of *Sardina*, a sardine.)

a. Side of body without distinct silvery lateral band; mouth moderate, the teeth very small, but permanent over most of the bones of the mouth; scales large and usually firm.
Sardinella:
  b. Ventral scutes 33 to 35.
    c. Body slender, the depth about $4\frac{1}{2}$ in length; a black opercular spot. ANCHOVIA, 694.
    cc. Body rather deep, the depth about $3\frac{1}{2}$ in length; no black opercular spot. CLUPEOLA, 695.
  bb. Species imperfectly described, probably allied to *Sardinella*.
    d. Snout and chin black. APICALIS, 696.
    dd. Snout and chin not black; a black humeral spot; sides with dark streaks. BISHOPI, 697.
Harengula (diminutive of *Harengus*, herring):
  bbb. Ventral scutes 25 to 28; body short and deep, compressed, the scales usually with vertical striæ.
    e. Scales not very firm and little adherent, so that many are lost in preserved examples; each scale with four vertical wavy striæ; ventral scutes about 15 + 10; depth $3\frac{2}{5}$ in length; eye $2\frac{1}{2}$ in head; no humeral spot. SARDINA, 698.
    ee. Scales firm and closely adherent so that few, if any, are lost in preserved examples; usually a humeral spot.
      f. Body moderately elongate, the ventral outline not strongly arched, the depth $3\frac{1}{3}$ to $3\frac{2}{5}$ in length.
        g. Head long, $3\frac{3}{7}$ in length; eye $2\frac{2}{3}$ in head. MACROPHTHALMUS, 699.
        gg. Head deep, 4 in length; eye 3 in head. THRISSINA, 700.
      ff. Body deep, the ventral outline arched, forming an even curve from snout to vent, the depth $2\frac{3}{4}$ to 3; head $3\frac{1}{5}$ in length; eye $2\frac{2}{3}$ in head. HUMERALIS, 701.

---

*Dr. Gill writes "The copy I have before me is in the original binding and has 'Thomas Munroe's Book 1812' on fly leaf."

LILE (Matti-lile, an Indian name given in Pondicherry to *Clupea lile*):

aa. Sides with a very distinct lateral silvery band; scales very firm, without vertical striæ; mouth very small, almost vertical; teeth small, none on vomer; tip of snout, chin, and upper fins dusky. STOLIFERA, 702.

Subgenus SARDINELLA.

694. SARDINELLA ANCHOVIA (Cuvier & Valenciennes).

Head about 4½; depth 4½. D. 16; A. 16. Body elongate and slender. Scales smooth, large, striated. Suborbital bones finely venulose; teeth on tongue and palatines, none on vomer; jaws mostly toothless. Dorsal nearer snout than root of caudal, the ventrals inserted below its middle. A black spot on opercle above. Martinique to Brazil; said to be closely allied to the European *Sardinella aurita*, also a little known species; apparently recognizable by the opercular spot. (Cuvier & Valenciennes.) (*Anchovia*, anchovy.)

Sardinella anchovia, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 269, 1847, Rio Janeiro; Martinique.
Clupea anchovia, GÜNTHER, Cat., VII, 421, 1868.

695. SARDINELLA CLUPEOLA (Cuvier & Valenciennes).

(CAILLEU.)

Head 4 in total length with caudal; depth 4. D. 18; A. 18. Ventral scutes 33. Head short; profile of back straightish; snout rather long and blunt. Last rays of dorsal very short; ventrals under seventh dorsal ray. Scales very solid, striate; serrations of belly less strong than in some species. Steel-blue above, silvery below; the back with traces of longitudinal streaks; yellow blotch in life behind opercle. Guadeloupe; a food-fish of delicate flavor. (Cuvier & Valenciennes.) A little known species, not recognized by late writers, identified by Poey with *Sardinella humeralis* and later by Jordan with *Sardinella sardina*, but different from either if the above description is trustworthy;[*] the ventral scutes more numerous. (Diminutive of *Clupea*, herring.)

Harengula clupeola, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 289, 1847, Guadeloupe.

696. SARDINELLA APICALIS (Müller & Troschel).

D. 18; A. 17. Lower jaw longer than upper; maxillary reaching first third of eye, which is more than half head. Ventrals under middle of dorsal. Scales large, forming nine rows on each side of body. Scales silvery, each one on belly with a copper-colored spot; point of snout above and beneath, black; a small, black, longitudinal band on front and a black spot over each eye; tip of dorsal and edge of caudal black. Barbadoes. (Müller & Troschel.) A species of uncertain relations. (*apicalis*, of the apex, the tip of snout black.)

Alosa apicalis, MÜLLER & TROSCHEL, in Schomburgk's Hist. Barbadoes, 675, 1848, Barbadoes.
Clupea apicalis, GÜNTHER, Cat., VII, 441, 1868.

---

[*] Possibly identical with *Clupea brasiliensis*, STEINDACHNER, Ichth. Beitr., VIII, 64, 1879, Rio Janeiro; name preoccupied, changed to *Clupea janeiro*, EIGENMANN & BRAY, Ann. N. Y. Ac. Nat. Sci., 1894, 626.

697. SARDINELLA BISHOPI (Müller & Troschel).

Allied to *Sardinella apicalis*, but with a black spot behind operculum and no black on dorsal; sides with faint dark streaks; eye large, half height of head; 11 rows of scales on each side. Barbadoes. (Müller & Troschel.) A doubtful species, of uncertain relations. (A personal name.)

Alosa bishopi, MÜLLER & TROSCHEL, in Schomburgk's Hist. Barbadoes, 675, 1848, Barbadoes.

Subgenus HARENGULA, Cuvier & Valenciennes.

698. SARDINELLA SARDINA (Poey).

(SARDINA DE LEY.)

Head $3\frac{4}{7}$; depth $3\frac{1}{3}$ to $3\frac{1}{2}$. D. 15; A. 18; scales 36; scutes 15 + 10. Head $1\frac{1}{10}$ in depth of body. Eye very large, $\frac{1}{3}$ longer than snout, $2\frac{1}{2}$ in head. Body rather elongate, the ventral outline little convex, forming a weak arch. Scales less firm and less adherent than in other species of *Harengula*, many of them lost in museum or market specimens; each scale with four vertical wavy striæ on its free edge. Insertion of dorsal nearly midway between snout and base of caudal. Color pale; no black humeral spot; trunk with longitudinal streaks; an orange area behind opercle in life; tips of dorsal and anal dusky. Length 8 inches. West Indian fauna; abundant; north to Key West. (*Sardina*, sardine.)

Harengula sardina, POEY, Memorias, II, 310, 1860, Cuba.
Harengula callolepis, GOODE, Proc. U. S. Nat. Mus., 1879, 152, Bermuda.
Harengula clupeola, JORDAN, Proc. U. S. Nat. Mus., 1889, 646; not of CUVIER & VALENCIENNES.

699. SARDINELLA MACROPHTHALMUS (Ranzani).

Head $3\frac{3}{7}$; depth $3\frac{2}{5}$; eye $2\frac{2}{3}$. D. 17; A. 18; scales 40–12; vertebræ 40. Body moderately elongate, the ventral outline little convex, forming a weak arch; length of head 1 to $1\frac{1}{5}$ in depth of body; eye large, $\frac{1}{5}$ longer than snout; insertion of ventrals nearly midway between snout and base of caudal. Bluish above, sides silvery; dark humeral spot usually evident, sometimes wanting; above this a dark line extends, bounding the dark of the back, above this a pale streak; caudal dusky. Scales less striate than in *S. humeralis*. West Indies, Cuba to Brazil; not very common. (*μακρός*, large; *ὀφθαλμός*, eye.)

Clupea macrophthalma, RANZANI, Nov. Comm. Ac. Sci. Bonon., V, 320, 1842, Brazil; GÜNTHER, Cat., VII, 421, 1868.
Harengula maculosa, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 292, 1847, Martinique.
Harengula jaguana, POEY, Repertorio, I, 190, 1866, Jagua, Cuba, near Cienfuegos.
Harengula macrophthalma, JORDAN, Proc. U. S. Nat. Mus., 1889, 646.

700. SARDINELLA THRISSINA (Jordan & Gilbert).

Head 4; depth $3\frac{1}{3}$; eye 3. D. 15; A. 13; scales 40–10. Scutes 16 + 13. Body deep, but less so than in *S. humeralis*. Head large, rather blunt; mouth moderate, the lower jaw projecting, the upper jaw scarcely emarginate; maxillary 2 in head, reaching past front of pupil. Both jaws with small teeth; teeth on palatines, pterygoids, and tongue. Eye large. Cheeks and opercles with fine but distinct branching striæ. Gill rakers short, close-set, 30 below angle, the longest half eye. Scales firm and adherent, the edge roughened; scales before dorsal similar but smaller. Belly sharply compressed, with strong scutes. Ventrals 2 in head; pectorals 1⅓. Bluish above, silvery below; a round black humeral spot; fins pale. Length 8 inches. Gulf of California, rather rare. (Diminutive from *Thrissa*, *ϑρίσσα*, a herring or sardine, from the hair-like bones; *ϑρίξ*, a hair.)

Clupea thrissina, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 353, Cape San Lucas. (Type, Nos. 6388, 2524, and 6339. Coll. Xantus.)

701. SARDINELLA HUMERALIS (Cuvier & Valenciennes).

(SARDINA ESCAMUDA; WHITE-BILL; PINCERS.)

Head 3⅘; depth 2¾ to 3, the Florida specimens (var. *pensacolæ*) averaging 2¾; Cuban examples about 3; eye 2⅔. D. 16; A. 17; scales 40; scutes 16 + 12. Body deep, with the ventral outline forming an even curve from chin to vent. Eye moderate, ⅓ longer than snout. Insertion of ventrals nearer tip of snout than base of caudal. Teeth in jaws small; a large patch on tongue. Scales very adherent, each with one to four vertical curved striæ, those before dorsal more or less laciniate. Silvery, dark humeral spot usually present, but often obscure or wanting; surrounded by golden in life; usually a row of dark points extending backward from it along upper parts of body; no distinct longitudinal streaks. Length 8 inches. West Indies and Gulf of Mexico. Abundant from Pensacola and Cedar Keys southward; the specimens from Florida deeper than others, representing a northern variety or subspecies *pensacolæ*. (*humeralis*, pertaining to the shoulder.)

Harengula humeralis, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 293, 1847, Rio Janeiro; Bahia; Guadeloupe; San Domingo.

Alausa striata, CUVIER & VALENCIENNES, *l. c.*, XX, 429, 1847, Guadeloupe; Bahia.

Harengula pensacolæ, GOODE & BEAN, Proc. U. S. Nat. Mus., 1879, 152, Pensacola, Florida. (Type, Nos. 22831 and 22829. Coll. Stearns.) JORDAN & GILBERT, Synopsis, 268, 1883.

Clupea humeralis, GÜNTHER, Cat., VII, 422, 1868.

Harengula arcuata, JORDAN, Proc. U. S. Nat. Mus., 1889, 646.*

Subgenus LILE, Jordan & Evermann.

702. SARDINELLA STOLIFERA, (Jordan & Gilbert).

Head 4¾; depth 3⅓; eye 2⅘. D. 14; A. 16; scales 40-11; scutes 17 + 12 = 29. Vertebræ 20 + 22 = 42, the membrane covering the vertebræ silvery. Body deep, much compressed, the belly strongly arched; the greatest depth just before dorsal. Head short; preopercle vertical. Mouth very small, very oblique, almost vertical, the maxillary reaching front of pupil; lower jaw longer, the upper scarcely emarginate. Both jaws with a few very small, weak teeth; a linear patch on tongue; none on vomer or palatines. Gill rakers slender, numerous, the longest 3/6 eye, about 29 below angle. Eye large, longer than snout. Dorsal fin inserted nearer snout than base of caudal, the ventrals under its first ray; anal short and low; pectorals $1\frac{1}{3}$ in head; ventrals $1\frac{2}{3}$. Scales smooth, firm, closely adherent, entire-edged, without striæ; a very narrow sheath of scales along dorsal and anal; caudal scaled half its length. Ventral scutes strongly developed, with strong spines. Translucent greenish, sides silvery, each scale with its marginal half punctate; a dark line along middle of back; snout and tip of lower jaw dusky; side with a very bright, well-defined silvery band, as in *Stolephorus*, margined by bluish above; the band widest mesially, as wide as a scale, a little wider than pupil; at base of caudal the band expands abruptly; tips of dorsal and caudal lobes jet-black. Length 6 inches. Gulf of California to Panama; abundant about Mazatlan; a beautiful and well-marked species, and a very delicate food-fish, allied to the genus *Pellonula*, and to the East Indian species *Clupea lile*, which belongs to the same subgenus (*Lile*). (*stolifer*, bearing a stole, or white zone.)

---

* This species is probably not identical with *Clupea arcuata*, JENYNS, Ichth. Voy. Beagle, 134, 1842, from Bahia Blanca, Patagonia.

Clupea stolifera, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 339, Mazatlan. (Type, No. 28125. Coll. Gilbert.)

211. OPISTHONEMA, Gill.

(THREAD HERRING.)

Opisthonema, GILL, Proc. Ac. Nat. Sci. Phila., 1861, 37, (*thrissa* = *oglinum*).

Characters essentially those of *Sardinella*, except that the last ray of the dorsal is produced in a long filament as in *Dorosoma*, *Megalops*, and *Tarpon*. Species few, American. (*ὄπισθε*, behind; *νῆμα*, a thread.)

a. Head 4 to $4\frac{1}{2}$ in length; depth about $3\frac{1}{2}$; anal rays about 23; sides of back with dark spots. OGLINUM, 703.

aa. Head larger, $3\frac{2}{5}$ to $3\frac{5}{6}$ in length; depth 3 to $3\frac{1}{2}$; anal rays about 20; back without dark spots. LIBERTATE, 704.

703. OPISTHONEMA OGLINUM (Le Sueur).

(THREAD HERRING; MACHUELO; CAILLEU-TASSART; SPRAT.)

Head $4\frac{1}{3}$; depth $3\frac{1}{2}$. D. 19; A. 24; lateral line 50; scutes 17 + 14. Body oblong, compressed, formed as in *Harengula*, the belly strongly serrate. Tongue with minute teeth; jaws toothless, lower jaw slightly projecting; maxillary reaching nearly to middle of orbit. Gill rakers very long and slender. Dorsal fin inserted in front of ventrals, much nearer snout than base of caudal; dorsal filament about as long as head; anal very low; paired fins small. Scales smooth, rather firm, but easily detached, much as in *Sardinella sardina*. Bluish above, silvery below; an indistinct bluish shoulder spot; each scale on the back with a dark spot, these forming longitudinal streaks. Length 12 inches. West Indian fauna; regularly northward to Florida and Carolina, occasionally straying much farther (Longport, New Jersey, Bean; and Fortress Monroe, Kendall). Abundant in the tropics. (Name unexplained, unless from the word *ogle*, in allusion to the large eyes.)

Clupea thrissa, BROUSSONET, Ichthyologie, fasc. I, 1782, Carolina; Jamaica; not of Osbeck, 1757, which is a Chinese species of *Dorosoma*; GÜNTHER, Cat., VII, 432, 1868, and of many authors.

Megalops oglina, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1817, 359, Newport, Rhode Island.

Megalops notata, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1817, 359, Guadeloupe.

Chatoëssus signifer, De Kay, N. Y. Fauna: Fishes, 264, 1842, New York.
Chatoëssus eumorphus, Gosse, Naturalist's Sojourn in Jamaica, 290, 1851, Jamaica.

704. OPISTHONEMA LIBERTATE (Günther).

(Sardina Machete.)

Head 3⅔ to 4; depth 3 to 3½. D. 17; A. 19; scales 48. Similar to *Opisthonema oglinum*, the head longer, the gill rakers longer and more numerous. Bluish above, silvery on sides and below, a yellowish streak on level of orbit; an indistinct dark spot on opercle, and a larger humeral spot; no dark spots on side of back; caudal tipped with jet-black; tip of snout and lining of opercle black. Pacific coast of Mexico and Central America, abundant, especially in the Gulf of California. (Name from Libertad, port of San Salvador, where the type was taken.)

Meletta libertatis, Günther, Proc. Zool. Soc. Lond., 1866, 603, Libertad, Central America.
Clupea libertatis, Günther, Cat., vii, 433, 1868.
Opisthonema libertate, Jordan & Gilbert, Proc. U. S. Nat. Mus., 1882, 622.
Opisthonema libertatis, Evermann & Jenkins, Proc. U. S. Nat. Mus., 1891, 134.

212. BREVOORTIA, Gill.

(Menhadens.)

Brevoortia, Gill, Proc. Ac. Nat. Sci. Phila., 1861, 37, (*menhaden*).

Body elliptical, compressed, deepest anteriorly, tapering behind. Head very large; cheeks deeper than long. Mouth large, the lower jaw included; no teeth; gill rakers very long and slender, densely set, appearing to fill the mouth when it is opened; gill arches angularly bent. Scales deeper than long, closely imbricated, their exposed edges vertical and fluted or pectinated. Dorsal fin low, rather posterior; anal fin small. Intestinal canal elongate. Vertebræ 48. Peritoneum dusky. Species few; inhabiting the Atlantic; spawning probably in brackish water in the spring. Coarse, herbivorous fishes, not valued as food, but the young of the greatest value as food to other fishes. (Dedicated to James Carson Brevoort, of Brooklyn, a gentleman long interested in the study of fishes.)

705. BREVOORTIA TYRANNUS (Latrobe).

(Menhaden; Mossbunker; Bony-fish; Whitefish; Bugfish; Fatback; Pogy.)

Head 3⅕; depth 3. D. 19; A. 20; lateral line 60 to 80; ventral plates 20 + 12. Head rather short and heavy. Fins comparatively short, the height of the dorsal less than the length of the maxillary; height of anal less than half the length of the maxillary. Pectorals not reaching to ventrals; dorsal inserted slightly behind ventrals, about midway between snout and base of caudal. Scales moderate, strongly serrated, arranged very irregularly, those before dorsal strongly pectinate. Operculum strongly striated or almost smooth (var. *aurea*). Gill rakers much longer than eye. Bluish above; sides silvery, with a strong brassy luster; fins usually yellowish; a conspicuous dark scapular blotch, behind which are often smaller spots. Length 18 inches. Nova Scotia to Brazil; very abundant southward; herbivorous, running in schools, probably spawning in brackish water. Held in no esteem as a food-fish, but very valuable for oil and manure. (*tyrannus*, *τύραννος*, ruler.*)

Clupea tyrannus, LATROBE, Trans. Amer. Phil. Soc. Phila., v, 1802, 77, pl. 1, Chesapeake Bay.
Clupea menhaden, MITCHILL, Trans. Lit. and Phil. Soc. N. Y., I, 1815, 453, New York; GÜNTHER, Cat., VII, 436, 1868.
Clupea neglecta, RAFINESQUE, Amer. Monthly Mag., 1818, 206, Long Island.
Clupea carolinensis, GRONOW, Cat. Fishes, 140, 1854, South Carolina.
Alosa menhaden, STORER, Hist. Fishes Mass., 337, 1867.
Brevoortia tyrannus, GOODE, Proc. U. S. Nat. Mus., I, 1878, 531; GOODE, Rept. U. S. Fish Comm., v, 1877 (1879), 19; complete biography; JORDAN & GILBERT, Synopsis, 269, 1883.

Represented on the coast of Brazil by

705a. BREVOORTIA TYRANNUS AUREA (Agassiz).

Opercles almost smooth; head rather shorter, jaws shorter and body deeper, the scales more regularly arranged than in *Brevoortia tyrannus*. Coast of Brazil. (*aureus*, golden.)

Clupanodon aureus, AGASSIZ, Spix, Pisc. Brasil, 52, 1828, Brazil.
Clupea aurea, GÜNTHER, Cat., VII, 437, 1868.

Occasional specimens taken along the Atlantic Coast of the United States represent

705b. BREVOORTIA TYRANNUS BREVICAUDATA, Goode.

Similar to *aurea*, but the jaws and caudal shorter, the latter not longer than pectorals. Noank, Connecticut, and south. (Goode.) (*brevis* short; *caudatus*, tailed.)

Brevoortia tyrannus brevicaudata, GOODE, Proc. U. S. Nat. Mus., 1878, 34, Noank, Connecticut. (Type, No. 14846, *a. b.* Coll. Goode.)

The common form on the coast of the Gulf of Mexico is

705c. BREVOORTIA TYRANNUS PATRONUS, Goode.

(GULF MENHADEN.)

Head 3; depth 2⅗. D. 19; A. 22; lateral line 50 to 65. Head larger than in *B. tyrannus*; fins long, the height of the dorsal greater than the length of the maxillary; that of the anal more than half the height of the maxillary. Pectorals reaching beyond front of ventrals; insertion of dorsal in front of ventrals, just behind the middle point between the snout and the base of the caudal. Scales moderate, with their margins entire, fluted. Axillary appendages large; large scales at base of pectoral. Operculum delicately striated. Greenish-gray above; sides silvery, with brassy luster; scapular blotch inconspicuous. Gulf of Mexico, generally abundant on the Florida Coast, apparently varying into *B. tyrannus*. (*patronus*, patron, in allusion to the ever present Crustacean, *Cymothoa prægustator*.)

Brevoortia patronus, GOODE, Proc. U. S. Nat. Mus., I, 1878, 39, Brazos, Santiago. (Type, No. 892, *a. b.*). GOODE, Rept. U. S. Fish Comm., v, 1877 (1879), 19; JORDAN & GILBERT, Synopsis, 269, 1883.

---

* A parasitic Crustacean (*Cymothoa prægustator*, LATROBE) is found in the mouths of a very large proportion of the individuals of this species. The specific names both of the fish and the Crustacean refer to this peculiarity, the ancient Roman rulers (*tyranni*) having had their tasters (*prægustatores*) to taste their food before them to prove its harmlessness, thus to prevent poisoning.

213. CHIROCENTRODON, Günther.

Chirocentrodon, Günther, Cat., vii, 463, 1868, (*tæniatus*).

Body oblong, much compressed, covered with deciduous scales. Belly weakly serrated, the serræ beginning at the thorax. Lower jaw projecting; teeth strong, a pair of strong canines in front of each jaw; evident teeth on maxillary; narrow bands on vomer, palatines, pterygoids, and tongue. Anal long, of about 40 rays; dorsal opposite anal; ventrals very small; caudal forked. Branchiostegals 6, short and broad. One species. (*χείρ*, hand; *κέντρον*, spine; *ὀδούς*, tooth.)

706. CHIROCENTRODON TÆNIATUS, Günther.

Head 4¼; depth 4⅔; eye 3½. D. 15; A. 41. Snout compressed, longer than eye. Maxillary large, reaching to behind margin of eye. Gill rakers fine, nearly as long as eye, 10 + 17 in number. Dorsal inserted behind front of anal, midway between occiput and root of caudal; ventrals not longer than eye; pectorals nearly as long as head without snout. Serrature of abdomen not prominent; 11 scutes behind ventrals. White, with a narrow silvery, lateral band. Jamaica. (Günther.) Not seen by us. (*tæniatus*, striped.)

Chirocentrodon tæniatus, Günther, Cat., vii, 463, 1868, Jamaica. (Coll. Dr. Parnell.)

214. ILISHA, Gray.

Platygaster, Swainson, Classif. Anim., ii, 294, 1839, (*africanus*); name preoccupied.

Ilisha (Gray) Richardson, Ichthyol. China, in Proc. Brit. Assoc., 1845 (1846), 306, (*abnormis*); no description.

Pellona,* Cuvier & Valenciennes, Hist. Nat. Poiss., xx, 300, 1847, (*orbignyana* = *flavipinnis*).

Ilisha, Bleeker, Ned. Tydskr. Dierk., 300, 1866, (*abnormis*).

Body much compressed, the thorax and abdomen strongly serrated. Scales moderate. Lower jaw prominent; mouth moderate, with rasp-like bands of minute teeth on jaws, palatines, pterygoids, and tongue; none on vomer. Anal fin very long; ventrals present, small, inserted before the small dorsal; upper ray of pectoral strong; caudal deeply forked. Tropical coasts of America and Asia. (*Ilisha*, an East Indian name of *Sardinella lisha*.)

a. Anal rays 40 to 45; anal placed behind dorsal.
  b. Dorsal rays 19 or 20; eye 4 in head. FLAVIPINNIS, 707.
  bb. Dorsal rays 15; eye 3½ in head. BLEEKERIANA, 708.
aa. Anal rays about 50.
  c. Depth less than one-third length; the ventral outline weakly arched; anal placed behind dorsal. PANAMENSIS, 709.
  cc. Depth more than one-third length, the ventral outline strongly arched; anal partly below dorsal. FURTHI, 710.

707. ILISHA FLAVIPINNIS (Valenciennes).

Head 3⅘; depth 3⅖; eye 4. D. 19 or 20; A. 40; scales 65–18. Posterior halves of ridges on upper side of head distinctly convergent anteriorly, very slightly so posteriorly. Insertion of dorsal midway between end of snout and root of caudal. Base of anal 3½ in length; ventrals longer than eye. Coast of Surinam and Brazil. (Günther.) (*flavus*, yellow; *pinna*, fin.)

---

* *Pellona* is the Spanish name of *Pellona flavipinnis* at Buenos Ayres, apparently from *pelon*, bald, in allusion to the caducous scales.

If "typonyms," or now generic names based on the indication of a type, without description, are to be rejected, the name *Pellona* should take the place of *Ilisha*.

Pristigaster flavipinnis, VALENCIENNES, in D'Orbigny, Voy. Amer. Mér., Poiss., pl. x, fig. 2, 1839, Buenos Ayres.

Pellona orbignyana, CUVIER & VALENCIENNES, Hist. Nat. Poiss., xx, 302, 1847; same type.

? *Pellona castelnæana*, CUVIER & VALENCIENNES, Hist, Nat. Poiss., xx, 306, 1847, Mouth of Amazon; (D. 19; A. 36 to 38).

Pellona flavipinnis, GÜNTHER, Cat., VII, 454, 1868.

708. ILISHA BLEEKERIANA (Poey).

(ANCHOA PELADA.)

Depth 5⅔ in length with caudal; eye 3½. D. 15; A. 43; scutes 25. Ventral line strongly curved. Mouth wide, oblique. Anal placed behind dorsal; length of anal equal to its distance from posterior border of eye. Scales very caducous. Silvery. Matanzas, Cuba; rare. (Poey.) Perhaps not distinct from *I. flavipinnis*. (Named for Dr. Pieter van Bleeker, surgeon in the Dutch Indies, the most indefatigable worker who has yet appeared in ichthyology; author of very many papers on East Indian fishes.)

Pellona bleekeriana, POEY, Repertorio, II, 242, 1867, Matanzas.

709. ILISHA PANAMENSIS (Steindachner).

Head 3¾; depth 3⅙ to 3⅖; eye 3⅖ to 3⅚. D. 16; A. 50; scales 58–21; scutes 22 + 12. Ventral line very weakly curved. Mouth very oblique. First ray of anal under last of dorsal, which is ⅗ of the eye's diameter nearer snout than base of caudal. Silvery, with yellowish fins. Length 16 inches. Panama; not rare.

Pellona panamensis, STEINDACHNER, Ichth. Beitr., I, 14, 1874, Panama.

710. ILISHA FURTHI (Steindachner).

Head 3¾ to 4; depth 2⅔ to $2\frac{6}{7}$; eye 3 to 3⅖. D. 16; A. 50; Scales 55; scutes 23 + 12. Ventral line very strongly curved. Mouth very oblique. First 5 to 7 rays of anal below dorsal, which is inserted an eye's diameter nearer snout than base of caudal. Silvery, fins yellow, more or less punctate. Length a foot. Panama; not rare. (Named for Ignatius Fürth, Austrian Consul at Panama.)

Pellona fürthi, STEINDACHNER, Icth. Beitr., I, 14, 1874, Panama.

215. OPISTHOPTERUS, Gill.

Opisthopterus, GILL, Proc. Ac. Nat. Sci. Phila., 1861, 31, (*tartoor*).

Body elongate, very much compressed, with the abdomen prominent and strongly serrated. Scales thin, deciduous, of moderate size. Lower jaw projecting; maxillary not produced; teeth rather small, in villiform bands on both jaws, palatines, pterygoids, and tongue; vomer toothless. Dorsal fin small, inserted considerably behind middle of body; behind front of anal; anal fin very long; ventrals wanting; caudal deeply forked. Tropical parts of the Pacific. (*ὄπισθε*, behind; *πτερόν*, fin, the dorsal being placed farther backward than in *Pristigaster*.)

a. Anal rays 53 ; eye 2¾ in head. LUTIPINNIS, 711.
aa. Anal rays 56 ; eye 3½ in head ; dorsal nearer root of caudal than scapula. DOVII, 712.
aaa. Anal rays 61 , eye 3 in head ; dorsal midway between scapula and root of caudal. MACROPS, 713.

711. OPISTHOPTERUS LUTIPINNIS (Jordan & Gilbert).

Head 4½; depth 3½; eye 2⅘. D. 13; A. 53; scales 44–11; scutes 29. Body elongate, strongly compressed, anterior profile straight. Mouth large, very oblique, the lower jaw longest; maxillary a little more than half head. Teeth rather strong, present on most bones of the head except the vomer. Eye very large. Gill rakers about 18, not longer than pupil. Dorsal small, posterior, slightly nearer base of caudal than occiput; pectorals long, nearly as long as head; anal moderate. Scales thin, deciduous; ventral scutes very strong. Greenish, sides golden-silvery, fins mostly yellow; a black spot on preopercle and a very distinct humeral spot. Length 6 inches. Pacific coast of Mexico, rather scarce at Mazatlan. (*luteus*, yellow; *pinna*, fin.)

Pristigaster lutipinnis, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 340, Mazatlan. (Type, Nos. 28126, 28209, and 28320. Coll. Gilbert.)

712. OPISTHOPTERUS DOVII (Günther).

Head 4⅘; depth 3½; eye 3½. D. 11; A. 56; scales 51–13. Maxillary less than half head, its supplemental bone moderate, reaching end of the bone. Insertion of dorsal considerably nearer root of caudal than scapula. Panama. (Günther.) (Named for Capt. John M. Dow, formerly resident at Panama, and who made large collections of fishes for the British Museum and for the Smithsonian Institution.)

Pristigaster dovii, GÜNTHER, Cat., VII, 461, 1868, Panama. (Coll. Capt. Dow.)

713. OPISTHOPTERUS MACROPS (Günther).

Head 4½; depth 3; eye 3. D. 13; A. 61; scales 53–17. Dorsal inserted midway between scapula and root of caudal. Maxillary less than half head, its supplementary bone narrow, extending to its extremity. Silvery, scapula black. Panama. (Günther.) (*μακρός*, large; *ὤψ*, eye.)

Pristigaster macrops, GÜNTHER, Proc. Zool. Soc., 1866, 603, and Cat., VII, 461, 1868, Panama. (Coll. Salvin.)

216. ODONTOGNATHUS, Lacépède.

Odontognathus, LACÉPÈDE, Hist. Nat. Poiss., II, 221, 1799, (*mucronatus*).
Gnathobolus, BLOCH & SCHNEIDER, Syst. Ichth., 556, 1801, (*mucronatus*).

Body rather elongate, compressed, covered with caducous scales. Ventral outline not prominent, covered with sharp scutes. Dorsal fin small, much behind front of the long anal. Maxillary very long, in the adult, extending beyond eye, shorter in the young. Teeth small. One species known. (*ὀδούς*, tooth; *γνάθος*, jaw.)

a. Anal rays about 76; scutes on belly 8 + 12.	MUCRONATA, 714.
aa. Anal rays about 67; scutes on belly 13 + 16.	PANAMENSIS, 715.

714. ODONTOGNATHUS MUCRONATA, Lacépède.

Head 5; depth 4⅗. D. 11 or 12; A. 74 to 82; scutes 8 + 12. Eye as long as snout, 3½ in head in young. Maxillary tapering, extending in the adult at least as far as interopercle, shorter and truncate in young. Insertion of dorsal twice as far from eye as from base of caudal. Coast of Guiana. (Günther.) (*mucronatus*, with sharp points.)

Odontognathus mucronatus, LACÉPÈDE, Hist. Nat. Poiss., 221, pl. 7, fig. 2, 1799, Cayenne.
Gnathobolus mucronatus, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 91, 1848.
Pristigaster mucronatus, GÜNTHER, Cat., VII, 462, 1868.

715. ODONTOGNATHUS PANAMENSIS (Steindachner).

Head 5½; depth nearly 4. D. 12; A. 67; scales 55 or 56. Eye equals snout, 3⅔ in head. Body very slender and compressed. Upper profile of head strongly concave; dorsal line before dorsal arched; ventral outline strongly arched; base of anal straight. Mouth oblique; maxillary produced in a slender process, which reaches beyond gill opening; a thin accessory bone, with a bluntish keel on the maxillary, half hidden when the mouth is closed. Teeth small, short, mostly in one row. Top of head narrow, with five ridges. Pectoral longer than head by an eye's diameter, the first ray broad. Dorsal small, twice as far from gill opening as from base of caudal; caudal as long as head; ventral scutes 13 + 16; scales caducous. Panama. Length 8 inches. (Steindachner.)

Pristigaster (*Odontognathus*) *panamensis*, STEINDACHNER, Ichth. Beitr., V, 24, 1876, Panama.

217. PRISTIGASTER, Cuvier.

Pristigaster, CUVIER, Règne Animal, Ed. 1, 176, 1817, (*cayanus*).

This genus differs from *Opisthopterus* in the deeper body, the ventral ridge being very prominent and convex, and especially in the position of the dorsal. This fin is larger in *Pristigaster* than in related genera, and is inserted near the middle of the length of the body, before the anal. One species know, from South America. (*πρίστης*, a saw; *γαστήρ*, belly.)

716. PRISTIGASTER CAYANUS, Cuvier.

Head 4; depth 2. D. 15; A. 46 to 52. Front of dorsal much nearer tip of snout than base of caudal; upper caudal rays produced in filaments in adult, these longer than the fin itself. Abdominal profile subcircular in the adult. Scutes 32. Color silvery. Length 4 inches. Coast of Guiana and northern Brazil. (Cuvier & Valenciennes.) (*Cayanus*, from Cayenne.)

Pristigaster cayanus, CUVIER, Règne Animal, Ed. 1, pl. 10, fig. 3, 1817, Cayenne; CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 334, 1847; GÜNTHER, Cat., VII, 463, 1868.
Pristigaster martii, AGASSIZ, Spix, Pisc. Brasil., 55, 1829, Brazil.
Pristigaster phaëton, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XX, 338, 1847, mouth of Amazon.

Family LXII. ENGRAULIDIDÆ.

(The Anchovies.)

Body elongate, more or less compressed, covered with thin cycloid scales. Head compressed. Mouth extremely large, more or less oblique, usually overlapped by a pointed, compressed, pig-like snout. Gape very wide, the maxillary very long and slender, formed of about three pieces, extending backward far behind the eye; in some species beyond the head. Premaxillaries not protractile, very small, firmly joined to the maxillaries. Teeth usually small, sometimes obsolete, usually fine and even, in a single row in each jaw; canines sometimes present. Eye large, well forward, without adipose eyelid. Preorbital narrow. Opercles thin and membranaceous. Gill rakers long and slender. Branchiostegals slender, 7 to 14 in number. Gill membranes separate or joined, free from the isthmus. Pseudobranchiæ present. No lateral line. Belly rounded or weakly serrate. Fins various; the dorsal usually short and median; no adipose fin; caudal forked. Small, carnivorous shore fishes, usually swimming in large schools on sandy shores; abundant in all warm seas, occasionally entering rivers. Genera 9; species about 80. This group is often regarded as a subfamily under the *Clupeidæ*, from which it differs in no character of high importance.

(*Clupeidæ*, group *Engraulidina*, Günther, Cat. vii, 383–406, 1868.)

a. Teeth in the jaws equally small, if present; no canines.

  b. Insertion of dorsal before that of anal.

    c. Gill membranes nearly or quite separate, free from the isthmus.

      d. Teeth present at all ages; maxillaries not greatly produced; no pectoral filaments.

        e. Vertebræ about 41 in number; bones firm; species chiefly tropical. Stolephorus, 218.

        ee. Vertebræ about 45 in number; bones rather feeble; species of the temperate zones. Engraulis, 219.

      dd. Teeth wanting in the adult; minute, but present in the young; body very deep, but not strongly compressed. Anchovia, 220.

    cc. Gill membranes broadly united, free from the isthmus. Cetengraulis, 221.

  bb. Insertion of dorsal behind front of the very long anal; gill membranes separate. Pterengraulis, 222.

aa. Teeth in jaws unequal, some of them enlarged and canine-like. Lycengraulis, 223.

218. STOLEPHORUS, Lacépède.

(Silvery Anchovies.)

Stolephorus, Lacépède, Hist. Nat. Poiss., v, 381, 1803, (*japonica*).

Body oblong, compressed, covered with rather large, thin, deciduous scales. Belly rounded, or weakly compressed. Snout conical, compressed, projecting beyond the very large mouth. Maxillary narrow, little movable, usually formed of three pieces, extending backward far behind the eye, to the base of the mandible, or beyond, not beyond gill opening. Premaxillaries very small. Teeth small, subequal, present at all ages, usually on the jaws, vomer, palatines, and pterygoids. Anal fin moderate, free from caudal (its rays 12 to 40). No pectoral filaments.

Dorsal inserted about midway of body, posterior to ventrals. Pectorals and ventrals each with a large axillary scale. Adipose eyelid obsolete. Vertebræ[*] about 40 (40 to 42) in species examined. Flesh rather pale and dry, more or less translucent; the bones firm. Pseudobranchiæ present. Branchiostegals 9 to 14. Gill rakers long and slender. Gill membranes separate, free from the narrow isthmus. Species about 50; small, carnivorous shore fishes, swimming in large schools on sandy shores of all warm seas, occasionally entering rivers. Most of them are marked by a very broad, distinct, silvery band. (*στολή*, a stole, a white band worn by priests; *φόρος*, bearing; in allusion to the silvery lateral band.)

- *a.* Anal rays 12 to 14; body very slender, the depth 6 in length; no distinct lateral band. MIARCHUS, 717.
- *aa.* Anal rays 15 to 17; body slender, compressed, the depth 5 to 6 in length.
  - *b.* Maxillary short, not quite reaching margin of preopercle; lateral band well defined, ¾ eye. PERFASCIATUS, 718.
  - *bb.* Maxillary of moderate length, reaching beyond preopercle nearly to gill opening.
    - *c.* Sides with a faint silvery streak; gill rakers short, the longest ½ eye; belly serrulate. EXIGUUS, 719.
    - *cc.* Sides with a well-defined lateral silvery band; belly not serrulate.
      - *d.* Eye 4 in head, as long as snout; scales caducous. CUBANUS, 720.
      - *dd.* Eye 3⅓ in head, longer than snout; axillary sheaths very large. PERTHECATUS, 721.
      - *ddd.* Eye 3¾ in head, longer than snout; scales not caducous. ISCHANUS, 722.
- *aaa.* Anal rays 19 to 24.
  - *e.* Side with a distinct silvery lateral band, with well-defined edges.
    - *f.* Maxillary long, reaching past root of mandible, nearly or quite to gill opening; snout projecting considerably beyond lower jaw.
      - *g.* Body moderately elongate, the depth 4 to 4¾ in length of body.
        - *h.* Silvery lateral band very sharply defined, as broad as eye, not much narrowed anteriorly; eye large, 3½ in head; belly serrulate; A. 20; gill rakers ⅔ eye. BROWNII, 723.
        - *hh.* Silvery lateral band narrow anteriorly, becoming as broad as eye opposite anal fin; belly compressed, not serrulate; anal rays 20. CULTRATUS, 724.
        - *hhh.* Silvery lateral band throughout narrower than eye; anal rays 23; gill rakers nearly as long as eye. DELICATISSIMUS, 725.
      - *gg.* Body more elongate, the depth about 5¼ in length of body; gill rakers as long as eye. A. 23 or 24; eye 4⅖ in head. CHŒROSTOMUS, 726.
    - *ff.* Maxillary short, not reaching root of mandible; eye small, not longer than snout, 4 in head; silvery stripe rather diffuse, half broader than eye; body little compressed, approaching *Engraulis mordax* in form. ARGYROPHANUS, 727.
  - *ee.* Sides without distinct silvery band, or with a faint diffuse streak.
    - *i.* Opercles short, the distance from lower posterior angle of cheek to gill opening much less than from the same point forward to middle of eye; snout bluntish, not produced.
      - *j.* Dorsal rays 11; depth 4⅔ in length; belly serrulate; anal 22 or 23. CURTUS, 728.
      - *jj.* Dorsal rays 15 or 16; depth 4⅓ in length, pectorals longer; anal 23 or 24. POEYI, 729.
    - *ii.* Opercle unusually long, the distance from lower posterior angle of cheek backward to gill opening as great as distance from same point forward to center of eye; cheeks very broad; snout projecting; eye 4 in head; anal 22. OPERCULARIS, 730.

---

[*] In but few of the many species has the skeleton been examined. In general the bones are firmer, the vertebræ larger and less numerous than in *Engraulis*, but the value of this character is yet to be proved.

aaaa. Anal rays about 30, (25 to 36).
- *k.* Silvery lateral band diffuse or obsolete; body much compressed; eye 3 to $3\frac{1}{2}$ in head.
  - *l.* Gill rakers shorter than eye; lateral band narrow.
    - *m.* Belly slightly serrulate; gill rakers $\frac{2}{3}$ eye; scales caducous; anal rays 25 or 26. MITCHILLI, 731.
    - *mm.* Belly not serrulate; gill rakers half eye; scales not caducous; anal rays 27. LUCIDUS, 732.
  - *ll.* Gill rakers long and slender, longer than eye; belly trenchant, not serrate; scales 40; lateral band broad and diffuse or obsolete; snout much projecting.
    - *n.* Snout moderately pointed; minute teeth in both jaws; lateral band diffuse. CLUPEOIDES, 733.
    - *nn.* Snout pointed; minute teeth in upper jaw only; lateral band obsolete. PRODUCTUS, 734.
- *kk.* Silvery lateral band well defined; snout short, little projecting.
  - *o.* Maxillary reaching little behind root of mandible; scales 40; silvery lateral band as broad as eye; gill rakers nearly as long as eye; anal rays 31. COMPRESSUS, 735.
  - *oo.* Maxillary reaching gill opening; scales 35; lateral band silver gray; anal rays 31 to 36. PANAMENSIS, 736.

aaaaa. Anal fin extremely long, its rays 37 or 38.
- *p.* Lateral band ill defined or obsolete; snout pointed, much projecting; insertion of dorsal nearer snout than base of caudal; subopercle with a flat triangular prominence. SPINIFER, 737.

717. STOLEPHORUS MIARCHUS, Jordan & Gilbert.

Head $4\frac{1}{5}$; depth 6. D. 11 to 13; A. 12 to 14. Very slender, little compressed, the belly not trenchant; snout subconical, projecting. Teeth evident in both jaws; maxillary short, reaching edge of preopercle. Eye not very large. Insertion of dorsal midway between snout and caudal; anal very short, its first ray under last of dorsal. Scales caducous. Perfectly transparent in life, with some black dots; a diffuse lateral silvery shade, but no stripe. Length 2 inches. Mazatlan to Panama; abundant. At Mazatlan it is not taken in the Estuary with other *Stolephori*, but is taken with dynamite in deep water, where it swims near the surface. It is probable that the types are immature and are possibly the young of *S. exiguus*. Very young specimens taken at Key West and called the same by Jordan, are not this species; they are either new or the young of *Stolephorus perfasciatus*. (μειόω, to reduce; ἀρχός, anus.)

Stolephorus miarchus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 344, Mazatlan. (Type, No. 28119. Coll. Gilbert.) JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 622.

718. STOLEPHORUS PERFASCIATUS (Poey).

Head $4\frac{1}{4}$; depth 6; eye $3\frac{1}{2}$. D. 12; A. 14 to 16. Body rather elongate; snout compressed and pointed, shorter than eye. Top of head with a slight keel. Maxillary and lower jaw finely toothed; maxillary unusually short, its posterior end rounded, not extending quite to margin of preopercle; gill rakers numerous; pectoral $1\frac{3}{4}$ in head, not reaching ventrals; insertion of anal below last rays of dorsal, the fin short; origin of dorsal midway between root of caudal and pupil. Color of *S. brownii*, the lateral band rather narrower, well defined, its width about $\frac{3}{4}$ eye; no dark punctulations except on base of caudal and sometimes on anal. Length 2 to 3 inches. Florida Keys to Cuba; common, but much less abundant than *Stolephorus brownii*. (*perfasciatus*, well-banded.)

Engraulis perfasciatus, POEY, Memorias, II, 313, 1860, Cuba; GÜNTHER, Cat., VII, 391, 1868; not of SWAIN, Bull. U. S. Fish Comm., II, 1882, 55; not of JORDAN & GILBERT, Synopsis, 273, 1883.

Stolephorus perfasciatus, SWAIN & MEEK, Proc. Ac. Nat. Sci. Phila., 1884, 34.

719. STOLEPHORUS EXIGUUS, Jordan & Gilbert.

Head 3¾; depth 5; eye 3¼. D. 12; A. 17; scales 38–5. Body slender, not greatly compressed and not elevated; belly compressed, serrulate; head short; opercular margin not very oblique; cheek narrowly triangular; snout ⅗ eye, which is large; maxillary about reaching opercular margin, tapering to an acute point; teeth in both jaws. Gill rakers short, the longest ½ eye. Dorsal inserted midway between middle of pupil and base of caudal; pectorals not reaching ventrals. Scales caducous. Translucent, with dark dots; sides with a faint silvery streak. Length 2½ inches. Mazatlan; not common. (*exiguus*, thin.)

Stolephorus exiguus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 342, Mazatlan. (Type, No. 28120. Coll. Gilbert.)

720. STOLEPHORUS CUBANUS (Poey).

(BOCON.)

Head 5 in length with caudal; depth 6⅔; eye 4. D. 14; A. 17. Allied to *S. brownii*, but with the anal shorter. Body slender, compressed. Eye as long as snout. Maxillary with teeth, its tip extending beyond the opercular border. Dorsal beginning midway between front of caudal and posterior edge of eye; pectoral not quite reaching ventral. Scales caducous. A silvery band ¼ depth of body. Length 2¾ inches. Cuba and Porto Rico. (Poey.)

Engraulis cubanus, POEY, Synopsis, 420, 1868, Cuba. (Coll. Poey.)

721. STOLEPHORUS PERTHECATUS, Goode & Bean.

Head 3⅔; depth 5; eye 3⅓. D. 11; A. 16; scales 38. Body somewhat compressed, the belly not carinated nor serrated. Eye longer than snout; snout conical; teeth minute, in both jaws; maxillary with acute tip almost reaching gill opening; gill rakers numerous, ⅔ eye. Dorsal inserted midway between center of eye and base of caudal; pectorals not quite reaching ventrals; axillary sheaths very large, almost as long as pectoral or ventral. Olivaceous, with a narrow silvery stripe, ¼ depth of body, not half as wide as eye. Length 3⅔ inches. Pensacola, Florida. (Goode & Bean.) Apparently allied to *S. perfasciatus*, but the maxillary longer. (*perthecatus*, well sheathed.)

Stolephorus perthecatus, GOODE & BEAN, Proc. U. S. Nat. Mus., 1882, 434, Pensacola. (Type, No. 30483. Coll. Stearns.)

722. STOLEPHORUS ISCHANUS, Jordan & Gilbert.

Head 3¾; depth 5. D. 13; A. 16; scales 40–7. Close to *Stolephorus brownii*, but slenderer and with fewer anal rays. Body elongate, not strongly compressed or elevated; belly compressed, its edge rounded. Head long and slender; opercular margin very oblique; cheeks triangular, rather broad; teeth evident in both jaws; maxillary not quite reaching gill opening. Gill rakers numerous, longest $\frac{2}{3}$ eye. Snout long, $\frac{3}{4}$ eye, which is $3\frac{3}{4}$ in head. Dorsal inserted midway between base of median caudal rays and front of eye; anal short; caudal shorter than head; pectorals short, not nearly reaching ventrals. Scales thin, not caducous. Translucent, with a sharply defined silvery stripe as in *S. brownii*, but narrower, confined to one series of scales; many black specks on body and fins. Length 3 inches. Mazatlan to Panama; abundant, replacing *Stolephorus brownii* on the west coast; a slender species, with shorter anal than *S. brownii*. (*ισχ[α]νός*, slender.)

Stolephorus ischanus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 340, Mazatlan. (Type, No. 28246. Coll. Gilbert.)

723. STOLEPHORUS BROWNII (Gmelin).

(STRIPED ANCHOVY; MANJÚA.)

Head $3\frac{3}{4}$; depth $4\frac{3}{4}$; eye $3\frac{1}{2}$. D. 15; A. 20; scales 40. Body rather elongate, compressed, not elevated; belly compressed, serrulate. Head rather short, the snout 5 in head, projecting much beyond the tip of the lower jaw. Teeth pretty strong; maxillary extending beyond base of mandible, but not quite reaching to the edge of the gill opening. Eye large; cheeks triangular, scarcely larger than eye. Gill rakers long, $\frac{2}{3}$ diameter of eye, but shorter than in *S. compressus*. Anal with a sheath of scales; dorsal inserted nearer caudal than snout. Olivaceous, translucent, sides silvery; the silvery lateral band about as wide as the eye, very distinct. Length 4 to 6 inches. Cape Cod to Brazil; very abundant southward, both on the Florida Coast and in the West Indies; the most abundant of the American species. (Named for Patrick Browne, author of the History of Jamaica, 1756.)

Piquitinga, MARCGRAVE, Hist. Bras., 159, 1648, Brazil.
Menidia, BROWNE, Hist. Jamaica, 441, 1756, Jamaica.
Atherina brownii, GMELIN, Syst. Nat., 1397, 1788, Jamaica; after BROWNE.

Engraulis lemniscatus, CUVIER, Règne Animal, Ed. 2, II, 323, 1829, Brazil; after *Piquitinga* of MARCGRAVE.
Engraulis tricolor, AGASSIZ, Spix, Pisc. Brasil., 51, 1829, Bahia; Pará.
Engraulis piquitinga, AGASSIZ, Spix, Pisc. Brasil., pl. 23, fig. 1, 1829; types of *tricolor*.
Argentina menidia, GRONOW, Cat., 141, 1854; after BROWNE.
Stolephorus hiulcus, GOODE & BEAN, Proc. U. S. Nat. Mus., 1879, 343, (depth $5\frac{1}{2}$, anal rays 22), Clearwater Harbor, Florida. (Type, No. 23632. Coll. Dr. Velie.)
Engraulis brownii, GÜNTHER, Cat., VII, 389, 1868.
Stolephorus browni and *hiulcus*, JORDAN & GILBERT, Synopsis, 273, 1883.

724. STOLEPHORUS CULTRATUS, Gilbert.

Head $3\frac{2}{3}$; depth $4\frac{1}{6}$. D. 12; A. 20; scales 40. Body compressed, of medium depth, the abdomen compressed to an edge both in front of and behind the ventral fins, but without serrations; behind the ventrals the edge is sharply carinate. Head slender and sharp, the snout long and compressed, extending beyond tip of lower jaw for a distance nearly equaling diameter of orbit; maxillary abruptly widened behind angle of mouth, then tapering to a rather sharp point, which extends beyond mandibular articulation nearly to gill opening. Teeth in lower jaw small, but distinctly visible; in upper jaw larger toward tip of maxillary, where they are directed forward. Opercle narrow, scarcely as wide as exposed portion of preopercle, the margin moderately oblique, not wavy. Front of dorsal midway between base of caudal and front of pupil; base of ventrals midway between origin of anal and articulation of mandible; origin of anal behind last ray of dorsal. Scales closely adherent, rather thick and firm. Olivaceous, the dorsal region with black specking; a silvery band along middle of sides, very narrow anteriorly, but increasing in width to opposite anal fin, where it is as wide as eye; snout and margin of caudal lobes dusky. Length 3⅓ inches. Santa Margarita Island, Lower California. (*cultratus*, knife-formed.)

Stolephorus cultratus, GILBERT, Proc. U. S. Nat. Mus., 1891, 544, Santa Margarita Island. (Coll. Gilbert.)

725. STOLEPHORUS DELICATISSIMUS (Girard).

Head 4¼; depth 4¾. D. 13; A. 23; scales 40. Head short, nearly as deep as long; eye large, much longer than the blunt snout, which projects considerably beyond the lower jaw. Gill rakers numerous, slender, nearly as long as the eye. Maxillary reaching past the root of the mandible. Lower lobe of caudal the longer; dorsal inserted midway between caudal and front of eye. Very pale olivaceous, translucent, with some dark points, and a silvery lateral band not as wide as the eye. Length 3 inches. San Diego Bay and southward in Lower California; locally very abundant. (*delicatissimus*, most delicate.)

Engraulis delicatissimus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 154, and Pac. R. R. Surv., x, 335, 1858, San Diego; (Coll. A. Cassidy); GÜNTHER, Cat., VII, 391, 1868.
Stolephorus delicatissimus, JORDAN & GILBERT, Synopsis, 274, 1883.

726. STOLEPHORUS CHŒROSTOMUS (Goode).

(HOG-MOUTH FRY.)

Head 4; depth 5½; eye 4⅖. D. 13 or 14; A. 23 or 24; scales 38. Snout projecting much beyond lower jaw, which just passes vertical from front of eye; eye as long as snout. Maxillary tapering, reaching gill opening. Gill rakers 10 + 25, as long as eye. Dorsal inserted before middle of body; anal under middle of body; pectorals reaching front of ventrals; scales large. Brownish, with a lateral silvery band, as broad as eye. Length 2¾ inches. Bermuda Islands; common in Hamilton Harbor. (Goode.) Allied to *Stolephorus surinamensis*, but more slender, the depth much less than length of head. (*χοῖρος*, hog; *στόμα*, mouth.)

Engraulis chœrostomus, GOODE, Amer. Journ. Sci. Arts, August, 1874, 125, Bermudas.

727. STOLEPHORUS ARGYROPHANUS (Cuvier & Valenciennes).

Head 3⅘; depth 6; eye 4. D. 14; A. 19. Body elongate, much slenderer than in *S. brownii*, and not so much compressed; belly slightly compressed, not serrated. Head not so deep as in *S. brownii*, more pointed, the snout rather sharp, which is 5 in head. Eye rather small, not longer than snout. Maxillary teeth well developed; mandibular teeth very slender. Gill rakers very long, as long as snout. Maxillary shorter than in *S. brownii*, not reaching quite to the base of the mandible. Scales very deciduous. Ventrals short, very slightly in front of dorsal; caudal peduncle long and slender; dorsal inserted scarcely nearer caudal than snout. Silvery stripe broad, half wider than the eye, bordered above by a dusky streak. Length 4 inches. Gulf Stream; occasional northward; here described from a specimen from Woods Holl, Mass., the type of *S. eurystole*, which seems to be identical with the type of *Stolephorus argyrophanus*, examined by us in Paris. (*ἄργυρος*, silver; *φαίνω*, to show.)

Engraulis argyrophanus, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 49, 1848, Equatorial Atlantic.
Stolephorus eurystole, SWAIN & MEEK, Proc. Ac. Nat. Sci. Phila., 1884, 34, Woods Holl, Mass.
Stolephorus perfasciatus, JORDAN & GILBERT, Synopsis, 273, 1883; not of POEY.

728. STOLEPHORUS CURTUS, Jordan & Gilbert.

Head $4\frac{1}{5}$; depth $4\frac{2}{3}$; eye $2\frac{3}{4}$ to $3\frac{1}{4}$. D. 11; A. 22 or 23; scales 35-5. Body compressed and deep, the upper and lower outlines little arched; belly before ventrals sharply compressed, serrulate. Head short and deep, the snout blunt, not produced; maxillary not quite reaching gill opening, ending in a sharp point; each jaw with minute teeth. Opercle shortish; cheeks broadly triangular. Gill rakers about $\frac{2}{3}$ eye, which is large. Dorsal inserted midway between middle of pupil and base of caudal; caudal short, the lower lobe longer; pectorals very short, barely reaching ventrals; scales thin, caducous. Translucent, with yellow shades and dark dots; sides with a faint diffuse silvery streak. Length $2\frac{1}{2}$ inches. Mazatlan; abundant in the muddy estuary. (*curtus*, short.)

Stolephorus curtus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 343, Mazatlan. (Type, No. 29242. Coll. Gilbert.)

729. STOLEPHORUS POEYI (Kner & Steindachner).

Head $4\frac{1}{3}$; depth $4\frac{1}{3}$; eye $3\frac{1}{2}$ to 4. D. 16; A. 23 or 24; scales 42. Body deep and compressed, the outlines not arched; snout short, bluntish, little projecting; eye moderate; both jaws with small teeth; maxillary moderate, extending little beyond joint of mandible; opercles short. Front of dorsal nearer base of caudal than tip of snout; pectorals rather long, not reaching ventrals; ventrals small. Scales deciduous. Greenish, sides silvery, with no distinct lateral band. Rio Bayano, near Panama. (Kner & Steindachner.) (Named for Felipe Poey, the ichthyologist of Cuba, for nearly a half century professor of zoölogy in the University of Havana.)

Engraulis poeyi, KNER & STEINDACHNER, Abh. Bayer, Ak. Wiss., x, 1864, 23, with plate, Rio Bayano; GÜNTHER, Cat., VII, 392, 1868.

730. STOLEPHORUS OPERCULARIS, Jordan & Gilbert.

Head 3; depth $3\frac{3}{4}$ to 4; eye 4; D. (injured in specimen examined); A. 20 to 24; scales 39. Body elliptical, short, and moderately compressed; dorsal outline evenly curved; belly compressed, not trenchant. Head large, compressed, the snout bluntish, projecting beyond lower jaw; maxillary short and slender, not reaching joint of mandible; maxillary with very fine teeth; mandible without teeth. Cheeks triangular, the form lower and broader than usual, its base at eye ⅘ length of other sides. Eye much longer than snout; opercles unusually long, the distance from ridge of preopercle at lower posterior angle of cheek back to gill opening equal to distance from same point forward to middle of eye. Insertion of dorsal midway between base of caudal and middle of eye; anal shortish, with a large scaly sheath; pectorals and ventrals short; scales large, rather adherent. Bluish above, silvery below, not translucent; no lateral silvery band. Length 5 inches. Gulf of California to Panama; not very common. (*opercularis*, pertaining to the opercle, which is very long.)

Stolephorus opercularis, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 275, Punta San Felipe, Gulf of California. (Type, No. 29366. Coll. Lieut. Nichols.)

731. STOLEPHORUS MITCHILLI (Cuvier & Valenciennes).

Head 3⅘; depth 4; eye 3. D. 14; A. 25 or 26; scales 37. Body rather short and deep, strongly compressed, the belly compressed and slightly serrated. Head short, compressed, bluntish; snout very short, not longer than pupil; eye very large; maxillary about reaching edge of opercle; both jaws with teeth; cheeks broadly triangular, almost equilateral, smaller than eye; opercle short, little oblique; gill rakers rather long, ⅔ eye. Dorsal inserted midway between caudal and middle of eye; anal very long; pectorals long, about reaching ventrals. Scales thin, caducous. Translucent whitish, sides silvery, with an ill-defined narrow silvery band scarcely wider than pupil; fins with yellowish; many dark dots on body and fins. Length 2½ inches. Cape Cod to Texas on sandy shores, entering rivers; very abundant. The smallest species of Anchovy found north of the tropics. (Named for Professor Samuel Latham Mitchill, author of a valuable early catalogue of the fishes of New York.)

Engraulis mitchilli, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 50, 1848, New York; Carolina; Lake Pontchartrain.

Engraulis louisiana, LE SUEUR, MS.? CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 51, 1848, Lake Pontchartrain.

Engraulis duodecim, COPE, Trans. Amer. Phil. Soc., 1866, 405, Beasleys Point, New Jersey; (dorsal fin said to be entirely anterior to the long and deeply concave anal, which is not true in *S. mitchilli*; the description otherwise agrees).

Stolephorus mitchilli, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1882, 248.

732. STOLEPHORUS LUCIDUS, Jordan & Gilbert.

("SARDINA.")

Head 3⅘; depth 3¾; eye 3. D. 12; A. 27; scales 36–6; B. 11. Body closely compressed, but not greatly elevated, the back weakly arched; belly carinate before anal, but not serrate. Head short, rather pointed, the margins of opercles forming an even curve; maxillary narrow-pointed, reaching little beyond mandibular joint; teeth evident; snout short, projecting, 2 in eye; cheeks oblique, V-shaped, the length more than ½ head; gill rakers rather few and short, the longest 2 in eye. Front of dorsal midway between base of caudal and front of eye; caudal short, the lower lobe the longer; pectoral about reaching ventrals.

Scales rather adherent. Translucent, with black dots on body and fins; some yellow shades; sides with a rather diffuse silvery band, narrowed behind and expanding on base of caudal. Length 5 inches. Mazatlan; locally abundant. (*lucidus*, bright.)

Stolephorus lucidus, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 341, Mazatlan. (Type, No. 28121. Coll. Gilbert.)

733. STOLEPHORUS CLUPEOIDES (Swainson).

Head 3½ to 3⅗; depth 3½; eye 3½. D. 14; A. 25 to 30; scales 40-8. Snout much projecting, blunt, short, about 2 in eye; maxillary obliquely truncate, ending in a point, just before joint of mandible. Teeth very small, in both jaws; gill rakers very fine, setiform, longer than eye; abdomen trenchant, but without conspicuous spines. Insertion of dorsal a little behind middle of body; insertion of anal before middle of dorsal. Silvery; lateral band broad, not very distinct. Size very large, length about a foot. Coast of Guiana and southward; common, ascending streams. (Steindachner; Günther.) (*Clupea sprattus*, the Sprat; εἶδος, likeness.)

?*Engraulis clupeoides*, SWAINSON, Nat. Hist. Fishes, II, 388, 1839, Pernambuco.

Stolephorus surinamensis, BLEEKER, Nederl. Tijdschr. Dierk., 1866, 178, Surinam.

Engraulis surinamensis, GÜNTHER, Cat., VII, 393, 1868; A. 25 or 26; STEINDACHNER, Ich. Beitr., VIII, 55, 1875; A. 30.

734. STOLEPHORUS PRODUCTUS (Poey).

(HECHUDO; GRUBBER BROAD-HEAD.)

Head 3⅗; depth 3½. D. 13; A. 32; scales 40. Body deep, much compressed; belly compressed, not serrate; maxillary tapering behind, nearly reaching gill opening; snout pointed, much projecting beyond lower jaw; teeth very small, in upper jaw only. Dorsal midway between tip of snout and base of caudal. Scales caducous. Greenish, silvery on sides, without distinct lateral band. Cuba and Jamaica. (Poey; Günther.) Possibly not distinct from *Stolephorus clupeoides*. (*productus*, lengthened.)

Engraulis productus, POEY, Repertorio, 380, 1866, Cuba; Günther, Cat., VII, 388, 1868.

735. STOLEPHORUS COMPRESSUS (Girard).

Head 4½; depth 3¾. D. 12; A. 31; scales 40. Body strongly compressed, deeper than in most other species; head short, nearly as deep as long; eye large, anterior, much longer than the blunt snout, which does not project much beyond the lower jaw. Gill rakers numerous, slender, nearly as long as the eye. Maxillary reaching beyond the root of the mandible. Lower lobe of caudal the longer; anal fin very long; dorsal inserted midway between caudal and front of eye; pectoral with a basal sheath. Very pale olivaceous, translucent; a silvery lateral band as broad as the eye. Flesh thin and dry, the bones firmer than in *Engraulis mordax*. Length 6 inches. Point Concepcion to Lower California, abundant about San Diego. (*compressus*, compressed.)

Engraulis compressus, GIRARD, Pac. R. R. Surv., X, 336, 1858, San Diego. (Coll. A. Cassidy); GÜNTHER, Cat., VII, 395, 1868.

Stolephorus compressus, JORDAN & GILBERT, Synopsis, 274, 1883.

736. STOLEPHORUS PANAMENSIS (Steindachner).

Head $4\frac{2}{5}$; depth $3\frac{2}{5}$ to $3\frac{4}{5}$; eye about $3\frac{1}{3}$. D 12; A 31 to 36; scales 35. Body strongly compressed, the outlines not strongly arched. Snout short, bluntly conical, not $\frac{2}{3}$ length of the large eye. Maxillary pointed behind, reaching gill opening; evident teeth in both jaws; no process on subopercle. Insertion of dorsal a little nearer posterior edge of eye than caudal; caudal longer than head; pectorals long, reaching anal. Pale, a well-marked silvery-gray lateral band. Length 6 inches. Panama; not rare.

Engraulis panamensis, STEINDACHNER, Ichth. Beitr., IV, 39, 1875, Panama.

737. STOLEPHORUS SPINIFER (Cuvier & Valenciennes).

Head 4; depth $4\frac{1}{2}$. D. 15; A. 37 or 38. Abdomen compressed, not serrated; snout pointed, much projecting; each jaw with minute teeth; maxillary tapering, reaching gill opening; subopercle projecting beyond opercle, forming a small triangular prominence. Gill rakers slender, longer than eye, 10 + 16. Insertion of dorsal considerably nearer tip of snout than base of caudal; pectorals reaching ventrals. Coloration uniform, no distinct lateral stripe. Length 6 inches. Coast of Guiana; recorded from Panama by Steindachner. (Günther.) (*spina*, spine; *fero*, I bear; in allusion to the subopercular process.)

Engraulis spinifer, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 39, 1848, Cayenne; GÜNTHER, Cat., VII, 384, 1868.

219. ENGRÀULIS, Cuvier.

(ANCHOVIES.)

Engraulis, CUVIER, Règne Animal, Ed. I, 174, 1817, (*encrasicholus*).
Encrasicholus, FLEMING, British Animals, 183, 1828, (*encrasicholus*).

We separate from *Stolephorus* as a distinct genus, the typical species of *Engraulis*, with a few related species, the anchovies of the north and south Temperate zones, the species of *Stolephorus* being confined chiefly to the tropics. The technical basis of this division, the increased number of vertebræ in *Engraulis*, is connected with the geographical distribution of its species. *Engraulis* includes spindle-shaped species, little compressed, the sides rounded, the vertebræ in larger number (about 45*), the flesh rather dark, tender, and somewhat oily, not translucent, the bones soft, the appearance and flesh resembling that of the sardines. (*ἐγγραυλίς*, *engraulis*, the ancient name of *Engraulis encrasicholus*, the common anchovy of Europe.)

a. Head very long, the snout projecting; gill rakers very long, much longer than eye; A. 22; no distinct silvery lateral band; jaws with small teeth. MORDAX, 738.

738. ENGRAULIS MORDAX, Girard.

(CALIFORNIA ANCHOVY.)

Head $3\frac{1}{2}$; depth $5\frac{1}{2}$. D. 14; A. 22; scales 40; B. 14. Vertebræ 23 + 22 = 45. Body spindle-shaped, formed much as in a sardine, little compressed, rounded above, slightly carinated below, not serrated; head long, anteriorly compressed, the snout pointed and protruding; head nearly twice as long as deep; eye large, very near the tip of the snout; maxillary extending beyond root of mandible; jaws with small teeth; opercle deeper than long, placed very obliquely. Gill rakers very long, much longer than the eye. Bluish above; sides and below silvery, not translucent; no silvery lateral band. Young more compressed, the sides silvery, but not translucent and without lateral band. Flesh comparatively dark and easily torn, as in a sardine. Length 7 inches. Pacific Coast of America from Vancouver Island to Lower California; extremely abundant, in large schools; one of the largest of our anchovies, and the most valuable as food, ranging farther north than its American allies, as does the related *Engraulis encrasicholus* in Europe. (*mordax*, biting.)

---

* 44 or 45 in *E. mordax*; 46 or 47 in *S. encrasicholus*.

Engraulis mordax, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 138, and in Pac. R. R. Surv., x, 334, 1858, Shoalwater Bay, Washington. (Coll. Dr. J. G. Cooper.)

Engraulis nanus, GIRARD, *l. c.*, x, 335, 1858, San Francisco; young. (Coll. Heermann); KNER & STEINDACHNER, Sitz. Ak. Wiss. Wien, 1866, fig. 17.

Stolephorus ringens, JORDAN & GILBERT, Synopsis, 272, 1883, and of recent authors generally, but probably not identical with *Engraulis ringens*, JENYNS, Voyage Beagle, 136, 1842, a similar species from Chili and Peru, but with anal rays 19, and the head 4 in length. Neither species occurs on the west coast of Mexico.

220. ANCHOVIA, Jordan & Evermann.

Anchovia, JORDAN & EVERMANN, new genus, (*macrolepidota*).

The genus is closely allied to *Stolephorus*, differing in the form of the body which is very deep, but not strongly compressed, and in the absence of teeth in both jaws in the adult, although teeth are developed in the young. One species known. (*Anchovia*, Anchovy, a name long applied to *Engraulis encrasicholus*, the Anchovy of Europe.)

739. ANCHOVIA MACROLEPIDOTA (Kner & Steindachner).

(SARDINA BOCONA.)

Head 3½; depth 3. D. 15; A. 28 to 30; scales 35–9. Body very short and deep, both dorsal and ventral outlines strongly arched; head one-fourth longer than deep; snout very short, not longer than pupil; not projecting far beyond lower jaw; jaws toothless in adult; minute teeth present in young; maxillary narrow, rounded behind, extending to angle of preopercle; gill rakers fine, long, and very numerous; suboperclo with a slight process, as in *S. spinifer*. Abdomen slightly compressed. Scales adherent. Origin of dorsal slightly behind middle of body: ventrals very small, pectorals rather long. Silvery, sides with an indistinct bluish band. Length 8 inches. Gulf of Mexico to Panama, very abundant about Guaymas where it is often cast up dead on the beach in great numbers; one of the largest species of anchovy. (*μακρολεπιδοτός*, large-scaled.)

Engraulis macrolepidotus, KNER & STEINDACHNER, Abhandl. Bayer, Akad. Wiss., x, 1864, 21, pl. III, fig. 2, Rio Bayano, Panama; GÜNTHER, Cat., VII, 385, 1868; STEINDACHNER, Ichth. Beitr., IV, 37, 1875.

Stolephorus macrolepidotus, EVERMANN & JENKINS, Proc. U. S. Nat. Mus., XIV, 1891, 134.

221. CETENGRAULIS, Günther.

Cetengraulis, GÜNTHER, Cat. Fishes, Brit. Mus., VII, 383, 1868, (*edentulus*).

This genus differs from *Stolcyhorus* in having the gill membranes broadly united. The gill rakers are usually long, and the teeth are rudimentary or wanting. Two species. (*κῆτος*, whale; *Engraulis*; the long gill rakers suggesting whalebone.)

a. Anal rays 20 to 22; eye 5½ in head. MYSTICETUS, 740.
aa. Anal rays 23 to 25; eye 4½ in head. EDENTULUS, 741.

740. CETENGRAULIS MYSTICETUS (Günther).

Head 2⅔ to 2⅘; depth 3⅗; eye 5½. D. 15 to 17; A. 20 to 22; scales 42–14. No teeth; maxillary not reaching root of mandible; gill rakers very long, setiform, 10 + 42. Insertion of dorsal midway between eye and base of caudal; pectorals extending to or a little beyond ventrals. Coloration uniform. Panama. (Günther.) (*Balæna mysticetus*, the Right Whale, the long gill rakers suggesting whalebone.)

Engraulis mysticetus, GÜNTHER, Proc. Zoöl. Soc. Lond., 1866, 604, Panama.
Cetengraulis mysticetus, GÜNTHER, Cat., VII, 383, 1868.

741. CETENGRAULIS EDENTULUS (Cuvier).

(BOCON.)

Head 3¼ to 3½; depth 3; eye 4 to 4½. D. 15; A. 23 to 25; scales 40–11. Body deep, not greatly compressed; belly compressed, bluntly trenchant, not serrate; snout short, sharply pointed, 1⅔ in eye; maxillary slender, finely toothed posteriorly only in the young, not reaching root of mandible; lower jaw toothless. Gill rakers close-set, longer than eye, 3½ in head; cheeks triangular, longer than high. Scales not caducous. Insertion of dorsal midway between front of eye and base of caudal; pectoral short, 2 in head, not reaching ventral; caudal deeply forked, 1½ in head; dorsal and anal with large basal sheaths. Silvery, darker above, a dark lateral band concealed by the silvery scales. Length 6 inches. West Indies to Brazil, common in Cuba. (*edentulus*, toothless, which is not quite true of young examples.)

Sprat, SLOANE, Hist. Jamaica, II, 282, 1727, Jamaica.
Engraulis edentulus, CUVIER, Règne Animal, Ed. 2, II, 323, 1829, Jamaica; after SLOANE; CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 51, 1848.
Engraulis brevis, POEY, Repertorio, I, 379, 1866, Cuba.
Cetengraulis edentulus, GÜNTHER, Cat., VII, 383, 1868.
Cetengraulis brevis, SWAIN & MEEK, Proc. Ac. Nat. Sci. Phila; 1884, 35.

222. PTERENGRAULIS, Günther.

Pterengraulis, GÜNTHER, Cat. Fishes, VII, 398, 1868, (*atherinoides*).

This genus is very close to *Stolephorus*, differing chiefly in the insertion of the dorsal, which is a little behind the front of the very long anal fin. South American. (*πτερόν*, fin; *Engraulis.*)

742. PTERENGRAULIS ATHERINOIDES (Linnæus).

Head 4⅗; depth 4; eye 5¼; snout 6⅔. D. 10 or 11; A. 31 to 33; scales 40 to 44–8. Body elongate, compressed, the lower profile arched like the upper, the ventral edge trenchant, not serrate; snout short, blunt, upturned; teeth small; maxillary not reaching joint of mandible; gill rakers short, 7 + 14, the longest $\frac{4}{7}$ eye. Pectoral scarcely shorter than head, reaching middle of length of ventrals; insertion of dorsal midway between base of caudal and base of pectoral; anal inserted before dorsal; scales deciduous. Silvery lateral band broad, not strongly marked, narrowed on the tail. Coasts of Guiana and Brazil, ascending rivers. (Steindachner.) (*atherinoides*, like *Atherina*, referring to the silvery stripe.)

Clupea atherinoides, LINNÆUS, Syst. Nat., Ed. XII, 523, 1766, Surinam.
Engraulis atherinoides, GÜNTHER, Cat., VII, 398, 1868; STEINDACHNER, Ichth. Beitr, VIII, 59, 1875.
Pterengraulis atherinoides, EIGENMANN & BRAY, Ann. N. Y. Ac. Nat. Sci., 1894, 627.

223. LYCENGRAULIS, Günther.

Lycengraulis, GÜNTHER, Cat. Fishes, VII, 399, 1868, (*grossidens*).

This genus differs from *Stolephorus* chiefly in the dentition, the teeth being unequal in size, some of them canine-like. The known species are South American. (*λύκος*, wolf; *Engraulis*.)

743. LYCENGRAULIS GROSSIDENS (Cuvier).

Head $4\frac{1}{2}$; depth $4\frac{4}{5}$; B. 13; D. 14 or 15; A. 25 to 28; scales 40. Body compressed; snout pointed, projecting; upper teeth strong, subequal, lower still stronger, 14 to 18 on each side, between them a few smaller teeth maxillary tapering, reaching angle of lower jaw; gill rakers very short, lanceolate, about 10 + 12 to 15. Insertion of dorsal midway between middle of eye and base of caudal; anal inserted below posterior half of dorsal. Abdomen compressed, without scutes. Pectorals reaching ventrals. Silvery band broad, not well defined. Coast of Guiana and Brazil, very abundant southward; a good food-fish. (Günther.) (*grossus*, large; *dens*, tooth.)

Engraulis grossidens (CUVIER) AGASSIZ, Spix, Pisc. Brasil., 50, 1828, Rio Janeiro.
Engraulis janeiro, AGASSIZ, Spix, Pisc. Brasil., pl. 24, fig. 1, 1828, Rio Janeiro.
Engraulis dentex, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 28, 1848, Rio Janeiro.
Lycengraulis grossidens, EIGENMANN & BRAY, Ann. N. Y. Ac. Nat. Sci., 1894, 626.

Family LXIII. ALEPOCEPHALIDÆ.

Body oblong, compressed, covered with thin cycloid or keeled scales, or with naked skin; head naked. Lateral line present or absent. No barbels. Mouth moderate or large; margin of the upper jaw formed by the premaxillaries and the maxillaries, the former being placed along the upper anterior edge of the latter. Teeth feeble. Opercular apparatus complete, its bones thin. Phosphorescent spots none, or rudimentary, placed in nodules of the naked skin. No adipose fin; dorsal fin long and low, posterior, inserted nearly opposite the anal; pectorals short, placed rather high; ventrals usually well back, sometimes wanting. Gill openings very wide, the membranes free from the isthmus. Pseudobranchiæ present; no gular plate; no air bladder. Stomach curved, without blind sac; pyloric cœca in moderate number. Fishes of the deep seas; but one species known until recently, when 6 genera and numerous species have been described from the abyssal faunæ of the mid-Atlantic and Pacific. (*Alepocephalidæ*, GÜNTHER, Cat., VII, 477, 1868.)

a. Scales well developed, cycloid; teeth small; lateral line present.

  b. Ventral fins well developed.

    c. Mouth small; maxillary with teeth; body rather deep.

      d. Dorsal and anal rather short, of 15 to 17 rays, similar to each other; opercular flaps long; head large. ALEPOCEPHALUS, 224.

      dd. Dorsal and anal longer, of 20 to 25 rays each, the anal the longer; opercular flaps moderate. MITCHILLINA, 225.

    cc. Mouth rather large, moderate; body more elongate.

      e. Anal not longer than dorsal; teeth on palatines; maxillary with teeth.

        f. Dorsal longer than anal and inserted far in front of it. BATHYTROCTES, 226.

        ff. Dorsal scarcely longer than anal and inserted nearly opposite it. TALISMANIA, 227.

      ee. Anal twice as long as dorsal; body rather elongate; jaws strong; no palatine teeth. CONOCARA, 228.

  bb. Ventral fins wanting; body short, compressed; maxillary with teeth; scales keeled. PLATYTROCTES, 229.

aa. Scales wanting; skin thick, rugose, with nodules; no lateral line; teeth minute; ventral fins present. ALEPOSOMUS, 230.

224. ALEPOCEPHALUS, Risso.

Alepocephalus, RISSO, Mém. Ac. Nat. Sci. Turin, XXV, 270, 1820, (*rostratus*).

Body oblong, compressed. Mouth rather small, the snout somewhat prolonged; jaws nearly equal in front; a series of small teeth in each jaw and on the vomer and palatines. Eye very large. Gill membranes entirely separate. Branchiostegals 6. Opercular bones thin, the opercle with extended membranous flaps. Dorsal low, not very long, with a scaly base, similar to the anal; pectorals and ventrals moderate; caudal moderately forked. Scales rather large, thin and cycloid; no phosphorescent spots. Color violet black. Deep-sea fishes, found in most parts of the ocean. (ἀ, privative, without έπος, scale; κεφαλή, head.)

a. Head one-third of total length or nearly so; scales not minute. D. 15 to 17; A. 17.

  b. Scales moderate (in about 67 series). Snout 9 in body; eye 4 in head. PRODUCTUS, 744.

  bb. Scales small (in about 90 series). Snout 11 to 12 in body.

    c. Eye $3\frac{1}{3}$ in head; pectoral $3\frac{1}{2}$ in head, about as long as eye. AGASSIZII, 745.

    cc. Eye $4\frac{1}{4}$ in head; pectoral $2\frac{1}{2}$ in head, much longer than eye. TENEBROSUS, 746.

744. ALEPOCEPHALUS PRODUCTUS, Gill.

Head $2\frac{7}{9}$; depth 4; eye 4; snout 3. D. 17; A. 17; scales 9–67–12. Resembling *A. agassizii* in form and proportions, but with larger scales, smaller eye, and longer snout. Body quite robust, its height at the pectoral origin nearly one-fourth length from snout to base of median caudal rays. Least height of the tail about one-half length of body. Posterior margin of orbit nearly equidistant between snout and opercular margin; upper jaw extending a little behind vertical from posterior margin of pupil; lower jaw shorter and included, nearly one-half as long as the head. Interorbital width 7 in head; width behind the orbits less than 3. Insertion of dorsal above vent, length of its base twice diameter of eye; anal base under anterior portion of dorsal, the length of its base about ¾ that of dorsal. The caudal fin has its median rays as long as the diameter of the eye, and the external rays at least ⅕ the total length of the fish. The pectoral commences at a distance from the snout equal to ¼ of the length of the body. The ventrals are inserted considerably behind the middle of the length (0.57), and appear to have been at least as long as the diameter of the orbit. The type was obtained by the *Albatross* from station 2035, at a depth of 1,362 fathoms. (Goode & Bean.) (*productus*, drawn out.)

Alepocephalus productus, GILL, Proc. U. S. Nat. Mus., 1883, 256, Gulf Stream at Albatross Station 2035, in 1,362 fathoms; (Type, No. 33341. Coll. *Albatross*); GOODE & BEAN, Oceanic Ichthyology, 37, fig. 46, 1895.

745. ALEPOCEPHALUS AGASSIZII, Goode & Bean.

Head 3; depth 5; eye 3½. D. 15; A. 17; scales 10–90–11. Body a little deeper than in *Mitchillina bairdii*. Head compressed, the snout conically elongate, the lower jaw slightly produced; width of head 9½ in length of body (12 in *M. bairdii*). Scales parchment-like. Dorsal inserted directly above vent, the distance from its origin to base of caudal ⅓ its distance from front of eye; anal inserted under second ray of dorsal. Length of pectoral equal to diameter of eye, 10½ in body. Ventral about ⅙ of head. Dusky; head and fins nearly black. Gulf Stream, latitude 30°, in 922 fathoms. (Goode & Bean.) (Named for Professor Alexander Agassiz, in whose deep-sea researches the species was obtained.)

Alepocephalus agassizii, GOODE & BEAN, Bull. Mus. Comp. Zoöl., 1882, 215, Gulf Stream; GOODE & BEAN, Oceanic Ichthyology, 37, 1895.

746. ALEPOCEPHALUS TENEBROSUS, Gilbert.

Head 3; depth 4⅔ to 5; eye 4¼. D. 17; A. 17; P. 10; scales 16–90–16, 55 tubes in lateral line. Allied to *A. agassizii*. Body compressed, elongate; maxillary reaching front of pupil, its length from snout 2⅕ in head; teeth in single series. Snout short, compressed, 3¾ in head. Dorsal ending slightly before anal; pectoral 2½ in head, much longer than eye. Scales of lateral line much enlarged, forming a raised ridge. Uniform blue-black. Santa Barbara Channel, California, at 359 to 822 fathoms. (Gilbert.) (*tenebrosus*, dusky.)

Alepocephalus tenebrosus, GILBERT, Proc. U. S. Nat. Mus., 1891, 546, Santa Barbara Channel. (Coll. Gilbert.)

225. MITCHILLINA, Jordan & Evermann.

Mitchillina, JORDAN & EVERMANN, new genus, (*bairdii*).

In discussing the species of *Alepocephalus*, Goode and Bean make the following observations:

> There are two distinct groups in *Alepocephalus*, probably of subgeneric value. The first group includes the type, *A. rostratus*, Risso. It is characterized by a somewhat short, compressed body, large head, with extended membranaceous flaps, and by short dorsal and anal fins, similar in size and shape and nearly opposite each other.
>
> *A. bairdii* represents another type, having a stout body, about as high in proportion to its length as in *A. agassizii*, etc., but with a smaller head

and less voluminous opercular flaps. The eye is comparatively much smaller (18 in total length), and is nearer the upper profile of the head. The vertical fins are stronger and more muscular, and are heavily scaled at their bases. Lateral line nearly straight. Maxillaries slender, not expanded posteriorly.

For the second group as above indicated we suggest the name *Mitchillina.* (In honor of the faithful and enthusiastic ichthyologist, Samuel Latham Mitchill, United States Senator from the State of New York, 1804–1809, the first to study systematically the fishes of New York Harbor.)

747. MITCHILLINA BAIRDII (Goode & Bean).

Head $4\frac{1}{3}$; depth $5\frac{1}{3}$; eye $4\frac{1}{2}$. D. 22; A. 25; P. 12; V. I, 9; pyloric cœca 15; B. 6; scales 7–65–11. Body rather elongate; head moderately compressed, subconical, the lower jaw included; maxillary extending nearly to below middle of eye; eye large, as long as snout. Dorsal inserted slightly in advance of anal. Uniform indigo-blue, the color extending to the inside of the mouth and the gill membranes. Length 24 inches. Grand Banks; dredged at a depth of 200 fathoms. (Goode & Bean.) (Named for Professor Spencer Fullerton Baird, then at the head of the United States Commission of Fish and Fisheries.)

Alepocephalus bairdii, GOODE & BEAN, Proc. U. S. Nat. Mus., 1879, 55, Grand Banks of Newfoundland; (Type, No. 22468. Coll. Christian Johnson); JORDAN & GILBERT, Synopsis, 257, 1883; GOODE & BEAN, Oceanic Ichthyology, 38, 1895.

226. BATHYTROCTES, Günther.

Bathytroctes, GÜNTHER, Ann. Mag. Nat. Hist., 1878, 249, (*microlepis*).

Body rather elongate, compressed, covered with moderate scales. Mouth wide, extending to below middle of eye, which is large; maxillary with series of minute teeth, like those on premaxillary, mandible, vomer, and palatines; tongue toothless. Dorsal and anal moderate, the dorsal notably longer than anal and inserted considerably in front of the latter. Gill rakers lanceolate. Deep sea. (*βαϑύς*, deep; *τρώκτης*, one who gnaws.)

748. BATHYTROCTES STOMIAS, Gilbert.

Head $3\frac{3}{7}$; depth $5\frac{2}{5}$; eye small, $6\frac{1}{4}$; snout $3\frac{2}{5}$. D. 17; A. 14; P. 9; scales 9–57–10. Mouth much larger than in other species, the front of eye over middle of upper jaw. Body slender, the depth of caudal peduncle half that of body. Premaxillaries extended forward, making a triangular projection, as in *Labidesthes*; maxillary $1\frac{3}{4}$ in head; teeth uniform, incurved, depressible. Top of head with a deep lengthwise groove from nape to snout, a large mucous canal which borders it posteriorly opening above eye. Gill rakers $5 + 13$, long and slender, the longest $\frac{2}{3}$ eye. Dorsal beginning before vent; the anal inserted slightly behind its middle; caudal forked. Dark brownish, the fins, etc., black. Length 13 inches. Coast of Oregon, in 877 fathoms. (*stomias*, large-mouthed.)

Bathytroctes stomias, GILBERT, Proc. U. S. Nat. Mus., 1890, 53, Coast of Oregon, in 877 fathoms, *Albatross* station 3074. (Type, No. 43081. Coll. Gilbert.)

227. TALISMANIA, Goode & Bean.

Talismania, GOODE & BEAN, Oceanic Ichthyology, 41, 1895, (*homopterus*).

This genus is closely allied to *Bathytroctes*, differing chiefly in the longer vertical fins, the dorsal and anal being similar to each other and nearly opposite. Deep sea. (Named for the *Talisman*, one of the French vessels (*Travailleur et Talisman*) employed in deep-sea explorations.)

a. Maxillary reaching vertical from anterior margin of orbit. ANTILLARUM, 749.
aa. Maxillary reaching vertical from posterior margin of orbit. ÆQUATORIS, 750.

749. TALISMANIA ANTILLARUM, Goode & Bean.

Head 3½; depth 5; eye 3; pupil large, 2½ in orbit; snout 4. D. 20; A. 22; B. 7; P. 13; V. 8. Scales 47. Maxillary reaching orbit, and essentially to the vertical from the anterior margin of the pupil; bones of head thin; head compressed, moderately deep, its depth at occiput ⅗ its length; profile of head in advance of orbit, slightly concave; upper margin of orbit approaching very close to upper profile; supraorbital rim forming a portion of dorsal profile of the head; width of interorbital space nearly half diameter of eye. Eye large, conspicuous. Infraorbital ring very narrow; maxillary separated from the orbit by a very narrow strip of bone. Snout sharply conical, its upper profile concave, jaws equal in front. Dentition feeble; all the teeth equal, minute, uniserial; intermaxillary and maxillary toothed throughout; vomerine series transverse and straight, slightly interrupted in the middle; palatine series nearly as long as the vomerine; the two last-named series confluent. Branchiostegals 7, exceedingly slender and long. Gills 4, the fourth well developed, with a slit behind it; gill laminæ short, especially on the convex portion of the arches; gill rakers long, laneceolate, closely set, 17 on the outer branchial arch below the angle, 7 above. Vent equidistant between root of caudal and gill opening; origin of the dorsal nearer to the latter; dorsal fin longer than high, its anterior rays increasing in length from eighth to nineteenth ray; origin of the anal somewhat in advance of dorsal, which is inserted over third ray at the point where it emerges from its scaly sheath; caudal fin deeply emarginate; pectoral fin inserted in lower third of height of body, moderately broad at its base; its upper rays nearly twice as long as lower ones; its length half that of head; its tip, when extended straight, in vertical from insertion of ventral, or opposite twelfth scale of lateral line; ventrals close together, not reaching vent, but to origin of the sheath which incloses both vent and base of anal; their length equal to that of lower rays of pectoral, and to length of snout; root of ventral midway between tip of snout and rows above the ventrals. Lateral line in a concave sweep from near upper angle of operculum to a point above the origin of basal sheath of the anal, thence in a straight line to base of caudal. Color of the specimen (denuded of scales and long kept in alcohol) rusty brown; head blackish.

A single specimen was obtained by the *Albatross* at station 2394, latitude 28° 38′ 30″ N., longitude 87° 02′ W., at a depth of 420 fathoms. (Goode & Bean.) (*Antillarum*, of the Antilles.)

Talismania antillarum, GOODE & BEAN, Oceanic Ichthyology, 44, fig. 49, 1895, Gulf of Mexico, in 420 fathoms. (Type, No. 43739.)

750. TALISMANIA ÆQUATORIS, Goode & Bean.

Head 2⅓; depth 3⅔; snout 3⅔; eye 4⅔, 1⅓ in snout. D. 22; A. 21; B. 52; V. 7; P. 8; scales 45 to 48. Maxillary reaching vertical from posterior margin of orbit. Bones of head thin; head large, compressed, the depth at the occiput ¾ its length, its width about ⅓; its upper surface longitudinal, concave, and deeply concave between the orbits, with a convexity above the snout; width of interorbital space about equal to diameter of eye; infraorbital ring very narrow; maxillary broad, large, conspicuously dilated at the extremity, its greatest width at this point being more than ⅔ diameter of eye. Cleft of mouth wide; dentition feeble; no traces of teeth upon either vomer or palatine (on typical specimen). Branchiostegals long and slender; gills 4; gill laminæ short, especially on the convex portion of the arches; gill rakers long, strong, broad at the base; 6 + 17 on the outer arch. Vent placed equidistant from root of caudal and root of pectoral; origin of dorsal over vent, slightly in advance of anal; dorsal fin longer than high, its anterior rays increasing in length to the middle of the fin, the longest ray 3⅔ in head, about equal to longest ray of anal; caudal fin deeply emarginate; pectoral inserted far below middle of body; it has a narrow base, and its length in a perfect specimen is probably not greater than diameter of eye. Ventrals close together, remote from the vent, the root being nearly midway between the root of the caudal and the tip of the snout, and equidistant from root of anal and base of pectoral. Scales deciduous, cycloid, the lateral line beginning from a point on a level with the top of the eye, and ascending in a broad curve to a point over the ventrals, thence in a straight line to root of caudal. Color bluish-black. A single specimen, 14½ inches in length, obtained by the *Albatross*, from station 2793, latitude 1° 03′ N., longitude 80° 15′ W., in 741 fathoms. (Goode & Bean.) (*æquatoris*, of the equator.)

Talismania æquatoris, Goode & Bean, Oceanic Ichthyology, 44, fig. 50, 1895, off coast of Ecuador. (Type, No. 44085.)

228. CONOCARA, Goode & Bean.

Conocara, Goode & Bean, Oceanic Ichthyology, 39, 1895, (*macdonaldi*).

Body elongate, compressed; in the type species strongly suggestive of the Barracuda (*Sphyræna*). Mouth moderate; snout prolonged; jaws strong and powerful, the lower slightly included; teeth in the jaws acicular, rather numerous; also on the vomer, very small; absent from palatines. Eye large. Gill membranes entirely separate. Dorsal moderate in length; anal very elongate, nearly twice as long as the dorsal; pectoral and ventral small; caudal strongly forked. Scales minute and deciduous. Branchiostegals 6, the membrane of the left series folded conspicuously over the origin of that of the right. Opercular bones thin. Gill rakers rather short and stout, moderate in number. Deep sea. (κῶνος, cone; κάρα, head.)

a. Body moderately elongate, the depth 5¾ in length. D. 18; A. 36. MACDONALDI, 751.
aa. Body very elongate, the depth 8 in length. D. 21; A. 40. MACROPTERA, 572.

751. CONOCARA MACDONALDI, Goode & Bean.

Head 3⅓ in total length; depth 5¾ to base of caudal; thickness 12; eye 5, 2 in snout; snout 2½. D. 18; A. 36; P. 10; B. 6; V. 6; C. 22; scales 200. Body elongate; snout compressed, and with an obtuse point; the lower jaw included. Mouth large, the upper jaw about ⅓ length of head; the maxillary not reaching to front of eye; mandible reaching to below middle of eye. Teeth on the premaxillary, vomer, and palate very sharp, minute, widely separated, in a single row in each jaw. Nostrils lateral, posterior very much larger, their distance from eye ½ the length of eye. Gill openings wide; opercular apparatus membranous, its elements being very imperfectly ossified. Fifteen gill rakers on the first arch below the angle. Scales very small. Dorsal fin short, about ½ as long as anal fin, its posterior rays inserted nearly over last rays of the latter, distance of its insertion from tip of snout about 5½ times its own length; anal inserted at a distance from the snout equal to 2⅓ times its own length; ventral inserted nearly midway between the snout and the base of the caudal; pectoral short, twice diameter of eye, and inserted below median line of body; caudal fin short, its middle rays not more than ⅔ length of snout, forked. Color uniform deep blue-black in life.

A specimen 8½ inches in length was obtained by the *Blake* at station CLXXII, in 24° 36′ N. latitude, 84° 5′ W. longitude, at a depth of 955 fathoms, and another, 6 inches long, from station CLXV in latitude 24° 36′ N., longitude 84° 05′ W., at a depth of 955 fathoms. Another, 8¼ inches long, was taken by the *Albatross* at station 2392 (latitude 28° 47′ 30″, longitude 87° 27′). (Goode & Bean.) (Named for Hon. Marshall McDonald, Commissioner of Fish and Fisheries.)

Conocara macdonaldi, GOODE & BEAN, Oceanic Ichthyology, 39, fig. 48, 1895, Gulf of Mexico. (Type, No. 39482. Coll. Albatross.)

752. CONOCARA MACROPTERA (Vaillant).

Head elongate, 4; depth 8; thickness 11; snout 2½, compressed, with an obtuse point; eye large, 3⅔ in head, 5½ in interorbital width. D. 21; A. 40; P. 8; V. 5; B. 6. Scales more than 100. Mouth moderate, the upper jaw extending considerably beyond the lower, the maxillary scarcely reaching to the anterior margin of the orbit. Teeth on premaxillaries, maxillaries, vomer, and palatines, conical, elongated, rather small, and in a single row in each jaw. Nostrils wide, close together, the anterior near the middle of the length of the snout; gill opening wide; operculum for the most part membranaceous, its elements being very imperfectly ossified; preoperculum curved, thickened on its anterior edge; the interoperculum and suboperculum not prominent, apparently replaced in part by the branchiostegals. Gill rakers about 15 below angle. Vent a little behind the middle of total length. Lateral line extending from the upper part of the branchial opening to middle line of body. Scales remarkably small, those of lateral line very simple.

Dorsal with its outline a little convex, lower behind, and ending at a distance from the caudal equal to the length of its own base, which is equal to about 8 in body; anal more than twice as long, beginning near the vent and terminating a little behind the dorsal, its height nearly the same as that of the dorsal; caudal moderately long, 7 in body, slightly emarginate; pectoral small; ventrals very short. Color reddish brown; head a beautiful azure-blue; fins sepia; iris black; pupil azure-blue. Scales very simple in form; those of the body rounded in outline and measure from 1.5 to 1.6 mm. in diameter. Five pyloric cœca, moderately elongated. No trace of a swim bladder. Sixteen specimens of this species were obtained by the French expedition from the coast of Morocco to Soudan, from the Banc d'Arguin, and from the Canaries, at depths varying from 433 to 1,058 fathoms. A specimen 8 inches in length was obtained by the *Albatross* at station 2751, latitude 16° 57′ N., longitude 63° 12′ W., in 68 fathoms. (*μακρός*, long; *πτερόν*, fin.)

Alepocephalus macropterus, VAILLANT, Exp. Sci. Travailleur et Talisman, Poissons, 150, pl. XI, figs. 2*a*, 2*b*, 2*c*, 1888, Coast of Morocco, Soudan, and Canaries.

Conocara macroptera, GOODE & BEAN, Oceanic Ichthyology, 39, fig. 43, 1895.

229. PLATYTROCTES, Günther.

Platytroctes, GÜNTHER, Ann. Mag. Nat. Hist., II, 1878, 249, (*apus*).

Body rather abbreviated, much compressed, and covered with small, keeled scales. Mouth of moderate width; the maxillary, premaxillary and mandible each armed with a single series of small teeth; palate smooth. Eye rather large. Dorsal and anal fins opposite each other on tail, moderately long; adipose fin none; caudal forked; pectorals small; ventrals none. Humeral arch terminating in middle of chest in a long, projecting, acute spine. Gill opening wide; six branchiostegals; gills very narrow; pseudobranchiæ present; gill rakers lanceolate. Pyloric appendages rudimentary. Deep sea. (*πλατύς*, flat; *τρώκτης*, a gnawer.)

753. PLATYTROCTES APUS, Günther.

Head $3\frac{1}{2}$; depth $2\frac{3}{4}$; eye 3. D. 18; A. 17; P. 20; scales 20. Body much compressed and deep, its greatest depth at about the middle of its length. Head compressed, moderate, logitudinally concave above, the concavity bordered on each side by a perforated muciferous canal, and broadest behind, tapering to a point between the nostrils. Bones of head rather thin, but less so than in *Bathytroctes*. Eye large, equal to snout, and situated close to upper profile. Infraorbital ring incomplete. Mouth rather small, the lower jaw projecting; maxillary broad, short, extending to vertical from margin of orbit. Dentition very feeble; teeth uniserial, uniformly minute, occupying the whole extent of intermaxillary and maxillary, but confined to the front part of mandible; only a few rudimentary teeth are visible on the side of mandible; vomer with a minute tooth on each side; palatines toothless. Branchiostegals extremely slender, curved. Gills 4, the inner one very short; gill laminæ short, especially on the convex portion of the arches; gill rakers long, lanceolate, closely set, 20 + 10 on the outer branchial arch. Vent much nearer root of caudal than to gill opening; dorsal fin commencing immediately above it, the anal behind; these fins are very similar in shape and of moderate height; caudal peduncle more than half as deep as long, its depth being increased by a fold of the integument between the vertical fins; caudal rather short and forked; pectoral very short, only half as long as eye. Scales small, cycloid, each with a longitudinal keel, and not spinigerous, as in *Macrurus*, but simple, as in the keeled scales of a snake; the striations, instead of continually crossing the scale, are interrupted by the raised median line; head entirely scaleless; lateral line straight, running along the middle of the body and tail, and composed of very small pores. Brown; head, pectoral region, the vent, and fringes of the caudal peduncle, black. Length 5½ inches. Mid-Atlantic, Challenger Station 107, in 1,500 fathoms; also in the Arabian Sea. (*ἀ*, without; *πούς*, foot; *απους*, without feet, the ventrals being wanting.)

Platytroctes apus, GÜNTHER, Ann. and Mag. Nat. Hist., II, 1878, 249, Mid-Atlantic; (Coll. Challenger); GÜNTHER, Challenger Report, XXII, pl. LVIII, fig. A, 229, 1887; ALCOCK, Ann. and Mag. Nat. Hist., VI, II, 1890, 307; GOODE & BEAN, Oceanic Ichthyology, 46, 1895.

230. ALEPOSOMUS, Gill.

Aleposomus, GILL, American Naturalist, XVIII, 1884, 433, (*copei*).

Body elongate, scaleless; skin thick, finely rugose, with a considerable number of small nodules upon the belly, and sometimes also upon the sides and the lower part of the head. Lateral line wanting Mouth moderate, with minute teeth upon the mandible and premaxillary; palatines, tongue, and pharyngeal bones probably toothless. Dorsal and anal fins opposite, similar in form and equal in length; caudal probably forked. Vent behind the middle of the body. Gill openings wide. Deep sea; two species known. (*ἀ*, without; *λέπος*, scale or husk; *σῶμα*, body.)

754. ALEPOSOMUS COPEI, Gill.

Head 3⅔; depth 5½; eye 2 in head. Body compressed, its outlines sloping from head to middle of caudal peduncle. Snout short, declivous, its length ½ the horizontal diameter of the eye and about ⅕ that of head. Mandible scarcely extending beyond upper jaw; maxillary extending to vertical from middle of orbit. Small teeth upon mandible and premaxillary. Eye very large, its upper outline not projecting above the dorsal profile, as in *A. socialis* (Vaillant). Gill opening large. Skin thick, slimy; no lateral line distinguishable; no scales present, but numerous tubercles upon the sides of the body; none perceptible on the head. Vent midway between origin of ventral and tip of last dorsal ray. Dorsal origin equidistant from the gill opening and the base of the middle caudal rays; highest in its middle portion, rounding forward and behind; anal inserted immediately under the dorsal, similar in shape and equal in extent; caudal, though mutilated, undoubtedly emarginate, and probably forked. Accessory rays (characteristic not only of *Aleposomus* but of *Xenodermichthys*) not conspicuous; pectoral inserted very low down, close to the posterior angle of the preopercular flap, and appearing to have been feeble, its diameter not much greater than half the diameter of the eye; ventral origin equidistant between posterior margin of eye and base of last dorsal ray. Color uniform blackish.

A single specimen, 3¼ inches in length, was obtained by the *Albatross* at station 2099 in 37° 12′ 20″ N. latitude, 69° 39′ W. longitude, at a depth of 2,949 fathoms. (Named for Prof. Edward Drinker Cope, one of the most able and productive of living workers in ichthyology.)

Aleposomus copei, GILL, American Naturalist, XVIII, 1884, 443, Gulf Stream; (Type, No. 33551.) GOODE & BEAN. Oceanic Ichthyology, 47, fig. 51, 1895.

Family LXIV. SALMONIDÆ.

(THE SALMON FAMILY.)

Body oblong or elongate, covered with cycloid scales. Head naked. Mouth terminal, large or small, varying much in the different genera; maxillary forming the lateral margin of the upper jaw, provided with a supplemental bone; premaxillaries not protractile. Teeth various, sometimes wanting. Gills 4, a slit behind the fourth. Pseudobranchiæ present. Gill rakers various; gill membranes not connected, free from the isthmus; branchiostegals 10 to 20. No barbels. Dorsal usually nearly median, not greatly elongate, its rays 9 to 15, only one or two of the anterior simple or rudimentary, the others branched; adipose fin present; caudal fin forked; anal fin moderate or rather long; ventrals moderate, nearly median; pectorals placed low. Lateral line present. Abdomen rounded in outline. Parietals not in contact, separated at middle by the intervention of the supraoccipital, which connects with the frontals; epipleural appendages not developed. Air bladder large, stomach siphonal; pyloric cœca very numerous. Ova large, falling into the cavity of the abdomen before exclusion. Genera 10. Species about 70. As now restricted, this is no longer one of the large families of fishes, but in beauty, activity, gaminess, and quality as food, and even in size of individuals, different members of the group stand easily with the first among fishes. The *Salmonidæ* are confined to the northern regions, and north of about 40° N., everywhere abundant where suitable waters occur. Some of the species, especially the larger ones, are marine and anadromous, living and growing in the sea, and entering fresh waters to spawn. Still others live in running brooks, entering lakes or the sea as occasion serves, but not habitually doing so. Others again are lake fishes, approaching the shore, or entering brooks in the spawning season, at other times retiring to waters of considerable depth. Some of them are active, voracious and gamy, while others are comparatively defenseless and will not take the hook. The large size of the eggs and their lack of adhesiveness, with the ease by which the eggs may be impregnated, render the Salmon and Trout especially adapted for artificial culture. The *Salmonidæ* are of comparatively recent evolution, none of them occurring as fossils, unless it be in recent deposits. The instability of the specific forms and the lack of sharply defined specific characters may be in part attributed to their recent origin, as Dr. Gunther has suggested. (*Salmonidæ*, part, Günther, Cat., VI, 1–202, 1866.)

COREGONINÆ:

a. Mouth not deeply cleft, the maxillary broad, the mandible articulating with the quadrate bone under or before the eye. Dentition more or less feeble or incomplete; scales moderate or large; anal fin rather long; species imperfectly anadromous, or confined to rivers or lakes, their life lasting more than one year.

b. Jaws toothless or nearly so; scales large; maxillary short and broad, with a broad supplemental bone.

c. Premaxillaries broad, with the cutting edge nearly vertical or directed backward, the lower jaw short and more or less included; cleft of mouth short. COREGONUS, 231.

cc. Premaxillaries with the cutting edge nearly horizontal and directed forward; lower jaw long, projecting beyond upper; cleft of mouth rather long. ARGYROSOMUS, 232.

bb. Jaws, vomer, palatines, and tongue with bands of teeth; maxillary very long; lower jaw prominent; anal fin elongate; scales moderate. STENODUS, 233.

SALMONINÆ:

aa. Mouth deeply cleft, the long lower jaw articulating with the quadrate bone behind the eyes, the maxillaries rather narrow. Dentition strong and complete; conical teeth on jaws, vomer, and palatines; tongue with two series of strong teeth (sometimes deciduous in very old specimens); scales small.

d. Anal fin elongate, of 14 to 17 rays; vomer narrow, long, flat, with weak teeth; species spotted with black, if at all. ONCORHYNCHUS, 234.

dd. Anal fin short, of 9 to 12 developed rays.

e. Vomer flat, its toothed surface plane; teeth on the shaft of the vomer in alternating rows or in one zigzag row, those on the shaft placed directly on the surface of the bone, not on a free crest; posterior vomerine teeth sometimes deciduous; species black-spotted. SALMO, 235.

ee. Vomer boat-shaped, the shaft strongly depressed, without teeth; scales very small, about 200 in the course of the lateral line; species not anadromous; spotted with red or gray.

f. Vomer with a raised crest, extending backward from the head of the bone, free from its shaft, this crest armed with strong teeth; hyoid bone with a broad band of strong teeth; species spotted with gray, without bright colors. CRISTIVOMER, 236.

ff. Vomer without raised crest, only the head being toothed; hyoid bone with very weak teeth or none; species red-spotted, the lower fins with bright edgings. SALVELINUS, 237.

231. COREGONUS (Artedi) Linnæus.

(WHITEFISHES.)

Coregonus, ARTEDI, Genera Piscium, 9, 1738.

Coregoni, LINNÆUS, Syst. Nat., Ed. x, 1758, 310, (*lavaretus*).

Tripteronotus, LACÉPÈDE, Hist. Nat. Poiss., v, 48, 1803, (*hautin* = *lavaretus*).

Coregonus, LACÉPÈDE, Hist. Nat. Poiss., v, 263, 1803, (*lavaretus*).

Coregonus, CUVIER, Règne Animal, Ed. I, 162, 1817, (*thymallus*, *lavaretus*, etc.; restricted in Ed. 2, to *lavaretus*).

Prosopium, MILNER, in JORDAN, Man. Vert., Ed. 2, 361, 1878, (*quadrilateralis*).

Body oblong or elongate, compressed. Head more or less conic, compressed, the snout more or less projecting beyond the lower jaw. Mouth small, the maxillary short, not extending beyond the orbit, with a well-developed supplemental bone. Teeth extremely minute, if present. Scales moderate, thin, cycloid, rather firm. Dorsal fin moderate; caudal fin deeply forked, anal fin somewhat elongate; ventrals well developed. Pseudobranchiæ large. Gill rakers varying from short and thickish to long and slender. Air bladder very large. Vertebræ 56 to 60. Stomach horseshoe-shaped, with many (about 100) pyloric cœca. Ova small. Species about 15, inhabiting the clear lakes of northern Europe, Asia, and America, in Arctic regions descending to the sea. Most of them spawn in late fall or winter near the shore, at other seasons often frequenting considerable depths. The number of distinct species of *Coregonus* has been overestimated by many writers. The geographical range and range of variation of each one are much wider than has hitherto been generally supposed.* The species are highly valued for food, the flesh being generally pale and of fine flavor. The coloration is very uniform; bluish olivaceous above; the sides and below silvery. (*Coregonus*, a name used by Artedi for the European lavaret, or whitefish, *Coregonus lavaretus*, from *κόρη*, the pupil of the eye; *γωνία*, angle; "quia pupilla anteriore parte in angulum acutum procurrit." Artedi.)

PROSOPIUM (*προσώπιον*, a mask, from the large preorbitals):

- *a.* Gill rakers short, thickish, about 12 to 16 in number on the lower limb of the arch; maxillary short, broad, not reaching eye, the supplemental bone mostly narrow and sharply elliptical; mouth small.
  - *b.* Mouth comparatively large, the maxillary about 4 in head; gill rakers very short and thick, 10 + 16; body oblong, the back not elevated.
    - *c.* Scales large, 60 to 63 in lateral line; snout blunt and decurved. COULTERII, 755.
    - *cc.* Scales small, 72 to 90 in lateral line.
      - *d.* Supplemental bone of maxillary rather narrow; scales 83 to 90.
        - *e.* Head moderate, blunt anteriorly, 4½ to 5 in body; tip of snout below level of eye; gill rakers short, 9 + 15; lower fins pale. WILLIAMSONI, 756.
        - *ee.* Head very short, blunt, 5⅔ in body; gill rakers short and slender, about 7 + 14; fins all blackish. KENNICOTTI, 757.
      - *dd.* Supplemental bone of maxillary very broad, semicircular; scales 72 to 80. RICHARDSONII, 758.
  - *bb.* Mouth small, the maxillary 5 to 5½ in head; gill rakers shorter and thicker, about 7 + 10, about 5 in eye, fewer than in *C. williamsoni*. Body elongate, the back not elevated nor much compressed. QUADRILATERALIS, 759.

COREGONUS:

- *aa.* Gill rakers numerous, long and slender, 17 to 20 on the lower limb of the arch; preorbital long and narrow; maxillary rather long, more than ¼ head, the supplemental bone ovate.
  - *f.* Tongue toothless or nearly so; back elevated; head very low and short, especially in old examples.
    - *g.* Back elevated, but not greatly compressed; supplemental bone of maxillary nearly twice as long as deep. CLUPEIFORMIS, 760.
    - *gg.* Back elevated and much compressed; supplemental bone of maxillary more than ⅔ as deep as long; gill rakers about 26. NELSONII, 761.
  - *ff.* Tongue with 3 series of small teeth; body elongate, compressed; lower jaw slightly included.
    - *h.* Gill rakers short and few, about 10 + 15, the longest about 2 in eye. LABRADORICUS, 762.

Subgenus PROSOPIUM, Milner.

755. COREGONUS COULTERII, Eigenmann & Eigenmann.

Head 4½ to 5; depth 4½ to 5½; eye 4; snout 4½. D. 10 or 11; A. 10 or 11; scales 8-60 to 63-6. Form rather heavy, little elevated; the snout broad,

---

*For a useful analytical key to the species of *Coregonus*, see Bean, in Trans. Amer. Fish Cultural Ass'n, 13th annual meeting, 1884, 33.

very blunt and decurved; greatest depth of head equal to its length less the opercle. Mouth low, the snout but little projecting, maxillary reaching eye in larger specimens, further in the smaller ones; supplemental bone a crescent; gill rakers much as in *Coregonus williamsoni*; scales large. Dull silvery. Head waters of the Columbia River. A small species, not exceeding 8 inches in length, closely related to *Coregonus williamsoni*, but with larger scales. (Named for Dr. John Merle Coulter, the well-known botanist.)

Coregonus coulterii, EIGENMANN & EIGENMANN, American Naturalist, November, 1892, 961, Kicking Horse River, at Field, British Columbia, one of the head streams of the Columbia River. (Type, No. 44875. Coll. Eigenmann.)

756. COREGONUS WILLIAMSONI, Girard.

(ROCKY MOUNTAIN WHITEFISH; "MOUNTAIN HERRING.")

Head 4½ to 5; depth 4 to 5; eye 4⅔. D. 11 to 14; A. 11 to 13; scales 8 to 10–83 to 87–7 to 10. Body oblong, rather deeper than in *Coregonus quadrilateralis*, but little compressed. Head shortish, conic, the profile more abruptly decurved than in the other species. Snout compressed and somewhat pointed at tip, which is entirely below the level of the eye; preorbital broad, ⅔ width of eye. Maxillary short and very broad, reaching just about to the anterior margin of eye; therefore, apparently longer than in related species, owing to the shortness of the snout; supplemental bone narrow; maxillary contained 4 times in the length of the head; mandible 3 times. Pectoral 1⅕ in head; ventral 1⅖; longest dorsal ray 1⅓. Snout in the males produced, pig-like, in the breeding season. Adipose fin very large, extending behind anal. Gill rakers short and thick, shorter than pupil, about 9 + 15. Color bluish above, sides silvery; breeding males with the under parts white; all the fins tipped with black, caudal and adipose fins steel-blue. Scales on sides strongly tuberculate in breeding males. Length about a foot. Clear streams from the Rocky Mountains to the Pacific, the easternmost records being from Chief Mountain Lake at the head of the Saskatchewan in Montana (as type of *Coregonus couesii*); abundant in the Great Basin, and northwestward on both sides of the Cascade Range; found more often in clear brooks and rivers than in lakes. It readily takes the fly and is an excellent food-fish. (Named for Lieut. R. S. Williamson, in charge of one division of the United States Pacific Railroad explorations.)

Coregonus williamsoni, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 136, Des Chutes River, Oregon; GÜNTHER, Cat., VI, 187, 1866; JORDAN & GILBERT, Synopsis, 297, 1883; B. A. BEAN, in GILBERT & EVERMANN, Bull. U. S. Fish Comm., XIV, 1894, 55, pl. IX, fig. 3.

Coregonus couesii, MILNER, Rept. U. S. Fish Comm. for 1872–73 (1874), 88, Chief Mountain Lake, Montana; (Type, No. 14146. Coll. Coues); JORDAN & GILBERT, Synopsis, 297, 1883.

Prosopium couesii, MILNER, in JORDAN, Man. Vert., Ed. 2, 362, 1878.

Represented in the Madison and Yellowstone rivers and other tributaries of the Upper Missouri by

756a. COREGONUS WILLIAMSONI CISMONTANUS, Jordan.

Slenderer, with lower fins. Head 5 in length; depth 5 to 5¼; pectoral 1½ in head; ventral 1⅘; longest dorsal ray 1½. Scales 90. Otherwise like the typical form. (*cismontanus*, this side of the mountains.)

Coregonus williamsoni cismontanus, JORDAN, Bull. U. S. Fish Comm., IX, 1889, 49, pl. 9, figs. 8, 9, Horsethief Creek, a tributary of Madison River, Montana. (Coll. E. R. Lucas.)

757. COREGONUS KENNICOTTI, Milner.

(BROAD WHITEFISH ; MUKSUN OF THE RUSSIANS.)

Head small, $5\frac{2}{3}$; depth about $4\frac{2}{3}$. D. 11; A. 14; scales 10–87 to 90–10. Eye moderate, shorter than snout, $5\frac{1}{2}$ in head, $1\frac{4}{5}$ in interorbital space. Scales small, adherent, very regularly imbricated. Head very blunt, premaxillaries wide and vertically placed. Mouth inferior, with the high blunt snout but little projecting. Maxillary reaching slightly beyond the vertical from front of eye, its length, measured from its anterior articulation, equal to length of snout, and contained $4\frac{2}{3}$ times in the head ($=4$ in head when measured from tip of snout); maxillary broadly ovate, apparently slenderer than in *C. richardsonii* as figured by Günther, and with different outlines. Preorbital narrow, its greatest width contained 5 times in its length, and $3\frac{1}{3}$ times in diameter of eye; width of supraorbital bone $\frac{2}{5}$ its length. Gill rakers 6 or 7 + 14, short and slender, tapering to a slender flexible point, the longest $\frac{3}{4}$ diameter of pupil. Hyoid bone with a round patch of weak, bristle-like teeth; these are very similar to those found in *Stenodus*, and are disposed in longitudinal series. Vertical height of head at nape less than length of head by $\frac{1}{2}$ diameter of eye; distance from tip of snout to nape $\frac{1}{3}$ distance from nape to front of dorsal; front of dorsal nearer snout than base of median caudal rays by length of snout and eye. Adipose fin large, a wide strip at base covered with small, regularly imbricated scales; inserted over last rays of anal, extending but slightly behind last anal ray; ventrals reaching half way to front of anal; height of dorsal equal to length of head without snout. Color must have been very dark in life; fins all blackish, in spirits, with a bluish tinge; traces of what may have been blackish spots and vermiculations are discernible on basal portion of dorsal and anal fins. The above description from a specimen obtained by Miss Elizabeth Taylor in Great Bear Lake. The type of *C. kennicotti* (No. 8971, Fort Good Hope, British America) possesses the following characters: This specimen is a skin 21 inches long. Length of head $3\frac{1}{2}$ inches; tip of snout to end of maxillary $\frac{13}{16}$ inch; diameter of eye (not orbit) $\frac{5}{8}$ inch; length of longest gill raker $\frac{3}{16}$ inch. Maxillary contained $4\frac{4}{13}$ times in head; longest gill raker $3\frac{1}{3}$ times; width of preorbital $2\frac{3}{4}$ times, in eye. Number of gill rakers 7 + 13. Scales 10–90–10.

This species seems closely related to *Coregonus richardsonii*, Günther, with which it may prove identical. As Dr. Bean has already noticed, Günther's description includes no account of the gill rakers, which may be long and numerous, as in *C. clupeiformis*, but indicates a fish with a longer snout, and a broader supplementary maxillary bone. (Gilbert.) Mackenzie and Yukon rivers; locally abundant. (Named for Robert Kennicott, discoverer of the species, one of the first American naturalists to visit Alaska.)

? *Salmo lavaretus*, var. *muchsun*, PALLAS, Reise, III, 705, about 1780.
? *Salmo muksun*, P AS, Zoogr. Rosso-Asiat., III, 398, 1811.

Coregonus kennicotti, Milner, in Jordan & Gilbert, Synopsis, 298, 1883, Fort Good Hope, British America. (Type, No. 8971. Coll. Kennicott); Gilbert, Bull. U. S. Fish Comm., xiv, 1894, 23.

758. COREGONUS RICHARDSONII, Günther.

B. 9; D. 13; A. 13; scales 10–72 to 80–12. Very similar in form to *C. clupeiformis*. Snout of moderate length, obliquely truncated, with the upper jaw projecting beyond the lower; eye shorter than the snout; maxillary extending to anterior edge of the eye, its length 4 in head. Supplementary bone of the maxillary short, broad, semicircular. Length of mandible a little less than least depth of tail. Pectoral longer than head, without snout. Arctic North America. (Günther.) A doubtful species, perhaps identical with *Coregonus kennicotti*, or possibly with *Coregonus nelsonii*. (Named for John Richardson, the accomplished author of the Fauna Boreali-Americana.)

Coregonus richardsonii, Günther, Cat., vi, 185, 1866, exact locality unknown

759. COREGONUS QUADRILATERALIS, Richardson.

(Pilot-fish; Menominee Whitefish; Shad-Waiter; Round Whitefish.)

Head 5; depth 4¾; eye 5½. D. 11; A. 10; scales 9–80 to 90–8. Body elongate, not elevated nor much compressed, the back rather broad, the form more terete than in any of the other species. Mouth very small and narrow, inferior, the broad maxillary not reaching to opposite the eye, 5½ in head. Head long, the snout compressed and bluntly pointed, its tip not below level of eye; profile not strongly decurved. Preorbital wider than pupil. Mandible originating under middle of eye, 3⅓ in head. Adipose fin small. Gill rakers short and stoutish, about 7 + 10 in number, 4 to 5 in eye, but rather longer than in *C. williamsoni*. Color dark bluish above, silvery below. Length a foot or more. Lakes of New England and the Great Lakes, northwestward to Alaska, as far south as Yukon River; abundant in cold, deep waters. (*quadrilateralis*, four-sided.)

Coregonus quadrilateralis, Richardson, Franklin's Journ., 1823, 714, Fort Enterprise, British America; Günther, Cat., 176, 1866; Jordan & Gilbert, Synopsis, 298, 1883.
Coregonus novæ-angliæ, Prescott, Amer. Journ. Sci. Arts, xi, 1851, 342, Lake Winnipiseogee, New Hampshire; Günther, Cat., 186, 1866.

Subgenus COREGONUS.

760. COREGONUS CLUPEIFORMIS (Mitchill).

(Common Whitefish.)

Head 5; depth 3 to 4; eye large, 4 to 5. D. 11; A. 11; scales 8–74–9. Vertebræ 59. Body oblong, compressed, always more or less elevated, and becoming notably so in the adult. Head comparatively small and short, the snout bluntish, obliquely truncated; tip of snout on level of lower edge of pupil; width of preorbital less than half that of pupil. Maxillary reaching past front of orbit, about 4 in head. Gill rakers moderate, ½ diameter of eye, usually about 10 + 17 to 19. Color olivaceous above; sides white, but not silvery; lower fins sometimes dusky. Length 2 feet or more. Great Lakes and neighboring waters, rarely ascending streams; not in Alaska nor Arctic America; the best known and most highly valued of the American whitefishes. It feeds on minute organisms. This species, like others of wide distribution, is subject to considerable variations, dependent on food, waters, etc. One of these is the so-called Otsego Bass, var. *otsego* (Clinton), a form landlocked in Otsego Lake at the head of the Susquehanna River. (*Clupea*, a shad or herring; *forma*, shape.)

Salmo clupeiformis, MITCHILL, Amer. Month. Mag., II, 1818, 321, Sault Ste. Marie.

Coregonus albus, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1818, 231, Lake Erie to Arctic Sea; GÜNTHER, Cat., VI, 184, 1866, and of many authors.

Coregonus otsego, the "Otsego Lake Bass," DEWITT CLINTON, Med. & Phil. Register, III, 188, about 1814; Otsego Lake; a landlocked form.

Coregonus sapidissimus, AGASSIZ, Lake Superior, 344, 1850, Lake Superior.

Coregonus latior, AGASSIZ, Lake Superior, 348, 1850, Lake Superior.

Coregonus clupeiformis, JORDAN & GILBERT, Synopsis, 299, 1883.

761. COREGONUS NELSONII, Bean.

(HUMPBACK WHITEFISH.)

Head 5; depth 4. D. 12; A. 12; scales 10–88–8. Allied to *Coregonus clupeiformis*, but distinguished by its arched and compressed back; snout not very blunt. Maxillary 4 in head, reaching front of eye. Gill rakers moderate, a little more than half eye, about 26 in number; ventrals a little nearer snout than base of caudal. Coloration plain. Alaska, from Bristol Bay northward, common; a bony species of inferior flavor. (Bean.) (Named for Edward W. Nelson, its discoverer, the well-known ornithologist, who collected largely in Alaska.)

Coregonus nelsonii, BEAN, Proc. U. S. Nat. Mus., 1884, 48, Nulato, Alaska. (Type, No. 29903. Coll. Nelson.)

762. COREGONUS LABRADORICUS, Richardson.

(SAULT WHITEFISH; MUSQUAW RIVER WHITEFISH; WHITING OF LAKE WINNIPISEOGEE.)

Head 5; depth $3\frac{1}{5}$ to 4; eye large, $4\frac{1}{3}$ to 5; snout $4\frac{1}{2}$ to 5. D. 11 or 12; A. 11 or 12; scales 10–71 to 76–9. Gill rakers short, about 2 to $2\frac{1}{2}$ in eye, 10 + 15 or 16. Body rather elongate, compressed, the back not elevated. Head rather small and slender, compressed. Distance from tip of snout to occiput about $2\frac{1}{5}$ in distance from occiput to origin of dorsal fin. Mouth rather small, the lower jaw short, the snout projecting; the maxillary reaching front of pupil; maxillary bone broad, rather short, its supplementary piece ovate. Mandible reaching middle of eye. Tongue with about three series of small teeth. Supraorbital bone narrow. Dorsal fin high in front, the last rays short. Bluish-black above; silvery below; scales with dark punctulations on the edges; fins all dusky, pectorals and ventrals pale at base. Length 21 inches. Winnipeg and Great Lakes region to the lakes of the Adirondacks and White Mountains, and northeastward; generally abundant in cold, clear lakes and large streams; abundant at the Sault Ste. Marie; a species of good flavor, valued as food. A variable species, perhaps containing several recognizable subspecies.

Coregonus labradoricus, RICHARDSON, Fauna Bor.-Amer., III, 206, 1836, Musquaw River, Labrador; GÜNTHER, Cat., VI, 176, 1866; JORDAN & GILBERT, Synopsis, 299, 1883.

?? *Coregonus angusticeps*, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 534, 1848, Saskatchewan River; description brief and erroneous.

Coregonus neohantoniensis, PRESCOTT, Amer. Journ. Sci. Arts, XI, 1851, 343, Lake Winnipiseogee, New Hampshire.

232. ARGYROSOMUS, Agassiz.

(CISCOES.)

Argyrosomus, AGASSIZ, Lake Superior, 339, 1850, (*clupeiformis* = *artedi*).
Allosomus, JORDAN, Manual Vertebrates, Ed. 2, 361, 1878, (*tullibee*).

This genus is very close to *Coregonus*, from which it differs in the larger mouth and more produced jaws, the premaxillaries being placed nearly horizontally, and the lower jaw decidedly projecting beyond them. Gill rakers very long and slender, about 30 on lower limb. Vertebræ 55. These characters are associated with the greater voracity and, in general, greater activity of the species of *Argyrosomus*. The species are numerous in the northern parts of Europe, Asia, and North America, and all are valued as food. (ἀργυρός, silver; σῶμα, body.)

ARGYROSOMUS:

a. Body elongate, herring-shaped; scales small, uniform, the free edges convex.

  b. Lower fins pale or merely tipped with dusky; scales punctate with dark points.

    c. Eye large, not much, if any, shorter than snout in adult, its length 3½ to 4½ in head.

      d. Head long, 4 in body; body slender, its depth 5 to 6 in length; distance from occiput to snout 2¼ in distance from occiput to dorsal; teeth on tongue; maxillary 3 in head. OSMERIFORMIS, 763.

      dd. Head long, 4½ in length; distance from occiput to tip of snout nearly half its distance to front of dorsal fin; pectorals short, reaching about half way to ventrals.

        e. Maxillary 3¼ to 3½ in head; lower jaw projecting; gill rakers long and numerous, about 16 + 30. ARTEDI, 764.

        ee. Maxillary longer, 2⅗ to 3 in head; gill rakers fewer, about 14 + 25. HOYI, 765.

      ddd. Head shorter, about 5 in length; distance from occiput to tip of snout about ⅖ distance to front of dorsal fin; pectorals long, reaching more than half way to ventrals; maxillary 3⅓ in head. PUSILLUS, 766.

    cc. Eye small, shorter than snout, about 5 times in length of head.

      f. Head short, about 5 in length.

        g. Body rather slender, the depth equal to length of head; distance from occiput to snout 2½ to 2⅔ in its distance from dorsal; base of dorsal short. LUCIDUS, 767.

        gg. Body deep, the depth in adult greater than length of head; distance from occiput to snout 2⅓ to 2½ in distance from occiput to dorsal; base of dorsal longer. LAURETTÆ, 768.

      ff. Head long, 4 to 4½ in length; lower jaw strong.

        h. Maxillary very long, 2½ in head; lower jaw much projecting; gill rakers about 15 + 28; distance from snout to occiput 2⅕ in distance from occiput to dorsal; mouth larger than in *A. artedi* or in related species. PROGNATHUS, 769.

  bb. Lower fins all blue-black; body robust; mouth large; gill rakers numerous, 18 + 30; eye large, 4⅕ in head. NIGRIPINNIS, 770.

ALLOSOMUS (ἄλλος, different; σῶμα, body):

aa. Body short, deep, compressed, the curve of back similar to that of the belly; scales large, larger forward and closely imbricated, the free margin little convex.

  i. Jaws equal when closed or lower slightly projecting; depth 3 in length; mouth rather small; maxillary 3½ in head; eye 4½ in head; gill rakers about 16 + 31, long and slender, about equal to eye. TULLIBEE, 771.

Subgenus ARGYROSOMUS.

763. **ARGYROSOMUS OSMERIFORMIS** (H. M. Smith).

(Smelt of the New York Lakes.)

Head 4; depth 5 to 6; eye 4. D. 9; A. 13; scales 9–83–10. Body elongate, slender, back not elevated. Head rather large, its width equal to half its length. Length of top of head 2¼ in distance from occiput to dorsal; greatest depth considerably less than length of head. Eye large, equal to snout. Gill rakers very long and slender, as long as eye, 20 + 35. Dorsal fin rather high, its height equal to ⅘ depth of body and 1½ times length of base of fin; its origin nearer base of caudal than snout, its free margin nearly vertical, straight; longest anal ray ⅘ length of base of fin; ventral long, equal to height of dorsal, its length equal to ¾ of distance from ventral origin to vent; ventral origin midway between base of caudal and pupil; adipose dorsal long and slender, of same width throughout, its width ⅓ its length. Mouth large, the lower jaw projecting, the snout straight; maxillary contained 3 times in length of head, its posterior edge extending to line drawn vertically through the anterior margin of pupil; mandible ½ the length of head, its angle under the pupil. Teeth present on the tongue. Color above grayish silvery, sides bright silvery; below white; tips of dorsal and caudal dark. Length 10 inches. Lakes of central New York, known from Seneca Lake and Skaneateles Lake. (Smith.) (*Osmerus*, a smelt, *forma*, form; in allusion to the general shape of the fish, which is known as "smelt" in parts of New York.)

Coregonus hoyi, Bean, Proc. U. S. Nat. Mus., 1882, 658, not of Gill; Goode, Hist. Aquatic Animals, pl. 197 B, 1884; not of text.

Coregonus osmeriformis, Hugh M. Smith, Bull. U. S. Fish Comm., xiv, 1894, pl. 1, 2, Seneca Lake and Skaneateles Lake, New York. (Type, Nos. 32162 and 32165. Coll. Prof. H. L. Smith and J. C. Willetts.)

764. **ARGYROSOMUS ARTEDI** (Le Sueur).

(Cisco; Lake Herring; Michigan Herring.)

Head 4½; depth 4½; eye 4 to 4½. D. 10; A. 12; scales 8–75 to 90–7, 10 rows under base of dorsal; vertebræ about 60. Body elongate, compressed, not elevated. Head compressed, somewhat pointed, rather long, the distance from occiput to tip of snout usually a little less than half the distance from occiput to dorsal fin. Mouth rather large, the maxillary reaching not quite to the middle of the pupil, 3¼ to 3½ in head; the mandible 2⅛ in head. Preorbital bone long and slender; suborbital broad; supraorbital nearly as long as eye, about four times as long as broad. Gill rakers very long and slender, as in *Clupea*, 15 to 17 + 28 to 34, the longest 1⅖ in eye. Dorsal fin high, its rays rapidly shortened. Bluish black or greenish above; sides silvery, scales with dark specks; fins mostly pale, the lower dusky-tinged. Length 12 inches. Great Lakes and neighboring waters, not in Alaska nor Arctic America; very abundant, usually frequenting shallow waters. An active, voracious fish, valued as food. (Named for Petrus Artedi, the "Father of Ichthyology," the associate of Linnæus, and perhaps the ablest systematic zoölogist of the 18th century.)

Coregonus artedi, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1818, 231, Lake Erie; Niagara River; JORDAN & GILBERT, Synopsis, 301, 1883.

Coregonus clupeiformis, GÜNTHER, Cat., VI, 198, 1866, and of many authors, but not *Salmo clupeiformis*, of MITCHILL.

Salmo (*Coregonus*) *harengus*, RICHARDSON, Fauna Bor.-Amer., III, 210, 1836, Lake Huron.

Coregonus harengus, GÜNTHER, Cat., VI, 199, 1866.

Represented in numerous small lakes in Indiana and Wisconsin (Tippecanoe, Geneva, Oconomowoc, La Belle, etc.), by the slightly modified

764a. ARGYROSOMUS ARTEDI SISCO, Jordan.

(SISCO OF LAKE TIPPECANOE.)

Smaller than the Lake Cisco, but superior as food; living in deep waters, except in December, when it ascends brooks to spawn. (*Sisco* or *Cisco*, a vernacular name, probably Indian.)

Argyrosomus sisco, JORDAN, Amer. Nat., 1875, 136, Lake Tippecanoe, Warsaw, Indiana. (Coll. Judge J. H. Carpenter.)

765. ARGYROSOMUS HOYI, Gill.

(MOON-EYE CISCO; CISCO OF LAKE MICHIGAN; KIEYE OF LAKE MICHIGAN.)

Head $4\frac{1}{2}$; depth $4\frac{1}{2}$; eye $4\frac{1}{5}$ to $4\frac{2}{3}$; snout $3\frac{2}{5}$ to $3\frac{5}{6}$; maxillary $2\frac{3}{5}$ to 3 in head, reaching to vertical of middle of pupil. D. 10; A. 11 or 12; scales 8 or 9–73 to 80–7. Gill rakers 14 + 25 or 26, slender, about 2 in eye. Vertebræ 56; branchiostegals 8 or 9. Body rather elongate, compressed, the back somewhat elevated. Mouth rather large, subterminal, the lower jaw shorter than upper, even when the mouth is open; tip of muzzle rather bluntly truncate, somewhat as in a true *Coregonus*; mandible nearly reaching posterior edge of eye, $2\frac{1}{6}$ in head. Head rather long, slender, and pointed. Supraorbital and preorbital long and narrow. Distance from tip of snout to occiput $2\frac{1}{5}$ to $2\frac{2}{5}$ in distance from occiput to origin of dorsal fin. Fins low; free margin of dorsal very oblique, the length of the anterior rays $1\frac{3}{5}$ in head, that of the last ray less than half length of the first; longest anal ray $2\frac{3}{5}$ in head and more than twice as long as the last ray. Pseudobranchiæ very large; tongue with traces of teeth. Color light iridescent blue on back, scales with a few fine dark punctulations reaching about two scales below lateral line; sides and under parts rich silvery, brighter than in any other of our *Coregoninæ*, much as in *Hiodon* and *Albula*; top of head light olivaceous; cheeks silvery; dorsal, caudal, and pectorals with some dark on their margins; anal and ventrals white, with some dark dustings; the male perhaps a little richer, more iridescent blue on back, and with the scales a little thicker and less closely imbricated. Length 13 inches. Deep waters of Lake Michigan; one of the smallest and handsomest of *Coregoninæ*. The only specimens known were the two sent to Dr. Gill and the one to Dr. Jordan by Dr. Hoy, until recently rediscovered by the United States Fish Commission, who find it to be the principal fish caught in the gill nets in the western part of Lake Michigan. It is taken in large numbers off

Kenosha in 90 fathoms in November during its spawning season. It is a true *Argyrosomus,* though approaching *Coregonus.* (Named for Dr. Philo R. Hoy, of Racine, Wisconsin, an able naturalist, who early collected the fishes of Lake Michigan.)

Argyrosomus hoyi, GILL MS., JORDAN, American Naturalist, March, 1875, 135, Lake Michigan, near Racine, Wisconsin. (Type, No. 8902. Coll. Hoy.)

Coregonus hoyi, JORDAN, Man. Vert., Ed. 2, 275, 1878; JORDAN & GILBERT, Synopsis, 299, 1883; SMITH, Bull. U. S. Fish Comm., XIV, 1894, pl. 1, fig. 1, 6; not *Argyrosomus hoyi,* MILNER, Rept. U. S. Fish Comm., 1872–73 (1875), 86 (which is *A. prognathus*), nor *Coregonus hoyi,* BEAN, Proc. U. S. Nat. Mus., 1882, 658 (which is *A. osmeriformis*).

766. ARGYROSOMUS PUSILLUS (Bean).

Head 5; depth 5; eye 3¾ in head. D. 10; A. 12; V. 11; scales 10–91–9. Body rather elongate, compressed. Form of mouth as in *A. artedi,* the lower jaw considerably projecting; maxillary broad, with rather broad supplemental bone, three times as long as wide, extending not quite to middle of the very large eye, its length 3⅓ in head; preorbital extremely narrow. Mandible 2⅓ in head. Teeth none, or reduced to minute asperities on the tongue. Gill rakers numerous, very long and slender, 49 in all. Dorsal very high, much higher than long, its last rays rapidly shortened, the first rays twice the length of base of fin; insertion of dorsal midway between snout and middle of adipose fin; caudal large, well forked; anal small; ventral inserted under middle of dorsal, very long, ⅚ length of head; pectoral the same length. Scales as in *A. artedi.* Steel-bluish above, with many dark points; belly white; dorsal and caudal mostly blackish; pectorals and ventrals tipped with black; eye blackish, the iris silvery. Length a foot or less. Yukon River to Bering Sea and northward, ascending rivers. (*pusillus,* feeble.)

Coregonus merckii, var., BEAN, Proc. U. S. Nat. Mus., 1881, 256; JORDAN & GILBERT, Synopsis, 300, 1883; not of GÜNTHER.

Coregonus pusillus, BEAN, Proc. U. S. Nat. Mus., 1888, 526, Kowak River, Alaska. (Type, No. 38366. Coll. Chas. H. Townsend.)

767. ARGYROSOMUS LUCIDUS (Richardson).

(GREAT BEAR LAKE HERRING.)

Head small, 5 to 5⅓; depth 4⅓ to 4⅗; eye 5. D. 11 or 12 developed rays; A. 11 or 12. Scales 85 to 87, 11 or 12 scales in an oblique series downward and forward from front of dorsal to lateral line. Eye slightly less than length of snout, 1½ times in interorbital width. Body slender, elongate, the curve of back and belly about equal, the greatest depth exceeding length of head. The snout narrow, almost vertically truncate when mouth is closed, the lower jaw fitting within the upper, but the mouth not inferior. Distance from snout to nape 2⅗ to 3 in distance between nape and front of dorsal. The head is much smaller in one of our specimens than in the other. Mouth oblique, with rather slender maxillary, which extends to vertical midway between front and middle of pupil, its length from tip to articulation equaling distance from end of snout to front of pupil, and contained 3⅔ to 3⅕ in length of head. Supplemental maxillary bone probably broader than in *A. artedi,* from ⅗ to ⅔ greatest width of maxillary. Suborbitals very narrow, their least width less than half diameter of pupil. Supraorbital bone large, its width 2½ to 2⅔ in its length. Gill rakers very long and slender, the longest slightly more than ⅔ length of eye, 16 + 28 in number in each specimen. Front of dorsal slightly nearer tip of snout than base of upper rudimentary dorsal rays. The fins are mutilated, so that their length can not be given. *Adipose fin large, inserted vertically above last anal rays, its height from tip to posterior end of base equaling vertical diameter of eye. Color silvery. As pointed out by Dr. Günther, this northern form differs from *A. artedi* in its shorter head and smaller eye. It seems also to have the premaxillaries placed at a greater angle than in *A. artedi.* Mackenzie River and tributaries. Here described from two specimens from Great Bear Lake River, each 16 inches long, collected by Miss Elizabeth Taylor. (*lucidus*, shining.)

Salmo (Coregonus) lucidus, RICHARDSON, Fauna Bor.-Amer., III, 207, 1836, with good figure, Great Bear Lake.

Coregonus lucidus, GÜNTHER, Cat., VI, 198, 1866; GILBERT, Bull. U. S. Fish Comm., XIV, 1894, 24.

768. ARGYROSOMUS LAURETTÆ (Bean).

Head 5; depth 4; eye 4½ to 5. D. 12; A. 11; V. 12; scales 10–84 to 95–10, 84 to 87 in specimens examined. Body robust, the back elevated; head small and slender, the small eye not longer than snout. Distance from nape to front of snout 2½ times in its distance from dorsal. Maxillary about reaching middle of eye, 3½ in head, its supplemental bone half its length; lower jaw very slightly longer than upper; mandible 2⅓ in head; lingual teeth present. Gill rakers long and numerous, 10 + 25; ventral scale not half length of fin; pectorals short, not reaching half way to ventrals. Scales smaller than in *A. artedi*, 16 cross series under base of dorsal. Alaska, from Yukon River northward to Point Barrow; generally common. Apparently very close to *Argyrosomus lucidus*, but the base of the dorsal longer. (Named for Mrs. Lauretta H. Bean.)

Coregonus laurettæ, BEAN, Proc. U. S. Nat. Mus., 1881, 156, Point Barrow; JORDAN & GILBERT Synopsis, 890, 1883. (Type, Nos. 27695 and 27915. Coll. Capt. C. L. Hooper.)

769. ARGYROSOMUS PROGNATHUS (H. M. Smith).

(LONG JAW; BLOATER.)

Head 4⅓; depth 3½ to 4; eye 5. D. 9 or 10; A. 10 to 12. Eye rather small, 1⅓ in snout, 1⅓ in interorbital space, 1⅓ in suborbital space. Scales 9–75–8. Body oblong, much compressed, back elevated, tapering rather sharply towards the narrow caudal peduncle, the adult fish having a slight nuchal hump as in *C. clupeiformis.* Mouth large and strong; snout straight, its tip on level with lower edge of pupil. Top of head 2⅕ in distance from occiput to front of dorsal. Maxillary reaching to opposite pupil, 2½ in head, the length 3½ times its greatest width; mandible projecting beyond upper jaw when mouth is closed, very long, reaching to or beyond posterior edge of eye, 1¾ to 1⅞ in head. Head of medium size, rather short and deep, pointed, cranial ridges prominent. Dorsal rather high, the longest ray ⅓ longer than base of fin, contained 1⅔ times in greatest body depth, and 1½ times in head; free margin slightly concave; origin nearer end of snout than base of caudal. Longest anal ray equal to base of fin and ⅔ height of dorsal. Vertebræ 55. Gill rakers slender, about 15 + 28, about length of eye. Adipose fin the length of eye, its width half its length. Narrowest part of caudal peduncle contained nearly four times in greatest body depth. Ventral as long as dorsal is high, its origin midway between end of snout and fork of tail; pectoral as long as ventral. Lateral line straight except at origin, where it presents a rather marked curve. Sides of body uniformly bright silvery, with pronounced bluish reflection in life; the back dusky, the under parts pure white without silvery color; above lateral line, the upper and lower edges of scales are finely punctulated, central part unmarked, producing light longitudinal stripes extending whole length of body; fins flesh color or pinkish in life, the dorsal and caudal usually showing dusky edges; postorbital area with a bright golden reflection. Iris golden, pupil black. Length 15 inches. Lake Ontario, Lake Michigan, Lake Superior, and doubtless the entire Great Lake Basin, in deep water. (Smith.) This species and *A. osmeriformis* have been confounded under the name *Coregonus hoyi*, though neither much resembles the original of that name. (*πρό*, forward; *γνάθος*, jaw.)

---

* The vertical from last ray of anal traverses the posterior third of base of adipose dorsal. This is the only respect in which our specimens fail to agree with Richardson's description. The latter states that the adipose fin is located "about its own breadth posterior to the anal," but this can probably be accounted for by the nature of the specimen, Richardson's description being taken from a stuffed skin.—*Gilbert.*

Argyrosomus hoyi, Milner, Rept. U. S. Fish Comm., II, 1872-73 (1874), 86, Outer Island, Lake Superior; (Coll. Milner); not of Gill.

Coregonus prognathus, Hugh M. Smith, Bull. U. S. Fish Comm., XIV, 1894, 4, pl. 1, fig. 3, Lake Ontario, at Wilson, New York. (Type, No. 45568. Coll. John S. Wilson.)

770. ARGYROSOMUS NIGRIPINNIS, Gill.

(Bluefin; Blackfin.)

Head 4; depth 4; eye 4⅕. D. 12; A. 12; scales 9 or 10-73 to 77-7 or 8. Vertebræ 57. Gill rakers about 18 + 30, rather long and slender, 1½ in eye or 2 in maxillary. Lower jaw slightly projecting; the maxillary ⅕ greater than eye and reaching vertical of front of pupil. Body stout, fusiform, compressed. Head large, stout; mouth large. Distance from tip of snout to occiput about 3⅓ in distance from snout to origin of dorsal fin. Back not arched, profile from occiput to origin of dorsal very gently curved. Eye rather large, longer than snout. Teeth very minute, but appreciable on premaxillaries and tongue. Color dark bluish above; sides silvery, with dark punctulations; fins all blue-black. Length 18 inches. Deep waters of Lake Michigan and small lakes of Wisconsin and Minnesota (Madison, Wisconsin, and Lake Miltona, Minnesota); locally abundant. Larger than most of the other Ciscoes, and with larger mouth than any except *A. prognathus*; known at once by the black fins. (*niger*, black; *pinna*, fin.)

Argyrosomus nigripinnis, Gill MS. in Milner, Report U. S. Fish Comm. for 1872-73 (1874), 87, Lake Michigan, off Racine, Wisconsin. (Coll. Dr. Hoy.)

Coregonus nigripinnis, Jordan, Man. Vert., Ed. 2, 275, 1878; Jordan & Gilbert, Synopsis, 301, 1883

Subgenus ALLOSOMUS, Jordan.

771. ARGYROSOMUS TULLIBEE (Richardson).

(TULLIBEE; "MONGREL WHITEFISH.")

Head 4 to 4½; depth 3 to 3⅕; eye 4½. D. 11 or 12; A. 11; scales 8 or 9–67 to 74–8. Gill rakers about 16 + 31, long and slender, the longest about equal to eye. Body short, deep, compressed, shad-like, the dorsal and ventral curves similar. Distance from tip of snout to occiput 2 in distance from occiput to origin of dorsal. Caudal peduncle short and deep. Head conic, compressed, much as in *A. nigripinnis*. Mouth large, lower jaw projecting, the maxillary as long as the eye, about 3½ in head, extending past the front of eye, its supplemental bone narrowly ovate, with prolonged point; jaws equal when closed. Eye large, as long as snout. Preorbital narrow; supraorbital elongate, rectangular. Scales anteriorly considerably enlarged, their diameter half larger than the diameter of those on the caudal peduncle, the free margins less convex than in other species. Color bluish above; sides white, punctate with fine dots; each scale with a silvery area, these forming a series of distinct longitudinal stripes. Length 18 inches. Great Lakes, Lake of the Woods, and northward. A handsome and well-marked species. (Tullibee, a name of Indian origin, used by the fur traders.)

Salmo (Coregonus) tullibee, RICHARDSON, Fauna Bor.-Amer., III, 201, 1836, Cumberland House, Pine Island Lake.

Coregonus tullibee, GÜNTHER, Cat., VI, 199, 1866; JORDAN & GILBERT, Synopsis, 301, 1883.

Represented in small lakes of southern Michigan by

771a. ARGYROSOMUS TULLIBEE BISSELLI, Bollman.

Maxillary reaching middle of eye; lower jaw projecting. Eye 4⅗ in head; scales 80 to 82, anteriorly scarcely larger than posteriorly. Head 4⅖; depth 3½. Rawson Lake and Howard Lake, Michigan. (Named for John H. Bissell, then president of the Michigan Fish Commission.)

Coregonus tullibee bisselli, BOLLMAN, Bull. U. S. Fish Comm., VIII, 1888, 223, Rawson Lake and Howard Lake, Michigan. (Type, No. 40619. Coll. Bollman.)

233. STENODUS, Richardson.

(INCONNU.)

Stenodus,* RICHARDSON, in Back's Narrative Arctic Land Expedition, Back Appendix, 521, 1836, (*mackenzii*).

Luciotrutta, GÜNTHER, Cat., VI, 164, 1866, (*mackenzii*).

Body rather elongate, little compressed. Head long, the cleft of the mouth wide. Maxillary long, broad, lanceolate, extending far backward, lower jaw projecting much beyond the upper. Dentition very feeble, the teeth extremely small; maxillary toothless; vomer, palatines, and tongue with narrow bands of minute villiform teeth. Gill rakers rigid, awl-shaped, rough interiorly. Branchiostegals 10. Pyloric cœca in great number. Dorsal fin moderate, over ventrals; anal rather long; caudal forked. Scales moderate. Coloration silvery. Migratory fishes of large size, inhabiting the streams of Arctic America and Asia; intermediate between the Whitefish and the Trout. (*στενός*, narrow; *ὀδούς*, tooth.)

---

* "This fish, though agreeing with the trout in the structure of the jaws, differs from all the subgenera established by Cuvier in the Règne Animal, in having the teeth disposed in velvet-like bands, and broader on the vomer and palatine bones. From the crowded, minute teeth, the name of *Stenodus* may be given to the subgenus of which the inconnu or *Salmo mackenzii* is the only ascertained species."—*Richardson.*

772. STENODUS MACKENZII (Richardson).

(INCONNU.)

Head 4⅚; eye 6. D. 12; A. 14; scales 100. Eye less than snout, nearly equaling the narrow interorbital width. Maxillary reaching a vertical behind pupil, its length very slightly more than ⅓ head. Supplemental bone long and narrow, nearly as wide as the maxillary, the anterior end notched, the angle above the notch sharply pointed, the lower angle bluntly rounded. Teeth all weak and flexible, bristle-like; present in a narrow band in upper jaw, the band extending laterally onto proximal fifth of maxillary; a similar narrow band anteriorly in lower jaw; very broad patches of similar, but slightly stiffer, teeth are present on tongue, vomer, and palatines. Gill rakers 7 + 17, the one in the angle reckoned with the vertical limb, very stiff and bony, the longest ⅘ diameter of eye; they bear in their margins two rows of very short, weak teeth, which do not make them appreciably rough.

Here described from a specimen 32 inches long, from the delta of the Mackenzie River, collected by Miss Elizabeth Taylor. Mackenzie River and its tributaries below the cascades; locally abundant and reaching a large size, usually 5 to 15 pounds, but sometimes 30 to 40 pounds. A fair food-fish, but the flesh is oily.* (Named for its discoverer, Alexander Mackenzie, for whom the river was also named.)

Salmo mackenzii, RICHARDSON, Franklin's Journ., 1823, 707, Mackenzie River.
Luciotrutta mackenzii, GÜNTHER, Cat., VI, 164, 1866.
Stenodus mackenzii, JORDAN & GILBERT, Synopsis, 304, 1883.

234. ONCORHYNCHUS, Suckley.

(QUINNAT SALMON.)

Oncorhynchus, SUCKLEY, Ann. Lyc. Nat. Hist. N. Y., 1861, 312, (*scouleri*).
Hypsifario, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 330, (*kennerlyi*).

Body elongate, subfusiform, or compressed. Mouth wide, the maxillary long, lanceolate, usually extending beyond the eye; jaws with moderate teeth, which become in the adult male enormously enlarged in front. Vomer long and narrow, flat, with a series of teeth both on the head and the shaft, the latter series comparatively short and weak; palatines with a series of teeth; tongue with a marginal series on each side; teeth on vomer and tongue often lost with age; no teeth on the hyoid bone. Branchiostegals more or less increased in number. Scales moderate or small. Dorsal fin moderate; anal fin comparatively elongate,

---

*According to Dr. Bean our species may be not distinct from the Siberian species, *Stenodus leucichthys* (Guldenstadt).

of 14 to 20 rays. Pyloric appendages in increased number. Gill rakers rather numerous. Ova large. Sexual peculiarities very strongly developed; the snout in the adult males in summer and fall greatly distorted; the premaxillaries prolonged, hooking over the lower jaw, which in turn is greatly elongate and somewhat hooked at tip; the teeth on these bones also greatly enlarged. The body becomes deep and compressed; a fleshy hump is developed before the dorsal fin, and the scales of the back become embedded in the flesh; the flesh, which is red and rich in spring, becomes dry and poor. Salmon, mostly of large size, ascending the rivers tributary to the North Pacific in North America and Asia, spawning in the fall. Only five species are known. The genus is very close to *Salmo*, differing only in the increased number of certain organs. (*ὄγκος*, hook; *ῥύγχος*, snout.)

Concerning the habits and distribution of the salmon we quote the following, based on the observations of Jordan & Gilbert, which has been published elsewhere. (See "The Salmon Family," in Jordan's Science Sketches, 35–82, 1887, A. C. McClurg & Co., Chicago.) Some recent observations of Dr. Gilbert and Dr. Evermann are also included:

> Of the species of *Oncorhynchus*, the Blueback (*O. nerka*) predominates in Fraser River and in the Yukon River, the Silver Salmon (*O. kisutch*) in Puget Sound, the Quinnat (*O. tschawytscha*) in the Columbia and the Sacramento, and the Silver Salmon in most of the streams along the coast. All the species have been seen by us in the Columbia and in Fraser River; all but the Blueback in the Sacramento and in waters tributary to Puget Sound. Only the King Salmon has been noticed south of San Francisco. Its range has been traced as far as Ventura River. Of these species, the King Salmon and Blueback Salmon habitually "run" in the spring, the others in the fall. The usual order of running in the rivers is as follows: *nerka*, *tschawytscha*, *kisutch*, *gorbuscha*, *keta*. According to early authors, the *tschawytscha* precedes *nerka* in Kamchatka.
>
> The economic value of the spring-running salmon is far greater than that of the other species, because they can be captured in numbers when at their best, while the others are usually taken only after deterioration. To this fact the worthlessness of *Oncorhynchus keta*, as compared with the other species, is probably chiefly due.
>
> The habits of the salmon in the ocean are not easily studied. King Salmon and Silver Salmon of all sizes are taken with the seine at almost any season in Puget Sound. This would indicate that these species do not go far from the shore. The King Salmon takes the hook freely in Monterey Bay, both near the shore and at a distance of 6 to 8 miles out. We have reason to believe that these two species do not necessarily seek great depths, but probably remain not very far from the mouth of the rivers in which they were spawned. The Blueback and the Dog Salmon probably seek deeper water, as the former is seldom taken with the seine in the ocean, and the latter is known to enter the Strait of Fuca at the spawning season, therefore coming in from the open sea. The run of the King Salmon and the Blueback begins generally at the last of March; it lasts, with various modifications and interruptions, until the actual spawning season, September to November, the time of running and the proportionate amount in each of the subordinate runs varying with each different river. By the last of July only straggling Bluebacks can be found in the lower course of any stream; but both in the Columbia and in the Sacramento the Quinnat runs in considerable numbers, at least till October. In the Sacramento the run is greatest in the fall, and more run in the summer than in spring. The spring salmon ascends only those rivers which are fed by the melting snows from the mountains, and which have sufficient volume to send their waters well out to sea. Those salmon which run in the spring are chiefly adults (supposed to be at least three years old). Their milt and spawn are no more developed than at the same time in others of the same species which are not to enter the rivers until fall. It would appear that the contact with cold fresh water, when in the ocean, in some way causes them to run toward it, and to run before there is any special influence to that end exerted by the development of the organs of generation. High water on any of these rivers in the spring is always followed by an increased run of salmon. The salmon canners think,

and this is probably true, that salmon which would not have run till later are brought up by the contact with the cold water. The cause of this effect of cold fresh water is not understood. We may call it an instinct of the salmon, which is another way of expressing our ignorance. In general, it seems to be true that in those rivers and during those years when the spring run is greatest, the fall run is least to be depended upon.

It varies for each of the different rivers, and for different parts of the same river. It doubtless extends from July to December. The manner of spawning is probably similar for all the species, but we have no data for any except the Quinnat and the Redfish. In these species the fishes pair off; the male, with tail and snout, excavates a broad, shallow "nest" in the gravelly bed of the stream, in rapid water, at a depth of 1 to 4 feet; the female deposits her eggs in it, and after the exclusion of the milt, they cover them with stones and gravel. They then float down the stream tail foremost. As already stated, a great majority of them die. In the head waters of the large streams, unquestionably all die; in the small streams, and near the sea, an unknown percentage probably survive. The young hatch in about sixty days.

The salmon of all kinds, in the spring, are silvery, spotted or not, according to the species, and with the mouth about equally symmetrical in both sexes. As the spawning season approaches the female loses her silvery color, becomes more slimy, the scales on the back partly sink into the skin, and the flesh changes from salmon-red and becomes variously paler from the loss of oil, the degree of paleness varying much with individuals and with inhabitants of different rivers. In the Sacramento the flesh of the Quinnat, in either spring or fall, is rarely pale. In the Columbia a few with pale flesh are sometimes taken in spring, and a good many in the fall. In Fraser River the fall run of the Quinnat is nearly worthless for canning purposes, because so many are "white-meated." In the spring very few are "white-meated," but the number increases toward fall, when there is every variation, some having red streaks running through them, others being red toward the head and pale toward the tail. The red and pale ones can not be distinguished externally, and the color is dependent upon neither age nor sex. There is said to be no difference in the taste, but there is no market for canned salmon not of the conventional orange color.

As the season advances, the difference between the males and females becomes more and more marked, and keeps pace with the development of the milt, as is shown by dissection. The males have (1) the premaxillaries and the tip of the lower jaw more and more prolonged, both of the jaws becoming, finally, strongly and often extravagantly hooked, so that either they shut by the side of each other like shears, or else the mouth can not be closed. (2) The front teeth become very long and canine-like, their growth proceeding very rapidly, until they are often half an inch long. (3) The teeth on the vomer and tongue often disappear. (4) The body grows more compressed and deeper at the shoulders, so that a very distinct hump is formed; this is more developed in *Oncorhynchus gorbuscha*, but is found in all. (5) The scales disappear, especially on the back, by the growth of spongy skin. (6) The color changes from silvery to various shades of black and red, or blotchy, according to the species. The Blueback turns rosy or brick-red, the Dog Salmon a dull blotchy red, and the Quinnat generally blackish. The distorted males are commonly considered worthless, rejected by the canners and salmon salters, but preserved by the Indians. These changes are due solely to influences connected with the growth of the reproductive organs. They are not in any way due to the action of fresh water. They take place at about the same time in the adult males of all species, whether in the ocean or in the rivers. At the time of the spring runs all are symmetrical. In the fall all males, of whatever species, are more or less distorted. Among the Dog Salmon, which run only in the fall, the males are hook-jawed and red-blotched when they first enter the Strait of Fuca from the outside. The Humpback, taken in salt water about Seattle, have the same peculiarities. The male is slab-sided, hook-billed, and distorted, and is rejected by the canners. No hook-jawed females of any species have been seen. It is not positively known that any fully hook-jawed old male survives the reproductive act. If any do, the jaws must resume the normal form.

On first entering a stream the salmon swim about as if playing. They always head towards the current, and this appearance of playing may be simply due to facing the moving tide. Afterwards they enter the deepest parts of the stream and swim straight up, with few interruptions. Their rate of travel at Sacramento is estimated by Stone at about 2 miles per day; on the Columbia at about 3 miles per day. Those who enter the Columbia in the spring and ascend to the mountain rivers of Idaho, must go at a more rapid rate than this, as they must make an average of nearly four miles per day.

As already stated, the economic value of any species depends in great part on its being a "spring salmon." It is not generally possible to capture salmon of any species in large numbers until they have entered the rivers, and the spring salmon enter the rivers long before the growth of the organs of reproduction has reduced the richness of the flesh. The fall salmon can not be taken in quantity until their flesh has deteriorated; hence, the Dog Salmon is practically almost worthless, except to the Indians, and the Humpback Salmon is little better. The Silver Salmon, with the same breeding habits as the Dog Salmon, is more valuable, as it is found in the inland waters of Puget Sound for a considerable time before the fall rains cause the fall runs, and it may be taken in large numbers with seines before the season for entering the rivers. The Quinnat Salmon, from its great size and abundance, is more valuable than all the other fishes on our Pacific Coast taken together. The Blueback, similar in flesh, but much smaller and less abundant, is worth much more than the combined value of the three remaining species of salmon.

The fall salmon of all species, but especially of the Dog Salmon, ascend streams but a short distance before spawning. They seem to be in great anxiety to find fresh water, and many of them work their way up little brooks only a few inches deep, where they perish miserably, floundering about on the stones. Every stream, of whatever kind, has more or less of these fall salmon.

It is the prevailing impression that the salmon have some special instinct which leads them to return to spawn in the same spawning grounds where they were originally hatched. We fail to find any evidence of this in the case of the Pacific Coast salmon, and we do not believe it to be true. It seems more probably that the young salmon hatched in any river mostly remain in the ocean, within a radius of 20, 30, or 40 miles of its mouth. These, in their movements about in the ocean, may come into contact with the cold waters of their parent rivers, or, perhaps, of any other river, at a considerable distance from the shore. In the case of the Quinnat and the Blueback, their "instinct" seems to lead them to ascend these fresh waters, and, in a majority of cases, these waters will be those in which the fishes in question were originally spawned. Later in the season the growth of the reproductive organs leads them to approach the shore and search for fresh waters, and still the chances are that they may find the original stream. But undoubtedly many fall salmon ascend, or try to ascend, streams in which no salmon were ever hatched. In little brooks about Puget Sound, where the water is not 3 inches deep, are often found dead or dying salmon, which have entered them for the purpose of spawning. It is said of the Russian River and other California rivers, that their mouths, in the time of low water in summer, generally become entirely closed by sand bars, and that the salmon, in their eagerness to ascend them, frequently fling themselves entirely out of water on the beach. But this does not prove that the salmon are guided by a marvelous geographical instinct, which leads them to their parent river in spite of the fact that the river can not be found. The waters of Russian River soak through these sand bars, and the salmon instinct, we think, leads them merely to search for fresh waters. This matter is much in need of further investigation; at present, however, we find no reason to believe that the salmon enter the Rogue River simply because they were spawned there, or that a salmon hatched in the Clackamas River is more likely, on that account, to return to the Clackamas than to go up the Cowlitz or the Des Chutes.

ONCORHYNCHUS:

a. Gill rakers comparatively short and few (20 to 25 in number).

b. Scales very small, more than 200 in a longitudinal series; caudal spots large, oblong. GORBUSCHA, 773.

bb. Scales medium, about 145 (138 to 155) in a longitudinal series; pyloric cœca about 150.

c. Anal rays 13 or 14; black spots small or obsolete; B. 13 or 14. KETA, 774.

cc. Anal rays about 16; back and upper fins with round black spots; B. 15 to 19. TSCHAWYTSCHA, 775.

bbb. Scales comparatively large, about 130 (125 to 135) in a longitudinal series; pyloric cœca 50 to 80. KISUTCH, 776.

HYPSIFARIO, (ὕψι, high; *Fario*, trout):

aa. Gill rakers comparatively long and numerous (30 to 40 in number); scales large; lateral line about 130; back in adults unspotted, clear blue in spring, red in fall; young more or less spotted. NERKA, 777.

Subgenus ONCORHYNCHUS.

773. ONCORHYNCHUS GORBUSCHA (Walbaum).

(HUMPBACK SALMON; HADDO; HOLIA; GORBUSCHA; DOG SALMON of Alaska.)

B. 11 or 12. Gill rakers 13 + 15. A. (developed rays) 15; D. 11; scales 215 (210–240), those of the lateral line larger, 170. Pyloric cœca very slender, about 180. Body rather slender, in the female plump and symmetrical, in the fall males very thin and compressed, with the fleshy dorsal hump much developed and the jaws much elongated, strongly hooked, and with extravagant canines in front. Ventral appendage half the length of the fin. Color bluish; sides silvery; back posteriorly, adipose fin, and tail with numerous black spots; those on the caudal fin particularly large and oblong in form; fall males red, more or less blotched with brownish. Weight 3 to 6 pounds. Pacific Coast and rivers of North America and Asia from Oregon northward; not rare; occasionally taken in the Sacramento[*] where it is called "Lost Salmon." Known at once by the very small size of the scales, and by the coarse oblong spots on the tail. (*Gorbuscha*, the Russian vernacular name in Alaska.)

Salmo gorbuscha, WALBAUM, Artedi Piscium, 69, 1792, Kamchatka; after the Gorbuscha of PENNANT and KRASCHENINNIKOW.

Salmo gibber, BLOCH & SCHNEIDER, Syst. Ichth., 409, 1801, Kamchatka; after KRASCHENINNIKOW.

Salmo proteus, PALLAS, Zoogr. Rosso-Asiatica, III, 376, 1811, Bering Sea; SUCKLEY, Monogr. Salmo, 97, 1861 (1874).

Salmo scouleri, RICHARDSON, Fauna Bor.-Amer., III, 158, 1836, Observatory Inlet.

Salmo tschawytschiformis, SMITT, I Riksmuseeum Befintliga Salmonider, 161, 1886, Port Clarence.

Oncorhynchus proteus, GÜNTHER, Cat., VI, 157, 1866.

Oncorhynchus scouleri, GÜNTHER, Cat., VI, 158, 1866.

Oncorhynchus gorbuscha, JORDAN & GILBERT, Synopsis, 305, 1883.

774. ONCORHYNCHUS KETA (Walbaum).

(DOG SALMON; HAY-KO; LE KAI SALMON.)

Head 4; depth 4. D. 9; A. 13 or 14; scales about 28–150–30; B. 13 or 14, rather broad; gill rakers 9 + 15; pyloric cœca 140–185. General form of the Quinnat, but the head proportionately longer, more depressed and pike-like; the preopercle more broadly convex behind, and the maxillary extending considerably beyond eye. Gill rakers few, coarse, and stout, as in the Quinnat. Accessory pectoral scale short, not half the length of fin. Dusky above; sides paler, little lustrous; back and sides with no defined spots, but only fine specklings, which are often entirely obsolete; head dusky, scarcely any metallic luster on head or tail; caudal dusky, plain, or very finely maculate, its edge usually distinctly blackish; fins all mostly blackish, especially in males; breeding males generally blackish above, with sides brick-red, often barred or mottled. Weight about 12 pounds. San Francisco to Kamchatka, ascending all streams in the fall, and spawning at no great distance from the sea; abundant in Bering Straits. At the time of its run the males of this species are much distorted and the flesh has little value. (*Keta*, a vernacular name in Kamchatka.)

---

[*] This species appears in Alaska every year and in great abundance. In Puget Sound it comes each alternate year only, the odd year (1891, 1893, etc.). In the Sacramento each year, but in very small numbers. It ascends the Sacramento as far as Shasta County.

Salmo keta vel kayko, Walbaum, Artedi Piscium, 72, 1792, Rivers of Kamchatka; after the *keta* or *kayko* of Pennant and Krascheninnikow; Bloch & Schneider, Syst. Ichth., 407, 1801.

Salmo lagocephalus, Pallas, Zoogr. Ross.-Asiatica, iii, 372, 1811, Bering Sea.

? *Salmo japonensis*, Pallas, Zoogr. Ross.-Asiatica, iii, 382, 1811, Curile Islands; Amur River.

Salmo dermatinus, Richardson, Voyage Herald, Zoöl., 167, 1854, Yukon River.

Salmo consuetus, Richardson, Voyage Herald, Zoöl., 168, 1854, Yukon River.

Salmo canis, Suckley, Ann. Lyc. Nat. Hist. N. Y., 1858, 9, and Monogr. Salmo, 101, 1861 (1874),[*] Puget Sound.

Oncorhynchus lagocephalus, Günther, Cat., vi, 161, 1866.

Oncorhynchus keta, Jordan & Gilbert, Synopsis, 305, 1883.

775. ONCORHYNCHUS TSCHAWYTSCHA (Walbaum).

(Quinnat Salmon; Tchaviche; King Salmon; Columbia Salmon; Sacramento Salmon; Chinook Salmon; Tyee Salmon; Saw-kwey; Tschawytscha.)

Head 4; depth 4. B. 15 or 16 to 18 or 19, the number on the two sides always unlike. D. 11; A. 16. Gill rakers usually 9 + 14 (*i. e.*, 9 above the angle and 14 below). Pyloric cœca 140 to 185; scales usually 27–146–29, the number in a longitudinal series varying from 140 to 155, and in California specimens occasionally as low as 135. Vertebræ 66. Head conic, rather pointed in the females and spring males. Maxillary rather slender, the small eye behind its middle. Teeth small, longer on sides of lower jaw than in front; vomerine teeth very few and weak, disappearing in the males. In the males in late summer and fall the jaws become elongate and distorted, and the anterior teeth much enlarged, as in the related species. The body then becomes deeper, more compressed, and arched at the shoulders, and the color often nearly black. Preopercle and opercle strongly convex. Body comparatively robust, its depth greatest near its middle. Ventrals inserted behind middle of dorsal, ventral appendage half the length of the fin; caudal, as usual in this genus, strongly forked, on a rather slender caudal peduncle. Color dusky above, often tinged with olivaceous or bluish; sides and below silvery; head dark slaty, usually darker than the body and little spotted; back, dorsal fin, and tail usually profusely covered with round black spots (these are sometimes few, but very rarely altogether wanting); sides of head and caudal fin with a peculiar metallic tin-colored luster; male, about the spawning season (October), blackish, more or less tinged or blotched with dull red. Flesh red and rich in spring, becoming paler in the fall as the spawning season approaches. Length 2 to 5 feet. Usual weight in the Columbia River 22 pounds, in the Sacramento 16 to 18 pounds; in smaller rivers still less, but individuals of 70 to 100 pounds have been taken. Alaska, Oregon, and California, southward to Ventura River, and to northern China, ascending all large streams; especially abundant in the Columbia and Sacramento rivers, where it is the principal salmon. It ascends[†] the large streams in spring and summer, moving up, without feeding, until the spawning season, by which time many of those which started first may have traveled more than 1,000 miles. It ascends the Snake River to the neighborhood of Upper Salmon Falls, where it spawns in October and November. In the Salmon River of Idaho it ascends to the head waters, more than 1,000 miles from the sea, where it spawns in August and early September when the water has reached a temperature of about 54° F. After spawning, most or all of those which have reached the upper waters perish from exhaustion. It is by far the most valuable of our salmon. It has lately been introduced into eastern streams. (*Tschawytscha*, better spelled by earlier writers *Tchaviche*, the vernacular name in Alaska and Kamchatka.)

---

[*] Dr. Suckley's monograph of the genus Salmo was written in 1861, but not actually printed and published until 1874.

[†] The usual order of salmon running in the streams of Oregon and Washington is *nerka*, *tschawytscha*, *kisutch*, *gorbuscha*, and *keta*. Those which start first go farthest.

Salmo tschawytscha, Walbaum, Artedi Piscium, 71, 1792, rivers of Kamchatka; after the *Tschawitscha* of Krascheninnikow, Descr. Kamchatka, 178, 1768, and the *Tschawytscha* of Pennant, 1792; Bloch & Schneider, Syst. Ichth., 407, 1801.

Salmo orientalis, Pallas, Zoogr. Ross.-Asiat., III, 367, 1811, Kamchatka.

Salmo quinnat, Richardson, Fauna Bor.-Amer., III, 219, 1836, Columbia River; and of many writers.

Fario argyreus, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 218, Cape Flattery; Fort Steilacoom.

Salmo confluentus, Suckley, Ann. Lyc. Nat. Hist. N. Y., December, 1858, and Pacific R. R. Surv., XII, Part 2, 334, 1860, Puyallup River, near Fort Steilacoom; (Coll. Suckley); and Monogr. Salmo, 109, 1861 (1874).

Salmo argyreus, Suckley, Pacific R. R. Surv., XII, Part 2, 326, 1860, and Monogr. Salmo, 110, 1861 (1874).

Oncorhynchus quinnat, Günther, Cat., VI, 158, 1866; Jordan, Proc. U. S. Nat. Mus., 1878, 69.

Oncorhynchus orientalis, Günther, Cat., VI, 159, 1866.

Oncorhynchus chouicha,† Jordan & Gilbert, Synopsis, 306, 1883.

776. ONCORHYNCHUS KISUTCH (Walbaum).

(Silver Salmon; Kisutch; Skowitz; Hoopid Salmon; Coho Salmon; Bielaya Ryba; Quisutsch.)

Head 4; depth 4. B. 13 or 14. Pyloric cœca very few and large, 63 (45 to 80); gill rakers 10 + 13, rather long and slender, nearly as long as eye, toothed; scales 25–127–29. D. 10; A. 13 or 14 (developed rays). Body rather elongate, compressed. Head short, exactly conical, terminating in a bluntly pointed snout, which is longer and broader than the lower jaw; head shorter than in a young Quinnat of the same size. Interorbital space broad and strongly convex. Opercle and preopercle strongly convex behind; the preopercle very broad, with the lower limb little developed; cheeks broad. Eye quite small, much smaller than in young Quinnat of the same size. Suborbital very narrow, with a row of mucous pores along its surface; maxillary slender and narrow, but extending somewhat beyond the eye. Teeth very few and small, only two or three on the vomer; those on tongue very feeble. Fins small. Pectorals and ventrals short, the ventral appendage three-fifths the length of the fin; caudal strongly forked, on a slender peduncle. Bluish green; sides silvery, with dark punctulations; no spots except a few rather obscure on top of head, back, dorsal fin, adipose fin, and the rudimentary upper rays of the caudal; rest of the caudal fin unspotted; pectorals dusky tinged; anal with dusky edging; sides of head without the dark coloration seen in the Quinnat; males mostly red in fall, and with the usual changes of form. Length 15 inches. Weight 3 to 8 pounds. A small salmon, ascending streams in the fall to no great distance. Abundant from San Francisco northward, especially in Puget Sound and the Alaskan fjords; south on the Asiatic coasts to Japan. (*Kisutch*, the vernacular name in Alaska and Kamchatka; called by the Russians *Bielaya Ryba*, or whitefish.)

Oncorhynchus tsuppitch, Jordan, Forest and Stream, September 16, 1880, 130

Oncorhynchus kisutch, Jordan & Gilbert, Synopsis, 307, 1883.

Subgenus HYPSIFARIO, Gill.

777. ONCORHYNCHUS NERKA (Walbaum).

(Blue-back Salmon; Redfish; Fraser River Salmon; Saw-Qui Salmon; Krasnaya Ryba.

Head 4; depth 4. B. 13 to 15; D. 11; A. 14 to 16; scales 20–133–20; pyloric cœca 75 to 95; vertebræ 64. Gill rakers about 32 to 40, usually 14 or 15 + 22 or 23, as long as eye. Body elliptical, rather slender. Head short, sharply conic, pointed, the lower jaw included. Maxillary rather thin and small, extending beyond eye. Teeth all quite small, most of them freely movable; vomer with about 6 weak teeth, which grow larger in fall males, instead of disappearing. Preopercle very wide and convex; opercle very short, not strongly convex. Preopercle more free behind than in *O. tschawytscha*. Ventral scale about half the length of the fin. Caudal fin narrow, widely forked; anal fin long and low; dorsal low. Flesh deep red. Males becoming extravagantly hook-jawed in the fall, the snout being then prolonged and much raised above the level of rest of head, the lower jaw produced to meet it; mandible 1⅓ in head in fall males, 1¾ in females; snout 2¼ in head in fall males, 3½ in females. Color clear bright blue above; sides silvery, this hue overlying the blue of the back; lower fins pale, upper dusky; no spots anywhere in adults in spring; the young with obscure black spots above.

Color of breeding male: back blood red, with dark edges to some of the scales; middle of side darker red, but unevenly so, usually darkest at middle of body; under parts dirty white, with numerous fine dark dustings; head above and on sides pale olivaceous, some darker mottling on sides; tip of nose and sides of jaws dark, under part of lower jaw white; dorsal pale red, anal darker red; adipose fin red; ventrals and pectorals smoky, some red at base. Color of breeding female essentially the same, rather darker on the sides. Length 2 feet; weight 3½ to 8 pounds. Klamath and Rogue rivers northward to Kamchatka and Japan; generally abundant, especially northward; ascending streams in spring to great distances, and often frequenting mountain lakes in fall, spawning in their small tributaries; one of the most graceful of the *Salmonidæ*, scarcely inferior to the Quinnat when fresh, but the flesh more watery and less valuable when canned. The principal salmon of Alaska.

---

* Misprinted *hisutch* by Walbaum. the error corrected in the errata. The name *milktschitsch* has a few lines of priority over *kisutch*, but we are not absolutely sure that it belongs to the same species.

The Redfish is known to ascend to the small lakes of Alaska, British Columbia, Washington, Oregon, and Idaho, and to spawn in their inlets. Dr. Bean has observed it at Karluk Lake in Alaska, Dr. Dawson and Prof. John Macoun in British Columbia, Prof. O. B. Johnson at Lake Washington, Dr. Gilbert at Wallowa Lake in Oregon, while we have recently studied it on its spawning beds in the inlets to Alturas, Pettit, and Big Payette lakes in Idaho. This species enters the Columbia River with the spring run of the Chinook Salmon, but does not reach the lakes of Idaho until August. We observed them spawning in the shallow water of the inlets on beds of fine gravel and sand, which they scoop up into considerable heaps. The temperature of the water at Alturas and Pettit lakes, September 12, was 45° F., and the same temperature was found at Big Payette Lake September 27.

Two distinct and widely different sizes of the Redfish are found sexually mature, the large form described above, and a small form which is mature at a foot or less in length; and no specimens of intermediate size have been observed. The average weight of six spawning fish of the large form examined at Alturas Lake was 3 pounds 3½ ounces, the minimum and maximum being 2 pounds 5 ounces (a spent female), and 3 pounds 10½ ounces. The average weight of twenty-nine individuals of the small form obtained the same day and from the same stream was 6⅓ ounces, the extremes being 4½ (a spent female) and 9 ounces, respectively.

These little fish, which have been known as the Little Redfish or Kennerly's Salmon, have been regarded as being a landlocked variety, distinct from *O. nerka*. We are not able to discover any structural differences between the two. We have found them breeding at the same time and in the same stream. The mutilations and frayed-out fins point to the probability of their having made the long journey from the sea; indeed, Dr. Gilbert has traced their migration from the mouth of the Columbia to Wallowa Lake. There is no more evidence that they are landlocked than that the large ones are, and if they are not younger individuals of the regular *nerka*, they should be assigned specific rather than subspecific rank.

The fins of the little Redfish were observed to be frayed out and mutilated quite as generally as were those of the large ones, and many dead ones of each size were seen. It is doubtful if any which ascend to the Idaho lakes ever return to the sea, but all probably die after spawning.

The color of the breeding male of the small form is dirty red, brightest on middle of side; back with about 15 round black spots before the dorsal and an equal number behind it; lower parts colored as in the large fish; top and sides of head dark greenish olive; snout black; lower jaw white, with black tip; dorsal pale red; anal dirty red; other fins dark smoky. Female darker than the male; not greatly different in color from the black speckled trout. (*nerka*, a Russian name.)

Salmo nerka, Walbaum, Artedi Piscium, 71, 1792; after the *Nerka* of Pennant, the *Narka* of Kraschininnikow, rivers and seas of Kamchatka; Bloch & Schneider, Syst. Ichth., 417, 1801; after Pennant and Kraschininnikow.

235. SALMO (Artedi) Linnæus.

(Salmon and Trout.)

Salmo (Artedi, Genera Piscium) Linnæus, Syst. Nat., Ed. x, 1758, 308, (*salar*, etc).

Truttæ, Linnæus, Syst. Nat., Ed. x, 1758, 308, (*trutta*, etc.: "*Truttæ corpore variegato*").

Fario, Cuvier & Valenciennes, Hist. Nat. Poiss., XXI, 277, 1848, (*argenteus* = *trutta*).

Salar, Cuvier & Valenciennes, Hist. Nat. Poiss., XXI, 314, 1848, (*ausonii* = *fario*).

Trutta, Siebold, Süsswasserfische Mittel Europa, 280, 1863, (*trutta*).

Body elongate, somewhat compressed. Mouth large; jaws, palatines, and tongue toothed, as in related genera; vomer flat, its shaft not depressed, a few teeth on the chevron of the vomer, behind which is a somewhat irregular single or double series of teeth, which in the migratory forms are usually deciduous with age. Scales large or small, 110 to 200 in a longitudinal series. Dorsal and anal fins short, usually of 10 to 12 rays each; caudal fin truncate, emarginate or forked, its peduncle comparatively stout. Sexual peculiarities variously developed; the males in typical species with the jaws prolonged and the front teeth enlarged, the lower jaw being hooked upward at the end and the upper jaw emarginate or perforate. In the larger and migratory species these peculiarities are most marked. Species of moderate or large size, black-spotted, abounding in the rivers and lakes of North America, Asia, and Europe; no fresh-water species occurring in America east of the Mississippi Valley; two Atlantic species, marine and anadromous. The non-migratory species (subgenus *Trutta*) are in both continents extremely closely related, and difficult to distinguish, if indeed all be not necessarily regarded as forms of a single one. The excessive variations in color and form have given rise to a host of nominal species.* (*Salmo*, the Latin name of *Salmo salar*, originally from *salio*, to leap.)

The following observations on the species of trout are taken, with some slight abridgment and alteration, from Dr. Günther's account of this family. (Cat. Fish. Brit. Mus., VI, 3–5, 1866):

There is no other group of fishes which offers so many difficulties to the ichthyologist, with regard to the distinction of the species, as well as to certain points in their life history, as this genus. * * * The almost infinite variations of these fishes are dependent on age, sex, and sexual development, food, and the properties of the water. * * * The coloration is, first of all, subject to variation, and consequently this character but rarely assists in distinguishing a species, there being not one which would show in all stages the same kind of coloration. The young in all the species of this genus are barred, and this is so constantly the case that it may be used as a generic or even as a family character, not being peculiar to *Salmo* alone, but also to *Thymallus* and probably to *Coregonus*. The number of bars is not quite constant, but the migratory trout have two (or even three) more than the river trout. When the *Salmones* have passed this "parr" state the coloration becomes much diversified. The males, especially during and immediately after the spawning time, are more intensely colored and variegated than the females, specimens not mature retaining a brighter silvery color, and being more similar to the female fish. Food appears to have less influence on the coloration of the outer parts than on that of the flesh; thus, the more variegated specimens are frequently out of condition, whilst well-fed individuals, with pinkish flesh, are of more uniform though bright colors. * * * The water has a marked influence on the colors. Trout with intense ocellated spots are generally found in clear, rapid rivers and in alpine pools; in the large lakes, with pebbly bottom, the fish are bright silvery, and the ocellated spots are mixed with or replaced by X-shaped black spots; in dark holes, or lakes with peaty bottom, they often assume an almost uniform blackish coloration.

The brackish or salt water has the effect of giving them a bright silvery coat, without or with few spots, none of them ocellated. With regard to size, the various species do not present an equal amount of variation. Size appears to depend upon the abundance of the food and the extent of the water. Thus, the migratory species do not appear to vary considerably in size, because they find the same conditions in all the localities inhabited by them. A widely-spread species, however, like *Salmo fario* [or in America, *Salmo mykiss*], when it inhabits a small mountain pool, with scanty food, never attains a weight of 8 ounces, while in a large lake or river, where it finds an abundance of food, it attains to a weight of 14 or 16 pounds. Such large river trout are frequently named or described as Salmon trout, Bull trout, Steelheads, etc.

---

* European writers have described numerous hybrids among the various species of *Salmo*, real and nominal, found in their waters; as also among the various European *Cyprinidæ*. We have thus far failed to find the slightest evidence of any hybridism either among our American *Salmonidæ* or *Cyprinidæ*, in a state of nature. Puzzling aberrant or intermediate specimens certainly occur, but such are not necessarily "hybrids."

The proportion of the various parts of the body to one another vary exceedingly, in the same species, with age, sex, and condition.

The fins vary to a certain degree. The variation in the number of rays in any one genus (except *Oncorhynchus*) is inconsiderable, and of no value for specific distinction. Although some species appear to be distinguished by a comparatively low dorsal and anal fin, yet the proportion of the height of these fins to their length is a rather uncertain character. In most of the species the fin rays are longer during the stages of growth or development. The caudal fin especially undergoes changes with age. Young specimens of all species have this fin more or less deeply excised, so that the young of a species which has the caudal emarginate throughout life is distinguished by a deeper incision of the fin from the young of a species which has it truncate in the young state. The individuals of the same species do not all attain to maturity at the same size.

Finally, to complete our enumeration of these variable characters, we must mention that in old males, during and after the spawning season, the skin on the back becomes thickened and spongy, so that the scales are quite invisible or hidden in the skin.

After this cursory review of variable characters, we pass on to those which we have found to be constant in numbers of individuals, and in which it is difficult to perceive signs of modification due to external circumstances.

Such characters, according to the views of the zoölogists of the present age, are sufficient for the definition of species; at all events, in every description they ought to be noticed, and the confused and unsatisfactory state of our knowledge of Salmonoids is chiefly caused by authors having paid attention to the more conspicuous but unreliable characters, and but rarely noted one of those which are enumerated here:

1. The form of the preoperculum of the adult fish.

2. The width and strength of the maxillary of the adult fish. In young specimens and in females the maxillary is proportionately shorter than in the adult.

3. The size of the teeth, those of the premaxillaries excepted.

4. The arrangement and permanence of the vomerine teeth.

5. The development or absence of teeth on the hyoid bone. In old examples these are often lost, and their absence in a species usually provided with them is not uncommon.

6. The form of the caudal fin in specimens of a given size, age, or sexual development.

7. The size of the scales, as indicated by counting the number of transverse rows above the lateral line. The scales of the lateral line are always more or less enlarged or irregular and the number of scales should be ascertained higher up; this is one of the most constant and valuable of all the specific characters.

8. A great development of the pectoral fins, when constant in a number of specimens from the same locality.

9. The number of vertebræ.
10. The number of pyloric cœca.
11. The number of gill rakers.

SALMO. Salmon; species anadromous:

a. The vomerine teeth little developed, those on the shaft of the bone few and deciduous; scales large, about 120 in the lateral line; no hyoid teeth; sexual differences strong; breeding males with the lower jaw hooked upward, the upper jaw emarginate or perforate to receive its tip. Size large. SALAR, 778.

TRUTTA (Low Latin *Trutta*, French *Truite*, hence Trout). Trout; species not anadromous or only partially so:

aa. The vomerine teeth well developed, those on the shaft of the bone numerous, persistent, arranged in one zigzag row, or in two alternating rows; sexual differences less marked, but similar in general character to those seen in the salmon.

b. Scales always small, usually about in 160 (150 to 200) cross series; a large deep red or scarlet dash on each side concealed below the inner edge of each dentary bone, this rarely obsolete; lower fins red or yellowish; usually no red lateral band; mouth large, the maxillary 1⅗ to 2¼ in head; hyoid teeth (on hypobranchial of second gill arch) usually present, but very small; size various. MYKISS, 779.

bb. Scales moderate, usually about in 150 cross series (130 to 180); no red dash on dentaries; a reddish lateral band usually present; form rather stout; mouth moderate, the maxillary 2 in head; hyoid teeth wanting so far as known; size very large. GAIRDNERI, 780.

bbb. Scales typically large, in 120 to 130 cross series, but varying from 115 to 180; usually no red on dentaries; a red or yellow lateral band; form stout; mouth small, the maxillary 2 to 2½ in head; no hyoid teeth; size rather small. IRIDEUS, 781.

Subgenus SALMO.

778. SALMO SALAR, Linnæus.

(COMMON ATLANTIC SALMON.)

Head 4; depth 4. B. 11; D. 11; A. 9; scales 23–120–21; vertebræ 60; pyloric cœca about 65. Body moderately elongate, symmetrical, not greatly compressed. Head rather low. Mouth moderate, the maxillary reaching just past the eye, its length 2½ to 3 in head; in young specimens the maxillary is proportionately shorter. Preoperculum with a distinct lower limb, the angle rounded. Scales comparatively large, rather largest posteriorly, silvery and well imbricated in the young, becoming embedded in adult males. Coloration in the adult, brownish above, the sides more or less silvery, with numerous black spots on sides of head, on body, and on fins, and red patches along the sides in the males; young specimens (parrs) with about 11 dusky crossbars, besides black spots and red patches; the color, as well as the form of the head and body, varying much with age, food, and condition; the black spots in the adult often X-shaped or XX-shaped. Weight 15 to 40 pounds. North Atlantic, ascending all suitable rivers in northern Europe and the region north of Cape Cod to Hudson Bay; formerly abundant in the Hudson and occasional in the Delaware, its northern limit in the Churchill, Albany, and Moose rivers, flowing into Hudson Bay; sometimes perfectly landlocked in lakes in Maine and northward, where its habits and coloration (but no tangible specific characters) change somewhat, when it becomes (in America) vars. *sebago* and *ouananiche*. Similar landlocked varieties occur in Europe. One of the best known and most valued of food-fishes, the flesh rich and oily; orange or "salmon color" when the fish is in condition. (*Salar*, an old name, from *salio*, to leap.)

Salmo salar, Linnæus, Syst. Nat., Ed. x, 1758, 308, Seas of Europe; Günther, Cat., vi, 11, 1866, and of nearly all authors; Suckley, Monogr. Salmo, 143, 1861 (1874); Jordan & Gilbert, Synopsis, 312, 1883.

Salmo mas, Walbaum, Artedi Pisc., 58, 1792, Germany; based on "Der Hakenlachs" of Bloch.

Salmo omisco maycus, Walbaum, Artedi Pisc., 65, 1792, Hudson Bay; after Pennant, Arctic Zoöl., Introd., 192, 1792.

Salmo gloveri, Girard, Proc. Ac. Nat. Sci. Phila., 1854, 85, Union River, Maine; (Coll. M. Townsend Glover); Günther, Cat., vi, 153, 1866.

Represented in lakes of Maine, New Hampshire, and New Brunswick by the landlocked

778a. SALMO SALAR SEBAGO (Girard).

(Landlocked Salmon.)

Smaller in size, rather more plump in form, and nonmigratory, not otherwise evidently different. Sebago Pond and northward, introduced into lakes in various parts of the country; seldom entering streams; reaches a weight of 25 pounds.

Salmo sebago, Girard, Proc. Ac. Nat. Sci. Phila., 1853, 380, Sebago Lake, Maine; Günther, Cat., vi, 153, 1866.

Represented in Lake St. John, Saguenay River, and neighboring waters of Quebec by the landlocked

778b. SALMO SALAR OUANANICHE, McCarthy MS., new subspecies.

(Ouananiche; Winninish.)

Still smaller, rarely reaching a weight of 7½ pounds and averaging 3½. An extremely vigorous and active fish, smaller and more active than ordinary salmon, but so far as known not structurally different. Saguenay River, Canada (outlet of Lake St. John), and neighboring waters. (*Ouananiche*,[*] the Indian name.)

Ouananiche,[†] Eugene McCarthy, Forest and Stream, March 10, 1894, 206, Saguenay River; and of anglers generally.

Subgenus TRUTTA, Linnæus.

779. SALMO MYKISS, Walbaum.

(Cut-throat Trout; Black-spotted Trout; Rocky Mountain Trout; Sa-pen-que, or good fish.)

Scales in general smaller than in the European Trout,[‡] *Salmo trutta*, the number of oblique cross series counted above the lateral line varying from 160 to 190. Back and sides with dark spots. Caudal fin subtruncate or with shallow fork.

---

[*] The word ouananiche is from the dialect of the Montagnais Indians who inhabit the country about Lake St. John. They have always been familiar with this fish, and, understanding its derivation, have properly named it "*ouanan*," meaning salmon, and "*ichi*," the diminutive—"the little salmon."—*McCarthy*.

[†] "The Ouananiche were born and grew to full size in the rough tributaries and outlet of Lake St. John, in waters than which none can be wilder or more rough. They are found where the water boils and tumbles the most, rarely in still water. * * * They are a terribly strong fish, able to ascend through the swiftest current or mount the wildest fall. * * * Born of fighting stock, he fights his native element constantly, and he fights his foe, the fisherman, as well. * * * There is nothing that can make me believe that any fish can exceed, or even equal, quite, the king of fresh-water fish, the gamiest of all, the Ouananiche of Lake St. John."—*McCarthy*.

[‡] *Salmo trutta*, L., the half migratory Salmon Trout, and its fresh-water representative or subspecies, the Brook Trout or Brown Trout, *Salmo fario*, L. This species, with some of its varieties (for example, the Loch Leven Trout, var. *levenensis*), has been largely introduced in the streams and lakes of the United States.

A very widely distributed species, found in all clear streams of the Rocky Mountains and Sierra Nevada, from Kamchatka and Alaska to Chihuahua and northern California, and often entering the sea. It is exceedingly variable, being subject to many local changes, and its extreme forms show a degree of variation rarely met within the limits of a single species.

Among the various more or less tangible varieties and forms of American trout, three distinct series appear which we here provisionally retain as distinct species; these may be termed the Cut-throat Trout series, the Steelhead series, and the Rainbow Trout series. The Steelhead series, *Salmo gairdneri*, is characterized by moderate scales (150 to 180 series), moderate mouth, red lateral band and the absence of red between the branches of the lower jaw. The *irideus* or Rainbow Trout series has usually large scales, small mouth, a red lateral band and usually no red below the lower jaw. The Cut-throat Trout, *Salmo mykiss*, in its various forms, has smaller scales (150 to 190 series), a larger mouth, always a distinct red blotch between the branches of the lower jaw, and usually no red lateral band.

The Steelhead or *gairdneri* series is found in the coastwise streams of California and in the streams of Oregon and Washington, below the Great Shoshone Falls of the Snake River. In the lower course of the Columbia, and in neighboring waters, they are entirely distinct from the "Cut-throat" or *mykiss* forms, and no one could question the validity of the two species. In the lower Snake and in other waters east of the Cascade range, the two forms or species are indistinguishable, being either undifferentiated or else inextricably mingled. The proper interpretations of these facts, lately discovered by Dr. Gilbert, is yet to be shown. The *irideus* forms are chiefly confined to the streams of California and Oregon. The *mykiss* series inhabit the waters from Humboldt Bay northward, the coastwise streams of northern California, the head waters of the Columbia and Snake rivers, and all the clear streams on both sides of the Rocky Mountains, and in the Great Basin.

Along the western slope of the Sierra Nevada there are also forms of trout with the general appearance of *gairdneri*, but with scales intermediate in number (McCloud River), or with scales as small as in the typical *mykiss* (Kern River). In these smaller-scaled forms more or less red appears below the lower jaw, and they are doubtless in fact what they appear to be, really intermediate between *mykiss* and *gairdneri*. A similar series of forms occurs in the Columbia Basin, the Upper Snake being inhabited by *mykiss*, the lower basin of the Snake, as above stated, by *gairdneri* and *mykiss*, together with a medley of intermediate forms.

Concerning the trout of the Upper Columbia Basin, Gilbert and Evermann observe (Investigations Columbia River Basin, 50, 1894):

> "With every additional collection of black-spotted trout it becomes increasingly difficult to recognize any of the distinctions, specific or subspecific, which have been set up. The present collection [from Idaho and Washington] adds not a little to the difficulty. We are now convinced that the greater number of the subspecies of *Salmo mykiss* have no sufficient foundation.

We find our specimens from the Upper Snake River (Ross Fork and Mink Creek at Pocatello) to be typical *mykiss* [*Salmo mykiss lewisi* of the present work; see page 493], having smaller scales, in 176 to 180 transverse rows, and a deep-red dash on inner side of mandibles. The spots are most abundant posteriorly, and the specimens are scarcely to be distinguished from the so-called *Salmo mykiss pleuriticus* of the Colorado River. When taken in the larger river channels the fish is lighter colored, with finer spots and fainter red marks on lower jaw.

"Between such typical *mykiss* and the form represented in our collection from such coastwise streams [*Salmo irideus masoni* of this work; see page 501], as the Newaukum River at Chehalis, Washington, there seems to be a wide difference. The latter has conspicuously larger scales (in 120 to 130 crossrows) and no red streak on lower jaw. The sea-run individuals of the latter kind we believe to be the Steelhead (*S. gairdneri*), and between it and the *mykiss* we are now unable to draw any sharp line. Thus the specimens from Wood River, Idaho, have fine scales (150 to 163 transverse rows) and have usually no red dash under the jaw. Some specimens show traces of the latter, and in such it is usually faint and irregular. From the Umatilla River at Pendleton, the Natches River at North Yakima, and the Pataha River at Starbuck, Washington, the scales are intermediate in size, ranging from 142 to 163 in number, averaging perhaps 148. In these [*Salmo mykiss gibbsii* of this work; see page 493] the lower jaw shows no red.

"Specimens from the Cœur d'Alene region have the red dashes usually very distinct, but vary greatly in the size of their scales. Examples from Wardner look much like typical *mykiss*, with 165 to 170 scales. From Cœur d'Alene Lake we find 130 to 166, with the average about 145, while from the Little Spokane River at Dart's Mill specimens with conspicuous red dash on mandibles have the scales averaging 125 in number.

"Trout from the Green River at Hot Springs, Washington, and from the Newaukum River at Chehalis have also 123 to 130 scales. We think it not unlikely that the coastwise forms should be recognized as *Salmo mykiss gairdneri*, though the question is sadly in need of systematic and thorough investigation."—*Gilbert & Evermann.*

Since the above was written, Dr. Gilbert has verified the fact discovered by him in 1880, that in the streams about Astoria, near the mouth of the Columbia, *Salmo mykiss* and *Salmo gairdneri* occur together and are perfectly distinct and both easily and unquestionably distinguishable from a third form, here called *masoni*, found in the brooks of the same region and not descending to the sea. As already stated, the interpretation of these facts is yet to be given.

It seems not improbable that the American Trout originated in Asia, extended its range southward to the Upper Columbia, thence to the Yellowstone and Missouri; from the Missouri southward to the Platte and the Arkansas, thence from the Platte to the Rio Grande and the Colorado, and from the Colorado across the Sierra Nevada to Kern River,[*] thence northward and coastwise, the sea-running forms passing from stream to stream, as far north as Frazer River, where the variety *kamloops* would mark one extreme of the series, and reentering as a distinct species the waters long occupied by typical *mykiss*. The present writers have elsewhere[†] shown that, beyond a doubt, the Trout of the Yellowstone and the Upper Missouri is derived directly from that of the Upper Snake River. To this day the Yellowstone and the Snake are connected by two streams crossing the main divide of the Rocky Mountains from the Yellowstone to the Snake across Two-Ocean Pass.

---

[*] It may be that the trout of the Sierra Nevada in California originated from the Lahontan stock (*Salmo mykiss henshawi*), rather than from the Colorado River. There are localities between the Truckee Valley and that of the American River or the Feather River, where it is conceivable that such a transfer might have taken place. Or it may be that the California trout are descended through the Steelhead from the trout of the Middle Columbia. This interesting subject merits the fullest investigation. (See Jordan, on How the Trout came to California, in Recreation, Vol. I, No. 1, October, 1894, 5–11.)

Evermann, Two-Ocean Pass, in Proc. Ind. Ac. Sci., 1892, 29–34, pl. I.

Evermann, Two-Ocean Pass, in Pop. Sci. Month., June, 1895, with plate.

Professor Evermann has elsewhere described the locality as follows:

Two-Ocean Pass is a high mountain meadow, about 8,200 feet above the sea and situated just south of the Yellowstone National Park, in longitude 110° 10′ W., latitude 44° 3′ N. It is surrounded on all sides by rather high mountains except where the narrow valleys of Atlantic and Pacific creeks open out from it. Running back among the mountains to the northward are two small canyons down which come two small streams. On the opposite side is another canyon down which comes another small stream. The extreme length of the meadow from east to west is about a mile, while the width from north to south is not much less. The larger of the streams coming in from the north is Pacific Creek, which, after winding along the western side of the meadow, turns abruptly westward, leaving through a narrow gorge. Receiving numerous small affluents, Pacific Creek soon becomes a good-sized stream, which finally unites with Buffalo Creek a few miles above where the latter stream flows into Snake River.

Atlantic Creek was found to have two forks entering the pass. At the north end of the meadow is a small wooded canyon down which flows the North Fork. This stream hugs the border of the flat very closely. The South Fork comes down the canyon on the south side, skirting the brow of the hill a little less closely than does the North Fork. The two, coming together near the middle of the eastern border of the meadow, form Atlantic Creek which, after a course of a few miles flows into the Upper Yellowstone. But the remarkable phenomena exhibited here remain to be described.

Each fork of Atlantic Creek, just after entering the meadow, divides as if to flow around an island, but the stream toward the meadow, instead of returning to the portion from which it had parted, continues its westerly course across the meadow. Just before reaching the western border the two streams unite and then pour their combined waters into Pacific Creek; thus are Atlantic and Pacific creeks united and a continuous water way from the Columbia via Two-Ocean Pass to the Gulf of Mexico is established.

Pacific Creek is a stream of good size long before it enters the pass, and its course through the meadow is in a definite channel, but not so with Atlantic Creek. The west bank of each fork is low and the water is liable to break through anywhere and thus send part of its water across to Pacific Creek. It is probably true that one or two branches always connect the two creeks under ordinary conditions, and that following heavy rains or when the snows are melting, a much greater portion of the water of Atlantic Creek crosses the meadow to the other side.

Besides the channels already mentioned, there are several more or less distinct ones that were dry at the time of our visit. As already stated the pass is a nearly level meadow, covered with a heavy growth of grass and many small willows 1 to 3 feet high. While it is somewhat marshy in places it has nothing of the nature of a lake about it. Of course during wet weather the small springs at the borders of the meadow would be stronger, but the important facts are that there is no lake or even marsh there and that neither Atlantic nor Pacific Creek has its rise in the meadow. Atlantic Creek in fact comes into the pass as two good-sized streams from opposite directions and leaves it by at least four channels, thus making an island of a considerable portion of the meadow. And it is certain that there is, under ordinary circumstances, a continuous water way through Two-Ocean Pass of such a character as to permit fishes to pass easily and readily from Snake River over to the Yellowstone, or in the opposite direction. Indeed, it is quite possible, barring certain falls in the Snake River, for a fish so inclined to start at the mouth of the Columbia, travel up that great river to its principal tributary, the Snake, thence on through the long, tortuous course of that stream, and, under the shadows of the Grand Teton, enter the cold waters of Pacific Creek, by which it could journey on up to the very crest of the Great Continental Divide,—to Two-Ocean Pass; through this pass it may have a choice of two routes to Atlantic Creek, in which the down-stream journey is begun. Soon it reaches the Yellowstone, down which it continues to Yellowstone Lake, then through the lower Yellowstone out into the turbid waters of the Missouri; for many hundred miles it may continue down this mighty river before reaching the Father of Waters, which will finally carry it to the Gulf of Mexico—a wonderful journey of nearly 6,000 miles—by far the longest possible fresh-water journey in the world.

We found trout in Pacific Creek at every point where we examined it. In Two-Ocean Pass we found trout in each of the streams and in such positions as would have permitted them to pass easily from one side of the divide to the other. We also found trout in Atlantic Creek below the pass, and in the upper Yellowstone they were abundant. Thus it is certain that there is no obstruction, even in dry weather, to prevent the passage of trout from the Snake River to

Yellowstone Lake; it is quite evident that trout do pass over in this way; and it is almost certain that Yellowstone Lake was stocked with trout from the west via Two-Ocean Pass.

The trout of the great basin of Utah (Lake Bonneville), is descended from the trout of the Upper Snake (*lewisi*) which is not evidently different from typical *mykiss*; the fish fauna of Lake Bonneville and the Upper Snake being still virtually identical, the disappearance of the outlet of Lake Bonneville to the north having taken place in times comparatively recent. The trout of the Nevada Basin (Lake Lahontan) is apparently descended from typical *mykiss*, the outlet of that lake having entered the Columbia below the Snake River falls, and its disappearance being no doubt of earlier date. The faunas of lakes Bonneville and Lahontan at present have little in common. Almost nothing is known of the Tertiary Lake Idaho, now represented by lakes Malheur, Warner, Goose, etc.

In any event, whether this hypothetical line of descent be true or not, the fact remains that nowhere in the series can we place an absolute line of separation between *Salmo mykiss* and *Salmo gairdneri*, and they approach each other most closely in southeastern California, and in the Middle Columbia.

We arrange the subspecies in accordance with the above suggestions, leaving each recognizable variation, for the time being, with the title of subspecies. Some of them, as *macdonaldi* and *agua-bonita*, may ultimately be ranked as species, on account of their local isolation and consequently better defined characters, while others may prove wholly undefinable.

It is not unlikely, that when the waters of the Northern Hemisphere are fully explored, it will be found that all the black-spotted trout of America, Europe, and Asia are forms of one species, for which the oldest name is *Salmo trutta*, Linnæus.

The various subspecies or varieties of the *Salmo mykiss* group which we are able to distinguish with more or less certainty are given in the following analysis:

a. Black spots almost as numerous on the head as on the posterior part of body. (Northwestern forms.)

b. Scales usually about 160 to 170.

c. Spots rather large, profusely scattered and irregular, usually none on the belly.

d. Red marks under the dentary bones always present. MYKISS; CLARKII; LEWISI, 779–779b.

dd. Red marks under dentary bones obsolete or nearly so. GIBBSII, 779c.

cc. Spots rather large, sparsely scattered, some present on the belly and on lower side of head; adult with elongate spots; head slender and conical. Lake Tahoe (Basin of Lake Lahontan.) HENSHAWI, 779d.

bb. Scales larger, usually about 145; spots numerous but rather small. Great Basin (Lake Bonneville Basin.) VIRGINALIS, 779e.

aa. Black spots chiefly placed on the posterior half of body. Red blotch on dentary bones conspicuous. (Southwestern forms.)

e. Scales not very small, about 160; spots of moderate size. (Rio Grande Basin.) SPILURUS, 779f.

ee. Scales very small, about 180.

f. Spots rather large; lower fins distinctly red, rarely orange.

g. Spots very numerous; a red lateral band. (Colorado Basin.) PLEURITICUS, 779g.

gg. Spots less numerous, none anteriorly. (Lake Waha, Washington.) BOUVIERI, 779h.

ggg. Spots few and large, chiefly on the tail; opercles more curved than in *bouvieri.* (Head waters of Arkansas and Platte rivers.) STOMIAS, 779i.

ff. Spots all small; lower fins bright yellow; a yellow lateral shade. (Twin Lakes, Colorado.) MACDONALDI, 779j.

The typical form from Alaska, Bering Sea, and Kamchatka is

779. SALMO MYKISS, Walbaum.

(MYKISS; CUT-THROAT TROUT.)

Head 4; depth 4. D. 10; A. 10. Cœca 43. Scales small, variable in size, about 39–165 to 170–30. Body moderately elongate, compressed. Head rather short. Mouth moderate, the maxillary not reaching far beyond the eye. Vomerine teeth as usual, set in an irregular zigzag series; teeth on the hyoid (second hypobranchial) normally present, but often obsolete, especially in old examples. Dorsal fin rather low; caudal fin slightly forked, (more so in young individuals than in the adult, as in all trout). Back and caudal peduncle profusely covered with rounded black spots of varying size; dorsal, caudal, and adipose fin covered with small spots about as large as the nostril; a few spots on the head; belly rarely spotted; inner edge of the mandibles below with a deep-red blotch. Sea-run specimens are nearly uniform silvery; males with a lateral band and patches of light red; lower fins largely red; extremely variable in color and form. The common trout of all the streams of Alaska and Kamchatka, where it descends to salt water, and reaches a considerable size. The black-spotted trout of British Columbia is probably of the same type, and no character is known by which the similar form in the lower Columbia may be separated. The red blotches on the lower jaw between the dentary bones on the membrane joining them is usually constant and characteristic. (*Mykiss*, a vernacular name of the species in Kamchatka.)

Mykiss, PENNANT, Arctic Zoölogy, Introd., 126, 1792, Kamchatka; after KRASCHENINNIKOW, etc.

Salmo mykiss, WALBAUM, Artedi Piscium, 59, 1792, Kamchatka; based on *Mykiss* of PENNANT.

Salmo muikisi, BLOCH & SCHNEIDER, Syst. Ichth., 419, 1801, Kamchatka; after STELLER.

Salmo purpuratus, PALLAS, Zoöl. Ross.-Asiat., III, 374, 1811, Bering Sea; JORDAN & GILBERT, Synopsis, 314, 1883.

Represented southward by a form provisionally recorded as

779a. SALMO MYKISS CLARKII (Richardson).

(COLUMBIA RIVER TROUT.)

Not evidently different from the preceding. Usually profusely spotted, with the red cut-throat mark distinct. Scales small, in 150 to 164 cross-series. Back profusely spotted, anteriorly and posteriorly, the spots often extending on the belly. Coastwise streams from Puget Sound, south to Elk River, Humboldt County, California; locally abundant; replaced inland by var. *gibbsii* and var. *lewisi.* (Named for Capt. William Clark (1770–1838) of the famous expedition of Lewis and Clark.)

Salmo clarkii, RICHARDSON, Fauna Bor.-Amer., III, 225, 1836, Cathlapootl River. (Coll. Dr. Gairdner.)

Fario stellatus, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 219, Fort Steilacoom, Shoalwater Bay.

Salmo brevicauda, SUCKLEY, Ann. Lyc. Nat. Hist. N. Y., VII, 1861, 308, Puget Sound. (Coll. Kennerly, Cooper, and Suckley.)

Salmo stellatus, GÜNTHER, Cat., VI, 117, 1866.

Salmo aurora, GÜNTHER, Cat., VI, 119, 1866.

Salmo brevicauda, GÜNTHER, Cat., VI, 120, 1866.

Represented in the head waters of Snake River, Yellowstone River, and Missouri River by

779b. SALMO MYKISS LEWISI (Girard).

(YELLOWSTONE TROUT; CUT-THROAT TROUT.)

Similar to var. *clarkii* in all respects, the body perhaps a little more robust, with the spots encroaching less on the belly. Scales small, 145 to 170. Red throat mark always present. The Snake River Basin above the Shoshone Falls, and crossing the main divide of the Rocky Mountains at Two-Ocean Pass to the head waters of the Yellowstone, thence to other affluents of the Upper Missouri; common in all suitable waters. Infested in Yellowstone Lake by great numbers of a parasitic worm (*Dibothrium cordiceps**, Leidy). (Named for Captain Meriwether Lewis, (1774–1809), leader of the noted exploring expedition of Lewis & Clark, in 1803–6.)

Salar lewisi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 219, Falls of Missouri River. (Coll. Lewis & Clark.)

Salmo carinatus, COPE, Hayden's Geol. Surv. Mont., 1871 (1872), 471, locality unknown, probably Yellowstone River.

Represented in tributaries of the Columbia between Shoshone Falls and the Cascade Range by the variable and imperfectly defined

779c. SALMO MYKISS GIBBSII (Suckley).

Scales small, usually 142 to 175 series. No red below lower jaw; no hyoid teeth. To this form are provisionally referred the variously intermediate examples from the streams of Idaho and Washington, mentioned by Gilbert and Evermann in the paragraph quoted on page 489. Similar specimens have been since taken by Dr. Gilbert in the Des Chutes and other rivers, and by Dr. Evermann in Big Payette Lake, Idaho. It seems to be the prevailing form in the region between that occupied by *clarkii* near the coast, and that taken by *lewisi* above the Shoshone Falls. (Named for Dr. George Gibbs, geologist of the Northwest Boundary Commission.)

Fario tsuppitch, GIRARD, Proc. Ac. Nat. Sci. Phila., VIII, 1856, 218, Fort Dallas, Oregon; not of RICHARDSON.

Salmo gibbsii, SUCKLEY, Ann. Lyc. Nat. Hist. N. Y., 1858, Fort Dallas; (Type, No. 940); also in Yakima River, John Day's River, and Boise River, and at The Dalles: SUCKLEY, Monogr. Salmo, 141, 1861 (1874).

Represented in western Nevada and neighboring parts of California by

779d. SALMO MYKISS HENSHAWI (Gill & Jordan).

(LAKE TAHOE TROUT; TRUCKEE TROUT; SILVER TROUT.)

Head $3\frac{4}{5}$; depth 4. D. 11; A. 12; scales 27–160–27 to 37–184–37; usually 170 in a longitudinal series; cœca 50–60. Body elongate, not greatly compressed. Head comparatively slender and long acuminate, its upper surface very slightly carinated; muzzle somewhat pointed, but bluntish at the tip; head not convex above; maxillary rather short, not reaching much beyond the eye. Vomerine teeth as usual; a small, rather narrow, but usually distinct patch on the hyoid bone. Dorsal fin small; caudal fin short, rather strongly forked. Scales medium. Coloration dark green in life, in the pure waters of Lake Tahoe; pale green in the salty waters of Pyramid Lake; the sides silvery, with a strong lateral shade of coppery red; back about equally spotted before and behind; the spots large and mostly round; sides with rather distant spots; belly generally with round spots; head with large black spots above, some even on the snout and on lower jaw; dorsal and caudal also spotted; a few spots on anal; red dashes on lower jaw; young specimens less spotted. Length 18 inches or more, usually weighing 5 or 6 pounds, but occasionally 20 to 29 pounds. Basin of the post-Tertiary Lake Lahontan; found in Lake Tahoe, Pyramid Lake, Webber Lake, Donner Lake, Independence Lake, Truckee River, Humboldt River, Carson River, and in most streams of the east slope of the Sierra Nevada; also in the head waters of Feather River, west of the Sierra Nevada, where it is probably introduced from Nevada Related to *Salmo mykiss*, but better distinguished than most of the varieties, with a longer and more conical head, and with the spots differently arranged. A fine trout, now common in the San Francisco markets.

---

*For a full discussion of this parasite and its relation to the trout of Yellowstone Lake see Linton "On Two Species of Larval Dibothria from Yellowstone National Park," in Bull. U. S. Fish Comm., IX, 1889, 65–79, plates 23–27.

In Lake Tahoe there are two forms of this type, (1) the ordinary Tahoe Trout (locally known to fishermen as "Pogy," the young as "Snipe"), weighing from 3 to 6 pounds, dark in color, with coppery sides, ascending the streams to spawn, and (2) the "Silver Trout," a large robust trout profusely spotted, the spots often oblong, the coloration more silvery. These trout live in deep water and spawn in the lake itself. A careful comparison of specimens convinces us that there is no specific nor varietal difference between the one and the other. The largest "Silver Trout" on record, weighing 29 pounds, was caught at Tahoe City, about 1876, and sent as a present to Gen. U. S. Grant. The following is a description of a Silver Trout taken near Tahoe City in September, 1894, and presented to the Leland Stanford Junior University by Mr. A. J. Bayley, of Tahoe City:

Specimen 2 feet 4 inches long, weighing 7½ pounds. Head $4\frac{1}{15}$; depth $3\frac{4}{5}$; eye $7\frac{2}{3}$ in head. D. 9; A. 12; B. 10; scales 33–205–40 (140 pores). Pectoral $1\frac{2}{3}$ in head. Maxillary $1\frac{2}{3}$.

Body very robust, compressed, unusually deep for a trout, the outline elliptical. Head large, rather more compressed than in typical *Salmo henshawi*, (possibly a character of the adult male). Eye small, silvery. Vomerine teeth in two long series, those of the two series alternating in position. Hyoid teeth distinct, in a rather long series. Gill rakers short, thickish, 5 + 13. Mouth large, the maxillary extending well beyond the eye. Preopercle moderate, its lower posterior edge not evenly rounded, but with a slightly projecting, rounded lobe and a slight concavity above and below; this character not strongly marked. Opercle evenly, but not strongly, rounded. Scales small, reduced above and below, those in or near lateral line largest. Fins moderate, the anal rather high, with one more ray than usual. Caudal slightly lunate, almost truncate when spread open. Color dark-green above, belly silvery; sides with a broad coppery shade covering cheeks and opercles; sides of lower jaw yellowish; fins olivaceous, a little reddish below. Orange dashes between rami of lower jaw moderately conspicuous. Back, from tip of snout to tail, closely covered with large, unequal black spots. Spots on top of head and nape round; posteriorly the spots run together, forming variously shaped markings, usually vertically oblong; these may be regarded as formed of three or four spots placed in a series, or with one or two at the side of the other; the longest of the oblong markings are not quite as long as eye. Along side of head and body the spots are very sparse, those on head round, those behind vertically oblong. Belly profusely covered with small black spots, which are nearly round; still smaller round spots numerous on lower jaw; all the spots on caudal peduncle vertically oblong or curved. Dorsal and caudal densely covered with oblong spots, smaller than those on the body. Anal with rather numerous round spots; pectorals and ventrals with a few small spots, the first ray in each case with a series of faint small spots; adipose fin spotted.

(Named for Henry W. Henshaw, naturalist of the Geological Survey west of the 100th meridian, who discovered the species.)

Salmo henshawi, Gill & Jordan, Man. Vert., Ed. 2, 358, 1878, Lake Tahoe; Jordan & Henshaw, Rept. Chief Eng., Part 3, 1878, App. NN, 1619, plate IV; Jordan, Proc. U. S. Nat. Mus., I, 1878, 75; Jordan & Gilbert, Synopsis, 316, 1883.

Salmo tsuppitch, Jordan & Henshaw, Rept. Chief Engineers, Part 3, 1878, App. NN., 1618; not of Richardson.

Represented in the lakes and streams of the Great Basin (Lake Bonneville) by

779e. SALMO MYKISS VIRGINALIS (Girard).

(Trout of Utah Lake.)

Profusely but rather finely spotted, the spots being numerous anteriorly as well as posteriorly, confined to the back rather than to the tail. Scales a little larger than in other forms, 140 to 150 in lengthwise series, anteriorly less crowded than in *spilurus* and *stomias*. In partially alkaline or milky waters, as in Utah Lake, this form reaches a large size—8 to 12 pounds—and is very pale in color, the dark spots few and small, mostly confined to the back. Similar variations are shown by the other forms of trout in other lakes. Lakes and streams west of the Wahsatch range, especially in Bear, Provo, Jordan, and Sevier rivers, and in Utah Lake; locally very abundant and of importance as a food-fish. (*virginalis*, like a virgin.)

Salar virginalis, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 220, Utah Lake.

Salmo utah, Suckley, Monogr. Salmo, 136, 1861 (1874), Utah Lake; pale specimens from the lake.

Salmo mykiss virginalis, Jordan, Bull. U. S. Fish Comm., IX, 1889, 14, pl. 3, fig. 9.

Represented in the Rio Grande Basin by

779f. SALMO MYKISS SPILURUS (Cope).

(Rio Grande Trout.)

Head 3½; depth 4. D. 11; A. 10; scales 37–160–37. Head heavy, but proportionately short, its upper surface considerably decurved; interorbital space transversely convex, obtusely carinated; the head more convex than in any other of our species. Mouth large, maxillary reaching past eye. Teeth on vomer in two distinct series. Dorsal fin low in front, high behind, the last ray more than ⅔ the height of the first; last ray of the anal rather long; caudal with its middle rays about as long as the others. Profusely spotted; back and sides with round black spots, the spots most developed posteriorly, few on the head, most numerous on the caudal and adipose fin; sides with pale blotches. Length 30 inches. Upper Rio Grande and southward into the mountains of Chihuahua; abundant in mountain streams. In all respects apparently identical with subspecies *pleuriticus*, except that the scales are less crowded anteriorly and the number in a longitudinal series is 155 to 160. (*σπῖλος*, spot; *οὐρά*, tail.)

Salmo spilurus, COPE, Hayden's Geol. Surv. Mont., 1871 (1872), 470, Sangre de Cristo Pass, Colorado.

Salmo mykiss spilurus, JORDAN, Bull. U. S. Fish Comm., IX, 1889, 14, pl. 3, figs. 7 and 8.

Represented in the Colorado River Basin by

779g. SALMO MYKISS PLEURITICUS (Cope).

(COLORADO RIVER TROUT.)

Opercle short, 4⅗ to 5 in head. Scales small, 185 to 190. Close to the typical *mykiss*, but the black spots chiefly gathered on the posterior part of the body, the head nearly immaculate; extremely variable, the lower fins usually red, but sometimes orange; usually a red lateral band. Basin of the Colorado. A large, handsome, and variable trout, sometimes profusely speckled, sometimes with large spots, and occasionally with strong golden shades. Abundant throughout western Colorado and in all clear mountain streams throughout Arizona; specimens from the Colorado Chiquito similar to those from the Eagle and the Gunnison, in Colorado. (*pleuriticus*, from *πλευρόν*, side, in allusion to the red lateral band.)

Salmo pleuriticus, COPE, Hayden's Geol. Surv. Mont., 1871 (1872), 471, head waters of Green River, Wyoming.

Salmo mykiss pleuriticus, JORDAN, Bull. U. S. Fish Comm., IX, 1889, 14, pl. 2, fig. 6.

Represented in Waha Lake by

779h. SALMO MYKISS BOUVIERI (Bendire).

(WAHA LAKE TROUT.)

Head 4; depth 4⅔; eye 4. D. 10; A. 11; B. 12; scales 175. Maxillary 2⅕ in head. Size small. Similar to *S. mykiss*, but with dark spots only on the dorsal, caudal, and adipose fin, and on the tail behind front of anal, where the spots are very profuse, smaller than pupil. Anterior regions dusky-bluish, not silvery; red blotch on inner edges of dentary bones below very conspicuous. Head shorter and deeper than in *mykiss*, the snout shorter and blunter, not longer than eye. Opercle and preopercle less convex than in *mykiss*. Caudal moderately forked. A singularly colored local variety, found in Waha Lake, Washington, a mountain lake without outlet. (Named for Captain Bouvier.)

Salmo purpuratus bouvieri, BENDIRE, in JORDAN & GILBERT, Synopsis, 315, 1883, Waha Lake, Washington. (Coll. Capt. Charles Bendire, U. S. A.)

Salmo mykiss bouvieri, JORDAN, Bull. U. S. Fish Comm., IX, 1889, pl. 4, fig. 10.

Represented in the Upper Arkansas and South Platte rivers by

779i. SALMO MYKISS STOMIAS (Cope).

(GREEN-BACK TROUT.)

Mouth small; scales small, about 180. A small black-spotted trout, rarely reaching a pound in weight, close to var. *mykiss*, differing mainly in the very large size of its black spots, which are mainly gathered on the posterior half of the body. Back deep green, sides sometimes red. Flesh deep red. Head waters of Arkansas and South Platte rivers, in brooks and shallow places in lakes; abundant. (*στομίας*, big-mouthed.)

Salmo stomias, COPE, Hayden's Geol. Surv. Wyom. for 1870 (1871), 433, South Platte River, locality unknown. (Coll. Dr. Hammond.)
Salmo mykiss stomias, JORDAN, Bull. U. S. Fish. Comm., IX, 1889, 15, pl. 1, fig. 2.

Represented in the lakes in eastern Colorado by

779j. SALMO MYKISS MACDONALDI, Jordan & Evermann.

(YELLOW-FIN TROUT.)

Head 4; depth 4½ to 5; eye 5⅓; snout 4⅛. D. 12; A. 11; B. 10; scales 40–184–37, 125 pores. Head long, compressed, the snout moderately pointed; mouth rather large, the maxillary 1¾ to 2 in head; hyoid teeth present; opercle long, 4⅓ in head, its margin strongly convex. Allied to subspecies *pleuriticus*, but with the head and opercles longer and the color different. Body elongated, compressed. Gill rakers 10 + 10. Scales small, regularly placed. Color light olive; a broad shade of lemon-yellow along sides; lower fins bright yellow; no red anywhere except the "cut-throat" dash characteristic of *Salmo mykiss*. Body posteriorly, and dorsal and caudal fin profusely speckled with small pepper-like dots, smaller than the nostril; on head and anterior parts few or none of these spots are present. Flesh pale. A very handsome trout, abundant on gravelly bottoms in Twin Lakes,* tributary to the Arkansas River in the Saguache Range near Leadville, Colorado; not found in brooks. It reaches a weight of nearly 9 pounds. It is probably descended from the form called *pleuriticus*, certainly not from its associate *stomias*, with which it has very little in common. (Named for Col. Marshall McDonald, United States Fish Commissioner.)

Salmo mykiss macdonaldi, JORDAN & EVERMANN, Proc. U. S. Nat. Mus., 1889 (January 20, 1890), 453, Twin Lakes, Colorado; (Type, No. 41730. Coll. Geo. R. Fisher); JORDAN, Bull. U. S. Fish Comm., IX, 1889, 11, pl. 1, fig. 1.

780. SALMO GAIRDNERI, Richardson.

(STEELHEAD; HARDHEAD; "SALMON TROUT.")

We retain the name *Salmo gairdneri* for the large sea trout of the Pacific Coast and their derivatives; forms typically with moderate or small scales, and without the strongly-marked red dashes at the throat

---

*This form of trout occurs in company with subspecies *stomias*, but in Twin Lakes, the two are entirely distinct, the habits, size, and coloration being notably different. If we were to consider the Arkansas Basin alone, the two must be ranked as distinct species, but these and all other American trout seem to be connected by intergradations. Apparently *macdonaldi* is derived from the Colorado River *pleuriticus*, which may be descended from *spilurus*, the latter in turn from *stomias*. *Stomias*, *virginalis*, *henshawi*, and *bouvieri* seem to have sprung directly from *mykiss*.

which mark the Cut-throat series of trout, or *Salmo mykiss.* These forms are usually well separated from *mykiss,* on the one hand, and from *irideus* on the other. There is, however, a strange medley of forms apparently aberrant or intermediate, confusing any attempt at specific definition.

The following analytical key contrasts the two most clearly marked varieties:

a. Scales rather small, averaging 155 cross series, the number varying from 130 to 180 (counting the oblique cross series above lateral line). Sea-running forms reaching a large size; weight of sea-run adult 8 to 20 pounds; landlocked forms much smaller, down to ½ pound. Coloration pale, with few spots. Columbia River and southward to San Francisco Bay. GAIRDNERI, 780.

aa. Scales larger, averaging about 135 cross series, the number varying from 130 to 145. Lake forms; coloration very silvery and with few spots; weight 3 to 10 pounds. Fraser River, etc. KAMLOOPS, 780a.

Represented in large rivers and estuaries, especially from the Columbia southward to Monterey, by the anadromous form, the typical

780. SALMO GAIRDNERI, Richardson.

(STEELHEAD; HARDHEAD; SALMON TROUT.)

B. 12 or 11; D. 11; A. 12; scales usually about 150–28, varying in specimens from Astoria from 137 to 177 (specimens counted by Cramer and Otaki); pyloric cœca 42; vertebræ 38 + 20. Body rather stout, not very deep mesially, but with the caudal peduncle thick. Head comparatively short and rather slender, in the females small, in the males the jaws more or less prolonged; maxillary rather narrow, the small eye nearly above its middle; lower jaw included; upper jaw in males emarginate at tip and at junction of premaxillary. Teeth rather small, those on the vomer in two long, alternating series, which are about as long as the palatine series. Preopercle rather wide, with the lower limb short; opercle moderate. Gill rakers short and thick, 8 + 12 (essentially as in our other species). Ventral appendage not half the length of the fin. Tail wide, squarely truncate in the adult, somewhat emarginate in the young. Flesh rather pale. Bones much firmer than in *Oncorhynchus.* Color olive green above; sides silvery; head, back, upper fins, and tail more or less densely covered with black spots; belly usually unspotted; males with colors heightened, the back greenish; both sexes in spring with a broad flesh-colored lateral band, deep rosy red on the opercles, this often retained throughout the year; fins not red; no red on the membrane of lower jaw. Length 30 inches. Coastwise streams from Santa Ynez Mountains, Santa Barbara County, California, northward to British Columbia, west of the Sierra Nevada and Cascade Range, especially abundant in the Lower Columbia, ascending the Snake River as far as Auger Falls. Also common in Russian River and Klamath River. A large trout, abounding in the mouths of the rivers, reaching a weight of 20 pounds or more, migratory like the salmon, and ascending rivers fully as far. It spawns later than the salmon, (in early spring in the Snake and Salmon rivers in Idado), and is found in the lower parts of the rivers, spent, at the time of the spring salmon run. It is then nearly useless as food, but at other times it is similar in quality to other trout. In streams where it is resident, it rarely exceeds 5 or 6 pounds. Resident forms seem to pass into "*irideus*" southward and should be carefully compared with the latter; northward into "*kamloops*," while in the Lower Snake River it seems to intergrade with *mykiss*, through the form called *gibbsii*. In the Lower Columbia, according to Dr. Gilbert, it is well separated from *mykiss* on the one hand and from the non-migratory *S. irideus masoni* on the other. Both young and old are there well separated from *irideus*. (Named for Dr. Gairdner, its discoverer, an employee of the Hudson Bay Company at Fort Vancouver, mentioned by Richardson as an able and promising young naturalist.)

Salmo gairdneri, RICHARDSON, Fauna Bor.-Amer., III, 221, 1836, Columbia River at Fort Vancouver; SUCKLEY, Monogr. Salmo, 114, 1861 (1874); GÜNTHER, Cat., VI, 118, 1866.

Salmo truncatus, SUCKLEY, Ann. Lyc. Nat. Hist. N. Y., 3, 1858, New Dungeness, Straits of Fuca; GÜNTHER, Cat., VI, 122, 1866.

Fario aurora, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 218; GIRARD, Pac. R. R. Surv., x, 308, pl. 68, 1858, Astoria, Oregon. (Coll. Trowbridge.)

Fario newberryi, GIRARD, Proc. Ac. Nat. Sci. Phila., 1858, 224, Klamath River; specimen with scales, 36–146–33.

Fario gairdneri, GIRARD, Pac. R. R. Surv., x, 313, 1858.

Salmo purpuratus, GÜNTHER, Cat., VI, 116, 1866.

Represented in the lakes of British Columbia and northern Washington by

780a. SALMO GAIRDNERI KAMLOOPS (Jordan).

(KAMLOOPS TROUT; STIT-TSE.)

Head 4½; depth 4⅓; eye 4½. D. 11; A. 11 or 12; scales 30–135 to 146–26, 65 scales before the dorsal. Body elongate, somewhat compressed, the maxillary extending beyond the eye, its length not quite half the head; snout slightly rounded in profile, the profile regularly ascending; eye large, about as long as snout; teeth moderate, some of those in the outer row in each jaw moderately enlarged; opercles striate, not much produced backward; branchiostegal rays 11 on each side; dorsal fin rather low, its longest ray slightly greater than the base of the fin, 1⅗ in head; anal fin rather larger than usual in trout, its outline slightly concave, its longest ray greater than the base of the fin and a little more than half head; adipose fin moderate; caudal fin rather broad, distinctly forked, its outer rays about twice inner; pectoral fins rather long, 1⅛ in head; ventrals moderate, 1¾ in head; gill rakers comparatively short and few in number, about 6 + 12 or 11. Coloration dark olive above, bright silvery below, the silvery color extending some distance below the lateral line where it ends abruptly; when fresh, the middle of the sides in both specimens was occupied by a broad band of bright light-rose pink, covering about one-third of the total depth of the fish; back above with small black spots about the size of pin heads irregularly scattered and somewhat more numerous posteriorly; a very few faint spots on upper part of head; dorsal and caudal fins rather closely covered with small black spots similar to those on back but more distinct; a few spots on the adipose fin, which is edged with blackish; lower fins plain; the upper border of the pectoral dusky; a vague dusky blotch on the upper middle rays of the anal; ventrals entirely plain. Length of type 16¼ inches. Kamloops Lake, Okanogan Lake, Kootenay Lake, and other lakes tributary to Fraser River or to the Upper Columbia; locally abundant; a fine large trout, slender and graceful, somewhat different in appearance from the ordinary "Steelhead," but not distinguished by any technical character of any importance, and doubtless intergrading fully with the latter.

Salmo kamloops, JORDAN, Proc. U. S. Nat. Mus., 1892, Kamloops Lake, British Columbia. (Type, No. 44238. Coll. A. C. Bassett.)

781. SALMO IRIDEUS, Gibbons.

(RAINBOW TROUT; COAST RANGE TROUT.)

Head 4; depth 3⅘; eye 5. D. 11; A. 10; scales 21–135–20, varying considerably. Body comparatively short and deep, compressed, much more elongate in males than in females. Head short, convex, obtusely ridged above. Mouth smaller than in other species, the rather broad maxillary scarcely reaching beyond eye, except in old males. Eye larger than in other species. Vomerine teeth in two irregular series. Dorsal fin moderate; caudal fin distinctly, though not strongly forked. Color bluish above, the sides silvery; usually everywhere above profusely but irregularly spotted, the spots extending on the sides and on the vertical fins; spots on caudal small; belly nearly plain; sea-run specimens nearly plain silvery; with red lateral band and blotches. Weight ½ to 6 pounds. Mountain streams of the Pacific Coast; the typical form found in the brooks of the Coast Range in California, from the Klamath River to the San Luis Rey. Abundant and variable, probably entering the sea, and perhaps growing larger there, becoming a "Salmon Trout."

This form differs from *Salmo gairdneri* chiefly in the larger scales. Other characters are its small size and brighter colors; both sexes with a red lateral band. It is subject to large local variations, some of these landlocked in peculiar brooks, (*e. g.*, Purisima Creek in San Mateo County, California, where the individuals are small and brightly colored, popularly regarded as distinct species). Its range extends from the coast of Washington southward to San Diego County, California (Rio San Luis Rey). It is thought by some anglers that the young fishes hatched in the brooks from spawn of *gairdneri* remain in mountain streams for from six months to three years, going down to the sea with the high waters of spring, after which they return to spawn as typical *gairdneri*. Those which are landlocked or do not descend remain *irideus* all their lives. As against this view we have the fact that to the northward *irideus* and *gairdneri* are always distinguishable and the scales in *gairdneri* are always smaller than in typical rainbow trout. (*irideus*, rainbow-like.)

Salmo irideus, GIBBONS, Proc. Cal. Ac. Nat. Sci., 1855, 36, San Leandro Creek, Alameda County, California; JORDAN & GILBERT, Synopsis, 312, in part, 1883.

Salmo rivularis, AYRES, Proc. Cal. Ac. Nat. Sci., 1855, 43, Martinez, California.

The following analytical key will assist in the identification of the varieties of *Salmo irideus*, which we are at present disposed to recognize:

a. Scales well imbricated; upper ray of pectoral usually more or less spotted.
  b. Scales comparatively large, in 120 to 150 series; sides profusely spotted, both anteriorly and posteriorly, especially above the reddish lateral band.
    c. Scales decidedly large, in 120 to 130 series. Body elongate; no red under the throat; eye large; anal rays 11 or 12. Brook forms mostly of small size; sea-run examples occasionally large; confined to the streams of the Coast Range.
      d. Mouth moderate; coastwise streams of California. IRIDEUS, 781.
      dd. Mouth very small; coastwise streams of Oregon and Washington. MASONI, 781a.
    cc. Scales medium, in about 140 series. Body rather deep; eye comparatively small; anal rays 10 or 11. Coloration dark, usually with many spots; a small dash of red usually present at the throat. Size medium, weight 2 to 8 pounds. Streams of Upper Sacramento Basin, not running down to the sea. SHASTA, 781b.
  bb. Scales small, in 150 to 185 series; size large.
    e. Back profusely spotted, anteriorly as well as posteriorly; some red under lower jaw. Kern River, California. GILBERTI, 781c.
    ee. Back with the spots chiefly posteriorly; no red under the lower jaw. Upper Sacramento Basin. STONEI, 781d.
aa. Scales very small and not well imbricated, in about 175 transverse series. Belly, lower fins, and lateral band yellow; ventrals edged with pale; upper ray of pectoral unspotted; black spots numerous. A small form found in the head waters of Kern River. AGUA-BONITA, 781e.

781a. SALMO IRIDEUS MASONI (Suckley).

(BROOK TROUT OF WESTERN OREGON.)

The common brook trout of the tributaries of the lower Columbia and of coastwise streams of Oregon and Washington is very similar to the typical *irideus* and is readily distinguished from its associates, *gairdneri* and *mykiss*, by its large scales. Compared with *mykiss*, it is less slender, the snout more rounded; there is no red between branches of lower jaw; there are no hyoid teeth, the maxillary is broader and shorter, the opercle more evenly convex, and there are fewer spots below the lateral line; the red markings on sides usually coalesce into a red band. Scales 120–20 to 130–22. Size small, rarely weighing a pound. Puget Sound to southern Oregon, in streams of the Coast Range; locally abundant. Apparently merging into the ordinary *irideus* southward, if indeed the two forms are distinguishable. We know of no diagnostic character, but further comparison is needed. ("Named in honor of my good friend Governor Charles H. Mason of Washington Territory, who has so frequently aided me in adding to my collections specimens of great interest and value in various branches of natural history."—*Suckley.*)

Fario clarkii, GIRARD, Proc. Ac. Nat. Sci. Phila., 1856, 219; not of RICHARDSON.

Salmo masoni, SUCKLEY, Pac. R. R. Surv., XII, part 2, 345, 1860, Cathlapootl River. (Coll. Capt. Geo. B. McClellan.*)

---

*"I obtained this species at the Cathlapootl River, Aug. 2, 1853, and am indebted for it to the skill of Capt. Geo. B. McClellan, as he took it with the artificial fly at a time when they did not readily bite at any bait."—*Suckley.*

Represented in the upper Sacramento and its tributaries, and probably in most of the eastern tributaries of the Sacramento and San Joaquin, by

781b. SALMO IRIDEUS SHASTA (Jordan).

(McCloud River Rainbow Trout.)

Head 4; depth $3\frac{4}{5}$; D. 11; A. 11; scales 20 to 24–145–20, 65 before dorsal. Body comparatively short and deep, compressed, varying considerably, and much more elongate in the males than in the females. Head short, convex, obtusely ridged above. Mouth smaller than in most other forms of the genus, the rather broad maxillary scarcely reaching beyond eye except in old males; maxillary $1\frac{3}{4}$ in head in males, 2 in females. Eye larger than in typical *gairdneri*, 5 in head. Vomerine teeth in two irregular series. Dorsal fin moderate; caudal fin distinctly though not strongly forked, more deeply incised than in typical *mykiss*; pectoral $1\frac{1}{3}$ to $1\frac{3}{4}$ in head. Scales comparatively large. Coloration bluish above, the sides silvery; everywhere above profusely but irregularly spotted, the spots extending on the sides and on the vertical fins; head well spotted; dorsal, caudal, and usually upper ray of pectoral spotted; spots on caudal small; belly nearly plain; fins usually not red; almost always a dash of red between branches of lower jaw; males and usually females also with red lateral band and blotches; much red on cheeks and opercles; belly partly red in males. Length 10 to 30 inches. Weight 2 to 8 pounds. Streams of the Sierra Nevada, from Mount Shasta southward, best known from McCloud River; the limits of its range not well known; abundant, and subject to many variations; also introduced into Truckee River and into many eastern streams, this form being the usual "Rainbow Trout" of fish-culturists. (Named for Mount Shasta.)

Salmo irideus, or Rainbow Trout of most writers and especially of fish-culturists; not *Salmo irideus*, Gibbons, which is based on coastwise specimens.

Salmo gairdneri shasta, Jordan, Thirteenth Biennial Rept. Fish Comm. California, 1894, 142, with plate, McCloud River, at Baird, Shasta County, California. (Type, No. 903, L. S. Jr. Univ. Mus. Coll. Stone.)

Represented in the lower waters of Kern River on the west slope of the Sierra Nevada by

781c. SALMO IRIDEUS GILBERTI (Jordan).

(Kern River Trout.)

Entirely similar to the McCloud River Trout, except that the scales are smaller, as small as in typical *mykiss*, in about 165 transverse series. The body is robust, the mouth moderate; back and sides profusely spotted; old specimens with more or less orange between the branches of the lower jaw, this mark faint or wanting in the young. Upper ray of pectoral spotted. Kern River, California, abundant in the river channels, below the waters inhabited by subspecies *agua-bonita*. Large, reaching a weight of 8 pounds. Our specimens from south fork of Kern River, at Soda Springs, California. (Named for its discoverer, Dr. Charles Henry Gilbert.)

Salmo gairdneri gilberti, Jordan, Thirteenth Biennial Rept. Fish Comm. California, 1894, 143, with plate, South Fork of Kern River at Soda Springs, California. (Type, No. 1511, L. S. Jr. Univ. Mus. Coll. Gilbert.)

In the Sacramento River is occasionally taken

781d. SALMO IRIDEUS STONEI (Jordan).

(NISSUEE TROUT; NO-SHEE TROUT.)

Anal rays 11. Depth 4 in length. Pectoral $1\frac{1}{3}$ in head. Eye large, $4\frac{1}{2}$ in head. Maxillary $2\frac{1}{10}$. Distinguished by its small scales, the number of scales in a longitudinal series being about 155, 82 before dorsal, where they are small and embedded, 25 above lateral line. Teeth fewer and smaller than in var. *shasta*, those on the vomer in a single zigzag series. Axillary scale of ventral small. Upper parts plain greenish; spots few, and confined chiefly to posterior part of body; spots small and sparse on dorsal, adipose fin, and caudal; a red lateral band usually distinct; cheeks and opercles with red; no red between branches of lower jaw. Described from a specimen 14 inches in length, collected by Livingston Stone in McCloud River at Baird, California. This form is well known to Indians and to fishermen on the Upper Sacramento. According to Mr. Stone, the Indian fishermen say that it is abundant in the McCloud River, about 8 miles above Baird. They are larger in size than the ordinary *irideus*, one having been taken weighing 12 pounds. A second specimen is deeper in color, the red lateral band very distinct (female taken in May). The scales rather larger (140) and irregularly placed. (Named for its discoverer, Livingston Stone, Superintendent of the United States Fish Hatchery at Baird, in recognition of his valuable services in the propagation of salmon and trout.)

Salmo gairdneri stonei, JORDAN, Thirteenth Biennial Rept. Cal. Fish Comm., 1894, 142, with plate, McCloud River at Baird, California. (Type, No. 900, L. S. Jr. Univ. Mus. Coll. Stone.)

Represented in the mountain streams of the Sierra Nevada, on the west slope of Mount Whitney, by

781e. SALMO IRIDEUS AGUA-BONITA (Jordan).

(GOLDEN TROUT OF MOUNT WHITNEY.)

Head $3\frac{3}{4}$; depth $4\frac{1}{3}$. D. 12; A. 10; scales in 160 to 180 rows, 123 pores. Body formed as usual. Head rather long, bluntish at tip; mouth moderate, the maxillary extending a little beyond the eye, $1\frac{4}{5}$ in head; hyoid teeth not evident; opercle moderate; postorbital bone very small, its greatest length $4\frac{1}{3}$ in head; its posterior margin moderately convex; eye $4\frac{2}{3}$ in head; snout $4\frac{1}{2}$; gill rakers not very short, 10 + 11. Scales extremely small, round, not imbricated, smaller than in other forms of *Salmo*. Fins moderate; the anal high; the caudal moderately emarginate; pectoral $1\frac{4}{7}$ in head; ventral 2; caudal $1\frac{2}{5}$. Olive above; sides and belly light golden, always showing the dark cross shades of immature trout; middle of sides along lateral line with a deep scarlet lateral stripe, broadest under the dorsal, where it is about as wide as eye, thence narrowing to either end and not reaching either head or caudal; middle line of belly with a broad scarlet band, extending from chin to anal fin, equally bright all the way; a fainter shade along lower side from anal fin to tip of caudal; no crimson dash at throat between branches of lower jaw; the whole region uniform bright orange; opercle largely orange; dark spots chiefly posterior, large and well marked, some as large as pupil on tail and posterior part of body; smaller and well marked on dorsal; a few small ones scattered along forward to the head in two specimens; none on body before adipose fin in the other; upper anterior angle of dorsal abruptly yellowish white; this color edged by a dark oblique streak made by coalescent spots; the rest of the fin light olive with 4 or 5 rows of small black spots; pectorals light orange; ventrals deep orange, with a faint blackish tip; the anterior edge of the fin conspicuously and abruptly whitish, as in *Salvelinus fontinalis*; anal dusky orange, the tips of the last rays blackish, the outer anterior corner abruptly white, the white stripe wider than the pupil and separated from the color of the fin by a dusky shade; caudal olive, tinged with orange on its lower edge, and profusely spotted with black; inside of mouth pink, of gill cavity light orange. The small size of the scales is shown in their lack of imbrication rather than by their increased number. Mountain streams on the west side of Mount Whitney, tributary to Kern River, locally abundant in Volcano Creek, and South Fork of Kern River; also largely introduced into streams about Owen Lake, on the east slope of the mountains, streams formerly destitute of trout. (Gilbert.) This form is apparently derived from the Kern river trout, var. *gilberti*, but is so much modified that unless intermediate specimens now exist, it may be ranked as a distinct species. (*"Agua-bonita,"* beautiful water, name of a cascade on Volcano Creek, near which this trout abounds.)

Salmo mykiss agua-bonita, JORDAN, Proc. U. S. Nat. Mus., 1892, 481, Volcano or Whitney Creek,[*] California. (Types, No. 514, L. S. Jr. Univ. Mus. and 44237, U. S. Nat. Mus. Coll. Mr. Harvey of Lone Pine, Cal.)

236. CRISTIVOMER, Gill & Jordan.

(GREAT LAKE TROUT.)

Cristivomer, GILL & JORDAN, in JORDAN, Manual Vertebrates E. U. S., Ed. 2, 356, 1878, (*namaycush*).

This genus contains one or two species—large, coarse charrs, distinguished from *Salvelinus* by the presence of a raised crest behind the head of the vomer and free from its shaft; this crest is armed with teeth. The hyoid teeth constitute a strong, cardiform band. The typical species is a large charr or trout, spotted with gray instead of red, and found in the larger lakes of Eastern North America. (*crista*, crest; *vomer*, vomer.)

782. CRISTIVOMER NAMAYCUSH (Walbaum).

(GREAT LAKE TROUT; MACKINAW TROUT; LONGE (VERMONT); TOGUE (MAINE); NAMAYCUSH; MASAMACUSH.)

Head 4¼; depth 4; eye large, 4½. B. 11 or 12; D. 11; A. 11; lateral line 185 to 205. Body elongate, covered with thin skin, there being no special development of fatty tissue. Head very long, its upper surface flattened. Mouth very large, the maxillary extending much beyond the eye, the head and jaws proportionately lengthened and pointed. Maxillary nearly half the length of the head; interorbital space nearly one-fourth; teeth very strong. Caudal fin well forked; adipose fin small. General coloration dark gray, sometimes pale, sometimes almost black; everywhere with rounded paler spots, which are often reddish tinged; head usually vermiculate above; dorsal and caudal reticulate with darker. Length 36 inches. Reaches weight of 60 to 100 pounds, averaging about 17. Great Lake region and lakes of northern New York, New Hampshire, and Maine, the head waters of the Columbia and Fraser rivers, streams of Vancouver Island, and north to the Arctic Circle, said not to enter tidal waters; very abundant in the larger bodies of water; varying in form and color in the different lakes; specimens from Lac des Neiges, Canada, said to be almost black (Garman), others variously paler and gray. Some in smaller lakes short and deep in body. (An Indian name.)

---

[*] It has since been ascertained that the original type came from Cottonwood Creek on the east slope of Mount Whitney, the variety having been introduced there from Volcano or Whitney Creek.

Namaycush Salmon, PENNANT, Arctic Zoölogy, Introd., 191, 1792, Hudson Bay.

Salmo namaycush, WALBAUM, Artedi Piscium, 68, 1792, Hudson Bay; based on the Namaycush Salmon of PENNANT; GÜNTHER, Cat., VI, 123, 1866, and of authors generally.

Salmo pallidus, RAFINESQUE, Amer. Monthly Mag., December, 1817, 120, Lake Champlain

Salmo amethystinus, MITCHILL, Journ. Ac. Nat. Sci. Phila., 1818, 410, Sault Ste. Marie.

Salmo hoodii, RICHARDSON, App. Ross's Voyage, LVIII, 1835, in part; specimen from Boothia Felix; RICHARDSON, Fauna Bor.-Amer., III, 174, 1836, Mingan River.

Salmo confinis, DE KAY, N. Y. Fauna: Fishes, 238, 1842, Louis Lake, Hamilton County, New York; Silver Lake, Pennsylvania.

Salmo adirondacus, NORRIS, American Angler's Book, 255, 1865, Adirondack Lakes.

Salmo siscowet, GÜNTHER, Cat., VI, 123, 1866; not of AGASSIZ.

Salvelinus namaycush, JORDAN & GILBERT, Synopsis, 317, 1883.

Represented in Lake Superior by

782a. CRISTIVOMER NAMAYCUSH SISCOWET (Agassiz).

(SISCOWET.)

Scales rather small, about 175 in the lateral line. Body short and deep, covered with thick skin, there being an excessive tendency to the development of fatty tissue. Head very short and deep, its upper surface broad and short, covered by a skin so thick as to completely hide the bones; no distinct median carina. Mouth very large, its gape narrower than in *C. namaycush*. Teeth weaker than in *C. namaycush*; supplemental bone also shorter and broader. Maxillary a little more than half the length of the head. Caudal fin well forked. Coloration as in *C. namaycush*, but usually paler; fin rays the same. Lake Superior; abundant, but not yet found elsewhere. Very close to the preceding, but differing in the shortness and breadth of the bones of the head and in the extreme fatness of the flesh. It is probably a local variety rather than a distinct species. (An Indian name, probably from the same root as *Cisco*.)

Salmo siscowet, AGASSIZ, Lake Superior, 333, 1850, Lake Superior.

Salmo siskawitz, AGASSIZ, in Herbert, Frank Forester's Fish and Fishing, 112, with plate, 1850, Lake Superior

Salmo ursinus, BARNSTON, Rept. Fisheries Canada, Lake Superior; reference uncertain.

Salvelinus namaycush siscowet, JORDAN & GILBERT, Synopsis, 318, 1883.

237. SALVELINUS (Nilsson) Richardson.

(CHARRS.)

Salvelini, NILSSON, Prodr. Ichth. Scand., 7, 1832, (*alpinus*); (group name).
Salvelinus, RICHARDSON, Fauna Bor.-Amer., III, 169, 1836, (*alpinus*); after NILSSON.
Baione, DE KAY, N. Y. Fauna: Fishes, 244, 1842, (*fontinalis*).
Umbla, RAPP, Fische Bodensee, 32, 1854, (*umbla* = *alpinus*).

Body moderately elongate. Mouth large or small. Teeth of jaws, palatines, and tongue essentially as in *Salmo*, the hyoid patch present or not. Vomer boat-shaped, the shaft much depressed, without raised crest, with teeth on the head of the bone and none on shaft. Scales very small, 200 to 250 in a lengthwise series. Fins moderate, the caudal forked in the young, truncate in some species in the adult. Sexual peculiarities not strongly marked, the males with the premaxillaries enlarged and a fleshy projection at the tip of the lower jaw. Coloration dark, with round, crimson spots, the lower fins sometimes with marginal bands of black, reddish, and pale. Species numerous in the clear streams and lakes of the northern parts of both continents, sometimes descending to the sea, where they lose their variegated colors and become nearly plain and silvery. The members of this genus are by far the most active and handsome of the trout, and live in the coldest, clearest, and most secluded waters. "No higher praise can be given to a Salmonoid than to say, it is a charr." (*Salvelinus*, an old name of the charr; from the same root as *Sälbling* or *Saibling*.)

a. Back unspotted, strongly marbled with dark olive or black; dorsal and caudal fins mottled; body rather stout, the head heavy; gill rakers small, 6 + 11, not curled. FONTINALIS, 783.
aa. Back not marbled with darker.
  b. Back with red spots, like those on the sides, but smaller and usually paler; mouth large, the maxillary reaching beyond eye; gill rakers 8 + 12. MALMA, 784.
  bb. Back unspotted, the red spots confined to the sides; maxillary usually not reaching beyond eye.
    c. Gill rakers numerous, 6 + 12 to 16; head rather large, 4 to 4½ in length; body rather stout; belly orange in breeding season. ALPINUS, 785.
    cc. Gill rakers fewer, 6 + 11, small; head small, 4¼ to 5 in length; body slender. OQUASSA, 786.

783. SALVELINUS FONTINALIS (Mitchill).

(BROOK TROUT; SPECKLED TROUT.)

Head 4½; depth 4½. D. 10; A. 9; scales 37–230–30; gill rakers about 6 + 11. Body oblong, moderately compressed, not much elevated. Head large, but not very long, the snout bluntish, the interorbital space rather broad. Mouth large, the maxillary reaching more or less beyond the eye. Eye large, usually somewhat above the line of the axis of the body. Caudal fin slightly lunate in the adult, forked in the young; adipose fin small; pectoral and ventral fins not especially elongate. Red spots on the sides rather smaller than the pupil; back mostly without spots, more or less barred or mottled with dark olive or black; dorsal and caudal fins mottled or barred with darker; lower fins dusky, with a pale, usually orange, band anteriorly, followed by a darker one; belly in the males often more or less red; sea-run individuals (the Canadian "Salmon Trout") are often nearly plain bright silvery. Many local varieties distinguished by shades of color, also occur. Length 18 inches or less. The best known of our charrs, abounding in all clear, cold streams from Maine to the Saskatchewan and northward to Labrador, southward in the Alleghanies to the head waters of the Savannah, Chattahoochee, Catawba, and French Broad; largely introduced into western streams but not native west of the Mississippi. (*fontinalis*, living in springs.)

Salmo fontinalis, MITCHILL, Trans. Lit. and Phil. Soc. N. Y., I, 1815, 435, near New York City;

Salmo alleghaniensis, RAFINESQUE, Ich. Oh., 44, 1820, Brooks falling into the Alleghany and Monongahela rivers.

Salmo nigrescens, RAFINESQUE, Ich. Oh., 45, 1820, near the Laurel Hills, Pennsylvania; GÜNTHER, Cat., VI, 152, 1866, and of nearly all early authors.

Salmo canadensis, HAMILTON SMITH, in Griffith's Cuvier, X, 474, 1834, Canada; dots blood red, each "in a white circular spot."

Salmo hoodii, RICHARDSON, Ross Voyage, App. LVIII, 1835, and Fauna Bor.-Amer., III. 173, 1836, Fort Enterprise, Pine Island Lake, etc.; based in part on *namaycush*.

Salmo immaculatus, [*] H. R. STORER, Bost. Journ. Nat. Hist., VI, 1850, 364, Lower St. Lawrence; (Canadian "Salmon Trout"), name preoccupied; GÜNTHER, Cat., VI, 125, 1866.

Salmo hudsonicus, SUCKLEY, Ann. Lyc. Nat. Hist. N. Y., 1861, 310, Hudson Bay and tributaries; Labrador; Newfoundland; (Coll. Drexler, Gill, and Coues); GÜNTHER, Cat., VI, 153, 1866.

Salvelinus fontinalis, JORDAN, Proc. U. S. Nat. Mus., 1878, 81, in part.

Represented in certain ponds in New Hampshire by

783a. SALVELINUS FONTINALIS AGASSIZII[†] (Garman).

(DUBLIN POND TROUT.)

Coloration pale grayish, almost without red spots, thus resembling the lake trout. Otherwise similar to *fontinalis*. (Named for Louis Agassiz.)

Salmo agassizii, GARMAN, Nineteenth Report Mass. Fish Comm., 1885, 20, Dublin Pond (Lake Monadnock), Keene, New Hampshire; Center Pond, New Hampshire.

784. SALVELINUS MALMA (Walbaum).

(DOLLY VARDEN TROUT; OREGON CHARR; BULL TROUT; RED-SPOTTED TROUT; MALMA; GOLET.)

Head $3\frac{2}{3}$; depth 4; eye $4\frac{1}{2}$. D. 11; A. 9; scales 39–240–36; pyloric cœca large, 45 to 50; gill rakers about 8 + 12. Body stout, the back somewhat elevated, deeper, and less compressed than in *S. fontinalis*. Head large, snout broad, flattened above. Mouth large, the maxillary reaching past the eye. Fins short; the caudal fin slightly forked or almost truncate; adipose fin usually large; in large specimens its length is twice that of the eye. General color olivaceous; the sides with round red spots nearly the size of the eye, the back commonly with smaller pale ones, a feature of coloration which distinguishes this species at once from the others; lower fins colored as in *S. fontinalis*, dusky, with a pale stripe in front, followed by a dark one; sea-run specimens silvery, with the spots faint or obsolete; fins and back without dark reticulations. Gill covers without concentric striæ. Length 5 to 20 inches. Streams east and west of the Cascade Range from the Upper Sacramento to Montana, Alaska, and Kamchatka, generally abundant northward, descending to the sea, where it reaches a weight of about 12 pounds. One of the most beautiful and active of all the *Salmonidæ*. In small mountain brooks, dwarf forms occur (as var. *lordii*, etc.), but it is not necessary to distinguish these by separate names. (*Malma*, a vernacular name in Kamchatka.)

---

[*] Sea-run forms of this and other charrs and trout are larger in size, silver-gray in color and without spots, or nearly so. A silvery-gray form abundant in Canadian estuaries, and locally known as Salmon Trout, has been called var. *immaculatus*, but this name is preoccupied by *Salmo immaculatus*, Walbaum, which is one of the *Characinidæ*.

[†] This form is thus described by Mr. Garman:

Salmo agassizii: B. 11 to 13; D. 12 to 13; A. 10 to 12; V. 8 to 9; P. 14 to 15; pores 109 to 119; scales 38 to 42-217 to 237-38 to 42; second dorsal to lateral line, 28.

A variety of the brook trout; apparently restricted to the small lakes in the neighborhood of Dublin, New Hampshire. Compared with those of *S. fontinalis*, the young are rather more slender, the caudal notch slightly deeper, and the sides more silvery. The young are much darker colored than the adults; on both the red spots of the flanks are large and numerous. On the adult the brown color has become so much bleached that the specimen is nearly uniform silvery; very faint indications of the red spots remain. The differences between the young of *S. fontinalis* and those of this variety are even more marked than those between adults; side by side, the clouded parr marks or bands at once distinguish the young of *S. agassizii*. Apparently it is later in attaining sexual development, and has the appearance of a deep-water species. Length $7\frac{1}{2}$ inches.

Snout longer than eye; maxillary extending behind orbit; in young the diameter of the eye equals the length of the snout, and the length of the head is one-fourth of the total, without caudal; the length of the head of a $12\frac{1}{2}$-inch specimen (fig. 18) equals the depth of the body, and is contained $4\frac{3}{4}$ times in the length of the body and head. Dublin Pond; Lake Monadnock, Keene, New Hampshire; Center Pond.

Goltra, Krascheninnikow, Descr. Kamch., 183, 1768, Kamchatka.

Malma, Pennant, Arctic Zoöl., Introd., 126, 1792, Bering Sea; after Steller, etc.

Salmo malma, Walbaum, Artedi Piscium, 66, 1792, Kamchatka; based on *Malma*, of Pennant.

Salmo curilus, Pallas, Zoogr. Rosso-Asiat., III, 251, 1811, Curile Islands.

Salmo callaris, Pallas, Zoogr. Rosso-Asiat., III, 353, 1811, Bering Sea; Günther, Cat., VI, 143, 1866.

Salmo lævigatus, Pallas, Zoogr. Rosso.-Asiat., III, 385, 1811, Curile Islands.

Salmo nummifer, Cuvier & Valenciennes, Hist. Nat. Poiss., XXI, 365, 1848, Kamchatka; on a drawing by Mertens.

Salmo erythrorhynchos, Cuvier & Valenciennes, Hist. Nat. Poiss., XXI, 367, 1848, Kamchatka.

Salmo spectabilis, Girard, Proc. Ac. Nat. Sci. Phila., 1856, 218, Fort Dalles, Oregon; name preoccupied.

Salmo parkei, Suckley, Ann. Lyc. Nat. Hist. N. Y., 1861, 309, Kootenay River. (Coll. Gibbs.)

Salmo bairdii, Suckley, Ann. Lyc. Nat. Hist. N. Y., 1861, 309, tributary of Flathead River, Montana. (Type, No. 2010. Coll. Kennerly.)

Salmo campbelli, Suckley, Ann. Lyc. Nat. Hist. N. Y., 1861, 313, Fort Dalles, Oregon; substitute for *spectabilis*; preoccupied. (Coll. Kennerly.)

Salmo lordii, Günther, Cat., VI, 148, 1866, Skagit River; dwarf specimens.

Salmo tudes, Cope, Proc. Amer. Phil. Soc. Phila., 1873, 24, Captains Harbor, Unalaska. (Coll. Prof. Geo. Davidson.)

Salmo bairdii, Günther, Cat., VI, 121, 1866.

Salmo parkii and *campbelli*, Günther, Cat., VI, 121, 149, 1866.

Salvelinus spectabilis, Jordan, Proc. U. S. Nat. Mus., I, 1878, 79.

Salvelinus bairdii, Jordan, Proc. U. S. Nat. Mus., I, 1878, 82.

Salvelinus malma, Jordan & Gilbert, Synopsis, 319, 1883; Evermann, Bull. U. S. Fish Comm., XI, 1891, 50, pl. XXV, fig. 1.

785. SALVELINUS ALPINUS (Linnæus).

(European Charr; Sälbling; Saibling; Ombre Chevalier; Greenland Charr.)

Head $4\frac{1}{2}$; depth 5. D. 13; A. 12; scales 195 to 200. Vertebræ 59 to 62. Cœca 36 to 48. Body elongate, compressed; head moderate; maxillary extending little beyond orbit; hyoid teeth usually present, in a feeble band; teeth moderate. Grayish or greenish above, the lower parts red, especially in the male; lower fins anteriorly margined with white. Sides of body with round red spots; back not marbled. Gill rakers 6 + 11 to 18, usually longer than in *fontinalis*, and in the adult more or less curled. Cold lakes and mountain streams of central and northern Europe and northeastern America, abundant in suitable waters and running into many varieties. Some of the nominal species in Siberia may belong to this type, but too little is known of them to permit their reference, either to *Salvelinus alpinus* or to *Salvelinus malma*. (Eu.) (*alpinus*, alpine.)

Salmo rutilus, Nilsson, Prodromus, 10, 1832, Hadeland, Norway.
Salmo ascanii, Cuvier & Valenciennes, Hist. Nat. Poiss., xxi, 256, 1848, Norway.
Salmo distichus, Heckel, Reisebericht, 93, 1851, Austria.
Salmo monestichus, Heckel, Reisebericht, 93, 1851, Austria.
Salmo rivalis, Gaimard, Voyage Island, Grœnland, pl. 15, 1851, Iceland.
Salmo alpinus nivalis, Faber, Fische Islands, 169, Iceland.
Salmo willughbii, Günther, Proc. Zoöl. Soc., 1862, 46, Lake Windermere.
Salmo grayi, Günther, Proc. Zoöl. Soc., 1862, 51, Lough Melvin, Ireland.
Salmo colii, Günther, Proc. Zoöl. Soc., 1863, 12, Lough Esk.
Salmo perisii, Günther, Ann. Mag. Nat. Hist., xv, 1865, 75, North Wales.
Salmo killinensis, Günther, Proc. Zoöl., 1865, 699, Loch Killin, Inverness.
Salmo carbonarius, Ström, Egers Beskrivelse, 122, Western Norway.

Represented in American waters by several forms, scarcely differentiated from each other or from the parent type. We provisionally recognize the following, but do not know any positive character by which to separate any of them from *Salvelinus alpinus*.

Represented in the inlets of Boothia by the long-finned

785a. SALVELINUS ALPINUS ALIPES (Richardson).

(Long-finned Charr.)

D. 11; A. 10; scales 210; B. 11; cœca 41. Body elongate; head of moderate size; snout elongate, pointed, with the lower jaw projecting beyond the upper in adult examples. Teeth small. Maxillary elongate, narrow, extending beyond the eye. Preopercle very short, with a very short lower limb; opercle and preopercle very conspicuously and deeply striated, the striæ radiating from the base of each. Fins much developed, the dorsal much higher than long; pectoral very long, reaching more than halfway to ventrals, which are also very long; adipose fin very small; caudal well forked. Lakes of Greenland and Boothia Felix. (Günther.) (*ala*, wing; *pes*, foot).

Salmo alipes, Richardson, Nat. Hist. App. Ross's Voy., lvii, 1835, and Fauna Bor.-Amer., iii, 169, 1836, lakes in Regent's Inlet, Boothia Felix; Günther, Cat., vi, 149, 1866.
Salmo nitidus, Richardson, App. Ross's Voy., lvii, 1835, Lake at Regent's Inlet, Boothia Felix; and Fauna Bor.-Amer., iii, 171, 1836; Günther, Cat., vi, 150, 1866. In *nitidus*, the dorsal and pectoral are represented as a little shorter than in *alipes*, but no other evident difference.
Salvelinus nitidus, Jordan & Gilbert, Synopsis, 321, 1883.
Salvelinus stagnalis, Jordan & Gilbert, 321, 1883.

Associated with *S. alipes* and probably not distinct from it, and like it not entering the sea is

785b. SALVELINUS ALPINUS STAGNALIS (Fabricius).

(Greenland Charr.)

Gill rakers as in *alpinus*, slender and straightish, 9 + 15 in number, the longest 2⅓ in eye. Body moderately elongate; pectorals shortish, 1⅔ in head, not reaching quite halfway to ventral; dorsal about as high as long, the longest ray 1¾ in head (8½ in total length with caudal, according to Fabricus). Dark green, with lighter irregular green streaks, silvery below; sides everywhere with pale pink spots, the largest less than eye; upper fins greenish; lower pink. Sea-run specimens nearly plain silvery. Waters of Greenland, Boothia, and neighboring regions, abundant; the specimen examined by us (described in full by Dresel) from Godhavn, Disco Island. (*stagnum*, a pond or tarn.)

Salmo stagnalis, Fabricius, Fauna Grœnlandica, 175, 1780, Alpine ponds of Greenland; not migratory.

Salmo rivalis, Fabricius, *l. c.*, 176, 1780, Alpine brooks of Greenland; not entering the sea.

Salmo hearnei, Richardson, Franklin's First Voyage, 706, 1823, and in Fauna Bor.-Amer., iii, 167, 1836, Bloody Fall, Coppermine River, lat. 67°; description imperfect; Günther, Cat., vi, 148, 1866.

Salmo rossii,[*] Richardson, App. Ross's Voyage, lvi, 1835; and in Fauna Bor.-Amer., iii, 163, 1836, Regent's Inlet, Boothia Felix.

Salvelinus rossi, Jordan & Gilbert, Synopsis, 321, 1883.

Salvelinus stagnalis, Dresel, Proc. U. S. Nat. Mus., 1884, 255; good description.

Salmo hoodii, Richardson, Fauna Bor.-Amer., iii, 173, 1836; Günther, Cat., vi, 151, 1866.

Represented in the far north by

785c. SALVELINUS ALPINUS ARCTURUS (Günther).

Head 4½; depth 5; D. 11; A. 10; B. 11; cœca 31–44. Dull greenish, silvery or reddish below; lower fins yellowish; no red spots (on specimens seen). Body rather elongate; head small, the snout very obtuse; mouth moderate, the maxillary in the male reaching about to posterior margin of orbit; teeth small; a band of hyoid teeth; preopercle with a distinct lower limb; pectoral little shorter than head, reaching more than halfway to ventral. Caudal moderately forked; scales minute. Length 12 inches. Victoria Lake and Floeberg Beach, Arctic America, lat. 82° 34′, the northernmost Salmonoid known. (Günther.) (*Arcturus*, ἄρκτος, bear; οὐρά, tail, name of one of the northern stars.)

Salmo arcturus, Günther, Proc. Zoöl. Soc. Lond., 1877, 294, pl. xxxii, Victoria Lake, Floeberg Beach. (Coll. Capt. Fielden.)

Salvelinus arcturus, Jordan & Gilbert, Synopsis, 319, 1883.

---

[*] The following is the substance of Richardson's account of *S. rossi*:

Head 5. B. 12-13; D. 13; A. 11; P. 14; V. 10. Dorsal fin low; pectoral short, adipose fin very small. Rather slender; snout very obtuse; lower jaw remarkably long, with a knob at tip (male). Thirty teeth on tongue. Conspicuous pores on the face bones posteriorly. Scales very small, embedded. Olive-brown above, the dorsal and caudal similarly colored; belly red; scattered red spots near the lateral line. (Named for Captain James Clark Ross, an Arctic explorer by whose party the species was obtained.)

Represented in lakes of Western Maine and New Hampshire by

785d. SALVELINUS ALPINUS AUREOLUS (Bean).

(SUNAPEE TROUT.)

Head $4\frac{1}{5}$; depth $4\frac{1}{5}$. D. 9; A. 8; scales 35–210–40. Maxillary reaching middle of eye, $2\frac{2}{3}$ in head; eye a little longer than snout, $4\frac{2}{7}$ in head; gill rakers usually* about 6 + 12, quite short, not $\frac{1}{3}$ diameter of eye, and angularly bent; (in *alpinus*, longer, straighter, 7 + 14, and $\frac{2}{5}$ eye); pectoral shortish, $1\frac{2}{3}$ in head, longer in males; dorsal rather low. Brownish, sides silver gray, with small orange spots on sides above and below lateral line; caudal grayish; belly orange; anal orange, edged before with white; ventrals orange, with a white band on outer rays; no mottlings anywhere. Length 12 to 18 inches. Sunapee Lake, New Hampshire, Dan Hole Pond, Carroll County, New Hampshire; tributary to Saco River, and Flood's Pond, Ellsworth, Maine, tributary to Union River. Evidently almost or quite identical with the European Charr, and considered by Garman as probably introduced into these ponds from Germany.

In referring to the trout from Sunapee Lake, Mr. Quackenbos writes: The external characteristics of the Sunapee fish, however, distinguish it conspicuously from the three other charrs of New England. Its graceful build, small and delicately-shaped head, small mouth, excessively developed fins, more or less markedly emarginate caudal, spots without the blue areola, and unmottled back, at once separate it from the brook trout and link it as closely as its structural peculiarities with Austrian, British, and Swiss congeners. The nuptial coloration is gorgeous beyond example among our indigenous *Salmonidæ*. Throughout the spring and summer the back is dark sea-green, blending on the sides into a flashing silver, which in turn deepens below into a rich cream. But as the October pairing time approaches, the fish is metamorphosed into a creature of indescribable brilliancy. The deep purplish blue of the back and shoulders now seems to dissolve into a dreamy sheen of amethyst, through which the inconspicuous pale lemon spots of midsummer flame out in points of yellow or vermilion fire, while below the lateral line all is dazzling orange. The fins catch the hue of the adjacent parts, and pectoral, ventral, anal, and lower lobe of caudal, are ribboned with a broad white margin. As in the case of the Windermere charr, these white margins of the fins are very conspicuous in specimens seen swimming in the water. There are great differences in intensity of general coloration, and the females are not usually as gaudily tinted as the males. The intermediate types and different depths of hue observable in an autumn school recall the public promenade in a West Indian city, where all shades of transition are found from pure white to tawny black. Those who have seen the flashing hordes on the spawning beds, in all their glory of color and majesty of action, pronounce it a spectacle never to be forgotten.

The Sunapee charr is undoubtedly a representative of the European form; but reasons have been given why it is believed to be a native of this continent. It differs no more extensively from the several European varieties than they do among themselves. Von dem Borne, Professors Benecke, Dalmar, and Wittmack, of Berlin, all speak of important differences in form, size, and color, according to age, sex, season, and habitat. All authorities allude to the solid sea-green or dark-blue of the back, the yellowish sides, and the red or orange belly. Benecke and Dalmar refer picturesquely to the half-moon tail. As to spots, there is endless variety. Some forms have none; some, large spots; others, small—yellow, orange, and red—and singularly, in certain specimens, each spot is surrounded by a white ring or halo. The fins take their color from the back and sides, and have the broad white band. The foreign saïbling is gregarious like the Sunapee form ; lives similarly on crustaceans, worms, and fish-food, and seeks the deepest and coldest waters.

---

* The value of gill rakers as a distinctive character is questioned by Garman, Bean, and Quackenbos. It is not unlikely that these structures vary with age, food, and condition, and are subject to deterioration in large trout. Garman says that in foreign specimens examined by him the dentition differs, corresponding more or less nearly with that of the New Hampshire fish —that differences of age imply radical differences in teeth, fins, stomach, and especially gill rakers—which latter Garman believes to be "most important in function early in life and to deteriorate with change to coarser food." The deterioration consists in a distortion not alike in any two individuals; "the rakers curve and twist in every direction like a lot of writhing worms suddenly become rigid." "In old specimens, they lose their points and grow club-shaped.—*Quackenbos.*"

The greater the altitude the more intense the coloration and the smaller the fish. In Lake Zug the saïbling run 8 or 9 to the pound; in Lake Geneva, they are said to attain a weight of over 20 pounds. The flesh is white or red, which, however, makes no difference in the flavor. The foreign saïbling is taken in nets, or with hook and line; it is eaten fresh or smoked.

In Forest and Stream, Jan. 22, 1891, Dr. Jordan gave his reasons for thinking with Bean, Quackenbos, and others that the Sunapee trout is a native variety of *Salvelinus alpinus*, as follows: "For some time past ichthyologists and anglers alike have been deeply interested in the question of the name and origin of the splendid trout of Sunapee Lake. Is it a distinct and peculiar species which has always been with us, or is it simply the European charr or saibling which has been lately brought over from Europe? Two of our highest ichthyological authorities have expressed themselves with some positiveness in regard to this matter. Dr. Tarleton H. Bean, of the United States Fish Commission, has described the fish in question as a distinct species, under the name of *Salvelinus aureolus*, while Mr. Samuel Garman, of the Museum of Comparative Zoölogy, has declared it to be fully identical with the European *Salvelinus alpinus*, the charr, saibling, sälbling or *ombre chevalier* of the rivers and lakes of northern Europe. On the supposition of the identity of the Sunapee trout with the European form, its occurrence in the lakes of Maine has been attributed to a recent plant of saibling eggs brought from Germany by the United States Fish Commission. The possibility that this trout is a hybrid between the saibling and the European trout or brown trout (*Salmo fario*), has been also suggested.

The study of the species of charr is a very difficult one. The specific differences are slight and the individual variations surprisingly great. The presence of a large amount of material is necessary in order to reach any conclusion. Those conclusions which now seem to me probable I wish to present in the most modest manner possible, for they are liable to be wholly overturned when the waters between Maine and Greenland are more fully explored.

For the purposes of the present study, Dr. Bean has very kindly lent me a considerable amount of material, from the National Museum, by consent of Dr. Goode. This consists of the following specimens:

Salvelinus alpinus—10249, from Europe; 17456 (two specimens), Bergen; 39924, Sterling Lake, New Jersey (introduced).

Salvelinus aureolus—From Sunapee Lake, 37408, 37409, 37410, 39334, 39335, 39900.

Salvelinus—A hybrid of *Salvelinus alpinus*, male with *Salmo fario*, female, 2 years old, received from Norway, 17451.

Salvelinus (*nitidus*)—34384, Disco, Greenland.

Salvelinus (*arcturus*)—36097, mouth of St. Lawrence River; 37670, lake near Quebec.

Besides these specimens I have received several specimens of *Salvelinus aureolus* from Sunapee Lake and Dan Hole Pond, through the kindness of Mr. A. N. Cheney and others. From Dr. Bean I have also specimens of *S. oquassa* from Rangeley Lake, and of *S. fontinalis agassizii*, from Monadnock Lake. There is, however, no present question of the distinctness of the Sunapee trout from either *fontinalis* or *oquassa*, though its relations to the latter are very close.

From the material in hand the following conclusions seem justifiable, and I am pleased to find that these results agree in the main with the observations both of Dr. Bean and of Mr. Garman.

1. In comparing the specimens of *aureolus* with those of *alpinus* I find a very close agreement in all external respects, some of the specimens in hand coinciding, as Mr. Garman has noticed, in almost every detail with one of Dr. F. A. Smitt's colored figures of *alpinus* from Sweden. I find, however, the following distinctions constant in these specimens, these differences being substantially those already pointed out by Dr. Bean.

In *aureolus* the gill rakers, 6 + 11 or 6 + 12 in number, are quite short, less than ⅓ diameter of eye, and angularly bent outward, the oldest specimens having them shortest in proportion and most curved.

In *alpinus* the gill rakers are 7 + 15 or 7 + 14 in number, longer and straighter than in *aureolus*, ⅖ length of eye in specimens of the same length as those of *aureolus* measured. In form of gill rakers and in all other respects the specimen from Sterling Lake introduced (from Germany) agrees fully with the Norwegian saiblings.

In *aureolus* the pectorals are shorter (1⅔ in head) and the dorsal lower than in *alpinus*. In the latter the pectoral is 1⅓ to 1¼ in head.

Other apparent differences which may depend wholly or in part on the condition of the specimens are these: The hyoid (hypobranchial) teeth in *aureolus* are smaller and in a broader series than in *alpinus*, the stomach a little thicker and the pyloric cœca smaller. I doubt the constancy of these characters. The specimens of *aureolus* are also a little more robust in form, a character of trifling value among trout.

Dr. Day has recently maintained, and he has shown good cause for his opinion, that the six or eight nominal species of charr ascribed to the waters of Great Britain are all forms of one—*Salvelinus alpinus*. Recent continental writers seem to share this view, long ago advanced by Agassiz, who placed all the charrs of Europe, including Iceland, in a single species, *alpinus*. Dr. Day has shown that the species is subject to great variation in the development of the pectorals. None of the European writers has paid much attention to the gill rakers. Dr. Günther has counted in English specimens 9 and 11 gill rakers on the lower limb. If these counts are correct, the number would vary from 6 + 9 to 9 + 15. But this count may be questioned, as it is not unlikely that some of the smaller ones have been omitted in Dr. Günther's enumeration. When all these facts are taken into consideration, the only character left to distinguish the Sunapee charr from the saibling is the curved form and perhaps lesser number of its gill rakers.

This problem is complicated by the existence of other saibling-like charrs in lakes of Canada and Greenland. It is evident, too, that some of these are even more like the saibling than the Sunapee trout is, a fact which Dr. Bean has already pointed out in a letter to me.

The specimen above mentioned from Disco, Greenland, is a fine trout, 15 inches long, wholly silvery in color, a fact which shows that it was taken in the sea. This specimen has the gill rakers slender and straightish, 9 + 15 in number, the longest 2⅓ in eye. In this respect it agrees perfectly with the saibling, but in the form of the body and the shortish fins (the pectoral 1⅔ in head) it more resembles the Sunapee trout. This Greenland fish represents the species called *Salvelinus nitidus* (Richardson). This has been thought to be simply the female of a long-finned Greenland trout, called *Salvelinus stagnalis* (Fabricius). Perhaps *nitidus* is the female and *stagnalis* the male, or perhaps *stagnalis* is based on river and *nitidus* on sea-run specimens. Apparently the two are not distinct species and I do not see how either can be separated from *alpinus*. Apparently, also, *nitidus* only differs from *aureolus* in having the gill rakers of *alpinus*. An unpublished engraving of another Greenland trout (*nitidus*) agrees perfectly in form and color with *aureolus*, but the gill rakers are not shown.

In view of all these facts, I have no hesitation in regarding these Greenland charrs as forms of the saibling. That the saibling should extend its range across to Greenland need not surprise us. It is found in all the mountain lakes of Europe from Austria to Spitzbergen. It enters the northern seas and swarms in the ponds of Iceland. In late autumn, in the North Pacific, black-spotted trout (*Salmo mykiss*) and the Dolly Varden charr (*Salvelinus malma*) freely enter the ocean, and they inhabit alike both sides of Bering Sea. The saibling could as easily reach Greenland from Iceland as to cross to Iceland from the Scottish coasts.

Two other specimens before us are also of interest in this connection. One of these, a young trout, 10¾ inches in length, with parr marks and without red spots, is from a lake near Quebec. The other, 9¾ inches long, was taken in the Gulf of St. Lawrence. This specimen is very dark in color, almost like a blueback. It has no red spots and its scales have the silvery luster which is acquired on entering the sea. [These belong to the form since described as *Salmo marstoni*, Garman; previously recorded by Dr. Bean as *Salvelinus rossi*.]

These two specimens seem to agree with each other in essentials. They have straightish gill rakers like the saibling, but their number of these appendages (7 + 12 and 7 + 14) is intermediate between the saibling and the Sunapee trout. The pectoral fins are also intermediate in length, 1⅖ in head in one specimen, 1⅗ in the other. The opercular bones seem more straight than in any other specimens examined, but this appearance may be due to the fact of the partial drying of the skin over the bones before the fish was put into alcohol. These specimens are apparently intermediate between the saibling and the Sunapee trout, and again intermediate between the Greenland *nitidus* and the Sunapee fish. The specimen from Quebec agrees in all respects, waiving nonessentials, with Dr. Günther's figure of *Salvelinus arcturus*, the "northernmost Salmonoid known," from the northern limit of British America. Dr. Bean has suggested to me that this specimen may be the unrecognized *Salvelinus rossi* of Richardson. This view may be correct, but Richardson's description is so vague that we can only be sure that his fish was some one of the *alpinus* set, with red spots and a red belly, perhaps a *nitidus* or *stagnalis*.

The Sunapee charr is certainly not a hybrid between the saibling and any other species, European or American. The hybrid *alpinus* X *fario*, examined by me, has the scales adherent as in *alpinus*, but almost as large (135 series) as in *Salmo fario*. Its gill rakers, 6 + 11 or 12, are stiffish and nearly straight; there are a few teeth on the shaft of the vomer (*fario* has many, the species of *Salvelinus* none at all) and the color is very eccentric. The body is dark and is clouded all over with sharply defined yellowish reticulations, which extend on the head and fins. Its coloration somewhat resembles that of a pike. It has neither the red spots of *alpinus* nor the black spots of *fario*.

In this connection we may briefly notice the other nominal species of charr described from British America and Greenland. *Salvelinus arcturus* seems to be a form or variety of *S. alpinus* as already noticed. The same is true of *Salvelinus nitidus* and of *Salvelinus stagnalis*. *Salvelinus alipes* is the same as *stagnalis*, and *rossi* probably identical with *nitidus*, as is also *Salvelinus hearnii*. *Salvelinus hoodi* was based on a mixed lot of *Salvelinus fontinalis* and *S. namaycush*. *Salvelinus hudsonicus*, *canadensis*, and *immaculatus* are *fontinalis*, the latter name given to sea-run specimens. But for all we know the *alpinus* may run out to sea as well and become *immaculatus*, too. *Salvelinus naresi*, from the Arctic regions, seems to be the same as *oquassa*. If these views be correct, we have in America five species of charr, each highly variable and running into many local varieties.

As for the Sunapee charr itself, we may say that it seems to be distinguished from all the other forms of charr by its gill rakers. It is probably not a distinct species, and it is probably native to the waters in which it is now found, and not an importation from Europe. Should it appear, however, that the saibling in that part of Germany from which specimens have been brought to America have gill rakers like those of the Sunapee trout, this opinion would be reconsidered. Other lakes of Maine, Quebec, Labrador, and Boothia must be explored before these questions can be definitely settled.

It is interesting to notice that just as the right of the saibling to be regarded as a native American has been questioned in this country, so has its citizenship in England been also denied. Dr. Day tells us that in olden times the people were 'taught that three sons of the church introduced these fishes into Wales from Rome, and placed two in each of the lakes of Llanberries, Llynumber, and Trevennyn.' Perhaps we are justified in supposing that by the same persons and at the same time two were placed in Sunapee Lake, two in Dan Hole Pond, and two in the sea at Disco."

Salvelinus aureolus, BEAN, Proc. U. S. Nat. Mus., 1887, 628, Sunapee Lake, New Hampshire. (Type, Nos. 37408 and 39334. Coll. Col. E. B. Hodge and Dr. J. D. Quackenbos.)

Salvelinus alpinus aureolus, JORDAN, Forest and Stream, Jan. 22, 1891; QUACKENBOS, Trans. N. Y. Ac. Sci., XII, 1893, 139.

Salmo alpinus, GARMAN, American Angler, Feb. 5, 1891.

786. SALVELINUS OQUASSA (Girard).

(OQUASSA TROUT; BLUEBACK TROUT; QUASKY.)

Head 5; depth 5; eye large, 3½ in head. D. 10; A. 9; scales 230; gill rakers about 6 + 11. Body elongate, considerably compressed, less elevated than in the other species of this genus, the dorsal outline regularly but not strongly curved. Head quite small, smaller than in any other of our trout, its upper surface flattish; mouth quite small, the maxillary short and moderately broad, scarcely extending to the posterior margin of eye. Jaws about equal. Scales small, those along the lateral line somewhat enlarged. Pectoral and ventral fins not elongate; caudal fin well forked, more so than in the other species; preopercle as in *S. fontinalis*, but the lower limb more developed; opercles without concentric striæ. Coloration dark blue, the red spots small and round, much smaller than the pupil, usually confined to the sides of the body; sides with traces of dark bars; lower fins variegated, as in *S. fontinalis*. Length 12 inches. Smallest and handsomest of the charrs, as yet known only from the Rangeley Lakes in western Maine. Although quite different in appearance, it shows no important structural differences from *S. alpinus*, and may prove to be a variety of that species. (*Oquassa* or *Oquassoc*, name of one of the Rangeley Lakes.)

Salmo oquassa, GIRARD, Proc. Ac. Nat. Sci. Phila., 1854, 262, Oquassa Lake, Maine; GÜNTHER, Cat., VI, 154, 1866.

Salvelinus oquassa, JORDAN, Proc. U. S. Nat. Mus., I, 1878, 81; JORDAN & GILBERT, Synopsis, 318, 1883.

Represented in Arctic America by the scarcely different

786a. SALVELINUS OQUASSA NARESI (Günther).

Head $4\frac{1}{4}$; depth 5–6. D. 11; A. 9; B. 11; cœca 42; vertebræ 65. Greenish above, sides silvery or deep red, with very small red spots, much smaller than pupil; lower fins deep red, with the anterior margins yellowish white; dorsal red posteriorly. Body long and slender; head rather small, the snout blunt; the forehead flat; mouth not large, maxillary reaching posterior margin of orbit in male only; teeth very small; teeth on the middle line of the hyoid bone; angle of preopercle much rounded; gill covers with scarcely a trace of the concentric striæ for which *S. nitidus* is distinguished; pectoral not longer than the head without snout; reaching halfway to ventrals; ventrals not to vent; caudal deeply forked; scales minute. Length 10 inches. (Günther.) Lakes of Arctic America, Discovery Bay, and Cumberland Gulf. (Named for Captain George Nares, in charge of the exploring expedition by which it was taken.)

Salmo naresi, GÜNTHER, Proc. Zoöl. Soc. London, 1877, 476, plate, fresh-water lakes near Discovery Bay.

Salvelinus naresi, BEAN, Bull. U. S. Nat. Mus., XV, 1879, 135; JORDAN & GILBERT, Synopsis, 318, 1883; DRESEL, Proc. U. S. Nat. Mus., 1884, 255; compares *naresi* with *stagnalis*. In *S. naresi*, the eye is very much larger, the snout is much shorter, the maxilla does not extend beyond the posterior margin of the eye, and the gill rakers are longer and more numerous. In *stagnalis*, DRESEL says that the gill rakers are 9 + 14 or 15, the longest $\frac{1}{2}$ eye.

Closely allied to *Salvelinus oquassa*, and perhaps a variety either of it or of *S. alpinus* is

786b. SALVELINUS OQUASSA MARSTONI,[*] Garman.

(THE LAC DE MARBRE TROUT.)

B. 11, 12; D. 13; A. 13; V. 9; P. 14; vertebræ 60. Gill rakers straight, short, sharp, rough, 8 + 14 on the first arch. The specimen described is about 12 inches in length. Body subfusiform, compressed, pointed at snout, slender at the tail. Height of body near $\frac{1}{6}$ of the total length; head $\frac{1}{5}$, crown convex. Snout $1\frac{1}{3}$, and interorbital space $1\frac{1}{2}$ times the eye. Eye little less than $\frac{1}{5}$ of the head, $\frac{2}{3}$ of the space between the orbits on the forehead. Mouth large; maxillary straight, extending backward almost as far as the hinder edge of the eye, bearing strong teeth on its lower edge for nearly its entire length. Teeth on intermaxillary and mandibles stronger. The tongue bears a series of four strong hooked teeth at each side, and behind the glossohyal on the basibranchials there is a band of several series of smaller ones. Opercle thin, with a few striæ. Scales very small; apparently there are about 230 in the series immediately above the lateral line, and more than 250 in a row 5 or 6 scales above this. Distance from first ray of dorsal to end of snout little more than that from the same ray to the tip of the adipose fin. The middle of the total length falls halfway between the ends of the hinder rays of the dorsal and its base. Dorsal and anal fins are slightly emarginate at the ends of their median rays. Pectorals and ventrals small; base of latter slightly behind the middle of that of the dorsal. Caudal pedicle slender, notch very deep, hinder border sinuous, as in *Salmo alpinus*, lobes pointed. The caudal notch is deeper in this species than in any other of the American forms except *C. namaycush*.

---

[*] Dr. Bean furnishes us the following notes on a specimen, doubtless identical with *S. marstoni* and formerly referred by us to *Salvelinus alpinus*, called by him

SALVELINUS ROSSI (No. 37670).

Township of Decalonnes, Quebec, 70 miles east and 40 miles north of Montreal. Received from Mr. Blackford, February 10, 1886; caught by C. H. Simpson. Length $10\frac{1}{2}$ inches; sex not to be ascertained. Above steel blue. Seven or eight broad parr marks along the sides, very indistinct, and separated by very much narrower yellowish interspaces. Lower half of body pink, overlaying a yellowish ground. Pectoral dusky at base and along most of its upper half, the rest running into orange. Ventrals red, the outer margin milk-white. Anal red, the outer anterior margin milk-white. Lower caudal lobe reddish along its lower margin. Eye dusky, mingled with bronze. Gill rakers about 8 + 12, rather short and feeble, longest about $\frac{1}{2}$ length of iris. Teeth in jaws and on tongue very strong. Closely related to *alpinus*, from which it seems to differ in the shape of the subopercle; this bone is twice as long as deep and is conspicuously striated. The hyoids are well developed, in a long and unusually broad band for the genus *Salvelinus*.

Back dark brown, with an iridescent bluish tint, unspotted; dorsals dark, clouded, without spots or bands; pectorals, anal, and ventrals orange in the middle, yellowish or whitish toward bases and at their margins. The dark color of the back shades into whitish, tinged with pink below the lateral line; ventral surface white, no doubt reddish in breeding season; head black on top, silvery on the cheeks, white beneath. Flesh pink. Caudal fin yellowish toward the base, brown toward the hinder border, which has a narrow edging of light color; faint areas of lighter tint suggest a few spots of red in life along the lateral line; the condition of the specimens is such that this may be left in question, as also the number of cœca or presence of parr bands, of which there are faint indications.

This fish is evidently allied to the blueback of the Rangeley Lakes, *S. oquassa*, but reaches a greater size than that species, and is readily distinguished by the maxillary and its dentition, the caudal fin, and the coloration. Similarly when compared with *S. arcturus*, *S. stagnalis*, and *S. rossi*, it is seen to be quite distinct. With the saibling, *S. alpinus*, introduced in Sunapee Lake and elsewhere, it has still less in common.

Our specimens were taken in Lac de Marbre, Ottawa County, Province of Quebec, Canada, whence they were sent by favor of the Hon. J. G. A. Creighton. They reached us at the instance of Mr. A. N. Cheney. (Garman.) (Named for R. B. Marston, editor of *Fishing Gazette*, London.)

Salmo marstoni, GARMAN, Science, July 14, 1893, 23, Lac de Marbre, Ottawa County, Quebec.

Family LXV. THYMALLIDÆ.

(THE GRAYLINGS.)

The family contains Salmonoid fishes, with ripe ova first discharged within abdominal cavity, branchiostegals 8–10 (11), pyloric cœca in moderate number, a rather long dorsal fin, whose anterior half is composed of simple unbranched rays, and posterior half of bifurcate or little branched rays, epipleural spines to anterior ribs, and the parietal bones meeting at middle and excluding frontals from supraoccipital. (Gill.) The graylings agree closely with the *Salmonidæ* in external characters and in habits. They, however, differ notably in the structure of the skull, as above indicated. The conventional statement that they are intermediate between the trout and the whitefishes is not borne out by the skeleton. One genus with about five species; beautiful fishes of the rivers of cold or Arctic regions, active and gamy and valued as food. (*Thymallidæ*, Gill, Proc. U. S. Nat. Mus., 1894, 121.)

238. THYMALLUS, Cuvier.

(GRAYLINGS.)

Thymallus, CUVIER, Règne Anim., Ed. 2, II, 306, 1829, (*thymallus*); not *Thymalus*,* LATREILLE, 1802, a genus of *Coleoptera*.

Choregon, MINDING, Lehrbuch, Naturgesch. Fische, 119, 1832, ((*thymallus*).

Body oblong, compressed, little elevated. Head rather short; mouth moderate, terminal, the short maxillary extending past the middle of the large eye, but not to its posterior margin. Teeth slender and sparse on the maxillaries, premaxillaries, and lower jaw; vomer short, with a small patch of teeth; teeth on the palatines; tongue toothless, or nearly so. Gill openings wide. Branchiostegals 7 or 8. Gill rakers short and rather stiff. Suborbital and preorbital bones narrow. Scales small and loose, 75 to 100 in the course of the lateral line. Dorsal fin very long and high, mostly in advance of the ventrals, of about 20 rays, of which the anterior half are slender and simple, most of the others simply bifid; adipose fin small; caudal fin forked; anal fin small, of 10–15 rays. Pseudobranchiæ well developed. Air bladder very large. Pyloric appendages about 15. Coloration brilliant, the dorsal with red or blue spots. Beautiful fishes of the fresh waters of northern regions. (*Thymallus*, an ancient name of the Grayling, the fish having the odor of thyme, *ϑύμος*.)

a. Dorsal fin very high, with 22 to 24 rays.	SIGNIFER, 787.
aa. Dorsal fin moderate, of 19 to 21 rays.	ONTARIENSIS, 788.

787. THYMALLUS SIGNIFER (Richardson).

(ARCTIC GRAYLING; POISSON BLEU.)

Head 5$\frac{1}{2}$; depth 4$\frac{2}{3}$; eye 3. D. 24; A. 11; scales 8–88 to 90–11; cœca 18. Body elongate, compressed, highest under the anterior portion of the dorsal. Head rather short, subconic, compressed, its upper outline continuous with anterior curve of the back. Mouth moderate, the maxillary extending to below the middle of the eye; maxillary 6 in head; jaws about

---

*Those who think that the two names (*Thymalus* and *Thymallus*) conflict, may take the name *Choregon* in place of *Thymallus*.—*Gill.*

equal. Tongue, in the young, with teeth which are usually absent in the adult. Eye quite large, rather longer than snout, about equal to the interorbital space. Scales moderate, easily detached; lateral line nearly straight; a small bare space behind isthmus. Dorsal fin long and high, its length rather greater than the depth of body, its height varying, about 3½ in length of body, greatest in the males; adipose fin rather small; anal fin small. Gill rakers slender, short, about 12 below the angle. Back dark, sides purplish-gray; belly blackish-gray, with irregular whitish blotches; five or six deep-blue spots anteriorly; head brown; a blue mark on each side of lower jaw; dorsal dark gray, blotched with paler, with crossrows of deep-blue spots, edged with lake red; ventrals striated with reddish and whitish. Length 18 inches. Mackenzie River to Alaska and the Arctic Ocean; Kowak River (C. H. Townsend); abounding in clear cold streams. Our specimens from Fort Simpson. (*Signifer*, standard bearer.)

Coregonus signifer, Richardson, Franklin's Journ., 1823, 711, Winter Lake, near Fort Enterprise.

Coregonus thymalloides, Richardson, Fauna Bor.-Amer., 714, 1836, Winter River.

Salmo (*Thymallus*) *signifer*, Richardson, Fauna Bor.-Amer., III, 190, 1836.

Thymallus signifer, Günther, Cat., VI, 202, 1866; Milner, Rept. U. S. Fish Comm., II, 1872–73 (1874), 738; specimens from Fort Simpson, Yukon River, and St. Michaels; Jordan & Gilbert, Synopsis, 302, 1883.

788. THYMALLUS ONTARIENSIS, Cuvier & Valenciennes.

(Michigan Grayling.)

Head rather larger, about 5 in length; scales about the same, 93 to 98; dorsal fin lower and smaller than in *T. signifer*, with 21 or 22 rays. Coloration brilliant, purplish-gray; young silvery; sides of head with bright bluish and bronze reflections; sides of body with small, black irregular spots, most numerous posteriorly in young specimens; ventral fins ornate, dusky, with diagonal rose-colored lines; dorsal with a black line along its base, then a rose-colored one, then a blackish one, then rose-colored, blackish, and rose-colored, the last stripe continued as a row of spots; above these is a row of dusky-green spots, then a row of minute rose-colored spots, then a broad dusky area, the middle part of the fin tipped with rose; anal and adipose fins dusky; central rays of caudal pink, outer rays dusky. Streams of northern Michigan, formerly abundant in Au Sable River, Jordan River, and other streams in the Southern Peninsula. Also in Otter Creek, near Keweenaw, in the Northern Peninsula, whence specimens have been sent us by David D. Banta. These Michigan localities evidently represent a detached colony, left from the former or post-Glacial extension of the range of *T. signifer*, of which this was once a variety. It is a beautiful and gamy fish, but is being rapidly exterminated through the influence of anglers and sawmills.

Thymallus ontariensis,* Cuvier & Valenciennes, Hist. Nat. Poiss., XXI, 452, 1848; said to have been brought by Milbert, from Lake Ontario.

---

*The following is a translation of Valenciennes' account of *Thymallus ontariensis:* We have received from Lake Ontario a *Thymallus* very near to that of the lake of Geneva. It has, however, more naked space under the throat, although less than in *Thymallus gymnothorax*. The head is evidently more pointed, the body more elongate, the dorsal a little longer. The denticulations of the scales are more pronounced. The colors seem scarcely to differ from those of *Thymallus*, for our specimens are greenish, with a dozen gray lines along the flanks. The dorsal has 4 or 5 longitudinal streaks of red. Our specimens are a foot long; they have been sent by M. Milbert.—(*Valenciennes, l. c.*)

Thymallus tricolor, COPE, Proc. Ac. Nat. Sci. Phila., 1865, 80, Au Sable River, Michigan; GÜNTHER, Cat., VI, 201, 1866; MILNER, Rept. U. S. Fish Comm., II, 1872–73 (1874), 739, and of late writers on angling generally.
Thymallus signifer tricolor, JORDAN & GILBERT, Synopsis, 303, 1883.
Thymallus signifer ontariensis, JORDAN, Bull. U. S. Fish Comm., X, 1890, 49.

Represented in the head waters of the Missouri by another isolated colony,

788a. THYMALLUS ONTARIENSIS MONTANUS (Milner).

(MONTANA GRAYLING.)

Depth $5\frac{1}{2}$* in length, as in other forms; scales 99, and (in specimens examined) a little different in color. Dorsal dusky green, its posterior part with three rows of bright-orange spots, faintly ocellated, irregular in position, some of the spots oblong and placed obliquely; above this one regular row of similar spots, extending obliquely across the fin from end of second third of anterior ray to tip of last ray; fin edged with bright orange-brown. Entirely similar to the Michigan Grayling, but the dorsal a little smaller. Madison and Gallatin rivers, very abundant in springs and small streams on the west side of the Yellowstone Park, ascending streams as far as Firehole Falls and Gibbon Falls.

Thymallus montanus, MILNER, Rept. U. S. Fish Comm., II, 1872–73 (1874), 741, tributary of Missouri River at Camp Baker. (Type, No. 13090. Coll. J. Scott Oldmixon.)
Thymallus signifer montanus, JORDAN & GILBERT, Synopsis, 303, 1883.

Family LXVI. ARGENTINIDÆ.

(THE SMELTS.)

Body elongate, covered with moderate or small scales, which are usually cycloid. Head naked. Mouth terminal, small or large, formed as in the *Salmonidæ*, the maxillary forming the margin of the upper jaw. Teeth various, sharp-pointed. Gills 4, a slit behind the fourth. Gill membranes separate, free from the isthmus, with 6 to 10 branchiostegals. No barbels. Stomach a blind sac, with the pyloric cœca few or none. Dorsal fin short, nearly median; adipose fin always present; caudal forked; anal moderate; pectorals placed low; ventrals moderate, nearly median; no spines in the fins. Lateral line present. No phosphorescent spots. Abdomen rounded. Air bladder large, single. Ova large, falling into the cavity of the abdomen before extrusion. Small fishes, marine or anadromous, some of them inhabiting deep waters; all but one genus confined to the waters of the Northern Hemisphere. There are about ten genera and perhaps a dozen species; reduced *Salmonidæ*, smaller and in every way feebler than the trout, but similar to them in all respects except the form of the stomach. Most of them are very delicate food-fishes, and the species of *Thalcichthys* is, in this respect, preeminent among our fishes. (*Salmonidæ*, part, Günther, Cat., VI, 166–172, 203–205, 1866.)

a. Branchiostegals 6 to 10; body not cylindrical, the sides more or less compressed; gill membranes separate.

---

* Not $4\frac{1}{2}$ as stated by Milner.

b. Ventral fins inserted in front of the middle of dorsal; mouth large.
  c. Scales very small, arranged in the male in villous bands; teeth feeble; pectoral fins broad, of 15 to 20 rays; pyloric cœca 6. MALLOTUS, 239.
  cc. Scales large, similar in both sexes; pectoral fin moderate, its rays 10 to 12.
    d. Teeth feeble, those on tongue very weak; scales small, adherent. THALEICHTHYS, 240.
    dd. Teeth strong, those on tongue enlarged, canine-like; scales moderate, loosely attached. OSMERUS, 241.
bb. Ventral fins inserted under or behind middle of dorsal; mouth rather small; scales large.
  e. Jaws with minute teeth; similar teeth on tongue and palate; maxillary reaching past front of eye. HYPOMESUS, 242.
  ee. Jaws toothless or very nearly so; vomer and palatines with small teeth; mouth small, the maxillary not reaching past front of eye.
    f. Tongue with a curved row of small teeth on each side; scales smooth or more or less spinescent. ARGENTINA, 243.
    ff. Tongue toothless; scales thin, caducous, probably not spiniferous; pyloric cœca about 9. LEUROGLOSSUS, 244.

239. MALLOTUS, Cuvier.

(CAPELINS.)

Mallotus, CUVIER, Règne Anim., Ed. 2, II, 305, 1829, (*villosus*).

Body elongate, compressed, covered with minute scales, a band of which, above the lateral line and along each side of the belly, are enlarged, and in mature males they become elongate-lanceolate, densely imbricated, with free, projecting points, forming villous bands. In very old males the scales of the back and belly are similarly modified, and the top of the head and the rays of the paired fins are finely granulated. Mouth rather large, the maxillary thin, extending to below the middle of the large eye. Teeth minute, forming single series on the jaws, vomer, palatines, and pterygoids; lingual teeth somewhat enlarged, in an elliptical patch. Lower jaw projecting. Branchiostegals 8 to 10. Dorsal inserted over ventrals; lower fins very large; pectoral fins large, horizontal, with very broad base, their rays in increased number (16 to 20). Pseudobranchiæ quite small. Gill rakers long, slender. Pyloric cœca 6, small. Ova very small. Marine species of the North Atlantic and Pacific, sometimes ascending streams. (*μαλλωτός*, villous.)

789. MALLOTUS VILLOSUS (Müller).

(CAPELIN; LODDE.)

Head 4½; depth about 6; eye large, 3½. D. 12; A. 18; scales about 150. Head long, pointed. Base of anal in males compressed and prominent, its anterior rays simple and stiff; pectorals reaching more than halfway to ventrals, the latter to anal. Mature males with a band of elongate scales along lateral line and along each side of belly; in very old examples the scales of back and middle of belly project beyond the skin; skin of head and rays of paired fins finely granulated. Dusky olivaceous above, grayish silvery on sides and below; opercles silvery, dotted. Arctic America, south to Cape Cod and Alaska; abundant northward, on both coasts, and in Kamchatka. A delicious little fish much valued in the far north. The eggs of the Capelin deposited in sand along Arctic shores in incredible numbers. They are washed up on the beaches, and in about 30 days they are hatched. "The beach then becomes a quivering mass of eggs and sand," from which the little fishes are borne into the sea by the waves. (*villosus*, hairy.)

Clupea villosa, MÜLLER, Prodr. Zoöl. Dan., 245, 1777, Greenland.
Salmo arcticus, FABRICIUS, Fauna Grönlandica, 177, 1780, Greenland.
Salmo grönlandicus, BLOCH, Ichth., VIII, pl. 99, 1794, Greenland.
Salmo socialis, PALLAS, Zoogr. Ross.-Asiat., III, 389, 1811, Islands between Asia and America.
Osmerus microdon, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXI, 385, 1848, no locality.
Mallotus villosus, GÜNTHER, Cat., VI, 170, 1866; JORDAN & GILBERT, Synopsis, 291, 1883; TURNER, Contr. Nat. Hist. Alaska, 102, pl. 10, 1886.

240. THALEICHTHYS, Girard.

(EULACHON.)

Thaleichthys, GIRARD, Pac. R. R. Surv., x, Fishes, 325, 1858, (*stevensi* = *pacificus*).

This genus is intermediate between *Mallotus* and *Osmerus*, differing from the latter in its rudimentary dentition, and in its small adherent scales. All the teeth are very feeble, slender, and deciduous, although occasionally present on all the bones of the mouth; no permanent teeth on the tongue. Scales are much smaller than in *Osmerus*, and more closely adherent; larger than in *Mallotus*, and similar in the two sexes. Coloration dusky. Small fishes of the North Pacific, somewhat anadromous, remarkable for their extreme oiliness, the oil being of a very delicate flavor. When dried they have been used as candles. (*θάλεια*, rich; *ἰχθύς*, fish.)

790. THALEICHTHYS PACIFICUS (Richardson).

(EULACHON; CANDLEFISH; OOLACHAN.)

Head 4¾; depth 6. B. 8; D. 11; A. 21; P. 11; scales 75; pyloric cœca 11; vertebræ 70. Body rather elongate, slender, and less compressed than in *Osmerus*. Head long, blunter than in *Hypomesus pretiosus*, less compressed, broader, and more convex above. Mouth large, the maxillary rather narrow and long, reaching beyond the middle of the rather small eye; lower jaw projecting. Opercle with strong concentric striæ. Gill rakers numerous, rather long and slender. Ventrals large, inserted just in front of dorsal. Pseudobranchiæ small. Color white, scarcely silvery; upper regions rendered dark iron-gray by the accumulation of dark punctulations. Length 12 inches. Oregon to Alaska, ascending the rivers from Fraser River northward, in enormous numbers in the spring. An excellent pan-fish, unsurpassed by any fish whatsoever in delicacy of flesh, which is far superior to that of the trout. The flesh is very oily, but the oil has a very attractive flavor. It is sometimes extracted and used as a substitute for cod-liver oil. It is, however, solid and lard-like at ordinary temperatures.

Salmo (Mallotus) pacificus, RICHARDSON, Fauna Bor.-Amer., III, 226, 1836, Columbia River.
Thaleichthys stevensi, GIRARD, Pac. R. R. Surv., x, 325, pl. 75, figs. 1–4, 1858, Puget Sound. (Coll. Dr. Suckley.)
Thaleichthys pacificus, GÜNTHER, Cat., VI, 168, 1866; JORDAN & GILBERT, Synopsis, 292, 1883.

241. OSMERUS (Artedi) Linnæus.

(SMELTS.)

Osmerus (ARTEDI) LINNÆUS, Syst. Nat., Ed. x, 1758, 310, (*eperlanus*).
Eperlanus, GAIMARD, Voy. Island and Grœnland, 1851, (*eperlanus*).
Spirinchus (JONSTON) JORDAN & EVERMANN, new subgenus, (*thaleichthys*).

Body elongate, compressed. Head long, pointed. Mouth wide, the slender maxillary extending to past the middle of the eye; lower jaw projecting; preorbital and suborbital bones narrow. Maxillaries and premaxillaries with fine teeth; lower jaw with small teeth, which are larger posteriorly; tongue with a few strong, fang-like teeth, largest at the tip; hyoid bone, vomer, palatines, and pterygoids with wide-set teeth. Gill rakers long and slender. Branchiostegals 8. Scales large, loose, 60 to 70 in the course of the lateral line. Dorsal small, about midway of the body, over the ventrals; anal rather long. Vertebræ about 40. Pyloric cœca small, few. Small fishes of the coasts of Europe and Northern America, sometimes ascending rivers; delicate in flesh and considerably valued as food. (*ὀσμηρός*, odorous; the name is equivalent to the English "smelt.")

SPIRINCHUS (An old name used by Jonston for the smelt; equivalent to *spirling* and *éperlan*):
- *a.* Vomer with a cross series of small teeth; small, weak species spawning in the sea.
  - *b.* Body not very slender, the depth 5½ in length; commissure of mouth curved. THALEICHTHYS, 791.
  - *bb.* Body very slender, the depth 6 in length; commissure of mouth nearly straight. ATTENUATUS, 792.

OSMERUS:
- *aa.* Vomer with 2 to 4 strong, fang-like teeth; species stronger in habit, ascending rivers.
  - *c.* Scales rather small, 66 to 68 in lateral line.
    - *d.* Maxillary not reaching posterior margin of eye; depth 6 to 6½ in length; coloration plain. MORDAX, 793.
    - *dd.* Maxillary reaching posterior margin of eye; depth 5½ in length; coloration brilliant. DENTEX, 794.

Subgenus SPIRINCHUS, Jordan & Evermann.

791. OSMERUS THALEICHTHYS, Ayres.

Head 4½; depth 5½; eye longer than snout, 4 in head. D. 9; A. 14 to 16; P. 11; scales 55 to 58. Body comparatively deep and compressed. Head rather short and deep, the maxillary broad, short, its edge strongly curved, extending to opposite posterior margin of pupil; premaxillary on the level of upper part of pupil; mandible projecting, its tip somewhat curved upward. Fins high, the pectorals usually reaching ventrals, and the ventrals to anal; anal reaching about to caudal. Teeth weak; maxillary teeth scarcely visible. Olivaceous, sides silvery and somewhat translucent. Length 9 inches. Pacific coast from San Francisco northward to Bristol Bay in Alaska; rather common; a weak and feeble species; its flesh of excellent flavor, but soft and not keeping well. (*Thaleichthys*, the Eulachon, a related species of similar flavor as food.)

Osmerus thaleichthys, AYRES, Proc. Cal. Ac. Nat. Sci., 1860, 62, San Francisco; GÜNTHER, Cat., VI, 168, 1866; JORDAN & GILBERT, Synopsis, 292, 1883.

792. OSMERUS ATTENUATUS, Lockington.

Head $4\frac{1}{5}$; depth 6; eye large, 4 in head. D. 10; A. 15–17; P. 11; scales 65. Body elongate, compressed. Head rather long, somewhat pointed; maxillary extending past pupil; lower jaw projecting; maxillary rather narrow, little convex. Outline of both jaws nearly straight, less curved than in *O. thaleichthys*. Teeth on tongue strong, but much smaller than in *O. mordax*; teeth on maxillary conspicuous; front of both jaws with rather strong teeth; palatine teeth variable, usually strong. Fins low. Pectorals not reaching ventrals, nor ventrals anal, nor anal to caudal. Greenish, sides silvery. Length 10 inches. Coast of California about San Francisco. Very close to *O. thaleichthys*, and doubtfully distinct; perhaps founded on very slender or feeble specimens of the latter. (*attenuatus*, drawn out slender.)

Osmerus attenuatus, LOCKINGTON, Proc. U. S. Nat. Mus., 1880, 66, San Francisco; JORDAN & GILBERT, Synopsis, 293, 1883.

Subgenus OSMERUS.

793. OSMERUS MORDAX (Mitchill).

(AMERICAN SMELT.)

Head 4; depth $6\frac{1}{2}$. D. 10; A. 15; P. 13; scales 68. Body rather long and slender. Head large, with large mouth, and stronger teeth than in the other species of the genus. Small teeth along the edge of the maxillary; strong fang-like teeth on tongue and front of vomer; cardiform teeth on palatines, pterygoids, and hyoid bone; mandible with moderate teeth, its tip projecting. Maxillary extending to or a little beyond middle of eye. Scales deciduous. Dorsal fin rather posterior, the ventrals under its front; lower fins moderate, none reaching the next behind it. Gill rakers $\frac{2}{3}$ diameter of eye. Transparent greenish above, silvery on sides; body and fins with some dark punctulations. Length 12 inches. Atlantic Coast of the United States from Virginia northward to Gulf of St. Lawrence, entering streams and often landlocked; abundant in Lakes Champlain and Memphremagog. Very close to the European *Osmerus eperlanus*, but the latter has larger scales (60), shorter gill rakers, and rather weaker teeth. (*mordax*, biting.)

Atherina mordax, MITCHILL, Trans. Lit. & Phil. Soc. N. Y., I, 1815, 446, New York.

Osmerus viridescens, LE SUEUR, Journ. Ac. Nat. Sci. Phila., I, 1818, 230, Coast of Maine; GÜNTHER, Cat., VI, 167, 1866.

Osmerus mordax, JORDAN & GILBERT, Synopsis, 293, 1883.

Represented in lakes of Maine by landlocked forms, as follows:

793a. OSMERUS MORDAX SPECTRUM (Cope).

(WILTON SMELT.)

Head $4\frac{1}{4}$; depth $8\frac{1}{3}$. D. 10; A. 15; scales 66–10. Eye 3 in head. Slender. Head short, with very large eye, and short mouth and maxillary. Maxillary not extending beyond middle of pupil. Small. Wilton Pond, Kennebec County, Maine; landlocked in fresh water. (Cope.) (*spectrum*, an image.)

Osmerus spectrum, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 490, Wilton Pond, Kennebec County, Maine. (Coll. Atkins.)

Osmerus mordax spectrum, JORDAN & GILBERT, Synopsis, 294, 1883.

793b. OSMERUS MORDAX ABBOTTI (Cope).

(COBESSICONTIC SMELT.)

Head $4\frac{3}{4}$; depth 7; scales 68–16. Eye smaller, $4\frac{1}{2}$ in head. Stouter. Maxillary reaching posterior margin of pupil. Landlocked in Cobessicontic Lake, Kennebec County, Maine. (Cope). (Named for Dr. Charles Conrad Abbott, an ardent naturalist who has studied the habits of the fishes of Delaware River.)

Osmerus abbotti, COPE, Proc. Amer. Phil. Soc. Phila., 1870, 490, Cobessicontic Lake, Maine.
Osmerus mordax abbotti, JORDAN & GILBERT, Synopsis, 294, 1883.

794. OSMERUS DENTEX, Steindachner.

(RAINBOW HERRING.)

Head $4\frac{1}{4}$; depth $5\frac{1}{2}$. D. 10; A. 13; V. 8; scales 66. Eye large, $\frac{2}{3}$ length of snout. Teeth as in *Osmerus eperlanus* and *O. mordax*; maxillary reaching posterior margin of eye, its length 5 times in distance from tip of lower jaw to dorsal. Height of dorsal $\frac{1}{2}$ length of head; height of anal $\frac{2}{7}$; pectoral shortish, reaching halfway to ventrals. Back pale olive, the scales edged with darker; sides above lateral line purple, changing below to blue, and then to violet and gold; silvery below with rosy sheen, the belly satin white, fins plain, slightly golden. Coast of Alaska and south on the Pacific Coast to northern China, abundant; a brilliantly colored fish, the flesh of firmer texture than in the rest of the genus. About Bristol Bay this species forms an important part of the food of the natives. (*dentex*, toothed.)

Osmerus dentex, STEINDACHNER, Sitzungsb. Kais. Akad. Wiss. Wien, LXI, 1870, 429, Northern China; JORDAN & GILBERT, Synopsis, 293, 1883; TURNER, Contr. Nat. Hist. Alaska, 102, plate 10, 1886; NELSON, Rept. Nat. Hist. Coll. Alaska, 313, 1887.

242. HYPOMESUS, Gill.

(SURF SMELTS.)

Mesopus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 168, (*pretiosa*).*
Hypomesus, GILL, Proc. Ac. Nat. Sci. Phila., 1862, 169, (*pretiosa*).

Body rather elongate, moderately compressed, covered with thin scales of moderate size. Head rather pointed. Mouth moderate, the shortish maxillary not extending quite to middle of eye its outline below broadly convex; lower jaw projecting. Teeth minute, on jaws, vomer, palatines, pterygoids, and tongue. Ventrals inserted directly under middle of dorsal, midway between eye and base of caudal. Branchiostegals 6 to 7. North Pacific. (*ὕπο*, below ; *μέσος*, middle ; in allusion to the position of the ventrals.)

a. Scales small, about 70 in lateral line; coloration pale; spawning in surf. PRETIOSUS, 795.
aa. Scales moderate, about 58 in lateral line; coloration dark; spawning in ponds. OLIDUS, 796.

---

* By inadvertence these two synonymous names were applied to this genus by Gill. *Mesopus* has priority of a page. Its occurrence is however an error of the proof reader as its author intended to substitute *Hypomesus* for it, and did so in every place except in the first use of the word where *Mesopus* was inadvertently left. A slip of this sort should apparently be treated as a misprint and not considered in nomenclature.

795. HYPOMESUS PRETIOSUS (Girard).

(Surf Smelt.)

Head 4½; depth 4¾; eye as long as snout, 4½ in head. D. 10; A. 15; P. 14; V. 8; scales 70. Fins low, the longest dorsal ray 8 in length without caudal; pectorals scarcely reaching halfway to ventrals, 7 in length of body; ventrals not reaching vent, their length 8⅓ in body. Light olivaceous; a silvery band along the lateral line. Length 12 inches. Coast of California and Oregon, from Monterey northward; abundant, spawning in the surf. A firm-fleshed and fat little fish of delicate flavor, scarcely inferior to the eulachon. (*pretiosus*, precious.)

Argentina pretiosa, Girard, Proc. Ac. Nat. Sci. Phila., 1854, 155, San Francisco.
Osmerus elongatus, Ayres, Proc. Cal. Ac. Nat. Sci., 1854, 17, San Francisco.
Osmerus pretiosus, Girard, Pac. R. R. Surv., x, 324, 1858.
Hypomesus pretiosus, Jordan & Gilbert, Synopsis, 294, 1883.

796. HYPOMESUS OLIDUS (Pallas).

(Pond Smelt.)

Scales 56 to 60. Fins higher than in *Hypomesus pretiosus*, the longest dorsal ray 6 in length of body; pectorals reaching ⅔ the distance to root of ventrals, their length 5 in body; ventrals 6 in length of body. Coloration dusky, little translucent. Alaska and Kamchatka, spawning in fresh-water ponds, excessively abundant about St. Michaels. A sweet little fish, excellent as food. (*olidus*, oily.)

Salmo (Osmerus) olidus, Pallas, Zoogr. Ross.-Asiat., iii, 391, 1811, lakes and rivers of Kamchatka.
Mesopus olidus, Günther, Cat., vi, 169, 1866; in part.
Hypomesus olidus, Jordan & Gilbert, Synopsis, 295, 1883; Turner, Contr. Nat. Hist. Alaska, 103, 1886.

243. ARGENTINA (Artedi) Linnæus.

(Argentines.)

Argentina (Artedi) Linnæus, Syst. Nat., Ed. x, 1758, 315, (*sphyræna*).
Silus,* Reinhardt, Bemærkinger Skandinavisk Icththyol., 11, 1833, (*silus*).
Acantholepis, Kröyer, Danmarks Fiske, iii, 98, 1846–'49, (*silus*).

Body oblong, covered with rather large cycloid scales, which are more or less rough with spinous points. Mouth small, the maxillaries very short, not reaching to the eye; eye very large. Jaws toothless; an arched series of minute teeth on the head of the vomer and on the fore part of the palatine; tongue with a series of small curved teeth on each side. Dorsal fin short, in advance of the ventrals; caudal fin deeply forked. Eggs small. Pyloric cœca present. Branchiostegals 6. Air bladder, according† to Cuvier, without duct. Fishes of deep or cold waters, never entering fresh streams. (Latin *argentum*, silver.)

a. Scales spinigerous; body deep, the depth 5 to 5½ in length; eye longer than snout; scales small, 60 to 66. SILUS, 797.

---

* The genus *Silus* (Norwegian Sil or Sild, herring) is founded on a species with spinescent scales. But it is not certain that any species has really smooth scales, and in *Argentina sphyræna*, the type of the genus, according to Day, the scales are provided with stellate spinules.

† This alleged character needs verification.

aa. Scales nearly or quite smooth.

b. Body rather deep, the depth 5½ in length; scales 40 to 45; eye shorter than snout. SIALIS, 798.

bb. Body rather slender, the depth about 7 in length; scales about 51; eye longer than snout. STRIATA, 799.

797. ARGENTINA SILUS, Ascanius.

Head 4⅓; depth 5⅓; eye 2⅘. B. 6; D. 12; A. 13; V. 14; scales 3-60-4 (66, Günther). Body compressed. Head not quite twice as long as deep; snout nearly 3½ in head. Insertion of dorsal midway between snout and adipose fin; ventrals under last ray of dorsal. Scales very large, cycloid, covered with spinules, the points of which are turned backward; a median row of scales along the back and belly. Color olivaceous; sides silvery. Length 17 inches. Northern Europe, occasionally taken on the Grand Banks and off the coast of Maine. (Goode & Bean.) (*Sild*, Norwegian word for Herring.)

Argentina silus, ASCANIUS, Icon. Rev. Nat., pl. III, 3, 24, 1763, Norway; JORDAN & GILBERT, Synopsis, 294, 1883; GÜNTHER, Cat., VI, 202, 1866.

Silus ascanii, REINHARDT, Bemærk. Skandinav. Ichth., 11, 1833, Norway.

Argentina syrtensium, GOODE & BEAN, Proc. U. S. Nat. Mus., 1878, 261, off Sable Island in 200 fathoms, from stomach of *Phycis tenuis*. (Type, No. 21624. Coll. R. L. Newcomb.)

798. ARGENTINA SIALIS, Gilbert.

Head 3; depth 5½; eye 3½; interorbital width 4. D. 11; A. 12. Resembling *Argentina elongata*, but with a much deeper body, and a larger eye. Length of maxillary from tip of snout 4 in head, 1⅗ in snout. Snout but little longer than eye, 3⅙ in head; upper jaw with a narrow band of small teeth borne on the vomer and the front of the palatines, not on the very narrow weak premaxillaries; lower jaw toothless; edge of tongue with a series of strong, backwardly curved teeth, six or eight in number. Gill rakers numerous, slender, rather short, about 25 in number below angle of arch. Front of dorsal fin nearer tip of snout than base of caudal by a distance equaling diameter of pupil. Ventrals inserted behind middle of dorsal, midway between base of caudal and front of orbit, extending but little more than halfway to front of anal; caudal forked. Scales not spinous, the margins entire, a few only preserved along sides of tail; 40 or 45 in a longitudinal series. Eye, streak along sides and sides of head, silvery; occiput and snout dusky; a black blotch above each eye; fins somewhat dusky; mouth and gill cavity white; peritoneum black. Length 3 inches. Coast of California. One specimen known. (*sialis*, a word first used by Swainson to mean plump, from σιαλός, plump.)

Argentina sialis, GILBERT, Proc. U. S. Nat. Mus., 1890, 56, Albatross station 3017, in 58 fathoms. (Coll. Gilbert.)

799. ARGENTINA STRIATA, Goode & Bean.

Head 3 in total length; depth 7; eye 2½, longer than the conical snout. D. 10; A. 11; P. 17; V. 14. Ventrals nearly median, their insertion under the penultimate dorsal rays. Scales in lateral line obliquely striate. Tongue with teeth. Origin of dorsal equidistant between snout and root of caudal. There appears to have been a silvery, longitudinal band under the lateral line.

The specimens studied were denuded of scales, but the impressions indicate that there were 51 in the lateral line, 4 above and 4 below. The specimens (No. 43858, U. S. Nat. Mus.) were obtained by the *Albatross* from station 2402, in 28° 36′ N. latitude, 85° 33′ 30″ W. longitude, at a depth of 111 fathoms. (Goode & Bean.) (*striatus*, striate.)

Argentina striata, GOODE & BEAN, Oceanic Ichthyology, 52, fig. 62, 1895, Gulf Stream

244. LEUROGLOSSUS, Gilbert.

Leuroglossus, GILBERT, Proc. U. S. Nat. Mus., 1890, 57, (*stilbius*).

Appearance of *Argentina*, but the snout shorter, the maxillary reaching front of eye, and the tongue toothless. Ventrals under middle of dorsal. Mandible with a few weak teeth or none; premaxillaries toothless; a row of stronger teeth on vomer and front of palatines; tongue toothless. Pyloric cœca 9. Scales unknown, very caducous. One species known. (*λευρός*, smooth; *γλῶσσα*, tongue.)

800. LEUROGLOSSUS STILBIUS, Gilbert.

Head 3; depth 5⅓. D. 10; A. 11. Snout 3¾ in head; interorbital width 4½. Eye 3⅕ in head, equaling maxillary, which reaches front of orbit. Body compressed, of moderate depth. Lower jaw projecting. Gill rakers long and numerous. Opercle very thin, membranous. Front of dorsal midway between base of caudal and front of pupil; ventrals inserted nearly under middle of dorsal, midway between base of caudal and preopercular margin; front of anal midway between base of caudal and base of ventrals. Scales wholly lacking in the two specimens obtained. Sides of head, body, and abdomen bright silvery; dorsal region dusted with fine black dots, which become coarser on tail. Snout blue-black; opercle with steely luster; upper part of eyeball black. Buccal and gill cavities, and peritoneum jet-black; fins dusky. Length 3 inches. Coast of California, in deep water. (*στιλβός*, shining.)

Leuroglossus stilbius, GILBERT, Proc. U. S. Nat. Mus., 1890, 57, from Albatross Stations 2997 and 2998, in 221 and 40 fathoms. (Type, No. 44283. Coll. Gilbert.)

Family LXVII. MICROSTOMIDÆ.

Closely allied to the *Argentinidæ*, but with the branchiostegals reduced to 3 or 4; mouth very small, terminal, with small teeth, chiefly on the lower jaw and vomer. Gill membranes separate or united. Body elongate, subterete. Adipose fin present; dorsal short, posterior; ventrals behind middle of body. Three genera and about six species known, all from the deep waters of the Atlantic; reduced *Argentinidæ*.

MICROSTOMINÆ:
- *a.* Gill membranes separate; mouth very small; body subterete.
  - *b.* Dorsal fin inserted before ventral. NANSENIA, 245.

BATHYLAGINÆ:
- *aa.* Gill membranes broadly united across the isthmus; body compressed; mouth small; eye very large; dorsal opposite ventrals. BATHYLAGUS, 246.

245. NANSENIA, Jordan & Evermann.

Nansenia, Jordan & Evermann, new genus, (*grœnlandica*).

Body elongate, cylindrical, covered with large, thin, silvery scales. Head short. Mouth very small, terminal; premaxillaries very small; maxillaries very short and broad, not extending to the front of the very large eye, which forms more than half the depth of the side of the head. Lower jaw and vomer with a narrow series of fine teeth; no other teeth. Dorsal fin short, inserted mostly before the ventrals, which are behind the middle of the body; anal fin small; caudal small, forked, its central part scaly; pectoral rather narrow; adipose fin well developed in the young, but usually disappearing with age. Branchiostegals 3 or 4. Pseudobranchiæ well developed. Air bladder large, silvery. No pyloric cœca; mucous membrane of stomach papillose. Arctic Ocean; in deep waters. An imperfectly known genus, apparently distinguished from *Microstoma*, Cuvier, by the more anterior position of the dorsal, which is behind the ventrals in *Microstoma*, and apparently by the stouter body and the better development of the adipose fin. Most of the other characters above mentioned are drawn from *Microstoma* and have not been verified in *Nansenia*. (Named for our friend, Fridtjof Nansen (1861——), author of a study of the development of *Myxine*, and since noted as an intrepid arctic explorer.)

801. NANSENIA GRŒNLANDICA (Reinhardt).

B. 3; D. 11; A. 10; V. 10. "This fish appears to be intermediate between *Argentina* and *Microstoma*, having the dorsal fin inserted for the greater part in advance of the ventrals, and a series of fine teeth in the lower jaw. Teeth on the vomer, none on the tongue. Adipose fin conspicuous. The height of the body is $\frac{1}{2}$ the length of the head and $\frac{1}{10}$ of the total." (Günther, after Reinhardt.) Greenland.

Microstomus grönlandicus, Reinhardt, Vidensk. Selsk. Naturv. Mathem. Afhandl., VIII, 1841, LXXIV, Greenland; Günther, Cat., VI, 205, 1866; Jordan & Gilbert, Synopsis, 290, 1883.

246. BATHYLAGUS, Günther.

Bathylagus, Günther, Ann. Mag. Nat. Hist., 1878, II, 248, (*atlanticus*).

Body oblong, compressed, covered with thin, deciduous scales of moderate size. Head short, compressed, the bones thin and membranaceous. Mouth very narrow, transverse, anterior. Maxillary very short, dilated, forming part of border of mouth. No luminous spots. Teeth in upper jaw rudimentary, those in lower jaw very small, on edge of bone forming a fine serrature; a series of minute teeth across vomer and along palatine. Eye very large. Pectorals and ventrals well developed, the ventrals with light rays, opposite dorsal, which is in middle of length of body; adipose fin small, near caudal; anal moderate or long. Gill opening narrowed, beginning opposite root of pectoral and extending across isthmus, the gill membranes united, free from isthmus. Gill rakers lanceolate, rather long; gills small. Pseudobranchiæ well developed. Deep seas, 5 species known.

"The thickness of the bones, the fragility of the fin rays, the delicacy of the skin and scales, and the enormously large eyes, seem to be sufficient evidence that these fishes are actually inhabitants of very great depths, although there may be reasonable doubts as regards the exact depth at which *Bathylagus atlanticus* was obtained. These fishes must, therefore, be entirely dependent for vision on the phosphorescent light which is produced by other abyssal creatures. Not being fish of prey themselves, or only to a slight degree, they would be attracted by the light issuing from the Pediculates and Stomiatids of the deep, and thus fall an easy prey to these fishes." (Günther.) (*βαθύς*, deep; *λαγῶς*, hare, from the big eyes.)

a. Depth of body about equal to length of head; scales about 32. D. 9; A. 19. BENEDICTI, 802.
aa. Depth of body much less than length of head.
  b. Interorbital space a little more than half eye; eye 2 in head. EURYOPS, 803.
  bb. Interorbital space ⅓ eye; eye 2¼ in head. PACIFICUS, 804.

802. BATHYLAGUS BENEDICTI, Goode & Bean.

Intermediate between *B. atlanticus* and *B. antarcticus*. Head 4½; depth 4½; eye 2, as in the other species. The width of the interorbital space is less than ⅔ of that of the eye (proportionately narrower than in the other species). Snout very short, 4 in eye. D. 9; A. 19; V. 9; P. 10. Mouth short, its angle being about on a level with lower margin of eye. Bones of head thin, semicartilaginous; head apparently scaleless; no traces of scales in the specimens before us. Gill cavity, membranes, and branchiostegals as in the other species. Origin of dorsal fin nearer end of snout than to base of caudal, and equidistant between snout and adipose fin, its length 2½ in head. Vent placed farther forward than in *B. atlanticus*, the length of the postanal portion of the body being greater than that of head, and contained 3½ times in the total without caudal; ventral fins opposite posterior portion of base of dorsal. Scales all lost; apparently in about 32 longitudinal rows; and their size may be judged by the fact that there were 7 rows between base of pectoral and vertical from origin of ventral. Adipose fin slender and long, 2 in eye.

Several specimens obtained by the Fish Commission steamer *Albatross*: One, 5¾ inches in length, from station 2094, at a depth of 1,022 fathoms; another, 5¾ inches in length, from station 2711, at a depth of 1,344 fathoms; a third specimen, about 4½ inches in length, from station 2572, at a depth of 1,769 fathoms. (Goode & Bean.) (Named for James E. Benedict, Asst. Curator of Invertebrates in the U. S. National Museum, for several years resident naturalist on the *Albatross*.)

Bathylagus benedicti, GOODE & BEAN, Oceanic Ichthyology, 55, fig. 64, 1895, Gulf Stream. (Type, No. 33510. Coll. Albatross.)

803. BATHYLAGUS EURYOPS, Goode & Bean.

Head 4; depth considerably less than length of head, equal to length of head without snout; eye 2. D. 9; A. 16; B. 7; P. 9. Width of interorbital space a little more than ½ eye. Snout very short; profile steep, its angle on a level with lower margin of eye. All the bones of the head very thin, semicartilaginous. Dorsal fin feeble, nearer tip of snout than root of caudal. Vent far back, the length of tail not being much more than that of head; anal feeble. Several specimens were obtained by the *Albatross* at about 40° N. latitude, 70° W. longitude, at a depth of 400 to 1,356 fathoms. (Goode & Bean.) (*εὐρύς*, wide; *ὤψ*, eye.)

Bathylagus euryops, Goode & Bean, Oceanic Ichthyology, 55, fig. 63, 1895, Gulf Stream. (Type, No. 35420, Coll. Albatross; and No. 31861, Coll. Fish Hawk.)

804. BATHYLAGUS PACIFICUS, Gilbert.

Head 4; depth 6⅔; eye 2¼. D. 8 or 9; A. 16; P. 9; scales 40. Anterior profile not decurved; premaxillaries anteriorly on level of middle of eye; snout short, less than half eye; interorbital space narrow, deeply grooved, ⅓ orbit; lower jaw with a series of small teeth; the very weak premaxillaries toothless; a strong series of teeth on vomer and palatines. Front of dorsal midway between adipose fin and front of snout; ventrals under posterior part of dorsal; anal far back; tail as long as head. Scales lost, apparently about 40 in lateral line. Head, lining of mouth, gill cavity, and peritoneum black; fins blackish; whole body probably black in life. Coast of Washington; two specimens taken in 685 and 877 fathoms.

Bathylagus pacificus, Gilbert, Proc. U. S. Nat. Mus., 1890, 55, Albatross Stations 3071 and 3074. (Coll. Gilbert.)

Order T. INIOMI.*

(The Lantern Fishes.)

Soft-rayed fishes, with the anterior vertebræ simple, unmodified, and without auditory ossicles; symplectic present; no interclavicles; opercular apparatus sometimes incomplete; pharyngeal bones unmodified; gill openings ample. Mesocoracoid arch wanting or atrophied.† Bones of jaws variously developed, the maxillary sometimes connate with the premaxillary. Shoulder girdle with its post-temporal not normally connected with the skull, but touching it at or near the nape. Gills 4, a slit behind the fourth. Air bladder, if present, with a duct. Dorsal and anal fins without true spines; ventral fins, if present, abdominal; scales mostly cycloid, often wanting; adipose fin present or absent. Skeleton mostly very weakly ossified. Photophores present in most cases.

Marine fishes, mostly inhabiting the oceanic abysses, closely allied to the *Isospondyli*, but lacking the mesocoracoid and having the connection of the shoulder girdle with the cranium imperfect. In the character of the mesocoracoid these fishes agree with the eels, and with the *Haplomi* and the spiny-rayed fishes. These latter have the post-temporal differently attached. This order is a provisional one, and its members may be

---

*We have had no opportunity for critical study of most of the families of the *Iniomi*. Our knowledge of them is drawn chiefly from the recent monographic works, especially the excellent report of Dr. Günther on the Deep-Sea Fishes of the Challenger Expedition, that of Dr. Vaillant on the fishes taken by the Travailleur et Talisman, and that of Dr. Lütken on the "Spolia Atlantica" in the museum at Copenhagen. Even more important than these has been the Oceanic Ichthyology of Goode & Bean, advance sheets of which comprehensive work have been most kindly placed at our disposal.

† This character, the most important by which the *Iniomi* are separated from *Isospondyli*, has not been verified in several of the families.

reunited with the *Isospondyli* or otherwise distributed when the osteology of the different families is known. In but few genera has the mesocoracoid or the post-temporal received examination. (*ἰνίον*, nape; *ὦμος*, shoulder.)

Günther divides the *Iniomi* into two families, *Stomiatidæ* and *Sternoptychidæ*, according to the relation of the maxillary to the border of the mouth. Goode and Bean follow Gill in separating the group into many families. Lütken, who has made most valuable studies among the deep-sea forms, seems inclined to recognize several families. He regards it as necessary either freely to subdivide the group or else to regard the whole as a single family. The composition of the group and the varied relations of its parts are best seen by regarding its principal types as of family value. We begin the series with the family which contains most shore species, and which is apparently nearest the *Isospondyli*, from which group the *Iniomi* have apparently been modified or degraded.

Families* of INIOMI.

a. Post-temporal connected with back of cranium near sides; no photophores or barbel.
b. Adipose fin typically present (rarely atrophied or lost); body not very elongate; anal fin distinct.
c. Scales present, usually persistent; teeth cardiform or villiform, usually movable.
d. Maxillary very narrow, rudimentary, or obsolete; hypocoracoids not divergent; pseudobranchiæ present. SYNODONTIDÆ, LXVIII.
dd. Maxillary well developed, dilated behind.
e. Pseudobranchiæ present; pectorals normal; hypocoracoids mostly divergent, undivided. AULOPIDÆ, LXIX.
ee. Pseudobranchiæ absent; pectorals not normal.
f. Pectorals subhumeral. BENTHOSAURIDÆ, LXX.
ff. Pectoral rays elongate, arranged in two groups. BATHYPTEROIDÆ, LXXI.
bb. Adipose fin absent.
g. Body covered with scales which are large, thin, and deciduous; teeth villiform, in bands; no photophores on the scales, but a large, luminous plate on the head in place of eyes; maxillary dilated behind; pectorals and ventrals well developed, approximate. IPNOPIDÆ, LXXII.
gg. Body scaleless; teeth granular, in bands; pectorals normal.
h. Ventrals present; opercular apparatus incomplete. RONDELETIIDÆ, LXXIII.
hh. Ventrals absent; opercular apparatus complete; a conspicuous lateral furrow; general form and appearance of young cetaceans. CETOMIMIDÆ, LXXIV.
aa. Post-temporal impinging upon occiput.
i. Vertebræ and neural spines normal, not projecting from the flesh in front of the dorsal fin.
j. Photophores present.
k. Barbel wanting.
l. Pseudobranchiæ present.
m. Premaxillaries forming entire margin of upper jaw; body scaly; opercles complete. MYCTOPHIDÆ, LXXV.
mm. Premaxillaries not forming the whole margin of upper jaw, the maxillary entering into it; body naked; opercular apparatus incomplete. MAUROLICIDÆ, LXXVI.
ll. Pseudobranchiæ absent; mouth large, with canine teeth; scales deciduous or wanting. CHAULIODONTIDÆ, LXXVII.
kk. Barbel present, very long.

---

*The analysis of the families of *Iniomi* is chiefly taken from Goode & Bean, Oceanic Ichthyology.

n. Maxillaries forming lateral margin of upper jaw; barbel free at tip.
  o. Adipose fin present; pectorals present; body naked; dorsal behind vent, but in advance of anal. ASTRONESTHIDÆ, LXXVIII.
  oo. Adipose fin absent; pectorals present or absent. STOMIATIDÆ, LXXIX.
nn. Maxillaries not forming part of margin of upper jaw; pectorals rudimentary; opercles membranaceous; body scaleless; dorsal short, postmedian; barbel of peculiar form, connecting throat with symphysis of lower jaw. MALACOSTEIDÆ, LXXX.

jj. Photophores minute or wanting; no barbel.
  p. Premaxillaries forming margin of upper jaw; fang-like teeth in mandibles and palatines and sometimes on vomer.
    q. Dorsal long, occupying entire back; body naked. ALEPISAURIDÆ, LXXXI.
    qq. Dorsal short, median or posterior.
      r. Body naked. ODONTOSTOMIDÆ, LXXXII.
      rr. Body covered with thin, caducous scales. PARALEPIDIDÆ, LXXXIII.

ii. Vertebral or neural spines projecting through skin of the back in front of dorsal fin.
  s. Body short and deep, compressed; anterior neural spines abnormally developed, projecting through the skin of the back, in advance of the dorsal; pectorals present; photophores present; mouth obliquely cleft or subvertical. STERNOPTYCHIDÆ, LXXXIV.
  ss. Body elongate, snake-like; vertebræ with spiny processes anteriorly which project through the skin of the back in front of dorsal rays; pectorals absent; body naked; dorsal long and low, beginning in advance of the vent. IDIACANTHIDÆ, LXXXV.

Family LXVIII. SYNODONTIDÆ.

(THE LIZARD FISHES.)

Body oblong or elongate, little compressed, covered with cycloid scales, rarely naked. Mouth very wide, the entire margin of the upper jaw formed by the long and slender premaxillaries, closely adherent to which are the slender maxillaries, the latter mostly rudimental or obsolete, never widened at tip. Teeth mostly cardiform on both jaws, tongue, and palatines; canines rarely present; large teeth usually depressible. No barbels. Opercular bones usually thin, but complete. Gill membranes separate, free from the isthmus. Branchiostegals usually numerous. Pseudobranchiæ present. Gill rakers tubercular or obsolete. Lateral line present. Adipose fin present, rarely obsolete; dorsal fin short, of soft rays only; pectorals and ventrals present; anal fin moderate or long; caudal forked. Skeleton rather well ossified. Air bladder small or wanting. Intestinal canal short. Sides sometimes with phosphorescent spots or photophores. Eggs inclosed in the sacs of the ovary and extruded through an oviduct. Genera about 10, species about 40, mostly inhabiting shore waters, some of them descending to the depths. (*Scopelidæ*, group *Saurina*, part, Günther, Cat., v, 393–403, 1864.)

a. Scales present, more or less adherent.
  b. Teeth of premaxillary simple, compressed, not barbed, in one or two rows; a broad band of similar teeth on palate.
    c. Vent slightly nearer base of caudal than axil of pectoral; head short, blunt, compressed. TRACHINOCEPHALUS, 247.
    cc. Vent much nearer base of caudal than base of ventrals; head depressed, with flat triangular snout. SYNODUS, 248.
  bb. Teeth of premaxillary in a very broad band, curved, unequal, and barbed at the end; a similar band on palatines. BATHYSAURUS, 249.
aa. Scales very caducous or wanting; teeth in narrow bands; vent posterior. BATHYLACO, 250.

247. TRACHINOCEPHALUS, Gill.

Trachinocephalus, GILL, Cat. Fish. East Coast N. Amer., 53, 1851, (*myops*). (Name only; first defined by JORDAN & GILBERT, Synopsis, 281, 1883.)

This genus is closely related to *Synodus*, from which it differs chiefly in form and in the relative development of the fins. Body stout, the head short, blunt, and compressed, its form much as in the genus *Trachinus*. Vent well formed, very slightly nearer base of caudal than base of ventrals, under tip of last dorsal ray. Teeth as in *Synodus*, but slender, smaller, and closely set. Lower jaw projecting. Species few, shore fishes, widely diffused in the tropical seas. (*Trachinus*, the weaver-fish, connected with *δράκαινα*, dragon, the name still used in Greece; *κεφαλή*, head.)

805. TRACHINOCEPHALUS MYOPS (Forster).

(GROUND SPEARING; LAGARTO.)

Head $3\frac{2}{3}$; depth about 5. D. 11; A. 14 or 15; scales 4–58–7. Vertebræ 58; cœca 25. Snout very short, shorter than eye, lower jaw projecting; top of head rough; interorbital space concave. Pectoral very short, nearly 2 in head, scarcely reaching beyond the front of the very long ventrals, which are as long as head and reach vent; anal very large, its base $1\frac{1}{4}$ in head, $\frac{1}{4}$ longer than the dorsal. Light brown; three or more lengthwise stripes of yellowish alternating with brown, the upper stripe just above lateral line and edged with darker; a pale streak along lateral line; six diffuse brown cross blotches on back, ceasing just below lateral line; back mottled, a large black scapular blotch; top of head vermiculated; a dark brown band from eye across lower jaw; fins nearly plain. Tropical parts of the western Atlantic, abundant and widely diffused; common in West Indies and Brazil, and ranging on our Atlantic Coast to South Carolina; originally described from St. Helena. (*μύωψ*, short-sighted, blinking.)

Salmo myops, FORSTER MS., BLOCH & SCHNEIDER, Syst. Ichth., 421, 1801, St. Helena.
Osmerus lemniscatus, LACÉPÈDE, Hist. Nat. Poiss., v, 236, 1803, Martinique; after Plumier.
Saurus truncatus, AGASSIZ, Pisc. Brasil., 82, 1828, Brazil.
? *Salmo trachinus*, SCHEGEL, Fauna Japon. Poiss., 231, 1842, Japan; the East Indian, Chinese, and Japanese form, *Trachinocephalus limbatus*, is little if at all different from *T. myops*.
? *Saurus limbatus*, EYDOUX & SOULEYET, Voyage Bonite, Poiss., 199, 1853.
Saurus brevirostris, POEY, Memorias, II, 305, 1861, Cuba; erroneously stated to have 10 rays.
Saurus myops, GÜNTHER, Cat., v, 398, 1864.
Synodus myops, JORDAN & GILBERT, Synopsis, 281, 1883.
Trachinocephalus myops, JORDAN, Proc. U. S. Nat. Mus., 1890, 314.

248. SYNODUS* (Gronow) Bloch & Schneider

(LIZARD FISHES.)

Synodus (GRONOW) BLOCH & SCHNEIDER, Syst. Ichth., 396, 1801, (*synodus*).
Tirus, RAFINESQUE, Caratteri, etc., 56, 1810, (*marmoratus*).
Saurus, CUVIER, Règne Animal, Ed. I, 169, 1817, (*saurus*).
Alpismaris, RISSO, Eur. Mérid., III, 458, 1826 (*Alpismaris risso*), (very young).
Laurida (ARISTOTLE) SWAINSON, Nat. Hist. Anim., II, 287, 1839, (*mediterraneus* = *saurus*).

---

* The species of *Synodus* have been critically studied by Dr. Seth E. Meek, Proc. Ac. Nat. Sci. Phila. for 1884.

First superior pharyngeal cartilaginous; second without teeth; third and fourth separate, with teeth; lower pharyngeals separate. Body elongate, subterete. Head depressed, the snout triangular, rather pointed. Interorbital region transversely concave. Mouth very wide; premaxillaries not protractile, very long and strong, more than half length of head; maxillaries closely connected with them, very small or obsolete; premaxillaries with one or two series of large, compressed, knife-shaped teeth, the inner and larger depressible; palatine teeth similar, smaller, in a single broad band; lower jaw with a band of rather large teeth, the inner and larger teeth depressible; a patch of strong, depressible teeth on the tongue in front, and a long row along the hyoid bone; jaws nearly equal in front. Eye rather large, anterior; supraorbital forming a projection above the eye. Pseudobranchiæ well developed. Gill rakers very small, spine-like. Gill membranes slightly connected. Top of head naked; cheeks and opercles scaled like the body; body covered with rather small, adherent, cycloid scales; lateral line present; no luminous spots. Dorsal fin short, rather anterior; pectorals moderate, inserted high; ventrals anterior, not far behind pectorals, large, the inner rays longer than the outer; anal short; caudal narrow, forked. Vent posterior, much nearer base of caudal than base of ventrals. Branchiostegals 12 to 16. Stomach with a long, blind sac and many pyloric cœca. Skeleton rather firm. Species numerous. Voracious fishes of moderate size, inhabiting sandy bottoms at no great depth, in most warm seas. (*συνόδους*, ancient name of some fish, from *συνόδους*, teeth meeting, not shutting past each other like scissors.)

a. Scales large, 43 to 50 in the lateral line, which has a blunt keel posteriorly.
b. Tips of first rays of dorsal not reaching tips of last rays when depressed; snout short, broad, 4½ in head; shoulder girdle with a large black blotch, anal rays 10 or 11;[*] scales 4–48–6. INTERMEDIUS, 806.
bb. Tips of first rays of dorsal reaching tips of last rays when depressed.
c. Shoulder girdle chiefly black; snout short, rounded, 4 in head; ventrals 1⅗ in head; anal rays 10; scales 4–48–5. EVERMANNI, 807.
cc. Shoulder girdle with the black spot very small or wanting; snout rather pointed, 3¾ in head; ventrals 1¼ in head; anal rays 10 to 12. POEYI, 808.
aa. Scales small, 58 to 68 in lateral line.
d. Anal fin very short, its rays 8 only; pectoral fin short.
e. Scales moderate, 58 in the lateral line; snout 4 in head; shoulder girdle slightly dusky; dorsal mottled. SYNODUS, 809.
ee. Scales small, 68 in the lateral line; snout 4⅓ in head; shoulder girdle pale; dorsal mottled. LACERTINUS, 810.
dd. Anal fin moderate, its rays 10 to 13; shoulder girdle chiefly yellowish.
f. Snout very broad, broader than long; about 10 scales in a cross series from dorsal to ventral; jaws subequal; scales 4–60 to 64–5; tail with a slight keel. SAURUS, 811.
ff. Snout not broader than long; more than 10 scales in a cross series from dorsal to ventral; lower jaw included; tail not keeled.
g. About 4 rows of scales (6 counting obliquely) between lateral line and adipose fin; scales on cheeks in 4 to 7 rows.
h. Head very small, 4½ to 4⅗ in length; first ray of dorsal coterminous with last ray when the fin is depressed; cheeks with 4 rows of large scales; ventrals 1⅐ in head. Scales 6–61–6. SCITULICEPS, 812.

---

[*] In the count of rays in the species of *Synodus*, only those fully developed are enumerated, the rudimentary simple ray being omitted.

hh. Head moderate, 3¾ to 4¼ in length; scales on cheeks in 6 or 7 rows.

i. Head not vermiculate above, its length 3¾ to 4 in body; 6 rows of scales on cheeks. JENKINSI, 813.

ii. Head vermiculate above, its length 4 to 4¼ in body; 7 rows of scales on cheeks. FŒTENS, 814.

gg. About 6 rows of scales in a vertical row between lateral line and adipose fin; cheeks with 9 rows of scales; scales 13–66–16, the vertical rows counted obliquely. LUCIOCEPS, 815.

806. SYNODUS INTERMEDIUS (Agassiz).

(SAND DIVER.)

Head 4; depth 8; eye 4½. D. 11; A. 11; scales 4–48–7. Body rather stout; head blunt, large, the snout broader than long, about equal to eye. Frontal bones little striate; interorbital space concave, 6 in head; prominent striæ behind eye; jaws subequal; premaxillary 1⅔ in head, longer than pectoral. Scales large, 4 to 6 rows on cheeks, 3 series between adipose fin and lateral line. Dorsal high, as high as long; pectoral 2 in head; ventral 1⅙. Grayish, abruptly paler below; back and sides with 8 dark crossbands broadest at lateral line, these sometimes alternating with fainter ones; a large jet-black blotch on upper part of shoulder girdle, hidden by opercle; membrane of maxillary black; dorsal and pectorals finely barred; lower fins and branchiostegals yellow; adult with an orange spot on each scale below. Length 15 inches. Coast of southern Florida to Brazil; not rare; the most brightly colored of our species. (*intermedius*, intermediate—between *myops* and *fœtens.*)

Saurus intermedius, AGASSIZ, Spix, Pisc. Brasil., 81, 1828, Brazil.
Saurus anolis, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXII, 483, 1849, Bahia; Martinique.
Saurus intermedius, GÜNTHER, Cat., V, 396, 1864.
Synodus intermedius, JORDAN & GILBERT, Synopsis, 889, 1883.

807. SYNODUS EVERMANNI, Jordan & Bollman.

Head 3⅓ to 3¾; depth 6⅓ to 7. D. 10; A. 10; scales 4–47 to 49–5. Body terete, rather robust; snout short, rounded rather than pointed, 4 in head. Mouth large; maxillary 1¾ in head. Lower jaw barely projecting. Interorbital area concave, rugose, its least width 5⅗ in head; supraorbital ridge prominent, finely striate. Origin of dorsal nearer adipose fin than snout by ¾ width of interorbital area; anterior rays of dorsal coterminous with posterior when depressed, the last rays not filamentous; the free edge of the fin little concave; dorsal fin higher than long by nearly an eye's diameter, its length 2⅓ in head; tip of ventrals reaching halfway to vent (farther in young); their length 1⅗–1⅘ in head; pectorals extending to near middle of ventrals, 1⅗–1⅘ in head; lobes of caudal equal. Lateral line with a blunt keel. Color dark above; 8 to 10 dusky greenish oblong spots along lateral line, between which and below lateral line are traces of smaller spots; a dusky shade over opercle; skin lining opercle and shoulder girdle dark, the black markings surrounded by yellow; adipose fin dark, edged with pale; caudal not barred, inner rays dusky; pectorals and dorsal somewhat dusky; other fins pale; tip of chin scarcely dusky. Mazatlan to coast of Colombia; abundant. Length 8 inches. (Named for Dr. Barton Warren Evermann, Ichthyologist of the United States Fish Commission.)

Synodus evermanni, JORDAN & BOLLMAN, Proc. U. S. Nat. Mus., 1889, 152, Pacific Ocean, off coast of Colombia, in 33 fathoms. (Type, No. 41144. Coll. Albatross.)

808. SYNODUS POEYI, Jordan.

Head 4; depth $6\frac{3}{4}$. D. 10; A. 10 to 12; scales 4–44–4. Body terete, rather robust, the snout rather long and pointed, $3\frac{3}{4}$ in head; mouth large, the premaxillary $1\frac{3}{4}$ in head; lower jaw slightly projecting; interorbital area concave; supraorbital ridge present. Dorsal fin inserted midway between tip of snout and front of adipose fin; the tips of first and last rays equal when the fin is deflexed. Ventrals $1\frac{1}{4}$ in head, reaching $\frac{3}{5}$ distance to vent; pectorals reaching base of ventrals, $1\frac{4}{5}$ in head. Lateral line with a slight keel posteriorly. Yellowish above, scales punctate with dark; breast flesh-colored; sides with a row of irregular black markings; scapula barred with black, occasionally with a small black spot, fins not barred, the caudal with dusky shades. Length 5 inches. Cuba; abundant. (Named for Prof. Felipe Poey, its discoverer.)

Synodus intermedius, POEY, Enumeratio, 175, 143, 1875; not of AGASSIZ; MEEK, Proc. Ac. Nat. Sci. Phila., 1884, 133.

Synodus poeyi, JORDAN, Proc. U. S. Nat. Mus., 1886, 526, Havana. (Coll. Jordan.)

809. SYNODUS SYNODUS (Linnæus).

Head $3\frac{1}{2}$; depth 5; eye $5\frac{2}{3}$ in head; snout 4; premaxillary $1\frac{3}{5}$; pectoral $2\frac{1}{4}$; ventral $1\frac{1}{10}$; anal very short. D. 11; A. 8; scales 5 or 6–58–8. Top of head quite warty, marked with radiating and with cross streaks of warts; interorbital space concave, marked with small warts; supraorbital with a conspicuous bony ridge. Palatine teeth long and slender, slenderer than teeth of the jaw and almost in one series. Body much mottled and vermiculated with darker, and crossed by about 15 dark half bands; scapular region dusky but without distinct spot; dorsal and anal mottled, other fins plain. Coast of Brazil and Lesser Antilles, its distribution imperfectly known; our description taken from two specimens in the museum at Paris from Bahia, types of the description of Cuvier & Valenciennes. The species may not be the original *Synodus* of Gronow and Linnæus. No other specific name seems, however, ever to have been given to it.

? Esox synodus, LINNÆUS, Syst. Nat., Ed. XII, 516, 1766, America; based on *Synodus* of GRONOW

Saurus synodus, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXII, 477, 1849.

? Synodus fasciatus, LACÉPÈDE, Hist. Nat. Poiss., V, 321, 1804; after GRONOW.

? Saurus varius, GÜNTHER, Cat., V, 395, 1864; the true *varius* is a closely related species, possibly identical with *S. synodus*, representing the latter in the Western Pacific; its scales, 60 to 64, appear smaller than in *S. synodus*.

810. SYNODUS LACERTINUS, Gilbert.

Head $3\frac{4}{5}$; depth $5\frac{2}{3}$; eye 6. D. 11; A. 8; scales 68. Snout short, $4\frac{1}{3}$ in head, $2\frac{3}{4}$ in premaxillary, its length slightly less than its width at base. Eye over middle of premaxillary, which is $1\frac{3}{4}$ in head; interorbital width half snout; occiput with well-developed rugosites. Scales on cheeks crowded, in 6 rows; four series between adipose fin and lateral line. Front of dorsal nearer tip of snout than adipose fin by a distance equaling diameter of pupil; the fin low, the tips of anterior rays barely reaching base of posterior ray in reflexed fin; base of dorsal $1\frac{7}{9}$ in head; upper outline of dorsal convex; anal very small, its base $\frac{1}{3}$ length of head; pectorals very short, bluntly rounded, the longest ray $2\frac{1}{2}$ in head, not reaching beyond vertical from base of ventrals; ventrals reaching halfway to front anal, $1\frac{1}{7}$ in head. Color black, with 5 broad dark bars reaching to lateral line or below; the middle of each interspace with a fainter bar confined to back; mandible below with alternating brown and silvery crossbars; a black spot at lower angle of cheeks, with a small silvery blotch below it; inside of mouth and gill cavity pale; dorsal and caudal faintly barred. Length $6\frac{1}{4}$ inches. Acapulco, Mexico; one specimen known. (*lacertinus*, lizard-like.)

Synodus lacertinus, GILBERT, Proc. U. S. Nat. Mus., 1890, 55, Acapulco. (Type, No. 44300. Coll. Albatross.)

811. SYNODUS SAURUS (Linnæus).

(TARENTOLA; LACERTO; TIRU.)

Head 4; B. 15; D. 12; A. 12. Scales 3 or 4–60–2. Snout broader than long, the jaws subequal; teeth small; upper surface of head corrugated. Dorsal slightly higher than long, the tips of the first rays not extending beyond tips of last; pectoral reaching ninth or tenth scale of lateral line. Scales on tail faintly keeled. Dusky gray, yellow below. Length 17 inches. (Günther; Goode.) Coasts of Southern Europe and neighboring islands, recorded by Dr. Goode from the Bermudas. (σαῦρος, lizard.) (Eu.)

Salmo saurus, LINNÆUS, Syst. Nat., Ed. XII, 511, 1766, Mediterranean; after ARTEDI.
Saurus griseus, LOWE, Trans. Zoöl. Soc., II, 1841, 188, Madeira; GÜNTHER, Cat., V, 394, 1864.
Laurida mediterranea, SWAINSON, Nat. Hist. Anim., II, 287, 1839, Mediterranean; name only.
Tirus marmoratus, RAFINESQUE, Caratteri, 56, 1810, Palermo.
Alpismaris risso, RISSO, Eur. Mérid., III, 458, 1826, Nice; very young.
Synodus lacerta, GOODE, Bull. U. S. Nat. Mus., V, 1876, 68, Bermuda specimen; not of RISSO.

812. SYNODUS SCITULICEPS, Jordan & Gilbert.

Head $4\frac{3}{5}$; depth $6\frac{2}{3}$. D. 10; A. 12; scales 6–61–6. Allied to *S. fœtens*, but with the head very small; cheeks with about 4 rows of large scales; opercles with 4; 4 rows between adipose fin and lateral line; ventrals $1\frac{1}{7}$ in head; pectoral 2. Coloration brownish olive, scales of back with pale dashes; head marbled above; pectoral and caudal blackish; adipose fin black, edge pale; no yellow. Length 7 inches. Cape San Lucas to Panama; not uncommon in shallow bays. (*scitulus*, slender; *-ceps*, head.)

Synodus scituliceps, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1881, 344, Mazatlan. (Type, No. 28392. Coll. Gilbert.)

813. SYNODUS JENKINSI, Jordan & Bollman.

Head $3\frac{3}{4}$ to 4; depth $6\frac{1}{5}$ to 7. D. 10 or 11; A. 13; scales 5–62 to 65–6, 6 rows on cheeks. Body slender, subterete, depressed. Head moderate, much larger than in *S. scituliceps.* Snout broadly triangular, little pointed, 3⅓ in head, its length about equal to its breadth at base. Mouth large, premaxillary 1⅔ in head. Interorbital area concave, rugose, slightly broader than eye, 5½ in head; supraorbital finely striate, with serrulate edge. Lower jaw included; teeth moderate. Lateral line without keel. Origin of dorsal midway between adipose fin and anterior margin of pupil; anterior rays of dorsal not extending so far as the last when depressed; tip of ventrals reaching slightly more than halfway to vent, their length $1\frac{3}{7}$ in head; pectorals reaching root of ventrals, 2 in head, and longer than snout and eye in larger specimens. Color brownish olive; scales on back with paler specks; a few rows of scales below lateral line with numerous black dots; head not marbled; jaws not spotted, tip of lower black; inside of opercles dark; lining of shoulder girdle yellow; pectorals and caudal dusky, former tipped with pale; adipose fin dark, margined with paler; lower fins pale. Gulf of California to Galapagos Islands, in 16 to 33 fathoms; common. (Named for Dr. Oliver Peebles Jenkins, who obtained the species at Guaymas.)

Synodus jenkinsi, Jordan & Bollman, Proc. U. S. Nat. Mus., 1889, 153, off coast of Colombia, Galapagos Islands. (Type, No. 41171. Coll. Albatross).

814. SYNODUS FŒTENS (Linnæus).

(Lizard Fish; Galliwasp; Lagarto; Soapfish.)

Head 4¼; depth 7; eye 5½. D. 9 or 10; A. 11 or 12; V. 8; scales 7–60 to 64–8 (the vertical rows counted obliquely). Snout long, the upper jaw 1½ in head. Scales less regularly arranged, and the rows less oblique than in *Synodus lucioceps*; those on the opercle in about 5 rows, on the cheeks in 7; 25 to 30 scales along back before dorsal, 4 in a vertical row between adipose fin and lateral line, 5 in an oblique row. Pectoral fin short, 2 in head, not reaching ventrals, its length ¾ that of the premaxillary; ventral large, 1¼ in head, its length from outer edge of base greater than from tip of snout to upper edge of gill opening. Interorbital space considerably concave, with radiating ridges. Olivaceous or sandy gray; yellowish below; back mottled; upper surface of head brownish, distinctly vermiculated with yellowish; ventral fins, lower side of head, and inside of mouth tinged with yellow; no scapular spot; snout not black at tip; dorsal scarcely barred. Length 12 inches. Cape Cod to Brazil, very common from South Carolina southward, on sandy coasts; not valued as food. (*fœtens*, odorous.)

Synodus fœtens and *spixianus*, Meek, Proc. Ac. Nat. Sci. Phila., 1884, 135.

815. SYNODUS LUCIOCEPS (Ayres).

Head 4; depth 8¼; eye 5. D. 11; A. 12; B. 14; scales 13–66–16 (the vertical series counted obliquely). Scales arranged in regular, very oblique rows; those on the opercles in about 8, on the cheeks in about 9, rows; 40 to 50 scales along the back before the dorsal, 6 in a vertical row between adipose fin and lateral line, and 10 in an oblique row. Pectoral fin longer, reaching base of ventrals, its length about equal to that of the premaxillary; ventral fin not so long as the space between snout and upper edge of gill opening. Interorbital space little concave, nearly smooth. Olive-brown above, grayish below, with some golden luster on sides; back with slaty reticulations; head not vermiculated above; lower side of head and ventral fins yellow. Length 18 inches, but usually much smaller. San Francisco to Santa Barbara, rather common in summer; resembles *S. fœtens*, but the scales are smaller. (*lucius*, pike; *-ceps*, head.)

Saurus lucioceps, AYRES, Proc. Cal. Ac. Sci., 1855, 66, San Francisco; GÜNTHER, Cat., v, 397, 1864. *Synodus lucioceps*, JORDAN & GILBERT, Synopsis, 281, 1883.

249. BATHYSAURUS, Günther.

Bathysaurus, GÜNTHER, Ann. Mag. Nat. Hist., August, 1878, 181, (*ferox*).

Body formed as in *Synodus*, subcylindrical, elongate, covered with small scales. Head depressed, with the snout produced, flat above. Cleft of the mouth very wide, with the lower jaw projecting; premaxillary very long, styliform, tapering, not movable; maxillary obsolete. Teeth in the jaws in broad bands, not covered by lips, curved, unequal in size, and barbed at the end; a series of similar teeth along the whole length of each side of the palate; a few teeth on the tongue, and groups of small teeth on the hyoid; eye moderate, lateral. Pectoral moderate; ventrals eight-rayed, inserted close behind pectoral; dorsal fin median, of about 18 rays; adipose fin present or absent; anal moderate; caudal emarginate. Gill openings very wide, the gill membranes separate, free from the isthmus. Branchiostegals 11 or 12. Gill laminæ well developed; gill rakers tubercular; pseudobranchiæ well developed. Scales rather small. Deep-sea fishes. (*βαθύς*, deep; *σαῦρος*, *Saurus* = *Synodus*.)

816. BATHYSAURUS FEROX, Günther.

Head 3½; depth 7. B. 10; D. 17 or 18; A. 11; C. 19; P. 15; A. 8; scales 8–74 to 78–8. Body elongate, subterete. Head alligator-like, naked, except on cheek and occiput, with strong nasal and interorbital ridges; its greatest width more than half its length; gape of mouth very wide, ⅙ length of body, extending behind eye for a distance equal to interorbital width. Premaxillary with 2 irregular rows of depressible teeth, some of them barbed, those of inner row much the largest; lower jaw enormously strong, its sides projecting beyond the upper jaw; its dentary edge thickly studded with depressible teeth, many of them, especially the larger inner ones, strongly barbed; those in front, claw-like, recurved; 3 rows of teeth on the palatines, the middle ones very much enlarged and most of them strongly barbed, these being the largest of all the teeth; on the tongue a few weaker teeth and groups of similar teeth on the vomer. Insertion of dorsal behind snout at a distance a little more than its own base and about ⅓ the total length, longest ray equal to greatest depth of body. No adipose dorsal (in the specimens known); anal inserted considerably behind last ray of dorsal, its base about half that of the dorsal; ventrals well apart, inserted just in front of the dorsal, their length half head; pectoral as long as lower jaw, its seventh ray prolonged to a length equal to that of head; caudal slightly forked; scales thin, cycloid, deciduous, those of the lateral line larger, brownish; lining of gill cavity blue-black. Atlantic and South Pacific, known from off New Zealand, Morocco, and the Gulf Stream if, as supposed, the American *B. agassizii* is identical with *B. ferox*. (Goode & Bean.) (*ferox*, ferocious.)

Bathysaurus ferox, GÜNTHER, Ann. Mag. Nat. Hist., 1878, 182, east coast of New Zealand.

Bathysaurus agassizii, GOODE & BEAN, Bull. Mus. Comp. Zoöl., 1882, 215, Gulf Stream, 33° N. in 647 fathoms; GOODE & BEAN, Oceanic Ichth., 58, 1895.

250. BATHYLACO, Goode & Bean.

Bathylaco, GOODE & BEAN, Oceanic Ichthyology, 57, 1895, (*nigricans*).

Body subcylindrical, rather elongate, stout, similar in form to *Synodus*. (Scales absent in the specimen studied, and it is not even possible to determine whether or not this is a naked species.) Head conical; snout short. Mouth very large, wide, oblique, lower jaw slightly projecting. Premaxillary narrow and long, with small teeth, which are somewhat biserial in front and uniserial behind, interrupted at the symphysis. Mandible with a narrow band of similar teeth; palatine teeth in a narrow band; tongue toothless. Eye moderately large, very far forward, its upper edge close to the dorsal profile. Pectoral small, placed low; ventral nearly median, a little in advance of the dorsal and far behind the pectoral, with 8 rays; dorsal origin nearly in the middle of the length and extending to above the middle of the anal; adipose fin probably absent; anal origin far back, fin short. Gill opening very wide, as in *Bathysaurus*, the left membrane overlapping the right, not attached to the isthmus. Branchiostegals numerous. Gill rakers short and few. Opercular bones very thin and feeble. Deep sea. (*βαθύς*, deep; *λάκωος*, a hole or pit.)

817. BATHYLACO NIGRICANS, Goode & Bean.

Head 4; depth 2; eye 4½ in head, equal to interorbital width. B. 8; D. 20; A. 10; V. 8; P. 6. Snout about 2 in eye and about 8 in head. The lower jaw the longer. The intermaxillary is nearly ⅔ length of head. The mandible is contained 3 times in distance from tip of snout to origin of dorsal; dorsal fin inserted at a distance from the tip of the snout equal to twice length of head, the length of its base nearly ⅕ of total (without caudal); origin of anal under posterior third of dorsal, the length of its base equal to half that of head; pectoral small, placed low, immediately back of the branchial opening; apparently few-rayed. Color black.

A single specimen in very bad condition, 8½ inches in length, taken by the *Blake* off Santa Cruz, at a depth of 2,393 fathoms. (Goode & Bean.) (*nigricans*, blackish.)

Bathylaco nigricans, GOODE & BEAN, Oceanic Ichthyology, 57, fig. 69, 1895, off Santa Cruz, Mexico.

Family LXIX. AULOPIDÆ.

Allied to the *Synodontidæ*, but with the maxillary separate, well developed, and dilated behind. Hypocoracoids extended downward as in many spiny-rayed fishes. Gill rakers mostly long and slender, needle-shaped. Eyes normal, large or small. No luminous spots; jaws without fang-like teeth. Dorsal fin moderate, nearly median in position, the body elongate. Pectorals present, normal in form and position; adipose fin normally present. Pseudobranchiæ present. This family as here understood includes some half dozen species—fishes of moderate depths, chiefly of the Atlantic.

a. Dorsal fin moderate, of less than 15 rays; teeth minute; scales ctenoid; gill rakers very slender. CHLOROPHTHALMUS, 251.

251. CHLOROPHTHALMUS, Bonaparte.

Chlorophthalmus, BONAPARTE, Fauna Italica, fasc. XXVIII, Pesci, 1840, (*agassizii*).
Hyphalonedrus, GOODE, Proc. U. S. Nat. Mus., III, 1880, 483, (*chalybeius*).

Head elongate; body subterete, covered with moderate-sized, adherent, pectinate, or ctenoid scales, which are arranged in straight, parallel, oblique lines. Mouth rather large, the maxillary well developed, dilated behind, reaching to beyond front of orbit; lower jaw projecting. Teeth very small, sharp on jaws, vomer, and palatines, usually minute teeth on tongue; eye very large. Dorsal short, inserted before middle of length of body; adipose fin small; anal short; caudal forked; pectorals and ventrals well developed, the ventrals inserted under dorsal and not far behind pectorals, none of the rays forming exserted filaments. Gill openings wide; branchiostegals 10; pseudobranchiæ well developed. Gill rakers needle-shaped, rather numerous. Color silvery, with darker markings. Deep seas; four species known, resembling smelt. (*χλωρός*, green; *ὀφθαλμός*, eye.)

a. Eye 2 in head; scales 60 to 63. AGASSIZII, 818.
aa. Eye 3 in head; scales 45 to 52.
  b. Dorsal rays 11; depth 6¼ in length. CHALYBEIUS, 819.
  bb. Dorsal rays 8; depth 5½ in length. TRUCULENTUS, 820.

818. CHLOROPHTHALMUS AGASSIZII, Bonaparte.

Head 3½; depth 5½; eye very large, about 2 in head. D. 11 or 12; A. 9; scales 60 to 63. Dorsal origin at ⅓ the distance from snout to base of caudal rays, its height about equal to that of the ventral, 5 times in total length; anal insertion about ¾ of distance from snout to base of caudal; ventral inserted under middle of dorsal; pectorals reaching nearly to middle of length of body. Color greenish bronze, with silvery reflections. (Goode & Bean.) Atlantic and Mediterranean, rare about Naples and Sicily. It also occurs at considerable depths in the eastern Atlantic. The French expedition obtained it off the Azores in 720 fathoms, also in the Sargasso Sea, 202 fathoms, and off the Cape Verdes, 230 to 290 fathoms. The *Albatross* obtained specimens from various localities in the Western Atlantic. (Named for Louis Agassiz, ichthyologist and teacher, "the best friend that ever student had.") (Ev.)

Chlorophthalmus agassizii, BONAPARTE, Fauna Italica, pl. 121, 1840, Italy; GÜNTHER, Cat., V, 404, 1864; GOODE & BEAN, Oceanic Ichthyol., 60, 1895.

Aulopus agassizii, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXII, 521, 1849.

819. CHLOROPHTHALMUS CHALYBEIUS* (Goode).

Depth 6¼; width 7¾. D. 11; A. 8; C. 16; P. 17 or 18; V. 9 or 10; scales about 6½–48–6. Body terete. Least height of the tail half that of body. The scales are moderately strong, sharply pectinated at the edge, and arranged in regular transverse rows, overlapping in such a manner as to resemble oblique plates upon the sides. Length of head to end of flexible flap of the operculum slightly more than ¼ of the body, and itself slightly more than 4 times length of snout. Orbit 4 times width of the interorbital space, 3 in length of head. Maxillary broad and flattened posteriorly, in length $\frac{1}{10}$ of the body; it extends back to anterior margin of pupil. Mandible protruding beyond the snout. When the mouth is closed the tip of mandible projects noticeably. Dorsal almost midway between snout and adipose dorsal, its height almost equal to that of ventral; adipose dorsal over middle of anal, its length half diameter of orbit; distance of anal from snout about ¾ of the body length, its length of base equal to length of snout; its height to that of middle caudal rays; caudal furcate; pectoral long, subfalcate, inserted close to the branchial cleft, its tip extending to fourteenth scale of lateral line, its length twice that of mandible; ventral located ⅖ of distance from snout to base of caudal, directly under middle of dorsal. Color grayish, mottled with brown; scales metallic silvery. Gulf Stream, in from 85 to 167 fathoms. (*chalybeius*, iron-colored.)

Hyphalonedrus chalybeius, GOODE, Proc. U. S. Nat. Mus., III, 1880, (Feb. 16, 1881), 484, Gulf Stream off Rhode Island; (Type, No. 26092. Coll. Fish Hawk); JORDAN & GILBERT, Synopsis, 296, 1883.

Chorophthalmus agassizii, GÜNTHER, Challenger Report, XXII, 132, pl. L, fig. C, 1887; not of BONAPARTE.

Chlorophthalmus chalybeius, GOODE & BEAN, Oceanic Ichthyology, 60, fig. 71, 1895.

820. CHLOROPHTHALMUS TRUCULENTUS, Goode & Bean.

D. I, 8; A. I, 7; V. 9 or 10. Body subterete, somewhat compressed, its height 5½ in its length, its width about 8. The least height of the tail about 2⅓ in greatest height of body at the insertion of dorsal. Scales moderate, cycloid, arranged in regular transverse rows, overlapping in such manner as to resemble oblique plates on the sides. Lateral line rather inconspicuous, containing between 40 and 50 scales; about 6 scales between lateral line and origin of dorsal, and 6 or 7 between it and ventral. Greatest length of head from tip of projecting lower jaw a little more than ⅓ that of body, or 2½ times in length of snout; lower jaw projecting beyond tip of snout a distance equal to ¼ length of snout. Orbit nearly equal to snout, and about ⅓ length of head; width of interorbital space 2 in orbit. The maxillary broad and flattened posteriorly, about 8 times in length of body, not reaching perpendicular from anterior margin of the orbit. Insertion of the dorsal midway between tip of snout and adipose dorsal, its height greater than length of ventral, which is equal to greatest height of body; the adipose dorsal over middle of base of anal, its length ⅖ diameter of orbit. Distance of anal from snout about ¾ length of body, length of its base about ⅔ that of snout, its height equal to diameter of orbit; caudal furcate; pectoral long and strong, its length equal to distance from tip of snout to posterior margin of orbit, and about twice that of mandible; ventral inserted under the middle of base of dorsal, the distance from posterior margin of orbit equal to distance of the latter from snout. Color brownish. One specimen about 8 inches in length, obtained by the steamer *Blake*, at Station LII, off Barbadoes, in 158 fathoms. (Goode & Bean.) (*truculentus*, truculent.)

---

* *Chlorophthalmus chalybeius* is not identical with *C. agassizii*, but is well separated by the smaller eye, longer, more conical snout, lower, more terete body, and larger scales. It closely resembles it, however, in general form. Dr. Günther's diagnosis of *C. agassizii* in the *Challenger* volume more nearly applies to *C. chalybeius*, and his figure is apparently of *C. chalybeius*. Specimens were obtained by the *Fish Hawk* in five localities ranging in depth from 101 to 156 fathoms, and by the *Albatross* from eleven stations at depths of from 85 to 167 fathoms.—*Goode & Bean.*

Chlorophthalmus truculentus, GOODE & BEAN, Oceanic Ichthyology, 61, fig. 72, 1895, off Barbadoes in 158 fathoms.

Family LXX. BENTHOSAURIDÆ.

This small family of deep-sea fishes is allied to the *Synodontidæ* but with well-developed supramaxillaries widening backward and applied to the dentigerous intermaxillaries; pectorals inserted near the shoulders, and very long ventrals. (Gill.) It includes a single genus, *Benthosaurus*.

252. BENTHOSAURUS, Goode & Bean.

Benthosaurus, GOODE & BEAN, Bull. Mus. Comp. Zoöl., XII, No. 5, 168, 1886, (*grallator*).

Body long, somewhat compressed, tapering into a slender, elongate, caudal peduncle. Scales cycloid, of moderate size. Head slightly depressed; cleft of mouth wide, horizontal, the lower jaw projecting at its extremity and anteriorly at the sides; maxillary long, slender, dilated posteriorly; premaxillary very long, styliform, tapering, immovable. The intermaxillary and mandible with bands of small teeth, of uniform size, interrupted at the symphysis; a short oblong band of similar teeth on each side of the vomer, separated by a rather wide interspace; palate and tongue smooth. Eye very small, inconspicuous. Gill opening extremely wide, the branchiostegal membrane free from the isthmus. Gill rakers long and slender, numerous, about twice as many below the angle as above. Pseudobranchiæ absent. Branchiostegals eleven. All the fins well developed; no adipose dorsal; dorsal fin median, anal postmedian; caudal forked, with lower lobe produced; ventral seven-rayed, inserted opposite the interspace between pectoral and dorsal, the outer ray produced. (*βένθος*, deep; *σαῦρος*, lizard.)

821. **BENTHOSAURUS GRALLATOR**, Goode & Bean.

D. 11; A. 12; P. 9; V. 7; B. 11; scales 9–55–8 or 9. Body elongate, somewhat compressed, depressed slightly forward, tapering behind into a long slender tail, its greatest height 7½ in its standard length, and equaling ½ length of head, its greatest width ⅓ length of head; its height at the origin of the anal ⅚ of its greatest height. Least height of tail half the height of body at ventrals; length of caudal peduncle 6½ times its least height. Scales very thin, cycloid, leathery, deciduous, oval in form, except at base of dorsal and anal fins, where they become more elongate; the horizontal diameter of a scale in the lateral line equals twice diameter of eye; lateral line straight, above the median line anteriorly, becoming median on caudal peduncle, the tube-bearing scales being prominent, and about 55 in number; about 9 rows of scales between dorsal fin and lateral line; between the latter and anal fin, 8 or 9 rows.

Head twice as long as greatest height of body, its length contained a little less than 4 times in the standard body length, considerably depressed, scaleless except on the vertex and the preoperculum. Operculum (perhaps accidentally) denuded. Snout much produced, almost equal to width of interorbital space, which is convex. Maxillary extending far behind eye, its length equal to postorbital part of head; mandible projecting beyond upper jaw a distance slightly more than diameter of orbit, with a series of 7 large pores on its lower surface; several similar pores under eye. Nostrils situated about midway between eye and extremity of snout, small, slit-like, the posterior about twice as large as the anterior one in each pair.

Dorsal inserted midway between tip of snout and base of middle caudal rays, highest in front, the length of the rays diminishing rapidly posteriorly; apparently no adipose dorsal; anal similar in shape to the dorsal, the anterior rays being longest, about equal in length to mandible, its distance from the snout about 3 times length of its longest ray, caudal forked, its middle rays $\frac{2}{5}$ as long as those in the upper caudal lobe; the lower lobe much prolonged, the lower ray being more than 4 times as long as the middle rays; its extremity broken off in our specimen, but apparently it must have been nearly twice as long as the stump which now remains; pectoral fin normal, inserted close to the opercular flap, its length slightly greater than that of the head (although mutilated), extending beyond origin of dorsal; ventral base entirely in advance of the perpendicular from the origin of the dorsal the inner rays reaching vent, while its outer ray is enormously prolonged, extending far beyond the extremity of the upper caudal lobe, the length of the prolonged ray fully 4 times that of head; ventrals close together.

Color brown, the roof of the mouth and inside of the branchiostegal flap black, as well as the operculum and branchiostegal membrane. One specimen, 15½ inches long to the tips of the prolonged ventral rays, was taken by the *Blake*, at a depth of 1,850 fathoms, at Blake Station CLXXIV, in latitude 24° 33′ N., longitude 84° 23′ W. A second example nearly the same size, taken by the *Albatross*, in latitude 39° 3′ 15″ N. and longitude 70° 50′ 45″ W., at a depth of 1,537 fathoms. (Goode & Bean.) (*grallator*, one who walks on stilts.)

Benthosaurus grallator, GOODE & BEAN, Bull. Mus. Comp. Zoöl., XII, No. 5, 168, 1886; GOODE & BEAN, Oceanic Ichth., 62, fig. 73, 1895, Gulf Stream. (Coll. Blake.)

Family LXXI. BATHYPTEROIDÆ.

Characters of the family included below in those of its single genus:

253. BATHYPTEROIS, Günther.

Bathypterois, GÜNTHER, Ann. and Mag. Nat. Hist., 1878, 5th series, II, 183, (*longifilis*).
Synapteretmus, GOODE & BEAN, Oceanic Ichthyology, 64, 1895, (*quadrifilis*).

Shape of the body like that of *Aulopus*. Head of moderate size, depressed in front, with the snout projecting, the large mandible very prominent beyond the upper jaw. Cleft of the mouth wide; maxillary much developed, very movable, much dilated behind. Teeth in narrow villiform bands in the jaws; on each side of the broad vomer a small patch of similar teeth; none on the palatines or on the tongue. Eye very small. Scales cycloid, adherent, of moderate size. Rays of the pectoral fin much elongate, some of the upper being separate from the rest and forming a distinct division. Ventrals abdominal, 8-rayed, with the outer rays prolonged. Dorsal fin inserted in the middle of the body above, or absent; anal short.; caudal forked. Gill openings very wide; gill laminæ well developed, separate from each other; gills rakers long. Pseudobranchiæ none. Deep-sea fishes, the American species belonging to the subgenus *Synapteretmus*. (*βαθύς*, deep; *Pterois*, a genus of *Scorpænoid* fishes, with pectoral filaments.)

SYNAPTERETMUS (*συναπτός*, joined together; *ἐρετμός*, oar):

- *a.* Outer ventral rays filiform, simple, prolonged, appressed or inseparably united. End of dorsal and origin of anal in same vertical, or overlapping.
  - *b.* Anal origin in nearly same vertical as end of dorsal. Dorsal origin over axis of ventrals or nearly so. Ventral rays elongate.
    - *c.* Ventral outer rays appressed; lower caudal ray prolonged; upper pectoral ray not extending beyond upper lobe of caudal. A. 9; scales 59. QUADRIFILIS, 822.
    - *cc.* Ventral with the outer rays closely appressed; lower caudal lobe produced; upper pectoral ray as long as the whole fish. A. 10; scales 55. LONGIPES, 823.

Subgenus SYNAPTERETMUS, Goode & Bean.

822. BATHYPTEROIS QUADRIFILIS, Günther.

Head 5; depth 7; B. 12; D. 14; A. 9; P. II, 9; V. 9; scales 6–59–8. Eye small, about 3 in snout, or 5 or 6 in postorbital portion of head. Uppermost and lowermost of the pectoral rays filiform, the former bifid for more than ⅔ its length, the latter simple. Outer ventral rays much prolonged, not dilated; dorsal inserted close to root of ventrals; adipose fin present, narrow. Head remarkably flat above and the width of the interorbital space greater than length of snout. Dorsal fin midway between tip of upper jaw and root of caudal; anal inserted immediately behind dorsal, its origin equidistant from roots of pectoral and caudal; caudal emarginate.

This species possesses not only the long detached upper pectoral ray, but also an equally long lower ray, which, however, is not removed from the remainder of the fin. The upper ray becomes bifid in its proximate third, and is accompanied by an extremely short rudimentary second ray; it scarcely reaches the caudal fin and is shorter than the lowermost ray, which may reach to the end of the caudal, and is split only at its very extremity. Structure of ventral fins as in *Bathypterois longipes*, but the strong outer rays are somewhat curved and do not reach the end of the anal. Scales cycloid, as in other species, but those behind the basal portion of pectoral fin are deeply pectinated, provided with from 5 to 10 long and narrow teeth, of which the middle ones are the longest. (Günther.) Color blackish or black; pectoral filaments whitish.

The types of this species were obtained by the *Challenger* off the coast of Brazil; two specimens, one from Station 126, at a depth of 770 fathoms, one from Station 121, at a depth of 500 fathoms. Other specimens obtained by the *Blake* off St. Vincent, and by the *Albatross* at Station 2385, in 740 fathoms, and at Station 2117, in 683 fathoms. (*quadrifilis*, having four threads.)

Bathypterois quadrifilis, GÜNTHER, Ann. & Mag. Nat. Hist., 1878, II, 184, off coast of Brazil, in 500 to 770 fathoms; GOODE & BEAN, Oceanic Ichthyology, 65, fig. 75, 1895.

823. BATHYPTEROIS LONGIPES, Günther.

B. 12; D. 13; A. 10; P. II, 7 or 8; V. 8; scales 6–55–8. Uppermost pectoral ray strongest, about as long as the whole fish, bifid toward its extremity; outer ventral rays much prolonged, strong, but not dilated at the extremity; dorsal fin inserted at some distance behind root of ventrals; adipose fin present or absent.

Similar to *Bathypterois longifilis*, differing in the following points: Eye minute; dorsal fin farther backward, its origin being nearly midway between end of snout and root of caudal; consequently the root of the ventral is some distance in advance of the dorsal, and the end of the dorsal is vertically opposite fifth anal ray. One specimen possesses, the other lacks, adipose fin. Caudal fin deeply forked, with the outer ray much produced. Of the two branches into which the posterior third of the long pectoral ray is split, one is much shorter and weaker than the other. Two outer ventral rays are closely appressed from the root to end, and much stouter and longer than the other rays; they are articulated to the end and without soft pads. These fin rays extend beyond the end of the anal fin. (Günther.) Color black, with white fins.

The *Challenger* obtained two specimens, 9 inches long, from off the east coast of South America, Station 325, depth 2,650 fathoms. Several specimens, 3 to 9 inches long, were obtained by the *Albatross* and the *Blake*. (*longus*, long; *pes*, foot.)

Bathypterois longipes, GÜNTHER, Ann. Mag. Nat. Hist., 1878, II, 184, east coast of South America in 2,650 fathoms; GÜNTHER, Challenger Report, XXII, 188, pl. 48, fig. A, 1887; GOODE & BEAN, Oceanic Ichthyology, 66, fig. 76, 1895.

Family LXXII. IPNOPIDÆ.

The characters of this singular group of deep-sea fishes are included below in the account of the single genus.

254. IPNOPS, Günther.

Ipnops, GÜNTHER, Ann. Mag. Nat. Hist., 1878, II, 187, (*murrayi*).

Body elongate, subcylindrical, covered with large, thin, deciduous scales, and without luminous organs. Head depressed, with a long, thin, spatulate snout, like that of *Bathypterois*, but more depressed, its whole upper surface occupied by a pair of large, transparent, lamelliform membrane bones which cover a peculiar organ divided longitudinally into two symmetrical halves. These organs, which represent the eyes, were at first supposed to be luminous organs, but according to recent investigations of Professor Moseley they "show a flattened cornea extending along the median line of the snout, with a large retina composed of peculiar rods, which form a complicated apparatus, destined undoubtedly to produce an image and to receive especial luminous rays." *

Bones of lower part of head well ossified, mouth wide, the lower jaw projecting, and the maxillary dilated, as in *Bathypterois*. Jaws with narrow bands of villiform teeth, none on vomer or palatines. None of the fins filamentous; pectorals and ventrals near together, well developed. Dorsal inserted just behind vent; no adipose fin; anal moderate; caudal subtruncate. Gill rakers needle-shaped. No air bladder, pseudobranchiæ, nor pyloric cœca. One species known, widely distributed. (ἰπνός, lantern; ὤψ, eye.)

824. IPNOPS MURRAYI, Günther.

Head 6; depth 13½. D. 10; A. 13; P. 14; V. 8; B. 12; scales 55. Body very slender; head much broader than deep, the snout much depressed, its outline obtusely rounded; maxillary extending beyond middle of head. Gill rakers 10 + 22, long and close-set. Vent between ventral fins, slightly more than a head's length behind gill opening, and nearly twice as far from base of caudal as from tip of snout. Caudal subtruncate; pectoral reaching ventrals, a little more than half head; ventrals rather long, stronger than pectorals and placed well apart. Lateral line faintly indicated. Brown, fins colorless; membranes of mouth and gill cavity black. Length 5½ inches. A bottom fish found at about 2,000 fathoms, recorded from coast of Brazil, Tristan da Cunha, Celebes, and in tropical America, (24° 36′ N., 84° W.), and off Bequia. (Named for Dr. John Murray, naturalist on the *Challenger* expedition.)

Ipnops murrayi, GÜNTHER, Ann. Mag. Nat. Hist., 1878, II, 187, coast of Brazil, etc.; GÜNTHER, Voyage Challenger, Deep-Sea Fishes, 191, 1887; AGASSIZ, Cruises of the Blake, II, 32, fig. 215, 1888; GOODE & BEAN, Oceanic Ichthyology, 67, 1895.

Family LXXIII. RONDELETIIDÆ.

Body more or less compressed, scaleless; head naked; no barbels; mouth large. Margin of the upper jaw formed by the premaxillaries only. Teeth coarsely granular. Opercular apparatus complete, its bones very thin, membrane-like; no adipose fin; dorsal fin far back, short and low, inserted opposite the anal; pectorals short, placed rather low. Ventrals present, abdominal. Gill opening very wide; membranes deeply cleft, free from the isthmus. Pseudobranchiæ absent. Deep-sea fishes. One species known. (Goode & Bean.)

(*Rondeletiidæ*, GOODE & BEAN, Proc. U. S. Nat. Mus., 1894 (1895), 454, and in Oceanic Ichthyology, 67, 1895.)

---

* "The existence of well-developed eyes among fishes destined to live in the dark abysses of the ocean seems at first contradictory, but we must remember that these denizens of the deep are immigrants from the shore and from the surface. In some cases the eyes have not been specially modified, but in others there have been modifications of a luminous mucous membrane, leading on the one hand to phosphorescent organs more or less specialized, or on the other to such remarkable structures as the eyes of *Ipnops*, intermediate between true eyes and specialized phosphorescent plates. In fishes that have been blinded and retain for their guidance only the general sensibility of the integuments and of the lateral line, these parts soon acquire a very great delicacy. The same is the case with tactile organs (as in *Bathypterois* and *Benthosaurus*), and experiments show that barbels may become organs of touch adapted to aquatic life, sensitive to the faintest movements or the slightest displacement, with power to give the blinded fishes full cognizance of the state of the medium in which they live."—*Alexander Agassiz.*

255. RONDELETIA, Goode & Bean.

Rondeletia, GOODE & BEAN, Proc. U. S. Nat. Mus., 1894 (1895), 454, (*bicolor*); and in Oceanic Ichthyology, 68, 1895.

Body oblong, compressed, scaleless. Mouth large, lower jaw slightly projecting. Teeth in bands, coarsely granular in the jaws; vomer and palatines toothless; a row of large mucous pores on the lower surface of the mandible, and extending upward on the preoperculum. Posterior nostril with a slender filament anteriorly. Eyes moderate, near the dorsal profile. Snout rather long, obtuse. Supraoccipital bones with a pair of strong spines projecting horizontally forward over the orbit. Gill membranes entirely separate; gill rakers numerous, rather long and slender; gills 4, a narrow slit behind the fourth. Branchiostegals 7. Opercular bones thin, membranous. Dorsal short, rather low, opposite and similar to the anal; pectorals and ventrals small; caudal small, probably forked. No vestiges of a lateral line. (Dedicated to Guillaume Rondelet, "the great French ichthyologist of the seventeenth century," one of the ablest of the "Fathers of Ichthyology.")

825. RONDELETIA BICOLOR, Goode & Bean.

Head about 2 in total length; depth 3; eye 6; snout 3. B. 7; D. 14; A. 14; P. 9; V. 5. Maxillary reaching to below the hind margin of eye. Origin of dorsal fin nearly opposite vent; origin of anal immediately behind vent, the terminations of the two opposite. Fins low, the rays pointing horizontally backward; longest dorsal ray 5 in head, longest anal ray 4; pectoral fin inserted below middle of body and under end of opercular flap, its length nearly ¼ that of head; ventrals inserted behind middle of total length, and still farther behind tips of the extended pectorals, their length about $\frac{2}{9}$ that of head, and when extended, reaching beyond vent. Color purplish black, with cherry-colored margins to the fins; whitish in spirits.

A single specimen 4¼ inches in length, was taken by the Fish Commission steamer *Albatross* at station 2724, at a depth of 1,641 fathoms. (Goode & Bean.) (*bicolor*, two-colored.)

Rondeletia bicolor, GOODE & BEAN, Proc. U. S. Nat. Mus., 1894 (1895), 454, pl. 17, fig. 1; and in Oceanic Ichthyology, 68, fig. 77, 1895. (Type, No. 38202. Coll. Albatross).

Family LXXIV. CETOMIMIDÆ.

Body somewhat compressed, scaleless; head naked; lateral line conspicuous. No barbels. Mouth exceedingly large; the margin of the upper jaw formed by the premaxillaries only; the lower jaw strongly curved, and slightly projecting beyond the upper. Teeth in jaws in bands, granular; vomer, palatines, pterygoids, and also the first gill arch and the lingual bones (which are greatly enlarged), as well as the upper pharyngeals, covered with teeth of a similar character. Opercular apparatus incomplete, its bones very thin, membrane-like. No adipose fin; dorsal fin far back, short, high, inserted opposite the anal, which it resembles; pectorals short, placed rather low; ventrals absent. Gill opening immense, the membranes deeply cleft, free from the isthmus.

Gills 3. Pseudobranchiæ absent. (Goode & Bean.) Deep-sea fishes of uncertain relationship, bearing a singular resemblance to diminutive whales. Two species known. (*Cetomimidæ*, Goode & Bean, Proc. U. S. Nat. Mus., 1894 (1895), 451; and in Oceanic Ichthyology, 68, 1895.)

256. CETOMIMUS, Goode & Bean.

Cetomimus, GOODE & BEAN, Proc. U. S. Nat. Mus., 1894 (1895), 452, (*gillii*); and in Oceanic Ichthyology, 68, 1895.

Body oblong, compressed, scaleless; similar in its vertical outline and proportions to that of the right whales (*Balænidæ*), a resemblance which is greatly enhanced by the shape of the enormous mouth, and in the lower jaw, which is strongly curved, projecting slightly beyond the snout. Teeth in granular bands, covering all the bones of the mouth, tongue, and throat. Mucous pores sometimes present on the back. Nostrils far forward, open slits without flap. Eyes very small and placed far below the dorsal profile. Gill membranes deeply cleft, not attached to the isthmus; gill rakers absent, replaced by a granular tooth-like surface upon the arch; gills 3, no slit behind the third. Branchiostegals 9. Opercular apparatus incomplete, bones thin and membranous. Dorsal short, high, inserted very far back, directly opposite the anal, which it resembles in shape and size. Caudal peduncle short and slender. Ventrals absent; pectorals broad and short, placed low; caudal small, weak, probably emarginate or truncate. Lateral line broad, consisting of two furrows, connected vertically by numerous short cross grooves. (κῆτος, whale; μιμέομαι, to mimic.)

a. Dorsal rays 16. GILLII, 826.

aa. Dorsal rays 19. STORERI, 827.

826. CETOMIMUS GILLII, Goode & Bean.

Head about 3; depth a little more than 4; B. 9; D. 16; A. 16; P. 16. Eye minute, about 23 in head, and about 8 in snout, inserted midway between margin of jaw and dorsal profile, distant from the former a space contained about 2½ times in length of snout. The maxillary reaches very far back, extending to a point behind orbit equal to 1½ times length of snout. Origin of dorsal directly above that of anal, which is inserted a short distance behind vent; distance from snout equal to more than 4 times length of its own base, and distance of its termination from root of upper rays of caudal equal to its own greatest height; anal similar in shape and extent to dorsal, but the thirteenth to the fifteenth rays the longest, while the eighth to eleventh are the longest in dorsal; length of these longest rays about equal in the two fins, and contained slightly less than 3 times in head; pectoral inserted somewhat below middle of body, close to extremity of opercular flap; broadly lanceolate, about 3½ times in head; ventrals lacking. Lateral line sweeping in a bold curve from a point above the upper angle of the gill opening to a point in middle of body between origin of dorsal and anal fins, and thence in a straight median line to base of caudal. Color blue-black.

A single specimen of this curious species, 5 inches in length, was taken by the *Albatross*, August 20, 1884, at station 2206, in 39° 35′ N. latitude, 71° 24′ 30″ W. longitude, at the depth of 1,043 fathoms. (Goode & Bean.) (Named for Dr. Theodore Gill.)

Cetomimus gillii, GOODE & BEAN, Proc. U. S. Nat. Mus., 1894 (1895), 452, pl. 17, fig. 2; and in Oceanic Ichthyology, 69, fig. 78, 1895, Gulf Stream. (Type, No. 35529. Coll. Albatross.)

827. CETOMIMUS STORERI, Goode & Bean.

D. 19; A. 16. Head 3⅓; depth about 4 in total length; eye 18 in head or 7 in snout, inserted nearer dorsal profile than to jaw, its position in the vertical being twice as far from the line of the upper jaw as from the dorsal line, and nearly in the line of the vertical erected from middle of upper jaw to the right angles of its edge. Lower jaw strongly curved, projecting far beyond upper. Origin of dorsal fin a little in advance of that of anal, which is inserted at a distance from the vent equal to 3 or 4 times diameter of eye; dorsal fin longer than anal, the termination of the latter being under the fifth ray from the end of the dorsal; they are about equal in height, and the direction of the rays when erected is backward and at an acute angle with the axis of the body; the longest rays about 2½ in head; pectoral fin inserted very far down, the lower portion of its peduncle almost on the abdominal line; the fin is lanceolate, and, although mutilated, is believed to have been about ½ as long as the head; lateral line in a sinuous curve from a point above the upper angle of gill opening to a point somewhat in advance of insertion of dorsal, and thence in a straight line to base of caudal. A line of mucous pores on either side of the median dorsal line in advance of dorsal.

A single specimen of this species, 4⅔ inches in length, was taken by the Fish Commission steamer *Albatross* at station 2222, on September 6, 1884, at a depth of 1,535 fathoms. (Goode & Bean.) (Named for David Humphreys Storer, the accomplished author of the History of the Fishes of Massachusetts.)

Cetomimus storeri, GOODE & BEAN, Proc. U. S. Nat. Mus., 1894 (1895), 453, pl. 17, fig. 3; and in Oceanic Ichthyology, 69, fig. 79, 1895, Gulf Stream. (Type, No. 35634. Coll. Albatross.)

Family LXXV. MYCTOPHIDÆ.

(THE LANTERN FISHES.)

Body oblong or moderately elongate, more or less compressed, covered with scales, which are usually cycloid, but sometimes ctenoid. Mouth wide, the entire margin of the upper jaw formed by the long and slender premaxillaries, closely adherent to which are the slender maxillaries. Teeth various, mostly villiform, and in bands in the jaws; also on the pterygoids, palatines, and tongue; and on the vomer in adults. No barbels. Gill membranes separate, free. Branchiostegals 8 to 10. Pseudobranchiæ well developed. Gill rakers long and slender. Lateral line usually present, the scales prominent and often enlarged. Cheeks and opercles scaly. Adipose fin present; dorsal fin short, median, of soft rays; pectorals and ventrals present; anal fin moderate; caudal forked. Air bladder small. Intestinal canal short. Luminous spots or photophores more or less regularly placed along sides of body; larger luminous glands often present on the head or on the caudal peduncle.

Species about 100, placed in one genus by Günther and Lütken, divided into many by Goode & Bean. Small fishes, very widely distributed in the open sea. They live away from the shores, ordinarily at a considerable depth, coming to the surface at night or in stormy weather, descending by day.

Until the recent review of the Mediterranean species by Raffaele and especially the admirable monograph by Dr. Lütken (Spolia Atlantica, part 2, 1892), the species were very imperfectly known. This masterly paper of Dr. Lütken has been followed by a very exhaustive account of the Atlantic species by Goode & Bean (Oceanic Ichthyology). Advance sheets of this paper have been kindly placed at our disposal by its authors, and our manuscript has been entirely recast to include the species there described. Lütken places the species in one genus, *Scopelus*, but "for convenience of study and comparison" Goode & Bean have thought it "best to break up this great polymorphous genus" into minor groups. We find, however, considerable difficulty in giving these smaller genera satisfactory definition, but on the whole we have found it more convenient to recognize them as distinct genera rather than to place them as subgenera under the common head of *Myctophum*. The extreme ranges of variation are greater than are usually recognized as occurring within the limits of a natural genus.

NOTE.—Dr. Raffaele and Dr. Lütken have shown the great importance of the position of the luminous spots or photophores as characters distinguishing the species of *Scopelidæ*. Dr. Lütken has proposed a system of nomenclature for them, as follows:

Caudal (or precaudal) spots or photophores, those 2, 3, or 4 in number at or near base of lower lobe of caudal, the first separated by a break from the anal series.

Anal spots, those forming a series from vent along base of anal and caudal peduncle; this series is usually interrupted above last part of anal, one or two spaces being without spots.

Posterolateral spots, or spots placed near the lateral line above the break in the anal series.

Supra-anal spots, usually 3 in number, forming an oblique series or a triangle between vent and lateral line.

Ventral spots, a series of 4 or 5 between ventrals and vent.

Supraventral, a single spot sometimes present between ventrals and lateral line.

Thoracic spots, a series, often irregular, of about 5, along breast.

Pectoral spots, usually about 3, about base of pectoral.

Opercular, 2 or 3 on opercle.

Mandibular, about 3 on mandible.

Besides these, *preocular*, *subocular*, *supracaudal*, and *infracaudal* luminous patches often occur. The luminous glands on tail are so often obsolete as to lose much of their value in classification. In this paper we have adopted in the descriptions written by us, the nomenclature of Dr. Lütken as above given. In the descriptions copied from Goode & Bean a somewhat different system is used, but we have preferred not to alter the language of these authors.

NOTE.—Goode & Bean (Oceanic Ichthyology) offer the following

Tentative Arrangement of the Genera of Myctophidæ.

I. Body oblong, compressed. Teeth in jaws in villiform bands.

A. Pectorals present.

1. Dorsal and anal fins touching (or nearly so) the same vertical, or overlapping.

a. Lateral line not at all, or but slightly, enlarged. Scales cycloid, smooth.

i. No luminous glands on head or tail. (Luminous scales sometimes present on tail, above or below.)

x. Head short, with limb of preoperculum nearly vertical; snout more or less blunt and declivous. Precaudal photophores 2.

Dorsal entirely in front of anal, and scarcely, or not at all, overlapping. Superanal photophores in two groups. **Myctophum.**

Dorsal operlapping anal. Superanals in one or two groups. **Benthosema.**

xx. Head long, limb of preoperculum oblique; snout conical and snake-like. Precaudal photophores 4 or 2 + 1.

Dorsal about equal to or shorter than anal, and not overlapping.

No orbital spines. **Lampanyctus.**

Orbital spines. **Ceratoscopelus.**

Dorsal much longer than anal, and overlapping it.

Pectorals placed normally. **Notoscopelus.**

Pectorals placed very low. **Catablemella.**

ii. Luminous glands on tail, but none on head.

x. Dorsal and anal nearly equal, not touching same vertical.

Head somewhat conical, with limb of preoperculum slightly oblique.

Saddle-like gland on tail, above and below. **Lampadena.**

iii. Large luminous glands on head, but none on tail.

x. Superanal photophores in two groups.

Precaudal photophores 4.

One large, irregular gland occupying entire front of head. **Æthoprora.**

Four luminous glands on head, one in front of each eye and one on each infraorbital. **Collettia.**

Precaudal photophores none.

A gland in front of each eye below the nostril.

Photophores and cephalic glands all divided into halves by horizontal septa of black pigment. **Diaphus.**

b. Lateral line obsolescent.

i. No luminous glands. Photophores much as in typical genus.

x. Head long, with oblique preopercular limb.

Dorsal overlapping anal, the latter much the longer. Pectoral very high.

Precaudal photophore 1. Apparently no photophores on head. **Tarletonbeania.**

c. Lateral line with scales much enlarged; scales hard, persistent.

i. Luminous glands or scales on top of caudal peduncle; none on head.

x. Scales cycloid. Anal passing behind soft dorsal.

Body elongate, fusiform; head short, with projecting snout.

Anal much longer than dorsal, but not overlapping. Caudal peduncle slender, elongate. **Stenobrachius.**

One posterolateral photophore over break in superanal series. **Stenobrachius (Alysia and Rhinoscopelus).**

Body ovate, compressed; head short, profile declivous; snout not projecting.

Anal somewhat longer than dorsal and overlapping it slightly. Caudal peduncle short and stout.

No posterolateral photophore. Superanals in unbroken series. **Electrona.**

xx. Scales ctenoid. Anal terminating below soft dorsal.

Body elevated, somewhat compressed. Caudal peduncle rather slender.

Anal longer than dorsal, but scarcely overlapping. **Dasyscopelus.**

2. Dorsal and anal short, similar, far apart.

a. Scales large, very deciduous, covered with minute spines.

i. No luminous glands on head or tail.

x. Scales along belly with luminous centers. Photophores far from normal.

Head conical; rictus short.

Dorsal and anal equal, the latter placed with its center under soft dorsal. **Neoscopelus.**

b. Scales (if present) very deciduous.

i. Mouth very large; maxillary much dilated at tip. **Scopelengys.**

B. Pectorals rudimentary.

1. Dorsal and anal overlapping considerably.

a. Luminous glands on tail, above and below. Photophores minute, irregularly placed.

i. Head long, with oblique preopercular limb; snout conical; mouth terminal, horizontal. NANNOBRACHIUM.

II. Body elongate, cylindrical. Teeth in lower jaw in several series. SCOPELOSAURUS.

Besides the species mentioned below, very many others are known from the open Atlantic and Pacific, any of which are likely to be found off our coasts. Descriptions of most of the known species are given in the papers above mentioned of Lütken and of Goode & Bean.

a. Dorsal fin not ending much, if any, before front of anal fin.

b. Caudal photophores 4 or 3, never 2; dorsal fin not much, if any, shorter than anal; body deep or slender, not much contracted behind, the caudal peduncle robust; edge of preopercle more or less oblique; pectorals long or short, placed rather low.

c. Dorsal fin very long, much longer than anal and overlapping the latter; pectorals small, narrow, placed low; head long and low, with small eye. MACROSTOMA, 257.

cc. Dorsal fin not much longer than anal.

d. Head without large luminous glands; pectorals long or short, with narrow base.

e. Pectoral fins long, reaching past ventrals; luminous glands on caudal peduncle above or below, occasionally present.

f. Orbit with a small antrorse spine or horn above front of each eye. CERATOSCOPELUS, 258.

ff. Orbit without antrorse spine above. LAMPANYCTUS, 259.

ee. Pectoral fin small or minute, not much longer than eye; usually a luminous blotch on caudal peduncle above or below, or both.

g. Scales in lateral line not larger than the others. LAMPADENA, 260

gg. Scales in lateral line notably larger than the others. NANNOBRACHIUM, 261.

dd. Head with large luminous glands before or below eye; pectoral fins short and broad, placed low; eye very large; snout short and convex; scales in lateral line usually more or less enlarged, the pores luminous.

h. Photophores and luminous glands most of them divided into halves by cross partitions of black pigment giving the form of the letter θ; a luminous gland in front of each eye below nostril. DIAPHUS, 262.

hh. Photophores simple, without septa.

i. Luminous blotches before and below eye separate. ÆTHOPRORA, 263.

ii. Luminous blotches before and below eye coalescent in one large blotch occupying whole front of head. COLLETTIA, 264.

bb. Caudal photophores 2, never 3 or 4; dorsal fin notably shorter than anal, its rays 9 to 14; anal rays 16 to 20; body deep anteriorly, the caudal peduncle slender; edge of preopercle nearly vertical; pectorals long, placed high; no luminous glands on head; eye large.

j. Lateral line well developed.

k. Scales cycloid.

l. Maxillary scarcely enlarged at tip; last rays of dorsal not behind first of anal.

m. Snout prominent, projecting beyond tip of lower jaw; scales of lateral line more or less enlarged; caudal peduncle very slender; usually a luminous gland on its upper surface. RHINOSCOPELUS, 265.

mm. Snout little prominent, scarcely projecting beyond tip of lower jaw; scales of lateral line usually not enlarged; no luminous glands on upper edge of tail; moderately elongate. MYCTOPHUM, 266.

ll. Maxillary abruptly dilated at tip; last ray of dorsal behind first of anal; form moderately elongate (not broad-ovate as in the European group *Electrona*). BENTHOSEMA, 267.

kk. Scales ctenoid, firm; tail with a luminous gland above. DASYSCOPELUS, 268.

jj. Lateral line obsolete; no glands on tail; scales crenulate. TARLETONBEANIA, 269

257. MACROSTOMA,* Risso.

Macrostoma, Risso, Europe Mérid., III, 447, 1826, (*angustidens*); not *Macrostomus*, Wied, 1817, a genus of insects.

Notoscopelus, Günther, Cat., V, 405, 411, 1884, (*resplendens*).

Catablemella, Eigenmann & Eigenmann, Proc. Cal. Ac. Sci., 2d series, III, 1890, 24, (*brachychir*).

Myctophids with the dorsal fin much longer than the anal, and overlapping the anterior half of the latter. Body elongate. Snout obtusely conical; jaws equal in front; cleft of mouth nearly horizontal; maxillary not dilated behind. No luminous glands on head or tail. Arrangement of photophores irregular. Precaudals 2 + 1 or 2, the last one high up. (*μακρός*, large; *στόμα*, mouth.)

- *a.* Mediolaterals 3, in a curved, subvertical series; posterolaterals 2 or 3.
  - *b.* Posterolaterals 2, horizontally side by side, under adipose dorsal.
    - *c.* Caudal spots 3 (2 + 1); posterolaterals under soft dorsal; pectoral weak and short.
      - *d.* Dorsal rays 21; anal 20; scales 42; anal photophores 8 + 8. QUERCINUM, 828.
      - *dd.* Dorsal rays 16; anal 14; anal photophores 9 + 17. MARGARITIFERUM, 829.
    - *cc.* Caudal spots 4 (2 + 2); first posterolateral under adipose dorsal, second behind it. D. 21 to 24; A. 17 or 18; anal series 8 or 7 + 6 or 7. ANGUSTIDENS, 830.
  - *bb.* Posterolaterals 3, horizontally side by side; caudal spots 3 (2 + 1); last posterolateral under adipose dorsal; pectoral short and weak. D. 20 or 21; A. 16; scales 46; anal series 9 + 4. CASTANEUM, 831.
- *aa.* Mediolaterals 2; posterolateral 1; caudal spots 3, the last at end of lateral line. D. 20; A. 18; scales 36. CAUDISPINOSUM, 832.

828. MACROSTOMA QUERCINUM (Goode & Bean).

Head $3\frac{2}{3}$ to 4; depth $5\frac{2}{3}$. D. 21 or 24; A. 19 or 20; scales 42. Eye moderate, nearly 4. Snout short, about $\frac{1}{2}$ as long as the diameter of the eye. Mouth oblique and very large, the maxillary extending to angle of preoperculum. Length of upper jaw about $\frac{4}{5}$ that of head. Origin of dorsal much nearer tip of snout than root of caudal, being over the twelfth scale of the lateral line and immediately above origin of ventral; length of its base equal to that of head, and longest ray $\frac{2}{3}$ as long as head, its end over seventh ray of anal; pectoral short, not reaching to origin of ventral; anal origin about under twenty-first scale of lateral line, the length of the base equals that of head without snout, and the longest ray is about $\frac{1}{2}$ as long as head; adipose fin very slender, its distance from end of dorsal equaling $\frac{1}{2}$ length of head; caudal moderate, deeply forked. A large luminous spot near the angle of the preoperculum; 2 above the pectoral base and 1 below it; 1 just below the lateral line above the origin of the anal; 5 or 6 between the isthmus and the root of the ventral; a number of others not accurately counted. Color dark brown.

Mediolaterals 3, in curved subvertical line; posterolaterals 2, under the soft dorsal; precaudals 2 + 1, the last below the end of the lateral line; one of the precaudals very high up. Western Atlantic, at 700 to 800 fathoms; also in the Mediterranean. (Goode & Bean.) This is very likely the original *elongatum* of Costa, rather than the species here called by that name (after Lütken). (*quercinus*, oak-like, from the tan-color.) (Eu.)

---

* By the rules of the Amer. Ornithol. Union, *Notoscopelus* should be used instead of *Macrostoma*, as there is a prior genus *Macrostomus*. We regard the two as distinct, as they are spelled differently.

Notoscopelus quercinus, GOODE & BEAN, Oceanic Ichthyology, 84, fig. 97, 1895, Grand Banks. (Type, No. 43789. Coll. Albatross.)

829. MACROSTOMA MARGARITIFERUM (Goode & Bean).

Head 4; depth 5; eye moderate, about 4 in head. D. 16; A. 14. Least height of tail ½ of greatest height of body. Snout very short, compressed into a keel on its upper edge, its length scarcely more than ½ diameter of the eye. Gill rakers 9 or 10 above the angle, about 16 below, the longest about ⅔ the diameter of eye. Intermaxillary reaching almost to angle of preoperculum. Space between eye and hinder edge of preoperculum much less than diameter of the eye. Origin of dorsal much nearer tip of snout than root of caudal, about over ninth scale of lateral line, and in same vertical with origin of ventral; length of dorsal base nearly ⅓ of total (without caudal); the ventral does not quite reach to origin of anal; pectoral very short, its length only ⅓ that of head; no adipose dorsal; anal origin under eighteenth scale of lateral line; base of fin as long as head without snout; caudal moderately forked. On top of the caudal peduncle a long, linear mirror, nearly ½ as long as head, its width about ⅓ of its length. Several large phosphorescent spots on inner edge of mandible, a large one near angle of preoperculum.

Mediolaterals 3, in a curved, subvertical line. Posterolaterals 2, under soft dorsal. Superanals 9 + 7. Precaudals 2 + 2, the last below end of lateral line. Grand Banks of Newfoundland; known from two specimens. (Goode & Bean.) (*margaritifer*, bearing pearls.)

Notoscopelus margaritifer, GOODE & BEAN, Oceanic Ichthyology, 85, fig. 98, 1895, off Banquereau. (Type, No. 43775. Coll. Sch. Alice M. Williams of Gloucester.)

830. MACROSTOMA ANGUSTIDENS, Risso.

(PRICK FISH; MAIRE D'AMPLORA.)

Head 4; depth 5½; eye moderate, 4⅖ in head. D. 21 to 24; A. 17 or 18. Caudal spots 4, 2 horizontally placed, 2 at base of caudal rays; posterolateral spots 2 or 3; anal spots about 8 + 7; supra-anal spots 3, not quite in line; ventral spots 5 or 6; a white or luminous spot on back of tail. Preopercle very oblique. Body elongate, the caudal peduncle not very slender. Head moderate, snout very short, low, but bluntish at tip; chin prominent; mouth not very oblique. Dorsal very high, anal long; pectoral slender, narrow, placed low, with 12 rays, not reaching ventrals. A luminous gland above and one below tail. Atlantic and Indian Oceans, Norway and Greenland. (Lütken; here described from Mediterranean examples.) It is not unlikely that several species are confounded under this name. According to Goode & Bean, the original *elongatum* may be the one called by them *quercinus*. (*angustus*, narrow; *dens*, tooth.) (Eu.)

Macrostoma angustidens, RISSO, Europe Méridionale, III, 448, 1826, Nice; D. 22; A. 18.

Scopelus elongatus, COSTA, Fauna Napoli, Pesci, I, 2, Scopelus, 1844, Naples; LÜTKEN, Spolia Atlantica, II, 44, 1892; LILLJEBORG, Sveriges Fiskar, VI, 25, 1889.

Lampanyctus resplendens, RICHARDSON, Voy. Erebus and Terror, 42, 1845, Gulf of Guinea; GÜNTHER, Cat., V, 415, 1864.

Scopelus kröyeri, Malm, Goteberg Vetensk. Handl., 100, 1863, Bohuslan, Sweden.

Scopelus pseudocrocodilus, Moreau (fide Lütken).

Myctophum brachychir,* Eigenmann & Eigenmann, West American Scientist, 1889, 126, Cortez Banks.

831. MACROSTOMA CASTANEUM (Goode & Bean).

Head 4; depth $5\frac{1}{3}$. D. 20 or 21; A. 16; scales about 46. Eye moderate, its diameter nearly 4 in head, and more than 2 in snout. Mouth exceedingly wide, oblique, with jaws equal; maxillary extending backward almost to angle of preoperculum. Intermaxillary as long as maxillary, and toothed throughout its entire length. Maxillary very little expanded posteriorly. Origin of dorsal fin very much nearer tip of snout than root of caudal, being as far from snout as from front of pearl-colored patch on top of tail and somewhat in advance of origin of ventral; dorsal base considerably longer than head, the longest ray equaling length of postorbital part of head; caudal deeply forked; pectoral small and not reaching nearly to ventral, its length not much more than $\frac{1}{3}$ that of head; ventral insertion under fourth ray of dorsal, its length about $\frac{1}{2}$ that of head; anal base nearly equal to head without snout. Mediolaterals 3, in curved subvertical line; posterolaterals 3, horizontally side by side. Precaudals $2 + 1$, last below the end of the lateral line. Last posterolateral under soft dorsal. Number of superanals $9 + 4$. Grand Banks, two specimens known. (Goode & Bean.) (*castaneus*, chestnut-colored.)

Notoscopelus castaneus, Goode & Bean, Oceanic Ichthyology, 85, fig. 95, 1895, Grand Banks. (Type, No. 31706. Coll. Str. Fish Hawk.)

832. MACROSTOMA CAUDISPINOSUM (Johnson).

Head $3\frac{2}{3}$; depth $5\frac{1}{2}$. D. 36; A. 18 or 19; V. 8; lateral line 36 to 38. Eye moderate. Snout obtusely conical, with jaws equal in front. Cleft of mouth rather oblique. Origin of dorsal fin midway between extremity of snout and adipose fin, and above base of outer ventral rays, its last ray behind vertical from middle of anal. A series of from 6 to 9 small spines bent backward, above and below, before the root of caudal, the tips of neural processes. Pectoral fins shorter than ventral, and not extending beyond its root. Mediolaterals 2; posterolaterals 1; precaudals $2 + 1$, the last at the end of the dorsal line; the single posterolateral in advance of the soft dorsal; number of superanals $7 + 4$ (?). (Goode & Bean.) Atlantic Ocean, two specimens known, one from the western Atlantic at a depth of 1,782 fathoms, 39° N., 68° W. (*cauda*, tail; *spinosus*, spined.)

Scopelus caudispinosus, Johnson, Proc. Zoöl. Soc. Lond., 1863, 42, Madeira; Günther, Cat., v, 416, 1864.

Notoscopelus caudispinosus, Goode & Bean, Oceanic Ichthyology, 85, fig. 96, 1895.

---

* Head $3\frac{1}{3}$ (4 in specimen examined); depth $4\frac{3}{4}$; D. 20 to 23; A. 18 to 20; scales 40. Luminous spots not described, probably as in *M. angustidens*, a white spot on back of tail; elongate, compressed; head long, slender, the snout pointed, the profile not much rounded; preopercular margin very oblique; mouth large, maxillary not dilated behind, $1\frac{2}{5}$ in head; eye moderate, 4 in head. Dorsal falcate, longer than anal; pectorals minute, not nearly reaching ventrals. Length $3\frac{1}{2}$ inches. Cortez Banks, near San Diego, in 45 fathoms. (Eigenmann.) Not evidently different from *M. angustidens*; a specimen examined by us, in poor condition, agrees perfectly with Lütken's account condensed above, so far as its characters can be ascertained. (βραχύς, short; χείρ, hand.)

258. CERATOSCOPELUS, Günther.

Ceratoscopelus, Günther, Cat., v, 405 and 412, 1864, (*madeirensis*).

Dorsal and anal fins touching the same vertical, but scarcely overlapping, the dorsal not greatly elongate. Scales of the lateral line somewhat enlarged. Head long; limb of preoperculum oblique; snout conical and snake-like. A spine above orbit on each side. No luminous glands on head or tail. Caudal photophores 4. (*κέρας*, horn; *Scopelus.*)

a. D. 13 or 14; A. 13; eye large; anal series 6 + 6; two posterolateral spots; four caudal spots. MADEIRENSIS, 833.

833. CERATOSCOPELUS MADEIRENSIS (Lowe).

Head 3; depth 4⅔. D. 13 or 14; A. 13; scales 36. Forehead with a bony projection or horn on each side above eye. Caudal spots 4, the last at base of middle rays; 2 posterolateral spots; anal spots about 6 + 6, the series not evenly placed; supra-anal spots forming an oblique series. Preopercle very oblique. Body rather elongate, the head large and heavy; eye large, twice length of the bluntish snout, 3⅓ in head; mouth large. Dorsal high, much shorter than anal; pectoral long and slender, reaching past front of anal. (Lütken.) Atlantic and Mediterranean, west to the Grand Banks, where it is rather common at about 1,500 fathoms. (Eu.)

Scopelus madeirensis, Lowe, Proc. Zoöl. Soc. Lond., 1839, 87; 1851, 250; and Trans. Zoöl. Soc. Lond., III, 14, 1839, Madeira; Günther, Cat., v, 412, 1864; Raffaele, Mitt. Zool. Stat. Naples, IX, 184, pl. 7, fig. 9, 1889; Lütken, Vid. Med. Naturh. Foren., 208, 1891.
Scopelus bonapartii, Cuvier & Valenciennes, Hist. Nat. Poiss., XXII, 449, 1848, Nice.
Ceratoscopelus madeirensis,* Goode & Bean, Oceanic Ichthyology, 82, 1895.

259. LAMPANYCTUS, Bonaparte.

Lampanyctus, Bonaparte, Fauna Italica, fasc. XXVII, 1840, (*crocodilus*).

Body oblong, compressed, slender, the caudal peduncle rather robust. Scales deciduous, cycloid, those of the lateral line not enlarged, so far as known; lateral line well developed; number of caudal photophores 3 or 4, never 2; luminous blotches almost always present on upper or lower edge of tail, none on forehead. Head compressed, the mouth large, with subequal jaws; premaxillary very long and slender. Eye large; preopercular edge more or less oblique. Gill rakers long and slender. Dorsal fin large, larger than in *Myctophum*, not notably shorter than anal, its insertion little, if any, behind that of ventrals; rays of dorsal 11 to 24, those of anal 9 to 19. Pectoral fins narrow, well developed, inserted low. Species numerous, very widely distributed in the open sea. (*λάμπη*, lamp; *νύξ*, night.)

a. Pectorals long and falcate.
  b. Caudal photophores 3 or 4, in two series, the last on or near end of lateral line.
    c. Mediolaterals 2; posterolaterals 2, nearly under adipose dorsal.

---

* Height of body ⅙ of total length; length of head nearly 1/3. Least height of tail nearly 1/2 greatest height of body. Snout moderate. Mouth large, oblique; jaws equal. Maxillary very slightly expanded behind. Ventral reaches to vent, and pectoral almost as far back as ventral. Anal origin under about nineteenth scale of lateral line. D. 13; A. 12; scales 36.—*Goode & Bean*; from American specimens.

d. Snout short, sharp, not much decurved above; eye small, 5 in head. Scales 38 or 39; D. 12 or 13 (sometimes 14 or 15); A. 14 or 15 (rarely 17 or 18); anal series 6 to 8 + 8 to 12; eye small, about 5 in head; head long, snakelike, with large mouth. CROCODILUS, 834.

dd. Snout blunt, decurved; eye large, 3 to $3\frac{1}{2}$ in head; scales 32 to 35.

e. Scales 35; D. 13 or 14; A. 14 or 15; pectoral reaching front of anal; no luminous glands on tail. TOWNSENDI, 835.

ee. Scales 32 or 33; D. 13; A. 15; anal series 7 + 6; pectoral reaching middle of anal; tail with a luminous gland above and below. ALATUS, 836.

cc. Mediolaterals 3; posterolaterals 2, in advance of adipose dorsal; caudal series 3 + 1; D. 12 or 13; A. 13 or 14. Scales 36; anal series 5 + 5; anterolaterals 2; pectoral reaching middle of anal; snout short; eye 4 in head. GUNTHERI, 837.

bb. Caudal photophores 4, in a continuous, nearly horizontal row; the last not approaching end of lateral line; mediolaterals 2; posterolaterals 2, nearly under adipose dorsal; D. 12; A. 16; scales 38; anal series 7 + 8; anterolaterals 3, horizontally placed, not approaching end of lateral line. GEMMIFER, 838.

aa. Pectorals comparatively short, slender; caudal spots 4, in a low, nearly horizontal series, the last much below lateral line; 1 posterolateral below adipose dorsal. D. 12; A. 12 or 13. Scales 36; anal series 5 to 7 + 5. LACERTA, 839.

834. LAMPANYCTUS CROCODILUS (Risso).

Head $3\frac{7}{11}$; depth $5\frac{5}{9}$. D. 12 to 15; A. 14 to 18; P. 14; scales 38 or 39. Four caudal spots, the last at base of middle rays; 2 posterolateral spots; anal spots variable, about 6 + 8; supra-anals 3, forming an obtuse-angled triangle. Preopercle extremely oblique. Body elongate, the caudal peduncle stout; snout very short, pointed; mouth very large, the chin projecting; eye small, 5 in head, close to the tip of snout. Dorsal high; pectoral long and slender, reaching front of anal. Atlantic and Mediterranean; rare; west to 33° N., 40° W. (Lütken.) (*Crocodilus*, a crocodile.) (Eu.)

Gasteropelecus crocodilus, RISSO, Ichth. Nice, 357, 1810, Nice.
Scopelus crocodilus, LÜTKEN, Spolia Atlantica, II, 43, 1892.
Lampanyctus crocodilus, GOODE & BEAN, Oceanic Ichthyology, 79, 1895.

835. LAMPANYCTUS TOWNSENDI* (Eigenmann & Eigenmann).

Head 3 to $3\frac{1}{2}$; depth $4\frac{1}{2}$ to 5; eye large, $3\frac{1}{3}$. D. 13 or 14; A. 14 or 15; scales 35, those of lateral line not enlarged. Caudal spots 3, two below, with a third higher up at base of caudal; posterolateral spot present; anal spots 6 + 6 = 12; 4 between ventrals and anal. Form rather elongate, the head longer than in *Myctophum humboldti*, the tail deeper; preopercle about as in *M. humboldti*. Pectorals long and narrow, reaching nearly to front of anal, $1\frac{1}{3}$ in body. Cortez Banks, near San Diego, in 45 fathoms. (Eigenmann.) A specimen examined by us is in poor condition, but the species is certainly a valid one, and allied to *Lampanyctus alatus*. (Named for Charles H. Townsend, naturalist on the *Albatross*.)

Myctophum townsendi, EIGENMANN & EIGENMANN, West American Scientist, 1889, 125, Corte Banks. (Type, No. 41921. Coll. Eigenmann.)

---

* "Phosphorescent spots of the head as in *californiense*, the spots in the ventral series fewer in number, 5 pairs on breast; 4 pairs between ventrals and anal; 6 pairs along base of anal; 6 pairs on caudal peduncle; 2 pairs on caudal peduncle above the spines. Spots of the sides as in *californiense*, with an additional spot on base of middle caudal rays, and another between the last of the anal pairs and the one below the tweny-fourth scale of the lateral line."—*Eigenmann.*

836. LAMPANYCTUS ALATUS, Goode & Bean.

Head 3½; depth 5; eye 3; snout nearly 2 in eye. D. 13; A. 17 or 18; scales 32-33. Least depth of tail ½ greatest height of body. Snout short; upper and lower profile deeply curved, and with a median crest. Mouth large; length of upper jaw equal to greatest depth of body. Origin of dorsal nearer to tip of snout than to root of caudal; pectoral fin very long, reaching to at least middle of anal base; ventral short, not reaching to origin of anal; anal origin under end of dorsal; caudal moderate and deeply forked. A small phosphorescent body on the upper and lower edges of the tail at the root of the caudal; length of lower patch a little greater than diameter ef eye.

Mediolateral photophores 2; posterolaterals 2, the latter one above the other or nearly so. Precaudals in two groups, 2 + 1 or 3 + 1, the last at the end of the lateral line. Posterolaterals nearly under soft dorsal. Number of superanals 7 + 6. Three specimens taken by the *Albatross* from station 2393, in 28° 43′ N. latitude, 87° 14′ W. longitude, 525 fathoms. (Goode & Bean.) (*alatus*, winged.)

Lampanyctus alatus, GOODE & BEAN, Oceanic Ichthyology, 79, 1895, Gulf Stream. (Type, No. 43769. Coll. Albatross.)

837. LAMPANYCTUS GUNTHERI, Goode & Bean.

Head 3⅔; depth 5½; eye nearly 4. D. 13; A. 13; scales 36. Body much compressed. Least depth of tail ½ greatest depth of body. Snout short, about ½ diameter of eye. Mouth oblique, very large, the maxilla extending nearly to angle of preoperculum; maxilla very little dilated posteriorly. Length of upper jaw about ⅔ that of head. Dorsal origin a little nearer to tip of snout than to root of ventral, immediately over origin of ventral and eleventh or twelfth scale of lateral line; anal origin under the sixteenth scale of lateral line, its base short, about ⅔ length of head; adipose fin present, small, entirely behind the base of the anal; nine rows of scales between its posterior margin and the root of the caudal; pectorals very long, reaching to above middle of anal; ventral reaches almost to anal origin; caudal moderate, well forked. Mediolaterals 3; posterolaterals 2. Precaudals 2 + 1, the last at the end of the lateral line. Posterolaterals in advance of the first dorsal, forming a gently curved series continuous with anterior half of the broken supra-anal series. One specimen obtained by the Gloucester fleet. (Named for Dr. Albert Günther, Keeper of the Zoölogical Collections in the British Museum, and the author of "monumental works," the foundations of ichthyological work in the last half of the nineteenth century.)

Lampanyctus güntheri, GOODE & BEAN, Oceanic Ichthyology, 80, 1895, Grand Banks. (Type, No. 43777.)

838. LAMPANYCTUS GEMMIFER, Goode & Bean.

Head 3⅔; depth 5½. D. II, 12; A. II, 16; V. 8; P. 15, 16; scales 5-38-5. Least depth of tail ⅔ height of body. Eye large, nearly ¼ length of head. Distance between posterior margin of orbit and preopercular edge equal to diameter of eye. Snout obtuse, very short, its length less than half diameter of eye. Maxillary scarcely dilated behind. Origin of dorsal midway between tip of snout and dorsal mirror; base of dorsal equal to length of postorbital part of head, and about equal to longest dorsal ray; ventral origin slightly in advance of dorsal origin; pectoral reaches slightly beyond origin of anal. Scales smooth, those of the lateral line scarcely larger than others. Mediolateral photophores 2; posterolaterals 2, the latter one above the other, or nearly so. Precaudals 4, in nearly horizontal, though curved row, the last far below the end of the lateral line; anterolaterals 3, in nearly continuous line with lowest prepectoral and mediolaterals; number of superanals 7 or 8. The pearly mirror upon the upper edge of the caudal peduncle as long as the eye, and much longer than the one extending from the end of the anal to the root of the caudal; slender and narrow, ⅔ as long as the head. Gill rakers 6 above and 12 below angle of first arch, longest ⅔ as long as eye. One specimen from 39° 40′ N., 71° 35′ W., in 538 fathoms. (Goode & Bean.) (*gemmifer*, bearing buds or gems.)

Lampanyctus gemmifer, GOODE & BEAN, Oceanic Ichthyology, 81, fig. 88, 1895, Grand Banks. (Type, No. 35604. Coll. Albatross.)

839. LAMPANYCTUS LACERTA (Goode & Bean).

Head 3½; depth 5; eye moderate 3½. D. 13; A. 15; scales about 36. Greatest depth of head ⅔ of its length. Snout somewhat obtuse, rounded, with strong keel; its length about ½ diameter of eye. Cleft of mouth somewhat oblique, maxillary reaching to angle of preoperculum and somewhat dilated. Origin of dorsal much nearer tip of snout than root of caudal; pectoral slender, its middle rays elongate; ventrals inserted slightly behind the origin of dorsal, and reach to base of first anal ray; anal inserted behind end of dorsal base; caudal large, forked. Photophores arranged somewhat as in *M. punctatum*.

Mediolaterals 3; posterolateral 1; the former in an obliquely vertical row, as in *M. punctatum*, the latter under the soft dorsal. Precaudals in low horizontal line. Number of superanals 7 + 5. Three large pits in the mandibles also show luminous qualities. Color apparently light brown, the scales opalescent. Gulf Stream, at moderate depths; not rare. (Goode & Bean.) (*lacerta*, lizard.)

Myctophum lacerta, GOODE & BEAN, Oceanic Ichthyology, 74, fig. 83, 1895, Gulf Stream, Lat. 28° 38′ 30″ N. Long. 85° 52′ 30″ W. (Type, No. 43778. Coll. Albatross.)

260. LAMPADENA, Goode & Bean.

Lampadena, GOODE & BEAN, Oceanic Ichthyology, 85, 1895, (*speculigera*).

This genus or subgenus is very close to *Lampanyctus*, differing from the latter chiefly in the small pectoral. From *Nannobrachium*, which it approaches in this respect, the fact that the scales of the lateral line are not enlarged, perhaps sufficiently distinguishes it. The anal fin is rather short, its first ray being not in advance of the last ray of dorsal. As in *Lampanyctus* and *Nannobrachium*, the scales are readily deciduous, and it is not always easy to find the character of those in the lateral line from preserved specimens. Probably *Lampadena* and *Nannobrachium* should be merged in *Lampanyctus*. (*λάμπη*, light; *ἀδήν*, gland.)

840. LAMPADENA SPECULIGERA, Goode & Bean.

Head 4; depth 4½; eye very large, 3. D. 13; A. 14; V. 8; P. very small; scales 4–35–5. Least depth of tail ⅗ height of body. Greatest depth of head about ¾ of its length. Distance between posterior margin of orbit and preoperculum edge about ½ diameter of eye. Snout short, conical, its length about ⅓ diameter of eye. Cleft of mouth somewhat oblique, the lower jaw included. Posterior tip of maxillary distant from angle of preoperculum a space almost equal to length of snout. Origin of dorsal nearer tip of snout than root of caudal by a distance equal to ⅔ the length of its own base, and inserted nearly over root of ventral, over eleventh scale of lateral line, its last ray over vent in advance of origin of anal; pectoral not reaching nearly to vertical from origin of ventral, its length being equal to ½ that of upper jaw, and a little greater than diameter of eye; ventral not reaching to vent, its length equal to about ½ that of head. Scales smooth, those of the lateral line not larger than the others, the tubes passing through them luminous. Eight scales between the adipose fin and the margin of the pearl-colored dorsal patch; there are 35 scales in the lateral line, 4 above and 5 below it. The luminous spot, ⅔ as long as the diameter of the eye, club-shaped, on the top of the tail immediately in front of the base of the caudal ray. A similar spot on the lower edge of the caudal peduncle, a little in advance of the origin of the caudal rays, its posterior edge about in line with the center of the dorsal patch, its length about ¾ the diameter of the eye; a luminous gland above and below on caudal peduncle; no postanal series of superanal photophores, these being replaced by the subpeduncular glands; anterolateral 1; posterolaterals 2; precaudals in two groups, the anterior and lower one of two photophores widely separated from the posterior and single one, which is placed at the end of the lateral line; the single posterolateral is under the root of the soft dorsal, and considerably behind the termination of the anal. Gill rakers 6 above and 13 or 14 below the angle, the longest about ½ as long as the diameter of the eye. Color purplish brown; very glossy, almost iridescent. One specimen from 39° 48′ W., 70° 36′ N., at 551 fathoms. (Goode & Bean.) (*speculiger*, mirror-bearing.)

Lampadena speculigera, GOODE & BEAN, Oceanic Ichthyology, 86, 1895, Gulf Stream. (Type, No. 43797. Sch. Alice G. Wonson.)

261. NANNOBRACHIUM, Günther.

Nannobrachium, GÜNTHER, Deep-Sea Fishes, Challenger, 199, 1887, (*nigrum*).
Stenobrachius, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., III, 1890, 5, (*leucopsarum*).

This genus is closely allied to *Lampanyctus*, from which it differs chiefly in the small pectorals. Caudal peduncle with luminous blotches above and below. Photophores small, arranged about as in *Lampanyctus*. Scales of lateral line enlarged in all species, so far as known. Last ray of dorsal more or less behind first of anal. (*νάννος*, dwarf; *βραχίων*, arm.)

a. Anal spots 12 to 14; anal rays 14 or 15; last ray of dorsal about over third anal ray.
  b. Gill rakers 5 + 13 to 15; caudal spots 3 or 4; snout bluntish; photophores moderate.

c. Luminous patches above and below tail, occupying nearly whole length of caudal peduncle. LEUCOPSARUM, 841.

cc. Luminous patches above and below tail short. NANNOCHIR, 842.

bb. Gill rakers 5 + 10; caudal spots 3, the last above end of lateral line; snout rather acute; photophores minute. MEXICANUM, 843.

aa. Anal spots small, 16 to 18.

d. Anal rays 19; eye moderate or small, $5\frac{1}{2}$ to $5\frac{3}{4}$ in head; caudal spots 3 or 4, the last well separated near end of lateral line; last ray of dorsal over sixth of anal; size large. REGALE, 844.

dd. Anal rays 16 or 17; eye 5 in head; last ray of dorsal over fifth of anal. MACDONALDI, 845.

841. NANNOBRACHIUM LEUCOPSARUM (Eigenmann & Eigenmann).

Head $3\frac{3}{4}$ to $3\frac{3}{5}$; D. 12 to 15; A. 14 or 15; scales 35 or 36. Caudal peduncle deep, its least depth about half that of body. Luminous patches above and below tail, occupying nearly the whole length of caudal peduncle; caudal spots 3 or 4; anteroanal spots usually 6; ventral spots 5; 1 or 2 posterolateral spots. Body deep forward, the head long and pointed; maxillary shortish, reaching edge of preopercle, $1\frac{1}{2}$ in head; cheek broader than in *N. nannochir*, less tapering behind; eye rather small, $3\frac{1}{2}$ in head. Scales very thin, those of the lateral line much deeper than others; pectoral very short and narrow. Color rather pale; opercles with silvery luster; iris with silvery pigment; fins not quite black. Length 4 inches. Alaska to San Diego, in rather deep water; not rare. Locally very abundant in stormy weather off Point Loma. (λευκός, white; ψαρός, spotted, piebald.)

Myctophum (Stenobrachius) leucopsarum, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., March, 1890, 5, off Point Loma, Lower California, in stomachs of *Sebastodes.* (Type, No. 41916. Coll. Eigenmann.)

842. NANNOBRACHIUM NANNOCHIR (Gilbert).

Very close to *Nannobrachium leucopsarum*, differing chiefly in the longer body and head, and especially in the less development of the luminous patches on the tail.

Head $3\frac{1}{4}$ to $3\frac{2}{5}$ in length; depth 5. D. 12 or 13; A. 15 or 16; scales 35 or 36. Gill rakers 5 + 13 to 15; caudal peduncle long and slender, its least depth $\frac{2}{5}$ to $\frac{1}{3}$ that of body; luminous patches on tail short, usually occupying $\frac{1}{4}$ to $\frac{1}{3}$ length of caudal peduncle. Maxillary long, the preopercle very obliquely placed; the cheek long, tapering to an acute angle posteriorly. Anal spots 7 + 7. Ventral spots usually 5; no spot before eye. Coloration darker than in *N. leucopsarum*, the opercle black, the iris usually with silvery, the fins uniformly black. Length 5 inches. Alaska to Santa Barbara Islands, abundant in 300 fathoms, often in company with *Nannobrachium leucopsarum*, which it very closely resembles. (νάννος, dwarf; χείρ, hand.)

Myctophum nannochir,* GILBERT, Proc. U. S. Nat. Mus., 1890, 51, July. (Types, No. 1059, Stanford Univ. Mus., and 44291 U. S. Nat. Mus. Coll. Albatross); from station 3072, off coast of Washington.

---

* Reexamination of the original types of *Myctophum nannochir* showed to Dr. Gilbert that two species were confounded by him under that name. One of these was almost simultaneously described by Eigenmann under the name of *leucopsarum*. The name *nannochir* has been restricted by Gilbert to the other.

843. NANNOBRACHIUM MEXICANUM (Gilbert).

Head 3½; depth 5¾; eye 4 to 4⅓ in head; snout 6½. D. 12; A. 14; scales 30 to 33; gill rakers 5 + 10. Caudal spots 3, the last one widely separated from the others and above end of lateral line; anal spots 6 + 6; posterolateral spots present, the uppermost on lateral line; 3 supra-anal spots in a series, 4 spots on course of lateral line and about equally distant; these are the upper pectoral, supraventral, upper supra-anal, and posterolateral spots; no spot before eye. Photophores all small; tail with luminous glands above and below. Body slender, the eye rather small, the snout comparatively acute; snout not projecting, the jaws equal; maxillary 1⅔ in head; scales very deciduous. Pectorals minute, of 3 or 4 rays only. Last ray of dorsal over fourth of anal. Length 2 inches. Coast of Lower California.

Myctophum mexicanum, GILBERT, Proc. U. S. Nat. Mus., 1890, 51, Albatross stations 3008 and 3009, Lower California. (Type, No. 44289. Coll. Albatross.)

844. NANNOBRACHIUM REGALE (Gilbert).

Head 3⅖; depth 5⅓; eye 5½ to 5¾. D. 16; A. 19; scales 37; gill rakers 5 + 10. Caudal spots 3 or 4, the last near end of lateral line, well separated from the others; anal spots 11 + 7; ventral spots 3; posterolateral spot present; a supra-anal spot halfway between vent and lateral line; a phosphorescent streak on caudal peduncle above and below. Body rather elongate, with stout caudal peduncle; snout pointed, lower jaw projecting beyond it; preopercular margin very oblique; eye small, slightly longer than snout; teeth on vomer evident. Scales entire, large, very deciduous, those along lateral line much larger. Front of dorsal slightly nearer adipose fin than eye, its origin over axil of ventrals; insertion of anal under its twelfth ray; last ray of dorsal over sixth of anal. Pectorals very slender, with 14 rays, the upper filamentous and produced to opposite base of ventrals; ventrals reaching vent. Black. Length 5 inches. Santa Barbara Channel in 600 to 820 fathoms. (*regalis*, royal.)

Myctophum regale, GILBERT, Proc. U. S. Nat. Mus., 1891, 544, Santa Barbara Channel. (Type, No. 44289. Coll. Albatross.)

845. NANNOBRACHIUM MACDONALDI, Goode & Bean.

Head 3½; depth 5. D. 13; A. 16 or 17; scales 4–35–4. Eye moderate, 5 in head, and considerably greater than snout. Mouth extremely wide, rather oblique. Premaxillary as long as maxillary; both bones narrow and rod-shaped. Gill laminæ very short; gill rakers long, needle-shaped, the longest a little longer than eye. Origin of dorsal nearer extremity of snout than root of caudal, its last ray opposite fourth or fifth ray of anal, while the origin of anal is opposite tenth ray of dorsal; the longest ray of the latter equal to length of head without snout; adipose fin small, opposite penultimate ray of anal; caudal much forked; pectoral composed of 3 or 4 small, short, delicate rays; ventral inserted slightly in advance of dorsal, and extending to vent. Phosphorescent organs arranged much as in *N. nigrum*. The glandular organ of white upon the top of the caudal peduncle much smaller than that described for *N. nigrum*, but it has possibly been partially obliterated; the one on the lower part of the peduncle is much larger. Coloration, purplish brown.

Type 5 inches in length, obtained by the *Albatross* from station 2553, in 39° 48′ N. latitude, 70° 36′ W. longitude, at a depth of 551 fathoms. In a second individual from the Gulf Stream the pectoral is much more developed than in the type, its length being ⅖ that of the head, and reaching nearly to origin of ventral. The species is abundant in the Gulf Stream, where many examples have been taken. (Goode & Bean.)

(Named for Marshall McDonald, United States Fish Commissioner.)

Nannobrachium macdonaldi, GOODE & BEAN, Oceanic Ichthyology, 94, fig. 100, 1895, Gulf Stream. (Type, No. 35545.)

262. DIAPHUS, Eigenmann & Eigenmann.

Diaphus, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., 2d Series, III, 1890, 3, (*theta*).

This genus is closely related to *Æthoprora*, its chief character being in the fact that all or nearly all of the photophores are divided by a horizontal cross septum of black pigment, giving them the form of the Greek letter θ, *theta*. This septum is readily injured or destroyed in badly preserved specimens. Two or three* species known. (*διά*, divided; *φῶς*, light.)

846. DIAPHUS THETA, Eigenmann & Eigenmann.

Head 3 to 3½; depth 3½ to 4; eye large, 3½ in head, 3 in length of the blunt snout. D. 11 to 13; A. 9 to 12; scales 34. Each of the luminous spots divided by a horizontal black line; 4 caudal spots: anal spots 5 + 5 or 6 = 10 or 11; no spot on base of middle caudal rays; 4 supra-anal spots in an oblique line; 2 or 3 posterolateral spots; a luminous blotch below eye varying more or less anteriorly; a small detached dot behind this; a photophore before eye above nostril; a flat, soft, glandular body attached by one side just above base of pectoral, nearly ½ the size of pupil; no glandular spots on tail. Body deep, compressed, with stoutish caudal peduncle; head short and deep, the profile convex. Scales entire, those of the lateral line somewhat enlarged. Pectorals small, placed low, rather short, not quite reaching ventrals. Length 2¾ inches. Point Loma, near San Diego, to Oregon, in deep water; the specimens† examined by us (*Albatross* Coll.), from off Point Arena, Humboldt County, California, in 455 fathoms. (*theta*, from the form of the luminous spots.)

---

* Besides *Diaphus theta*, the character of divided photophores appears also in *Diaphus engraulis* (Günther) and in *Diaphus cæruleus* (Klunzinger). Lütken regards *engraulis* as a synonym of *cæruleus*. In *Diaphus cæruleus* there is a luminous blotch below eye as in *Diaphus theta*. The body in *D. cæruleus* is more elongate, and the dorsal ends just before first ray of anal.

† Concerning these specimens Dr. Gilbert observes:

"They are identical with the types of *Myctophum protoculus*, and are in a state of preservation sufficiently good to show the division of the luminous spots, a character not visible in the types of *M. protoculus*. It is obvious that the spots are divided into upper and lower halves which are structureally different, the narrow pigment band indicating this separation on the surface.

"The specimens before us show great variation in the size of the subocular luminous blotch, and indicate how little dependence can be placed on that character. In addition to the roundish supranasal blotch described by Eigenmann, the species possesses a more or less developed subocular bar. In one specimen the latter is a bare line, with a minute point separated from it posteriorly. In others it is wider, and in the extreme in this respect we find a bar, the width of which is ⅓ the diameter of the pupil. There remains constantly separated from it the small dot already referred to. A peculiar soft flattish body ½ as large as pupil is attached by one edge to the shoulder girdle just above the insertion of the pectoral fin. It is constantly present and uniform in position in all specimens seen, including the types of *theta* and *protoculus*. It may be a luminous organ, though it has not strikingly the appearance of one, and its nature may be considered problematical."

Diaphus theta, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., March, 1890, III, 4, Point Loma, near San Diego. (Coll. Eigenmann.)

Myctophum protoculus, GILBERT, Proc. U. S. Nat. Mus., 1890, July, 52, coast of Washington, in 584 fathoms, Albatross Station 3072; specimens in poor condition, not showing division of photophores. (Type, No. 41922. Coll. Albatross.)

263. ÆTHOPRORA, Goode & Bean.

Æthoprora, GOODE & BEAN, Oceanic Ichthyology, 86, 1895, (*metopoclampa*).

Body oblong, compressed, resembling *Myctophum* in form; covered with large scales, those in the lateral line very slightly larger than the others. Head compressed. Snout very obtuse and short, projecting slightly beyond orbital margin, the jaws about equal. Eye moderate. Dorsal fin premedian, entirely or almost entirely in advance of the anal, which it closely resembles in shape and dimensions; ventral with 8 rays inserted under the anterior portion of the dorsal; pectorals moderate, placed low; adipose fin long and prominent. Luminous gland of irregular form occupying the front of the head in advance of eye; usually another below eye; these separate from their fellows on the other side; a luminous spot or glandular body of greater or less extent upon the body at the angle of the preoperculum and, in some species, others upon the interoperculum and upon the sides of the lower jaw. Precaudal photophores 4, forming a more or less crescent-shaped line at the base of the lower caudal lobe. Deep seas; very close to *Diaphus*, differing only in the simple photophores. (*αἶθος*, glow, and *πρῷρα*, prow, front.)

a. Scales 35 or 36.
  b. Anterolateral photophores 2; mediolaterals 2; posterolaterals none. LUCIDA, 847.
  bb. Anterolateral photophores 1; mediolaterals 3 or 4; posterolaterals 2. EFFULGENS, 848.

847. ÆTHOPHRORA LUCIDA, Goode & Bean.

Head $3\frac{2}{3}$; depth $4\frac{1}{2}$; eye about 4. D. III, 14; A. II, 14; scales 35. Least depth of tail $2\frac{1}{5}$ in height of body. Head considerably longer than high, its height equal to distance from anterior margin of pupil to end of opercular flap. Snout short, but less declivous and obtuse than in *Æ. metopoclampa*. A pearl-colored luminous organ touching the limb of orbit, but separated from it above and below, with posterior lobe not prolonged far back, and with a space between its lower margin and the opening of the jaw. Cleft of mouth oblique and curved, the maxillary reaching to angle of preoperculum and not dilated. Origin of dorsal and ventral nearly in same vertical, that of former midway between anterior margin of orbit and adipose fin; that of latter midway between tip of snout and adipose fin; insertion of the last ray of dorsal over interspace between third and fourth rays of anal; pectoral (unless mutilated) only half as long as ventral, and its tip does not approximate the vertical from its origin; dorsal and anal similar, the former with its upper margin concave; adipose dorsal inserted over interspace between antepenultimate and penultimate anal rays, and as long as ultimate dorsal ray. Scales smooth, those of lateral line scarcely enlarged.

Type specimen with 13 photophores in the anal series; a wide break over roots of last 2 rays of anal; no posterolaterals; 2 mediolaterals, the anterior the lowest; two anterolaterals, the anterior and highest very small, above the axil of the pectoral or very near the lateral line, the posterior one somewhat more than midway between this and the anterior of the mediolateral group, and forming, with the two photophores in that group, an obtuse isosceles triangle, with the anterior of the medial group at its apex; of the 4 precaudal photophores the last 3 are the most nearly together, and form a nearly vertical line at the base of the lower caudal lobe; a large, apparently luminous, pearl-colored spot under tip of flap of opercle. One specimen about 4 inches long, obtained by the *Albatross* at station 2127, in 19° 45′ N. latitude, 75° 01′ W. longitude, in 1,639 fathoms. (Goode & Bean.) (*lucidus*, shining.)

Æthoprora lucida, GOODE & BEAN, Oceanic Ichthyology, 88, fig. 102, 1895, Gulf Stream. (Type, No. 44084. Coll. Albatross.)

848. **ÆTHOPRORA EFFULGENS**, Goode & Bean.

Head nearly 4; depth 4; eye large, 2½ in head. D. II, 13; A. II, 14; scales 35 or 36. Least depth of tail ½ height of body. Head considerably longer than high, the flap of operculum extending above and behind axil of pectoral. Snout exceedingly short and obtuse, as in *Æ. metopoclampa*; the luminous organ enormous, gland-like, overlapping entire anterior margin of orbit, extending down upon edge of jaw and extending backward almost as far as in *Æ. metopoclampa*. Cleft of mouth oblique, somewhat curved, the maxillary reaching nearly to angle of preoperculum. Origin of dorsal somewhat in advance of vertical from that of ventral, which touches root of second dorsal ray; last dorsal ray over roots of short spines preceding anal; insertion of ventrals considerably posterior to a point equidistant from root of adipose dorsal and anterior margin of the orbit; origin of adipose dorsal over interspace between antepenultimate and ultimate anal rays; pectoral stout and much shorter than ventral, not reaching much more than halfway to its root. Scales smooth, those in the lateral line somewhat enlarged, shiny, and conspicuous; the lateral line descending in a gentle curve to a point above origin of ventral. Arrangement of the photophores very peculiar. A break in series of superanals, there being 5 on lower part of caudal peduncle behind anal; apparently 2 posterolaterals, the posterior and highest near lateral line, and forming the beginning of a series of 8, arranged in an arc of a circle, the last being the highest in the group of mediolaterals, of which there are 4; but one anterolateral, which is above axil of ventrals, slightly behind it and about midway between it and lateral line; a large, triangular, luminous patch in the space between the axil of pectoral and the flap of opercle, which covers its anterior portion, and is itself decorated with a circular photophore; apparently a luminous patch along anterior margin of preopercle. Two specimens from deep water in the Western Atlantic. (Goode & Bean.) (*effulgens*, shining out.)

Æthoprora effulgens, GOODE & BEAN, Oceanic Ichthyology, 88, fig. 103, 1895, Brown's Bank and Albatross Station 2127, 19° 45′ N., 75° W., in 689 fathoms. (Type, No. 43770.)

264. COLLETTIA, Goode & Bean.

Collettia, Goode & Bean, Oceanic Ichthyology, 83, 1895, (*rafinesquei*).

This genus is scarcely distinct from *Æthoprora*, differing only in the greater development of the luminous areas about the eye. These coalesce into one large irregular luminous blotch, occupying whole front of head, suggesting the headlight of an engine. (Named for Robert Collett, the distinguished ichthyologist of the University of Christiania.)

a. Dorsal rays 12; anal 15; scales 32 to 35; head 3 in length; depth 4. RAFINESQUEI, 849.

aa. Dorsal rays 14; anal 15; scales and spots (except luminous gland below eye) undescribed; head 4¾ in length with caudal. NOCTURNA, 850.

849. COLLETTIA RAFINESQUEI (Cocco).

Head 3; depth 4; eye 2⅔. D. 12; A. 15; scales 32 to 35. Body stout, short, moderately compressed; with a rounded, blunt snout, very large mouth, and comparatively small eye; comparatively short, triangular dorsal and anal, the former entirely in advance of the latter and inserted very far forward. Caudal peduncle stout, its height nearly ½ height of body. Eye moderately large; distance between posterior margin of orbit and preopercular edge ½ diameter of eye. Snout very short, obtuse, keeled, with profile abruptly declivous, its length ⅓ diameter of eye. Cleft of mouth slightly oblique, the lower jaw received within the upper. Mouth rather large, the maxillary extending to angle of preoperculum and behind orbit a distance equal to ⅔ diameter of eye, its posterior extremity not dilated, and entirely concealed under the scales of the cheek. Origin of dorsal over that of ventral, considerably nearer to tip of snout than to root of caudal, its last ray in advance of origin of anal; ventral stout and long, reaching to origin of anal; pectoral small, reaching to root of ventral; anal origin under the twelfth scale of lateral line, its last ray directly under adipose dorsal. Scales in lateral line somewhat enlarged, luminous. Anterolaterals 4, very irregular, the three posterior ones forming an isosceles triangle, as in *Æ. metopoclampa*; mediolaterals 3, arranged much as in *Myctophum punctatum*: posterolaterals 2, arranged much as in *Æ. effulgens* (perhaps only one posterolateral, if the photophore immediately below it should be recognized as belonging to the superanal series); superanals in two groups, 5 or 6 in the first, 4 in the last; precaudals 4, in nearly straight line, the last and uppermost at or near extremity of lateral line, the others descending forward at an angle of approximately 45 degrees with axis of body. (Goode & Bean.) (Named for Constantine Samuel Rafinesque, the eccentric and gifted naturalist, who first discovered the genus *Myctophum*, while studying the fishes of Palermo.)

Myctophus rafinesquei, Cocco, Alcuni Salmon., etc., 20, 1820, Messina.
Scopelus rafinesquei, Günther, Cat., v, 410, 1864; Lütken, Spolia Atlantica, ii, 30, 1892.
Collettia rafinesquei, Goode & Bean, Oceanic Ichthyology, 83, 1895.

850. COLLETTIA NOCTURNA (Poey).

Head 4¾ in total length, with caudal; depth 6; eye large, 3 in head, D. 14; A. 15. Luminous spots undescribed. Body rather robust; snout short; maxillary reaching beyond eye for a distance equal to ¾ diameter of eye; pectoral small, reaching front of dorsal; ventrals broad; anal lower than dorsal; an oblique, pale streak below eye. Coast of Cuba, caught in nets at night; rare. (Poey.) Probably a species of *Collettia*, and apparently related to *C. rafinesquei*, but this is not certain. (*nocturnus*, nocturnal.)

Myctophum nocturnum, Poey, Memorias, II, 426, 1861, Cuba. (Coll. Poey.)

265. RHINOSCOPELUS, Lütken.

Alysia, Lowe, Proc. Zoöl. Soc. London, 1839, 87, (*loricata* = *coccoi*; name preoccupied).
Rhinoscopelus, Lütken, Vid. Selsk. Naturv. Copenhagen, VII, 1892, 237, (*coccoi*).

Body oblong, slender, compressed, with slender and elongate caudal peduncle covered with smooth, stiff scales, those in the lateral line much larger than the others. Head compressed; cleft of mouth very wide; the jaws about equal, the snout projecting beyond the tip of lower jaw. Premaxillary long and slender; maxillary well developed, reaching nearly or quite to the angle of the preoperculum, without considerable posterior dilation. Teeth in villiform bands in the jaws, on the palatines, pterygoids, and tongue. Eye moderate, its diameter less than ⅓ of the length of the head. Gill rakers very long and slender. Dorsal fin premedian; pectoral large; adipose dorsal small; anal fin larger than dorsal; pectoral narrow, elongate. Precaudals 2; supra-anals about 18, in two groups, the break being over the middle of the long anal fin and at the end of the first third of the series, approximately; anterolaterals 1 or 2; mediolaterals 2 or 3. Species few, mostly of the Atlantic. ([*]*ῥίν*, snout; *Scopelus*.)

a. Supra-anal spots forming an obtuse angle; anal spots 15 to 20. COCCOI, 851.
aa. Supra-anal spots in a straight, oblique series; anal spots 13 to 17. ANDREÆ, 852.
aaa. Supra-anal spots not in a straight line series; anal spots 12 to 13. RARUS, 853.

851. RHINOSCOPELUS COCCOI (Cocco).

Head 5⅓; depth 4½ to 5; eye 4. D. 10 to 12; A. 20 or 21; V. 8; scales 1-41-3. Tail slender, elongate, its least depth ¼ height of body. Distance between posterior margin of orbit and preorpercular edge ⅔ diameter of eye. Preopercular edge obliquely descending. Snout conical, the upper part projecting beyond the lower, the upper and lower profiles nearly equally curved; maxillary extending to the angle of preoperculum and scarcely dilated. Dorsal origin nearer end of snout than to root of caudal, and behind base of ventral; last ray of the dorsal in vertical from second anal ray; pectoral reaching middle of ventral. In some specimens each of the scales on the back of the tail has a pearl-colored dot, probably a sexual character of the male; back and nape blackish; sides silvery, with gold and silver reflections; inside of the mouth blackish; iris silvery, the pupil transparent. (Goode & Bean.) Western Atlantic, very abundant among the surface fishes of the Gulf Stream, rare in the Mediterranean, and ranging from Newfoundland to Africa. (Named for Anastasio Cocco, an Italian naturalist, who carefully studied the deep-sea fishes which he could secure.) (Eu.)

---

[*] Goode & Bean adopt for this genus the name *Stenobrachius*. *Stenobrachius*, Eigenmann, was intended to replace *Alysia*, but its type, *leucopsarum*, is a *Nannobrachium* and not closely related to the type of *Alysia*.

Scopelus coccoi, Cocco, Giorn. Sci. Litt. Art. Sicilia (No. 77), Palermo, 1829, 143 ("Scopelo de Cocco"), Palermo; GÜNTHER, Cat., V, 413, 1864; GÜNTHER, Challenger Report, XXXII. Pelagic Fishes, 30, 1887; LÜTKEN, Spolia Atlantica, II, 236, 1892.

Alysia loricata, LOWE, Proc. Zoöl. Soc. Lond., 1839, 87, Madeira.

Stenobrachius coccoi, GOODE & BEAN, Oceanic Ichthyology, 91, 1895.

852. RHINOSCOPELUS ANDREÆ (Lütken).

Head $3\frac{2}{3}$; depth $4\frac{1}{2}$. D. about 10; A. about 20. Two caudal spots; a posterolateral spot; 3 supra-anal spots forming an oblique series; anal spots about 5 or 6 + 9 or 10, the series slightly interrupted; spots along belly in continuous series. Body deep anteriorly, tapering to a slender caudal peduncle; snout pointed, projecting beyond lower jaw; preopercle with its margin considerably oblique. Pectoral long, falcate. Open Atlantic and Indian Ocean. (Lütken.) Common in the Gulf Stream along our coasts with the preceding, of which Goode & Bean think it may be a sexual variation. (Named for Capt. A. T. Andreas, who collected this and other oceanic fishes for the museum at Copenhagen.)

Scopelus andreæ, LÜTKEN, Spolia Atlantica, Scopelini, 25, 1892, North Atlantic.

Stenobrachius andreæ, GOODE & BEAN, Oceanic Ichthyology, 91, fig. 104, 1895.

853. RHINOSCOPELUS RARUS (Lütken).

Head $3\frac{1}{2}$; depth $4\frac{1}{2}$. D. about 14; A. about 20; scales 39. Caudal spots 2; posterolateral 1; anal spots about 6 + 7; supra-anal spots not forming a straight line, usually 2 in number; thoracic and ventral spots few, not equidistant. Body rather short and plump, the caudal peduncle rather slender; snout moderate, projecting beyond lower jaw; pectoral short and small, not reaching the small ventral; preopercular margin not very oblique. Eye moderate. Open Atlantic, west to 50° W., 33° N. (Lütken.) (*rarus*, rare.)

Scopelus rarus, LÜTKEN, Spolia Atlantica, 26, II, 1892, North Atlantic.

266. MYCTOPHUM, Rafinesque.

Myctophum, RAFINESQUE, Indice d'Ittiologia Siciliana, 56, 1810, (*punctatum*).

Scopelus, CUVIER, Règne Animal, Ed. I, 56, 1817, (*humboldti*).

Nyctophus, Cocco, Giorn. Sicil., 44, 1829, (emended orthography of *Myctophum*).

Body oblong, compressed, covered with cycloid scales, those in the lateral line not much enlarged; the caudal peduncle rather slender. Head short, compressed, with limb of preoperculum nearly vertical. Mouth large, the jaws about equal; premaxillaries long and slender; maxillaries well developed. Snout more or less blunt and declivous. Teeth in villiform bands on jaws, palatines, pterygoids, and tongue. Eye large. Gill rakers long and slender. Air bladder small. Dorsal fin entirely in front of anal, overlapping it little or not at all; ventrals 8-rayed, under or but slightly in front of first dorsal rays; pectorals well developed; soft dorsal slender. Precaudal photophores 2; superanals in two groups, with one or two posterolaterals above the interval between them. Species rather numerous, widely distributed. (Name unexplained, usually derived from νύξ, night, and φῶς, light; hence altered by Cocco to *Nyctophus*. But we see no warrant for this supposed etymology. Rafinesque did not know that the spots were luminous.)

a. Mediolateral photophores 3, in obliquely vertical line; anterolateral 1; posterolateral 1.

b. Pectoral short; caudal photophores close together.

c. Posterolateral photophore in front of soft dorsal; D. 12; A. 19; scales 41 to 45. PUNCTATUM, 854.

cc. Posterolateral under adipose dorsal.

d. Scales 37; anal spots 7 to 10 + 4 to 6. AFFINE, 855.

dd. Scales 40; anal spots 8 + 6; D. 12; A. 20. OPALINUM, 856.

aa. Mediolaterals 2; posterolaterals 2.

e. Posterolateral spot 1, over break in the anal series.

f. Pectoral long, falcate, reaching middle of dorsal; caudal spots separated; posterolateral before adipose dorsal, behind middle of anal; anal spots 7 to 9 + 4 to 9.

g. D. 12; A. 20; scales 41. HUMBOLDTI, 857.

gg. D. 14; A. 22; scales 42. CALIFORNIENSE, 858.

ff. Pectorals moderate, barely reaching front of dorsal; scales 41; posterolateral much before adipose dorsal, over middle of anal; anal spots 5 to 7 + 11 to 14. D. 12; A. 19. GRACILE, 859.

ee. Posterolateral spots 2, over the break in anal series.

h. Anterolaterals side by side, but well apart; precaudals near together; the last far below end of lateral line; scales 39 or 40; D 12 or 13; A. 17 or 18; anal spots 5 to 6 + 6 to 7. BENOITI, 860.

hh. Anterolaterals not side by side, the first above and before second, touching lateral line. Scales 38 to 42; anals 5 to 7 + 6; D. 12; A. 19 to 22. HYGOMII, 861.

854. MYCTOPHUM PUNCTATUM, Rafinesque.

Head 3¾; depth 4½; eye 2½. D. 12; A. 19; scales 41 to 45. Least depth of tail ⅖ height of body. Greatest depth of head about ¾ its length. Distance between posterior margin of orbit and preopercular edge ⅓ diameter of eye. Snout very short, with a very inconspicuous keel on upper edge, its length scarcely ⅓ diameter of eye. Eye very large. Premaxillary reaching almost to angle of preoperculum. Origin of dorsal much nearer tip of snout than to root of caudal, the fin very short, the length of its base equal to ½ that of head and less than ⅙ of total; its origin over eleventh scale of lateral line, and vertical with origin of ventral, below twelfth scale of lateral line, its length equal to that of postorbital part of head; adipose dorsal present, over antepenultimate ray of anal; anal origin under twenty-first scale of lateral line, its base as long as head, and its longest ray equal to length of postorbital part of head; caudal rather small and deeply forked. Mediolateral photophores 3, in straight, obliquely ascending line; anterolateral photophore single; posterolateral single, over break in row of superanals and placed considerably in advance of soft dorsal; precaudal photophores close together. (Goode & Bean.) Warmer parts of the Atlantic; abundant off the Grand Banks and from the Gulf Stream across to the Mediterranean. (*punctatus*, spotted.) (Eu.)

Myctophum punctatum, Rafinesque, Indice d'Ittiol. Siciliana, 56, pl. ii, fig. 5, 1810, Palermo; Goode & Bean, Oceanic Ichthyology, 71, fig. 80, 1895.

Scopelus mülleri, Goode, Hist. Aquatic Animals, Sec. i, pl. 203, 1884.

855. MYCTOPHUM AFFINE (Lütken).

D. about 14; A. about 20; scales 43. Caudal spots 2; posterolateral 1; anal spots about 8 + 6 in a right line; supra-anal spots 3, forming an oblique series. Body moderately elongate, the head deep and blunt, the snout not half the diameter of the large eye, which is about 3 in head; pectoral short, reaching past front of dorsal; anal high. Open Atlantic, west to 63° W., 38° N. (Lütken.) (*affinis*, related, to *M. caninianus*= *M. punctatum*.)

Scopelus affinis, LÜTKEN, Spolia Atlantica, II, 32, 1892, open Atlantic.

856. MYCTOPHUM OPALINUM, Goode & Bean.

Head 4¼; depth 4⅔; eye about 2⅔. D. 12; A. 20; scales 40. Least height of tail ⅖ height of body. Snout very short, declivous, with a well-developed median keel, its length about ⅓ diameter of eye. Eye large. Premaxillary reaching nearly to angle of preoperculum, broadly expanded at its extremity and partly concealed by the large scales of the cheek. Space between eye and hinder edge of preoperculum only ½ diameter of eye. Origin of dorsal much nearer tip of snout than to root of caudal, midway between snout and adipose fin, over eleventh scale of lateral line and very slightly behind vertical through origin of ventral; length of dorsal base ⅔ that of head; origin of ventral under tenth scale of lateral line; it does not reach to vent; pectoral short, its length nearly ⅔ that of head; adipose dorsal present, its origin over thirtieth scale of lateral line; anal origin under eighteenth scale of lateral line, the end of its base under thirtieth scale; length of anal base equal to that of head; caudal rather small, moderately forked. Mediolateral photophores 3, in straight, obliquely ascending line; anterolateral 1; posterolateral 1, under soft dorsal and over and slightly in advance of break in row of superanals, which is above root of last ray of anal. Number of superanals 8 + 6. In most of the specimens examined, the 6 or 8 scales on the top of the caudal peduncle, immediately in front of the caudel fin, are luminous. (Goode & Bean.) Western Atlantic. (*opalinus*, like opal.)

Myctophum opalinum, GOODE & BEAN, Oceanic Ichthyology, 72, fig. 81, 1895, Gulf Stream. (Type, No. 43808. Coll. Albatross.)

857. MYCTOPHUM HUMBOLDTI (Risso).

Head 3¾; depth 5; eye 3, large. D. 12 to 14; A. 20 to 22; scales 40 to 42. Caudal spots 2, near together and horizontally placed; one posterolateral spot; supra-anal spots 3, forming an obtuse angle with the apex forward; anal spots about 8 + 8, the series slightly interrupted Body moderately elongate, with slender caudal peduncle, the snout rather blunt, not projecting beyond the mouth; preopercular margin slightly oblique. Pectoral long, reaching middle of dorsal and middle of length of ventrals. Least depth of tail ⅗ of height of body; depth of head 1⅗ in its length. Distance between posterior margin of orbit and preopercular edge ½ diameter of eye. Snout short, obtuse, its upper profile descending in strong curve. Maxillary reaching nearly to angle of preoperculum, and slightly dilated behind. Origin of dorsal somewhat nearer to end of snout than to root of caudal, above root of inner ventral rays; its last ray before vertical from origin of anal; pectoral long, extending to posterior third of ventral. Scales smooth, stiff.

Mediolateral photophores 2; anterolaterals 2; posterolateral 1, (over break in anal series) which, as in *Myctophum punctatum*, is considerably in advance of the vertical connecting the root of the soft dorsal with those of the last rays of the anal; caudal photophores somewhat apart, as in *Myctophum phengodes*; superanals 7–9 + 4–9. Length 4 inches.

Open seas, abundant in the Mediterranean and in the Atlantic off both coasts. If *Myctophum boops* and *Myctophum californiense* are the same, as is possible, the species is also not rare in the eastern and southern Pacific. As, however, no other species of *Myctophidæ* is common to the Atlantic and Pacific coasts of North America, we may provisionally regard *M. californiense* as distinct from *M. humboldti*. (Named for Alexander von Humboldt, 1769–1859, author of "Cosmos," whose interest in the relations of life to surroundings included some exact knowledge of fishes.) (Eu.)

Gasteropelecus humboldti, Risso, Ichth. Nice, 358, 1810, Nice.

Scopelus humboldti, Günther, Cat., v, 407, 1864; Lütken, Spolia Atlantica, ii, 34, 1892; Goode & Bean, Oceanic Ichthyology, 73, fig. 82, 1895.

858. MYCTOPHUM CALIFORNIENSE, Eigenmann & Eigenmann.

Head 3¾; depth 5; eye very large, 3 in head (specimens of 4 inches). D. 14; A. 21; scales 42. Phosphorescent spots arranged exactly as in *M. humboldti*. Body compressed, elongate, with long slender tail. Head short and deep; preopercular margin little oblique; maxillary 1½ to 1⅓ in head. Scales entire. Ventrals reaching beyond vent nearly to anal; pectorals short, (not reaching in the type to second third of ventrals). Cortez Banks, near San Diego. Very close to *M. humboldti*, but said to have shorter pectorals. It is probably not distinct, as in one of Dr. Eigenmann's types examined by us, the pectorals are as long as in *M. humboldti*. Both pectorals have been partly digested, but the slender rays on both sides reach middle of dorsal and beyond middle of ventrals.

? *Myctophum boops*,* Richardson, Voy. Erebus and Terror, 39, 1845, open sea between Australia and New Zealand.

Myctophum californiense, Eigenmann, West American Scientist, Nov. 9, 1889, 124, San Diego.

? *Scopelus boops*, Günther, Cat., v, 408, 1864.

859. MYCTOPHUM GRACILE (Lütken).

Head 5; depth 4¾; eye small, about 4 in head. D. 12; A. 19; scales 41. Caudal spots 2, very close together; posterolateral 1; anal spots about 6 + 12, in a slightly interrupted series; supra-anal spots 2, well separated. Body slender, the head deep, the snout not very blunt; pectoral moderate, reaching front of dorsal. Open Atlantic, west to 48° W., 23° N. (Lütken.) (*gracilis*, slender.)

Scopelus gracilis, Lütken, Spolia Atlantica, 35, ii, 1892, open Atlantic.

? *Myctophum hians*, Richardson, Voy. Erebus and Terror, 41, pl. 27, 1845, open sea, locality unknown.

---

* This nominal species, as Lütken has noted, agrees with *M. humboldti* in all respects except that the scales are said to be fewer, 37 to 39 in the lateral line instead of 41. The eye is a little larger, about 3⅓ in head. This species is from the open Pacific, between Australia and New Zealand. It has also been recorded (by Günther) from Vancouver Island, but doubtless the closely related *M. californiense* has been taken for it. Perhaps both *boops* and *californiense* are identical with *humboldti*.

860. MYCTOPHUM BENOITI (Cocco).

Head 3¼; depth 4. D. 12 or 13; A. 17 or 18; scales 39 or 40. Snout obtuse conical; eye large, nearly half head. Dorsal inserted nearly midway between snout and root of caudal behind ventral; pectoral nearly reaching tip of ventral. Mediolateral spots 2; anterolaterals 2; posterolaterals 2, over break in anal series; anterolaterals far apart; caudals near together, the last far below end of lateral line; a luminous plate on caudal peduncle; anal spots 5 or 6 + 6 or 7. (Goode & Bean.) Mediterranean to Norway and Greenland. (Named for M. Benoit.) (Eu.)

Scopelus benoiti, Cocco, Lett. su Salmon., 12, pl. II, fig. 4, 1838, Messina; GÜNTHER, Cat., V, 406, 1864; LÜTKEN, Spolia Atlantica, 256, 1892.

Myctophum benoiti, GOODE & BEAN, Oceanic Ichthyology, 74, 1895.

861. MYCTOPHUM HYGOMII (Lütken).

Head 3⅔; depth 4; eye about 2½. D. 12; A. 21 or 22; scales 38 to 42. Least height of tail about ⅓ of its greatest height. Snout very short, the upper and lower profile of the head being similar, its length a little less than ½ diameter of eye. Intermaxillary reaching as far back as maxillary, nearly to angle of the preoperculum; maxillary expanded posteriorly and concealed under large scales of cheek. Space between eye and hinder edge of preoperculum ⅓ diameter of the eye. Origin of dorsal nearer tip of snout than root of caudal, being over eleventh scale of lateral line, and nearly over origin of ventral; base of dorsal ⅔ as long as head, length of longest ray equaling length of head without snout; ventral not quite reaching vent; pectoral as long as head, reaching to above anal origin; anal origin nearly under end of dorsal base, the length of anal base a little greater than that of head; caudal rather small and forked. Posterolaterals 2, over break in superanal series and far apart, the anterior one nearly over middle of anal fin, the posterior one about one scale in advance of the vertical from the root of the soft dorsal; anterolaterals widely separated, the first obliquely in advance of and above the second, and touching or upon the lateral line, the second far behind the root of the ventral and over the interval between the first and second postventral photophores; superanals 7 + 6. (Goode & Bean, as *M. remiger*.) (Named for Captain V. Hygom, collector of some of Dr. Lütken's "Spoils of the Atlantic.") (Eu.)

Scopelus hygomii, LÜTKEN, Spolia Atlantica, Scopelini, 257, 1892, north Atlantic.

Myctophum remiger, GOODE & BEAN, Oceanic Ichthyology, 75, 1895, western Atlantic. (Type, No. 43972. Coll. Albatross.)

267. BENTHOSEMA, Goode & Bean.

Benthosema, GOODE & BEAN, Oceanic Ichthyology, 76, 1895, (*mulleri*).

This genus differs from *Myctophum* in having the maxillary dilated at tip. The dorsal fin considerably shorter than anal, but overlapping it, reaching to the vertical from the middle. Body elongate; caudal peduncle somewhat stout; eyes large; snout very short, with declivous upper profile; maxillaries considerably dilated behind; scales of the lateral line considerably enlarged. Northern seas. (*βένθος*, the ocean depths; *σῆμα*, a constellation of stars.)

a. Posterolateral spot 1 on each side; anal spots nearly in a straight series; caudal spots not close together. MULLERI, 862.

aa. Posterolateral spot wanting; caudal spots close together; anal spots in a series nearer horizontal than vertical; snout rather sharp. ARCTICUM, 863.

862. BENTHOSEMA MULLERI (Gmelin).

Head 4; depth 4. D. 12 to 14; A. 16 to 18; V. 8; scales 36 to 40. Depth of head equal to its length. Eye large, its diameter more than ⅓ length of head. Snout very short, obtuse, with upper profile descending in a very strong curve. Cleft of mouth oblique; maxillary reaching to angle of preoperculum and terminating in triangular dilation. Origin of dorsal a little nearer tip of snout than root of caudal, and inserted well behind root of ventral; pectoral very small, its length equal to diameter of eye; ventral not reaching to the vent. Scales smooth, those of lateral line larger. A luminous spot on the angle of the preoperculum; mediolaterals 2, in subhorizontal line continuously with the 2 anterolaterals; posterolateral 1, over break in series of anals; superanals 6–7 + 8–9. (Goode & Bean.) North Atlantic, occasionally taken in deep water from Norway to Greenland, more abundant southward, to South Carolina, probably always in very deep water. (Named for Otto Friedrik Müller, an early writer on the fishes of Denmark.) (Eu.)

Salmo mülleri, GMELIN, Syst. Nat., 1378, 1788, Norway; after STROM.

Scopelus glacialis, REINHARDT, Overs, 36, 1835, Greenland; LÜTKEN, Spolia Atlantica, 30, 1892.

Scopelus mülleri, COLLETT, Norsche-Nord-Havs Exp., 158, 1880; LILLJEBORG, Sveriges och Norges Fiskar, VI, 20, 1889.

Myctophum glaciale, JORDAN & GILBERT, Synopsis, 283, 1883.

Benthosema mülleri, GOODE & BEAN, Oceanic Ichthyology, 76, 1895.

863. BENTHOSEMA ARCTICUM (Lütken).

Head 3⅔; depth 4. D. 9; A. 17. Posterolateral spot (near lateral line, above last part of anal) entirely wanting, the anal spots forming a continuous line, 15 or 16 in number; caudal spots 2, close together; supra-anal spots 3, forming an oblique line; preopercular margin almost vertical. Body stout, short, the caudal peduncle not slender, the snout not projecting beyond chin; eye moderate; dorsal fin high. Davis Straits, Greenland. (Lütken.)

Scopelus arcticus, LÜTKEN, Spolia Atlantica, Scopelini, 29, 1892, Davis Straits.

268. DASYSCOPELUS, Günther.

Dasyscopelus, GÜNTHER, Cat. Fish. Brit. Mus., v, 405, 1864, (*asper*).

Dorsal and anal fins touching the same vertical, but not overlapping. Scales hard, persistent, ctenoid, those of lateral line much enlarged. Anal terminating below adipose dorsal. Body elevated, somewhat compressed; caudal peduncle rather slender; luminous scales on the back of the caudal peduncle. Arrangement of photophores much as in *Myctophum*. Species few; remarkable for the firm, rough scales. (*δασύς*, rough; *Scopelus:* Scopelus is an old name of some large-eyed fish, from *σκοπέω*, to look.)

a. Jaws subequal; anal spots 12 to 14; supra-anal spots in an oblique series. SPINOSUS, 864.

864. DASYSCOPELUS SPINOSUS (Steindachner).

Head 4 to 4⅓; depth 4 to 4⅓. D. 13; A. 19; scales 40–9. Body short, the snout very short; eye large; scales ctenoid; caudal spots 2; ventral spots more than 4; posterolateral spot single; supra-anal spots 3, forming an oblique series; anal spots 12 to 14; preopercular margin almost vertical. Open seas, known from the mid-Atlantic, Hawaiian Islands, etc. (Lütken.) (*spinosus*, spinous.)

Scopelus spinosus, STEINDACHNER, Sitzgber. Ichth. Notiz., v, 11, 1867, China; LÜTKEN, Spolia Atlantica, Scopelini, 19, 1892.

269. TARLETONBEANIA, Eigenmann & Eigenmann.

Tarletonbeania, EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., IV, 1890, 7 (*tenua*).

This genus is close to *Myctophum*, differing chiefly in the entire absence of the lateral line. (Named for Dr. Tarleton Hoffman Bean, Ichthyologist of the United States National Museum, who has written largely on deep-sea fishes and on the fishes of the eastern Pacific.)

a. Ventral outline more arched than the dorsal; ventrals short, not reaching halfway to vent. CRENULARIS, 865.

aa. Ventral and dorsal outlines about equally arched; ventrals reaching halfway to seventh anal ray. TENUIS, 866.

865. TARLETONBEANIA CRENULARIS (Jordan & Gilbert).

Head 3¾; depth 4⅕. Eye large, 3⅓ in head. D. about 12; A. about 16, scales about 45. Caudal spots probably 2, making with the anal and postlateral spots a series of 21; 6 ventral spots. Body much compressed, bluntly convex anteriorly, tapering behind. Caudal peduncle long and very slender; ventral outline more arched than dorsal. Head short and high, the snout very blunt. Scales of sides crenulate, those of back with acute crenations, but no spines; no lateral line. Origin of dorsal nearer snout than base of caudal; caudal peduncle with 2 or 3 spinules (exserted tips of vertebral processes); ventrals reaching not halfway to vent; pectorals to base of ventrals. Color dark steel-blue. Santa Barbara Channel; coast of Washington; two small specimens known, one from the stomach of an albacore, the other blown on a vessel during a storm. (*crenularis*, slightly scalloped.)

Myctophum crenulare, JORDAN & GILBERT, Proc. U. S. Nat. Mus., 1880, 274, Santa Barbara. (Type, No. 27402. Coll. Jordan & Gilbert.) JORDAN & GILBERT, Synopsis, 282, 1883.
Myctophum procellarum (Bean MS.) JORDAN, *l. c.*, 457, off Straits of Fuca.

866. TARLETONBEANIA TENUA, Eigenmann & Eigenmann.

Head 3¾; depth 4⅓. D. 12; A. 17. Caudal spots probably 2, making a series of 16 with the anal spots; 6 ventral spots; a posterolateral spot; 3 supra-anal spots in an oblique series; 5 thoracic spots. Body moderately deep, greatly compressed, the caudal peduncle very slender, its depth 4½ in greatest depth of body; ventral and dorsal outlines equally arched. Preopercular margin nearly vertical, the head formed as in *M. humboldti*. No lateral line; scales of sides much larger than those of back or belly; smaller scales denticulate, larger crenulate. Origin of dorsal midway between tip of snout and base of caudal; anal larger than dorsal; pectorals reaching ventrals, which reach halfway to seventh anal ray. Coronado Islands, near San Diego; one specimen from stomach of *Sebastodes miniatus.* (Eigenmann.) Very close to *T. crenularis*, but the belly less arched, the anal spots fewer, and the ventrals slightly longer; probably identical with the latter.

Tarletonbeania tenua (*tenuis*), EIGENMANN & EIGENMANN, Proc. Cal. Ac. Sci., IV, 1890, 7, Coronados. (Type, No. 41882. Coll. Eigenmann.)

Family LXXVI. MAUROLICIDÆ.

Body moderately elongate, compressed, scaleless. Barbels none. Margin of the upper jaw formed by the maxillary and premaxillary, both of which are provided with teeth. Opercular apparatus incomplete. Gill opening very wide, the outer branchial arch extending forward to behind the symphysis of the lower jaw. Pseudobranchiæ present. Air bladder none. Adipose fin rudimentary. Series of luminous photophores present along the lower side of the head, tail, and body. A single dorsal fin without spinous rays. (Goode & Bean.) Genera 4 or 5, with some 8 or 10 species; deep-sea fishes. (*Sternoptychidæ*, group *Cocciina*, Günther, Cat., V, 387, 1864.)

- *a.* Gill rakers very short; dorsal fin on hinder half of body.
  - *b.* Dorsal fin well forward, its last ray inserted nearly over the first of anal; luminous spots over and behind anal forming a nearly continuous series.
    - *c.* Luminous spots appearing as impressions on the skin, not placed on black globular bodies; anal rays 25 to 30; double row of spots behind pectorals ceasing at ventrals. MAUROLICUS, 270.
    - *cc.* Luminous spots occuring as "convex pearls, each sitting on a black globular body;" anal rays about 14; double row of spots behind pectorals reaching anal. VINCIGUERRIA, 271.
  - *bb.* Dorsal fin farther back, nearly opposite anal, its first ray nearly over the front of anal; luminous spots over and behind anal gathered in 5 clusters of 2 to 4 each, the spots on a black background; star-shaped pigment spots along lateral line; anal rays about 24. VALENCIENNELLUS, 272.

270. MAUROLICUS, Cocco.

Maurolicus, COCCO, Lett. su. Salmon., 32, 1838, (*amethystino-punctatus*).

Body oblong, compressed, covered with silvery pigment; series of luminous spots along the lower side of the head, body, and tail, those over and behind anal forming a nearly continuous series; luminous spots appearing as simple impressions on the skin. Scales wanting, or perhaps present in life, but very thin and caducous. Head compressed, the bones thin, but ossified. Cleft of mouth wide, very oblique, the lower jaw prominent. Maxillary large, broad, toothed on its edge, produced backward, receiving the slender premaxillary in the upper concave part of its margin; both jaws with minute teeth; no teeth on vomer or palatines. Eye large; gill rakers very long. Pectorals and ventrals well developed; dorsal long, inserted posteriorly, opposite anal, with no projecting neural spines before it; adipose fin rudimentary or obsolete; anal rays 25 or 30; caudal forked. Pseudobranchiæ well developed. No air bladder. Branchiostegals 8 or 9. Size small. (Named for Maurolico, an Italian naturalist.)

867. MAUROLICUS PENNANTI (Walbaum).

Head 3½; depth 4. D. 11 or 12; A. 11 + 18, the last rays very fine and not easily counted. Luminous spots occurring as impressions on the skin, not sitting on black globular bodies; twelve pairs of luminous spots along belly before ventrals; 9 in an upper series between pectorals and ventral , this series not continued backward; series from vent to caudal 1 + 14 + 8 = 23, with slight interruptions, the last spots close together; along shoulder girdle and isthmus 7; 7 about gill opening; 1 before eye and 2 behind it. Front of dorsal considerably nearer base of caudal than tip of snout, its last ray over origin of anal. Length 2½ inches. (Lütken; Günther.) Open seas, widely distributed, occasionally taken off the New England Coast. (Nahant, Provincetown, Woods Holl, etc.) (Named for Thomas Pennant, author of early works on Arctic Zoölogy and on the fishes of England.) (Eu.)

Argentina pennanti, WALBAUM, Artedi Pisc., 47, 1792, England; after "Sheppy Argentine" of PENNANT.

Scopelus borealis, NILSSON, Observ. Zool., 9, 1835, Norway.

Maurolicus amethystino-punctatus, COCCO, Lett. su. Salmon., 161, 1838, coast of Italy.

Scopelus maurolici, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXII, 439, 1849; after Cocco.

Maurolicus mülleri, KRÖYER, Danmark's Fiske, III, 113, 1838, Denmark.

Scopelus humboldti, DE KAY, N. Y. Fauna: Fishes, 246, 1842.

Maurolicus borealis and *amethystino-punctatus*, GÜNTHER, Cat., V, 389, 390, 1864.

Maurolicus pennanti, STORER, Hist. Fishes Mass., 328, 1867; not of CUVIER; LÜTKEN, Spolia Atlantica, II, 47, 1892; LILLJEBJORG, Sveriges Fiskar, VI, 10, 1889.

Maurolicus borealis, JORDAN & GILBERT, Synopsis, 284, 1883.

271. VINCIGUERRIA, Jordan & Evermann.

Vinciguerria, JORDAN & EVERMANN, new genus, (*attenuata*).

This genus is close to *Maurolicus*, from which it differs, according to Lütken, chiefly in the character of its luminous spots which are pearl-like and placed on black globular bodies. Anal short, of 14 rays. (Named for Dr. Decio Vinciguerra, director of the Acquario Romano, and one of the most active and scholarly of the naturalists of Italy.)

868. VINCIGUERRIA ATTENUATA (Cocco).

Head 3¾; depth 6. D. 12; A. 14. Last ray of dorsal just behind vertical from origin of anal. Luminous spots slightly prominent, "appearing as convex pearls, each sitting on a black globular body;" twelve to 14 pairs of spots between front of anal and base of caudal; upper row from gill opening to ventrals with 12, 11 between ventrals and anal; from tip of isthmus to anal, 7 + 16 + 10 = 33 spots. Length 2 inches. Open Atlantic, west to the Bahamas; in deep water. (Lütken, etc.) (*attenuatus*, slender.) (Eu.)

Maurolicus attenuatus, COCCO, Lett. su. Salmon., 33, 1838, coast of Italy; GÜNTHER, Cat., V, 390, 1864; LÜTKEN, Spolia Atlantica, II, 271, 1892.

Scopelus tenorei, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XXII, 440, 1849; after Cocco.

272. VALENCIENNELLUS, Jordan & Evermann.

Valenciennellus, JORDAN & EVERMANN, new genus, (*tripunctulatus*).

This genus is close to *Maurolicus* but with the dorsal fin farther back, opposite anal, its first ray nearly over front of anal. Photophores above anal gathered in about five clusters, each on a black background; anal fin long. Deep sea. (Named for Achille Valenciennes, the associate of Cuvier, author of the greater part of the "Histoire Naturelle des Poissons," a noble work which is the foundation of modern ichthyology.)

869. VALENCIENNELLUS TRIPUNCTULATUS (Esmark).

Head 3¾; depth 3¾. D. 9 or 10; A. about 24. Luminous spots arranged in and placed on black bodies, 16 pairs in the lower row from pectorals to ventrals, 5 between ventrals and anal; 5 black areas between vent and caudal about equidistant, and each one with 2 or 4 small luminous spots set close together (the first 3 with 3 each, the fourth with 2, and the last with 4); 1 spot on preopercle, 4 near shoulder girdle, 5 in an upper row behind pectoral; head and region along lateral line with a row of about 16 black pigment spots, some of them star-shaped, with many radiations, these largest posteriorly; large and small ones interspersed. First ray of dorsal slightly before first of anal. Length 2½ inches. Two specimens known, one from Madagascar and one from Denmark Straits, between Greenland and Iceland. (Lütken.) (*tripunctulatus*, three-spotted.)

Maurolicus tripunctulatus, Esmark, Christiania Vid. Selsk., Forh., 488, 1870, Madagascar; Lütken, Spolia Atlantica, Scopelini, 49, 1892.

Family LXXVII. CHAULIODONTIDÆ.

(The Viper-fishes.)

Body more or less elongate, covered with thin caducous scales, or sometimes naked; photophores present. Mouth large, the teeth irregular in size; maxillary entering margin of upper jaw. No pseudobranchiæ; interopercle rudimentary; gill-openings wide. Dorsal and anal moderate or large. Deep-sea fishes of rather small size but voracious habits, some 7 genera and about 20 species known.

Gonostominæ:

a. Opercles complete; dorsal inserted behind ventrals; teeth moderate, some of them enlarged or canine-like; gill rakers long.

b. Dorsal inserted on posterior half of body.

c. Dorsal inserted opposite anterior rays of anal; air bladder absent.

d. Scales present; adipose fin present; luminous spots large and conspicuous; no vomerine teeth; suborbital covering the cheek. Gonostoma, 273.

dd. Scales very caducous; adipose fin absent; suborbital not covering the cheek.

e. Dorsal rays about 20; photophores conspicuous. Bonapartia, 274.

ee. Dorsal rays 12 or 13; photophores small; vomerine teeth present. Cyclothone, 275.

bb. Dorsal nearly median in its position, inserted slightly in advance of anal, its posterior rays overlapping anterior rays of anal; body rather elongate; teeth in double rows in premaxillary and mandible; vomer with fangs. Yarrella, 276.

Chauliodontinæ:

aa. Opercles incomplete, the interopercle rudimentary; both jaws with excessively long fang-like canines; dorsal inserted before ventrals; gill rakers none; scales large, thin, and deciduous. Chauliodus, 277.

273. GONOSTOMA, Rafinesque.

Gonostoma, Rafinesque, Indice Ittiol. Sicil., 64, 1810, (*denudatum*).

Body elongate, somewhat compressed, and probably all species provided with very large, thin, caducous scales; lower parts with series of luminous spots. Head conical; cleft of mouth very wide, oblique, extending behind eye, the lower jaw strongly projecting; maxillary long and slender, sickle-shaped, closely connected with the short premaxillary; upper jaw with a single series of rather large, sharp, close-set teeth, about every fourth one more or less longer than the rest, and directed slightly outward; lower jaw with similar teeth, subequal, directed forward, with a few canines in front; no teeth on vomer. Eye small. Gill openings very wide, the membranes free from the isthmus. Gill rakers numerous, long, and slender. Pseudobranchiæ none; branchiostegals about 9. No air bladder. Dorsal and anal well developed, inserted opposite each other, the anal the longer; adipose fin small; caudal forked, its peduncle long and slender. Deep-sea fishes of small size. (*γωνία*, angle; *στόμα*, mouth.)

a. Anal rays about 30.	DENUDATUM, 870.
aa. Anal rays about 20.	BREVIDENS, 871.

870. GONOSTOMA DENUDATUM, Rafinesque.

Head 4; depth 5½. D. 14 or 15; A. 30 or 31; P. 11 or 12; V. 8; scales 36. Jaws heterodont, the intermaxillary being armed with 2, the maxillary with about 12 large, distinct teeth, the spaces between them being filled with very small teeth; lower jaw similarly armed with 10 or 11 large teeth. Entire cheek covered by the enormously enlarged infraorbital. (Günther.)

This species is common in the Mediterranean and the neighboring parts of the Atlantic, especially off Madeira. In 1881, it was trawled by the *Fish Hawk* off the New England Coast. It was also obtained by the *Albatross*, at station 2665, in 263 fathoms, and by the French expedition, in 590 fathoms, off the coast of Morocco, and off the Cape Verdes, in 230–290 fathoms. (Goode & Bean.) (*denudatus*, made naked.) (Eu.)

Gonostoma denudata, RAFINESQUE, Indice Ittiol. Sicil., 65, 1810, Palermo; GOODE & BEAN, Oceanic Ichthyology, 38, fig. 116, 1895.

Gasteropelecus acanthurus, COCCO, Giorn. Sc. Lit., No. 77, 1829, Italy.

Gonostomus acanthurus, COCCO, Lett. su. Salmon., 1838.

871. GONOSTOMA BREVIDENS, Kner & Steindachner.

Head 4; depth 6. D. 13 or 14; A. 18 or 19; V. 7. Body elongate, compressed. Eye equal to snout, and about $\frac{1}{5}$ length of head; interorbital space about $\frac{2}{3}$ diameter of eye. Mouth opening large, oblique, lower jaw projecting; upper jaw reaching back to the angle of the preoperculum, and convex on its lower edge. Intermaxillary, maxillary, and mandible provided with a single row of sharp teeth, unequal in size; tongue toothless; two stronger teeth near the symphysis of the lower jaw; on the palatines, and possibly upon the pterygoids, a few small, sharp-pointed teeth. Gill opening very wide; 12 short branchiostegals, a luminous dot at the base of each of the 8 anterior ones; no pseudobranchiæ; gill laminæ large. Probably the lower pharyngeal bones covered with teeth similar to those in the jaws but in several rows. The dorsal has its origin nearly midway between the ventral and the anal, and is composed of 13 or 14 rays; adipose fin thread-like; ventral in front of the middle of the body (not behind, as stated by Kner) with 7 rays, reaching to the vent; anal with from 17 to 19 rays, beginning under the last 3 or 4 rays of the dorsal, and the fin similar in height to the dorsal; caudal equal in length to that of the head from snout to preoperculum, and strongly forked; pectoral small, pointed, and nearly as long as the caudal. The thin, caducous scales with which the body is covered exhibit no radiating lines, but have simple, delicate, concentric rings. On either side 2 longitudinal rows of inconspicuous phosphorescent spots, surrounded with black pigment; the lower row near the line of the belly begins near the throat and ends at the origin of the anal. In the space from the pectoral to the ventral are 16 spots; between the ventral and the anal 11; the upper row commences with 2 large spots upon the suboperculum, and continues back to the caudal. Color dark gray; the back and belly silvery; all the fins whitish, uniform in color.

Specimens taken by the *Blake* from off Grenada in 161 and 461 fathoms, in the old Bahama Channel in 500 fathoms, and off Bequia in 458 fathoms; the original type from the open Atlantic. (Goode & Bean.) (*brevis*, short; *dens*, tooth.)

Gonostoma brevidens, KNER & STEINDACHNER, Sitzb. Akad. Wissensch. Wien, LXI, 1870, 443, Atlantic; GOODE & BEAN, Oceanic Ichthyology, 98, 1895.

274. BONAPARTIA, Goode & Bean.

Bonapartia, GOODE & BEAN, Oceanic Ichthyology, 102, 1895, (*pedaliota*).

Body oblong, compressed, slender behind, as in *Gonostoma*, covered with large cycloid scales, nearly equal in size. A continuous row of photophores on either side of the ventral line upon the lowest row of scales, extending from the anterior part of the lower jaw to the extremity of the base of the anal; others upon the caudal peduncle. Head much compressed, cleft of mouth very wide. Premaxillary short; maxillary long, curved, forming the entire margin of the upper jaw, extending to the angle of the preoperculum. Jaws armed with a single series of not very numerous, acicular teeth, uniform in size; minute teeth on the palatines and pterygoids. Eye moderate. Pectoral and ventral fins small; dorsal fin on the hinder half of the body, opposite the anterior portion of the anal; adipose fin absent; anal much longer and higher than dorsal; caudal (probably) subtruncate. Gill opening exceedingly wide, the branchial aperture extending nearly to the dorsal line on either side, and extending forward also to the symphysis of the lower jaw. Gill rakers very long. (Named for Charles Lucien Bonaparte, Prince of Canino, 1775–1840, "whose admirable work upon the fishes of Italy, one of the most essential of the older works in the ichthyologist's library, is full in its discussion of the fishes allied to the one now under discussion.")

872. BONAPARTIA PEDALIOTA, Goode & Bean.

Head 3½; depth 4½; eye 5. D. 20; A. 30; scales 46. Body elongate, compressed. Eye about equal to snout; width of interorbital space less than eye. Mouth large, oblique, the lower jaw slightly projecting; upper jaw reaching back to angle of the preopercle, and convex on its lower edge between the verticals from the anterior and posterior margins of the eye. Preopercle extending backward in a sharp angle. Origin of dorsal fin equidistant from root of ventral and the axil of posterior anal ray, and in vertical from fourth or fifth anal ray; greatest height of dorsal about equal to its base; origin of anal equidistant from the posterior margin of the orbit and base of middle caudal rays, its anterior third greatly prolonged, falcate in form; length of the longest or third ray about equal to length of base of fin; posteriorly to end of dorsal the fin is low; pectorals and ventrals short and feeble; ventrals inserted about midway between tip of snout and root of caudal fin. A single row of rather conspicuous phosphorescent spots from the lower jaw, beneath the eye, to end of anal on either side, these dots being heavily margined and with black above; 12 of these between branchial opening and the origin of ventral, 5 between ventral and anal, 16 in the anal series, and 2 upon caudal peduncle, 1 at origin of lower caudal rays, the other in vertical above it and about $\frac{1}{5}$ of the distance from the dorsal outline; a series of vertical, elongated spots, apparently phosphorescent, upon either side of the lower jaw, giving it a pectinate appearance. Color brownish gray; the head with silvery reflections.

The types of this species are two specimens, about 1 and 2 inches long respectively, obtained by the steamer *Albatross* from station 2642, at a depth of 217 fathoms. (*πηδάλιωτος*, having rudder-like fins.)

Bonapartia pedaliota, Goode & Bean, Oceanic Ichthyology, 102, fig. 120, 1895, Gulf Stream, at 25° 20′ 30″ N., 79° 58′ W. (Type, No. 44337. Coll. Albatross.)

275. CYCLOTHONE, Goode & Bean.

Cyclothone, Goode & Bean, Bull. Mus. Comp. Zoöl., x, No. 5, 1883, 221, (*lusca*).
Sigmops, Gill, Proc. U. S. Nat. Mus., 1883, 256, (*stigmaticus*).
Neostoma, Vaillant, Exp. Scient. Travailleur et Talisman, 86, 1888, (*bathyphilum*).

Body elongate, somewhat compressed, apparently devoid of scales; lower parts with inconspicuous series of luminous spots, with the latter arranged approximately as in *Gonostoma*, but usually much less conspicuous. Head conical, compressed; cleft of mouth very wide, oblique, extending behind the eye; the lower jaw strongly projecting. Maxillary long and slender, sickle-shaped; somewhat dilated posteriorly, but covering only an inconsiderable portion of the cheek. Upper jaw with a single series of needle-like teeth, some of which are enlarged; lower jaw with similar teeth, and in some species with a few canines in front; teeth on vomer sometimes in patches, sometimes reduced to a single pair of fangs; palatine and pterygoid teeth present or absent. Eye moderate, not conspicuous. Gill opening very wide, the membranes free from isthmus; gill rakers numerous, long and slender. Pseudobranchiæ none. No air bladder. Dorsal and anal moderate, opposite, the latter much the longer; adipose fin sometimes present. (*κύκλος*, round; *ὀθόνη*, veil.)

Cyclothone:
- *a.* Anal rays 18 to 22.
  - *b.* Body not greatly elongate, the depth 7 to 8 in length. microdon, 873.
  - *bb.* Body elongate, the depth 11 in length. bathyphila, 874.

Sigmops (*σίγμα*, the letter s; *ὦψ*, appearance):
- *aa.* Anal rays 27 to 30; depth 7 in length. elongata, 875.

Subgenus CYCLOTHONE.

873. CYCLOTHONE MICRODON (Günther).

Head 4⅔; depth 7⅔; eye as long as snout, 7 in head. B. 7 to 9; D. 11 or 12; A. 16 to 20; C. 17; P. 9 or 10; V. 5. Body elongate. Cheeks naked. Premaxillary very short, extending to vertical from posterior limb of anterior nostril; maxillary very strongly curved downward, with a short knob at its anterior extremity, not visible without dissection. Most of the teeth on maxillary inclined forward. Gill rakers 9 + 13 or 14. Lower jaw long, included, with the exception of the projecting tip. Eye circular, close to the profile, the interorbital area being very narrow; anal under second ray of dorsal, its base half as long again as that of dorsal, and nearly ⅓ as long as body; its outline resembling that of dorsal, its longest ray a little longer than the longest of the dorsal; caudal forked; pectoral inserted under tip of opercular flap, its length equal to greatest height of body; ventral inserted at a distance from snout equal to twice the length of the head, its length slightly exceeding that of the pectoral, 7 in body. Color blackish brown, the luminous pores inconspicuous, in a row on each side from pectoral region to tail, and another below it from throat to the origin of anal. (Goode & Bean.)

First obtained from great depths near Bermuda, subsequently at numerous localities in the Atlantic, Pacific, and Antarctic oceans, at depths of from 500 to 2,900 fathoms. Since also taken from numerous localities in the Atlantic by the *Albatross* and the *Blake*. It is equally abundant in deep water along the Pacific Coast from Oregon to the Galapagos. In fact it is everywhere one of the most widely distributed and common of all deep-sea fishes. "Although many hundreds of specimens are in the National Museum, the species is so exceedingly delicate and hard to preserve that not one of them gives satisfactory opportunity for study." (Goode & Bean.) (*μικρός*, small; *ὀδούς*, tooth.)

Gonostoma microdon, GÜNTHER, Ann. and Mag. Nat. Hist., II, 1878, 188, near Bermuda; GÜNTHER, Voy. Challenger, XXII, 175, 1887; LÜTKEN, Spolia Atlantica, Scopelini, 60, 1892.

Cyclothone lusca, GOODE & BEAN, Bull. Mus. Comp. Zoöl., X, No. 5, 1883, 221, Gulf Stream.

Cyclothone microdon, GOODE & BEAN, Oceanic Ichthyology, 990, fig. 114, 1895.

874. CYCLOTHONE BATHYPHILA (Vaillant).

Head 4½; depth 11. D. 12 or 13; A. 21 or 22; V. 7; P. 10; branchiostegals 13. Body elongate, compressed; vent midway between tip of snout and end of caudal rays. Eye moderate, its diameter equal to half length of snout, and also to the width of interorbital space; placed far forward, so that the snout is very short, ¼ length of head. Cleft of mouth exceedingly wide, oblique. Maxillary somewhat dilated, but not covering any considerable portion of the cheek, its tip separated from the angle of the operculum by a distance greater than the diameter of the eye. Teeth of premaxillaries moderate in size; upon maxillaries and mandible larger, conical, separated by moderate intervals, which are filled with smaller teeth; teeth also on palatines, pterygoids, and pharyngeals. Opercular bones very thin. Origin of dorsal and anal fins opposite, immediately behind vent, the anal more than twice as long as the dorsal and reaching nearly to the tail, which is forked; adipose dorsal small; pectoral and ventral composed of weak rays, the origin of the latter nearly midway from base of pectoral to vent, and tips of longest rays reaching to vent. Branchial arches 4, long and slender; very elongate gill rakers, 10 + 15 in number, the longest twice as long as eye. Velvety black, with a number of luminous spots.

This species was obtained by the French explorers at depths of 710 to 1,290 fathoms in the Gulf of Gascony and off the Azores. It has since been found in considerable numbers in the western Atlantic by the *Albatross.* (Goode & Bean.) (βαθύς, deep; φιλέω, to love.) (Eu.)

Neostoma bathyphilum, VAILLANT, La Nature, 1884, 184; name and rough figure only.

Cyclothone bathypila, VAILLANT, Travailleur et Talisman, 96, pl. 8, figs. 1, 1*a*, 1888, Gulf of Gascony; Azores; GOODE & BEAN, Oceanic Ichthyology, 100, fig. 118, 1895.

Subgenus SIGMOPS, Gill.

875. CYCLOTHONE ELONGATA (Günther).

Head 4½; depth 7. D. 13; A. 27 to 30; P. 11; V. 7. Vent midway between root of caudal fin and eye. Eye moderate, ⅔ of snout, about ⅛ length of head, its diameter less than width of interorbital space. Mouth exceedingly wide, maxillary extending to the posterior angle of the operculum, with a number of large teeth at considerable distances, with interspaces filled with smaller teeth; intermaxillary with 2, and mandible with about 10, large teeth. Infraorbital bone dilated, covering only about ½ of cheek; opercular bones thin. Gill laminæ short; gill rakers long; branchiostegals 11, very short. Dorsal fin inserted a little behind the vertical from vent, its greatest height exceeding that of the body at the point of its origin; anal fin directly under the dorsal, much longer, extending nearly to root of caudal, highest in front; pectoral narrow, slender, placed low, its length ⅔ that of the head; distance of ventral from vent contained ½ in its distance from pectoral. Scales have apparently been present, on a part at least, of the body, namely, the tail and ventral line. Luminous organs very pink, with silvery margins, in two rows on either side of the abdomen. Color black.

This species was obtained by the *Challenger* south of New Guinea, in 800 fathoms, and off Banda, in 360 fathoms. It has been found in considerable numbers in the deep waters off the American Coast by both the *Blake* and the *Challenger*, by the *Investigator* in the Indian Ocean, and by the *Albatross* in the Gulf Stream at station 2039 in 2,361 fathoms. (Goode & Bean.) (*elongatus*, elongate.)

Gonostoma elongatum, GÜNTHER, Ann. and Mag. Nat. Hist., II, 1878, 187, New Guinea; Banda.

Sigmops stigmaticus,* GILL, Proc. U. S. Nat. Mus., VI, 1883, 256, Gulf Stream, in 38° 19′ 26″ N., 68° 20′ 20″ W. (Type, No. 33291. Coll. Albatross.)

Cyclothone elongata, GOODE & BEAN, Oceanic Ichthyology, 101, fig. 119, 1895.

276. YARRELLA, Goode & Bean.

Yarrella, GOODE & BEAN, Oceanic Ichthyology, 103, 1895, (*blackfordi*).

Body elongate, compressed, covered with rather large, thin, deciduous scales; the lower parts with luminous spots. Head conical, compressed;

---

* The type of *Sigmops stigmaticus* is an imperfect individual, from which the luminous spots had been rubbed off before it was examined.—*Goode & Bean.*

cleft of mouth very wide, oblique, extending behind the eye. Lower jaw strongly projecting. Intermaxillary comparatively long, forming about half of margin of upper jaw. Upper jaw with a single row of teeth in the maxillary, and a double row in the intermaxillary, interspersed with occasional stronger teeth; those in the intermaxillary directed downward or backward, those in the maxillary somewhat forward; mandible with double row of small teeth, outer row with some larger ones; a row of short, weak teeth on the palatines; head of vomer with a short fang on either side. Eye moderate; gill openings very wide, the membranes free from the isthmus. Gill rakers not very numerous, rather short and stout. Pseudobranchiæ none. Branchiostegals numerous, 14. No air bladder. Dorsal and anal well developed, the former far in advance, its posterior rays over the origin of anal; no adipose fin; caudal moderately forked. (Named for William Yarrell, 1789–1856, an eminent ichthyologist, who wrote on the fishes of England.)

876. YARRELLA BLACKFORDI, Goode & Bean.

Head 4½; depth 7½; eye 7. D. 15; A. 27; V. 6. Body elongate. Eye moderate, its diameter ⅔ of snout; maxillary extending far behind the eye, its length equal to that of postorbital part of the head. Gill rakers 6 + 13, the longest about as long as the eye. Branchiostegals 14. Dorsal origin a little nearer root of caudal than tip of snout, nearly over middle of space between ventral and anal, its posterior ray over seventh ray of anal; distance of ventral origin from tip of snout contained 2½ times in total (without caudal), its rays imperfect, the longest only about ¼ length of head; pectoral placed low, on a narrow base. Scales have evidently been present, and of considerable size, but their character and number can not be ascertained from the specimens examined.

Color purplish brown; 9 phosphorescent spots on the isthmus, 25 between the symphysis of the mandible and the root of ventral, 12 between the origin of ventral and vent, and 26 from vent to tail; a second row of pearly spots extends from above root of pectoral to origin of anal.

The type obtained by the *Albatross* from station 2376, at a depth of 324 fathoms. Two other specimens, the larger one 9½ inches in length, taken at the same place. (Named for Eugene G. Blackford, president of the board of fish commissioners of the State of New York.)

Yarrella blackfordi, Goode & Bean, Oceanic Ichthyology, 103, fig. 121, 1895, Gulf Stream at 29° 03′ 15″ N., 88° 16′ W. (Type, No. 44242. Coll. Albatross.)

277. CHAULIODUS, Bloch & Schneider.

(Viper-fishes.)

Chauliodus, Bloch & Schneider, Syst. Ichth., 430, 1801, (*sloanei*).
Leptodes, Swainson, Nat. Hist. Anim., II, 298, 1839, (*sloanei*).

Body elongate, compressed, covered with very thin deciduous scales of moderate size; lower side of head, body, and tail with series of luminous spots. Head short, much compressed and elevated, the bones thin but ossified; lower jaw projecting, the snout much shorter than eye; mouth extremely wide, the cleft reaching much beyond eye; premaxillaries with 4 long, fang-like canines on each side; mandible with pointed, wide-set teeth, the anterior ones excessively long; none of these large teeth received within the mouth; maxillaries with fine teeth; palatine with a single series of small pointed teeth; no teeth on the tongue. Opercle very narrow, the interopercle rudimentary. Eye moderate. Pectorals moderate; ventrals large; dorsal fin high, placed anteriorly, well in front of the ventrals; adipose fin moderate, sometimes fimbriate, opposite the low, short anal; caudal moderate, forked. Gill openings very wide; no gill rakers. Branchiostegals numerous; no pseudobranchiæ. Deep-sea fishes of voracious habits; two species known. (*χαύλιος*, exserted; *ὀδούς*, tooth.)

a. Head 7 in length; Atlantic species.	SLOANEI, 877.
aa. Head 6 in length. Pacific species.	MACOUNI, 878.

877. CHAULIODUS SLOANEI, Bloch & Schneider.

Head 7; depth 7. B. 17; D. 6; A. 12; V. 7; scales 56 (65 in a figure published by Agassiz in Cruise of the *Blake*). Dorsal not far backward, its distance from occiput less than length of head, its first ray produced in a long filament nearly ⅓ length of body; pectoral fins short; ventral fins long, longer than head, and much longer than pectorals. About 30 luminous dots in a series from the chin to the ventrals. Scales of the body subhexagonal. Head nearly as deep as long. Greenish above; sides silvery; belly blackish. Length 12 inches. (Günther.) Mediterranean and deep waters of the Atlantic; a specimen found in the stomach of a cod on George's Banks; and elsewhere in deep water; also in the Mediterranean. (Named for Hans Sloane, an early naturalist and traveler, who wrote on the animals of Jamaica.) (Eu.)

Chauliodus sloanei, BLOCH & SCHNEIDER, Syst. Ichth., 430, 1801, Atlantic; after Vipera Marina of CATESBY; GÜNTHER, Cat., V, 392, 1864; JORDAN & GILBERT, Synopsis, 285, 1883.
Chauliodus setinotus, BLOCH & SCHNEIDER, Syst. Ichth., pl. 85; same type.
Esox stomias, SHAW, Gen. Zoöl., V, 120, 1804; after CATESBY.
Chauliodus schneideri, RISSO, Europe Mérid., III, 442, 1826, Nice.

878. CHAULIODUS MACOUNI, Bean.

Head 6; eye 4½; snout 4½. D. 6; A. 11; V. 7; P. 13; scales 56. Longest fang in mandible nearly half head. Dorsal beginning over seventh row of scales, its first ray 3½ to 4½ in body, its base 3 in head; base of adipose dorsal ⅔ that of anal, which is more than half head; ventral 5 in body, inserted under seventeenth scale of lateral line. Coast of California to British Columbia, in deep water; the type taken off Queen Charlotte Islands, in 876 fathoms; about 4 specimens known; close to *C. sloanei*, the head a little longer, the scales perhaps larger; probably not distinct. (Named for Prof. John C. Macoun, of the Geological Survey of Canada.)

Chauliodus macouni, BEAN, Proc. U. S. Nat. Mus., 1890, 44, off Queen Charlotte Islands, at Albatross Station 2860, at 51° 23′ N., 130° 34′ W. (Type, No. 45372. Coll. Albatross.)

Family LXXVIII. ASTRONESTHIDÆ.

Stomatoid fishes, with adipose dorsal present, and with scaleless body. Dorsal fin inserted behind vent, but in front of anal. A single genus, with few species; fishes of the deep sea. (*Astronesthidæ*, Gill, in Goode & Bean, Oceanic Ichthyology, 105, 1895.)

278. ASTRONESTHES, Richardson.

Astronesthes, RICHARDSON, Ichth. Voy. Sulph., 97, 1845, (*niger*).

Phænodon, LOWE, Proc. Zoöl. Soc. Lond., 1850, 250, (*ringens*).

Body rather elongate, compressed, scaleless. Head compressed, the snout of moderate length, the mouth wide, lower jaw prominent. Teeth pointed, unequal; upper jaw with 4 long, curved canines; front of lower with 2; maxillary teeth fine, subequal; palatines with a single series of small, pointed teeth, similar to those on tongue. Eye moderate, not longer than snout. Throat with a long fleshy barbel. Dorsal fin rather long, inserted entirely in front of anal, behind ventrals; adipose fin present; caudal forked; paired fins long. Gill rakers minute. No pseudobranchiæ. No air bladder. Sides and belly with very many small luminous spots; a small luminous patch below eye. Small fishes of the deep seas; remarkable for their strong teeth, the lower jaw much stronger than in *Malacosteus*; 4 species known. (*ἄστρον*, star (starfish); *ἐσθίω*, to eat.)

a. Barbel not much longer than head; last ray of dorsal considerably behind vent, nearly over first ray of anal.
  b. D. 17; A. 14. NIGER, 879.
  bb. D. 17; A. 17. GEMMIFER, 880.
aa. Barbel much longer than head; last ray of dorsal in advance of vent, and much before first ray of anal. RICHARDSONI, 881.

879. ASTRONESTHES NIGER, Richardson.

Head 4⅓; depth 5½; eye 4⅔. D. 17; A. 14; V. 30 + 15 = 45. Body rather stout, deepest at the nape. Barbel a little longer than head. Dorsal beginning just behind base of ventrals, its last ray considerably behind vent and nearly over first of anal; pectoral not reaching nearly to ventrals. Jaws subequal. Eye large, well forward, almost as long as snout, the luminous spot below it very small. Color black, with 22 photophores between chin and ventral. Deep waters of all seas. One specimen taken in the open sea off our coast.* (*niger*, black.)

Astronesthes nigra, RICHARDSON, Ichth. Voy. Sulphur, 97, 1845, Atlantic; GÜNTHER, Cat., v, 425, 1864; LÜTKEN, Spolia Atlantica, II, 537, 1892; JORDAN & GILBERT, Synopsis, 287, 1883.

Stomias fieldii, CUVIER & VALENCIENNES, Hist. Nat. Poiss., XVIII, 378, 1846, Mid-Atlantic. (Type, No. 34538. Coll. Capt. Field.)

Phænodon ringens, LOWE, Proc. Zoöl. Soc. Lond., 1850, 251, Madeira.

Astronesthes barbatus, KNER, Sitzber. Akad. Wiss. Wien, 1860, XXXIX, 543, Coast of Brazil.

880. ASTRONESTHES GEMMIFER, Goode & Bean.

Head 4½; depth 5½; eye 4. D. 17; A. 17; V. 7; P. 9. Barbel about equal in length to the head. Origin of dorsal fin a little nearer tip of

---

*This species is represented in the national collection by only a single specimen (No. 34538, U. S. National Museum), the type of *Chauliodus fieldii*, Cuvier & Valenciennes, obtained by Captain Field, in May, 1819, on a voyage from Mogador to New York, probably at the surface. This specimen passed from the hands of Dr. Mitchill to those of Mr. J. Carson Brevoort, then to Mr. E. G. Blackford, by whom it was presented to the National Museum. (Goode & Bean.)

snout than root of caudal; length of its base contained nearly 4 times in the total without caudal, its longest ray ⅔ length of head. Ventral origin directly under dorsal origin; length of ventral 5½ times in body, not reaching nearly to vent; distance of anal origin from root of the caudal a little more than ¼ of total length without caudal. Eye longer than snout. Pectoral nearly ⅐ as long as body without caudal.

The type of this species, about 7½ inches in length, was taken from a halibut's stomach, January 26, 1890, by the schooner *Polar Wave*, in 44° 25′ N. latitude, 53° 12′ W. longitude, in about 300 fathoms. This species may possibly prove identical with *A. niger*. The limits of variation of the fin rays in this genus have not been determined for lack of sufficient material. The specimen has 17 anal rays and numerous gem-like dots on the lower part of the body, there being about 30 in the series from the symphysis of the mandible to the ventral. (Goode & Bean.) (*gemma*, bud or gem; *fero*, I bear.)

Astronesthes gemmifer, GOODE & BEAN, Oceanic Ichthyology, 105, fig. 124, 1895, Grand Banks. (Type, No. 24645. Coll. Schr Polar Wave.)

881. ASTRONESTHES RICHARDSONI (Poey).

Head 4½; depth 6⅔; eye 7. D. 12 or 13; A. 13 or 14. Body more elongate than in *A. niger*, less rapidly tapering backward; barbel much longer than head, reaching beyond tip of pectorals; dorsal beginning over axil of ventrals, its last ray in advance of vent and far in advance of first of anal; pectorals almost reaching ventrals; lower jaw prominent; eye small, shorter than snout, the luminous organ below it as long as pupil. Black, with the usual many luminous spots. Deep waters of West Indies, Indian and Pacific oceans. (Lütken.) (Named for Sir John Richardson the discoverer of the genus *Astronesthes*.)

Chauliodus richardsoni, POEY, Memorias, I, 176, 1855, Cuba. (Coll. Poey.)

Astronesthes richardsoni, GÜNTHER, Cat., V, 425, 1864; LÜTKEN, Spolia Atlantica, II, 55, 1892.

Family LXXIX. STOMIATIDÆ.

Body elongate, tapering, naked or covered with very thin and deciduous scales. Head oblong; snout short and rounded. Eyes large and far forward. Opercular apparatus imperfectly developed. Mouth enormous, with deep lateral cleft; lateral margin of upper jaw formed by maxillary and provided with teeth along the edges; teeth usually strong, unequal, some of them often fang-like or barbed. Gill membranes not joined, free from the isthmus. Branchiostegals numerous (12 to 17); a long barbel at throat. No pseudobranchiæ. Dorsal fin short, median or posterior, without spines; anal free, far behind and small; caudal distinct; pectorals low down on the scapular arch and narrow; ventrals inserted far backward. Stomach cæcal, and pyloric appendages absent. Sides with phosphorescent spots. Skeleton feebly ossified. Eggs excluded through oviducts. (Goode & Bean.) Deep sea-fishes of extremely voracious habits; 8 genera and about 20 species known. (*Stomiatidæ*, part, Günther, Cat., V, 424, 1864.)

STOMIATINÆ:

- *a.* Pectorals present.
  - *b.* Body covered with fine scales; ventrals very far back. STOMIAS, 279.

bb. Body naked.
c. Pectorals with separate ray; vomer with teeth; teeth in jaws long, depressible; palatines with teeth. ECHIOSTOMA, 280.
cc. Pectorals normal; vomer toothless; dorsal and anal similar in size and opposite; teeth fang-like; pigment spots in place of lateral line; eye small. GRAMMATOSTOMIAS, 281.

PHOTONECTINÆ:
aa. Pectorals absent; body naked; dorsal inserted behind vent. PHOTONECTES, 282.

279. STOMIAS, Cuvier.

Stomias, CUVIER, Règne Animal, Ed. 1, 184, 1817, (*boa*).
